Help	Specifies the help string displayed on the status bar.
Command	Specifies the command(s) or macros.
Image	Specifies the image to use for the toolbar button; click ... to access the file dialog box.

Ribbon Tab Options	Description
Ribbon Tab	(6.757 on page 4020)
Ribbon tabs	To add a new ribbon tab: • Right click the **Ribbon tabs** node and click **Append ribbon tab** in the context menu to add a new tab at the bottom of the list. • Right click an existing tab and choose **Insert ribbon tab** in the context menu to add a new tab above the selected tab. Drag a tab to modify the order. To add a panel to a tab: • Right click the tab name and choose **Append panel** in the context menu to add a panel at the bottom of the list. • Right click an existing panel and choose **Insert panel** in the context menu to ad a panel above the selected panel. Drag a panel to modify the order.
Ribbon panels	See the Ribbon (1.17.6) item in the BricsCAD User Guide.

Keyboard Tab Options	Description
Keyboard Tab	(6.758 on page 4021) To assign a different command to a keyboard shortcut, select a command in the right and pane, then drag the command to the keyboard shortcut in the left hand pane.

Shortcut Menu	Right-click a keyboard shortcut: (6.759 on page 4021)
Insert Shortcut	Adds a new keyboard shortcut to the list; displays dialog box: (6.760 on page 4022) • **Select Available Tool**: Assigns an existing command to the keyboard shortcut. • **Create New Tool**: Assigns a new command/macro to the shortcut. • **Toolbox**: Specifies the toolbox to which to add the new command; click the droplist, and then choose a toolbox. • **Title**: Names the new tool. • **Help**: Specifies the help text. • **Command**: Specifies the command(s) or macros. • **Image**: Specifies the name of the image file; click ... to access the file dialog box. • **Delete Shortcut**: Erases the selected shortcut.
Keyboard Shortcut	(6.761 on page 4022) • **Key**: Specifies the keyboard shortcut. • **Tool ID**: Identifies the keyboard shortcut to other elements in the CUI file. (The Tool ID is assigned by BricsCAD.) • **Help**: Specifies the text of the help string, even though help strings are not displayed by keyboard shortcuts. • **Command**: Specifies the command(s) to associate with the keyboard shortcut. • **Image**: Specifies the image to associate with the command, even though images are not used with keyboard shortcuts.

Mouse Tab Options	**Description**
Mouse Tab	(6.762 on page 4023)

Tablet Tab Options	**Description**
Tablet Tab	(6.763 on page 4024)

Quad Tab Options	**Description**
Quad Tab	(6.764 on page 4025) • To add a command to a Quad tab: Select a command in the right and pane, then drag the command to the Quad tab in the left hand pane. • To move a command: Drag the command to its new location.

Shortcut Menus	Right click the CUI name (BRICSCAD) (6.765 on page 4025) • **Append quad tab**: Adds a new Quad tab at the bottom of the tab list. (6.768 on page 4026) Specify the **Label** and **Title** for the new Quad tab and click the OK button. Right-click a Quad tab: (6.767 on page 4026) • **Insert quad tab**: Inserts a new Quad tab above the selected Quad tab (6.768 on page 4026) Specify the **Label** and **Title** for the new Quad tab and click the **OK** button. • **Insert copy**: Inserts a copy of the selected Quad tab. Specify the **Label** and **Title** for the new Quad tab and click the **OK** button. • **Delete quad tab**: deletes the selected Quad tab. • **Append quad button**: Adds a new Quad button at the bottom of the list. Specify the **Label** and **Title** for the new Quad tab and click the **OK** button Right-click a Quad button (6.769 on page 4026) • **Insert**: Inserts a new Quad button above the selected button. • **Delete**: Deletes the selected Quad button.
Insert quad tab	Inserts a new quad tab: (6.770 on page 4026) • **Label**: The label name displays in the Quad. • **Title**: The title name identifies the Quad tab and therefore must be unique.
Delete quad tab	Select the Quad Tab you want to delete.
Append quad button	Adds a button in a tab.

Properties Tab Options	**Description**
Properties Tab	(6.771 on page 4027) To specify which properties show when the ROLLOVERTIPS system variable is ON, select an entity in the left hand pane, then check the desired properties in the right hand pane.

Workspace Tab Options	**Description**
Workspaces Tab	(6.772 on page 4028)
Menus	Controls the display of menus in the menu bar. To modify the order: drag the menu. • To control the display of a menu: click the **State** field and select **On** or **Off** .
Toolbars	Lists the toolbars which are currently open in the workspace.
Palettes	Controls which tool panels are open in the workspace. (6.773 on page 4028)

Ribbon	Controls which ribbon tabs are available in the workspace. (6.774 on page 4029) Drag a tab to modify the order. • Right click a tab in the list, then choose **Insert tab** in the context menu. (6.775 on page 4029)
Quad Groups	Controls the display and the order of the Quad item groups. • To modify the order: drag the Quad item groups. • To control the display of a Quad item group: click the **State** field and select **On** or **Off** .
On Switch	Sets the commands to be executed when switching to the workspace. To ad a command, do one of the following: • Right click, then choose **Append Tool** in the context menu. • Drag a command from the right hand pane to the **On Switch** command list.
Context Menu	(6.776 on page 4030) • **Insert workspace**: Creates a new workspace. • **Insert separator**: Inserts a separator before the selected workspace. • **Delete**: Deletes the selected workspace.

Command Aliases Tab Options	**Description**
Command Aliases Tab	(6.777 on page 4030)
Add	Adds an alias; displays a dialog box: (6.778 on page 4030)
Alias	Specifies the name of the alias, a command abbreviation.
Command	Specifies the command to which the alias is assigned.
Edit	Edits the selected alias.
Delete	Erases the selected alias.

Shell Commands Tab Options	**Description**
Shell Commands Tab	(6.779 on page 4031)
Add	Adds a shell command; displays the following dialog box: (6.780 on page 4031) Shell commands run programs external to BricsCAD.
Alias	Specifies the name of the shell command; this is the command you enter at the ' : ' prompt.
Shell Command	Specifies the operating system command to execute, or program to run. To run a program, use the Start prefix, as in Start Notepad.exe.
Prompt	Specifies the prompt to display in the command bar, such as "Enter file to edit:"

Flags	Determines how the shell command operates: • **Don't Wait** - BricsCAD immediately returns to the command prompt without waiting for the application to finish. • **Minimized** - the application runs minimized. • **Hidden** - the application does not appear on the screen. • **Quotes** - the shell command uses quotations when the command string uses spaces, such as "C:\cad programs\file name.exe".
Edit	Edits the selected shell command.
Delete	Removes the selected shell command.

Related Commands

AddInMan (6.4.3) - loads and unloads VBA functions through a dialog box. AppLoad (6.4.17) - selects external routines to load when BricsCAD starts. Commands (6.9.23) - lists the names of internal and external commands. CuiLoad (6.9.56) and CuiUnload (6.9.51) - loads and unloads menu files. MenuLoad (6.21.14) and MenuUnload (6.21.13) - loads and unloads menu files. Netload (6.22.3) - loads a .NET application. ProfileManager (6.24.52) - allows to set current, create, copy, delete, import and export user profiles through a dialog box. ToolPalettes (6.29.28) - opens the Tool Palettes bar. VbaLoad (6.32.2) and -VbaLoad (6.32.3) - loads VBA projects. VbaRun (6.32.6) and -VbaRun (6.32.7) - runs VBA macros. VbaIde (6.32.1) - opens the VBA integrated development environment. VbaMan (6.32.4) - manages VBA projects. VbaUnload (6.32.9) - unloads VBA projects. Workspace (6.33.14) - sets the current workspace and lets you create, modify and save workspaces. WsSettings (6.33.18) - opens the Customize Workspaces dialog box.

6.9.48 CutClip

(7.3 on page 6132) Copies entities to the Clipboard, and then erases them from the drawing.

Accessing the Command

 command bar: **cutclip** keyboard shortcut: **Ctrl+X** menu bar: **Edit | Cut** toolbar: **Standard |** ribbon: **Home | Edit | Cut** : **cutclip You are prompted:** Select entities to cut to the clipboard: **(Choose one or more entities, or press Ctrl+A to select all entities.)** Select entities to cut to the clipboard: **(Choose more entities, or eles press Enter to exit entity selection.)**

Command Options

Option	Description
Select entities to cut to the clipboard	Choose the entities to be cut; use any entity selection method. Once in the Clipboard, the entities can be pasted into the same drawing, into other drawings, and into other documents with Ctrl+V.

The **PictureExportScale** user preference sets the resolution of the image when the exported geometry is pasted in a bitmap format, e.g. in a Word document.

Procedures

- Using Cut and Paste to move entities between drawings (1.32.11)
- Move a selection as a block (1.32.11)

Related Commands

ChSpace (6.9.13) - moves entities from paper space to model space and vice versa. CopyBase (6.9.58)- copies selected entities to the Clipboard with a base point. CopyClip (6.9.36) - copies selected entities to the Clipboard. CopyHist (6.9.59) - copies all text from the Text window to the Clipboard. PasteBlock (6.24.11) - pasted entities from the Clipboard as a block at an insertion point. PasteClip (6.24.13) - pastes entities from the Clipboard into the current drawing. PasteOrig (6.24.12) - pastes entities from the Clipboard at the original coordinates. PasteSpec (6.24.14) - displays the Paste Special dialog box for controlling the format of pasted entities.

Figure 6.782

6.9.49 Cylinder

(7.3 on page 6132) Draws regular and slanted cylinders:

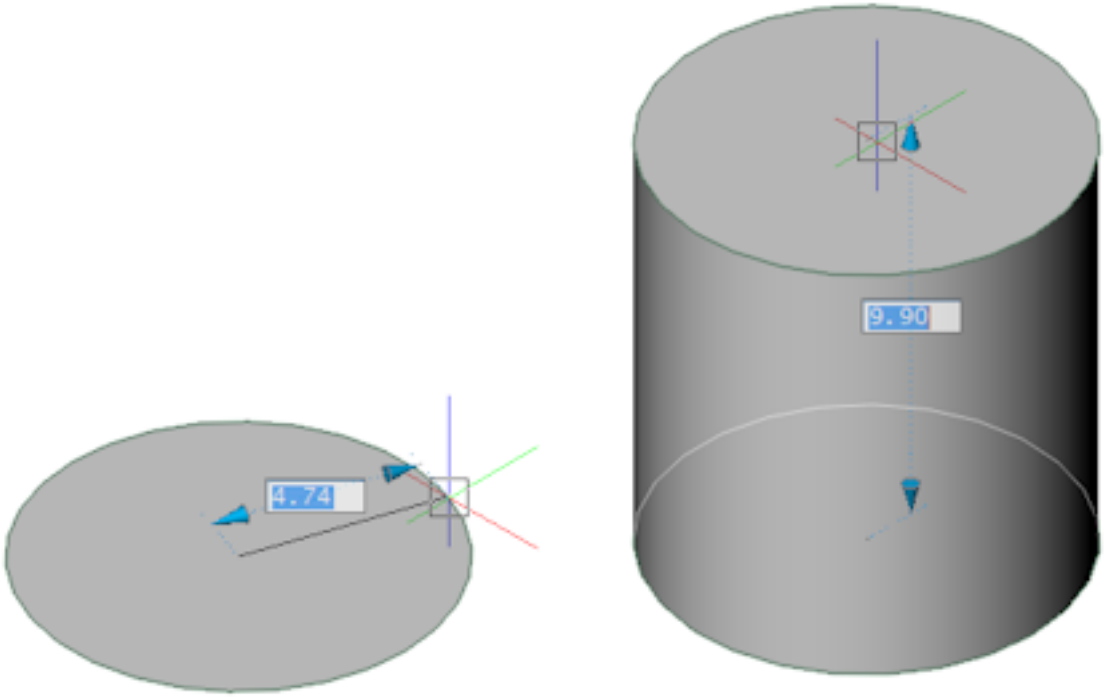
- Classic: cylider is drawn from a 3D polyface mesh (see Ai_Cylinder (6.5.9) command).
- Other license levels: cylinder is drawn as a 3D solid.

Accessing the Command

 command bar: **cylinder** alias: **cyl** menu bar: **Model | 3D Solids | Cylinder** toolbar: **3D Solids |**  ribbon: **Solid | Create | Primitive | Cylinder** : **cylinder You are prompted:** Select center point or [3Point (6.9.12)/2Point (6.9.12)/Tangent-tangent-radius (6.9.12)/Elliptica (6.13.5)l (6.13.5)]**: (Enter coordinates, pick a point, or else choose an option)** Radius of base of cylinder or Diameter <x.xx>: **(Enter a distance, pick a point, press Enter to accept the previously entered value, or else enter D)** Specify height or [2Point/Axis endpoint] <x.xx>: **(Enter a height, pick a point, press Enter to accept the previously entered value, or else choose an option)** (6.783) If Dynamic Dimensions (1.21.9) are active, you can enter the dimensions in the dynamic dimensions entry fields. (6.784 on the next page)

Figure 6.783

Figure 6.784



Command Options

Option	Description
Diameter	Specifies the radius of the cylinder; prompts you: **Diameter of base of cylinder <x.xx> - (enter x,y,z coordinates, a distance, pick a point, or else press Enter to accept the previously entered value.)**
2Point	Specifies the height of the cylinder as the distance between two points. Prompts you: 1. **Specify first point - (enter coordinates or pick a point)** 2. **Specify second point - (enter coordinates or pick a point)**
Axis endpoint	Specifies the endpoint of the axis, allowing to create a cylinder of which the axis is not parallel to the Z-axis of the current coordinate system. Prompts you: **Specify axis endpoint - (enter coordinates or pick a point)**

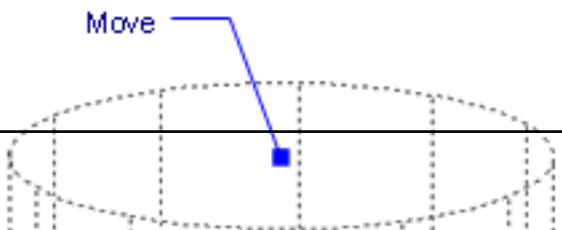
Grips Editing

Cylinders can be edited directly through grips:

1. Select the cylinder. Notice that it has two grips.
2. Drag a grip to move the cylinder. (Both grips perform the same function: move.)

(6.785)

Figure 6.785



Related Commands

Box (6.6.18) - creates 3D boxes as solid models. Cone (6.9.46) - creates 3D cones as solid models. Dish (6.10.42) - creates the lower half of 3D balls as solid models. Dome (6.10.35) - creates the upper half of 3D balls as solid models. Extrude (6.13.25) - extrudes 2D entities into 3D solid models. Interfere (6.17.17) - creates 3D volumes of intersecting 3D solid models. Intersect (6.17.20) - removes volumes not in common between two solid models. MassProp (6.21.2) - reports the mass properties of 3D solid models and 2D regions. Pyramid (6.24.64) - creates a pyramid as a 3D solid (Pro and Platinum). Creates a pyramid as a polygon mesh (Classic) Region (6.26.18) - creates 2D regions from 2D entities. Revolve (6.26.45) - revolves 2D entities into 3D solid models. Section (6.27.11) - creates 2D regions from 3D models. Slice (6.27.40) - cuts 3D solids into two parts. SolidEdit (6.27.42) - edits the bodies, faces, and edges of 3D models. Sphere (6.27.50) - creates 3D balls as solid models. Subtract (6.27.58) - removes one solid model from a second. Torus (6.29.29) - creates 3D donuts as solid models. Union (6.30.6) - joins two or more solid models into a single entity. Wedge (6.33.6) - creates 3D wedges as solid models.

Figure 6.786

6.9.50 CopyGuided

(6.2981 on page 6079) After selecting the entities, their relation to their reference curves will automatically guide you to inserting the copy in similar locations. The command can be executed in pre-pick mode : select entities first, then launch the command; or post-pick mode: select entities in the command workflow.

Accessing the Command

Keyboard: **copyguided** Quad Tab: **Modify** Ribbon Tab | Panel: **Home | Modify : copyguided Prompts you:**

If a selection set exists: Select reference curves or [Region select]: **(Select the first reference curve.)** Entities in set: 1 Select reference curves or [Region select]: **(Select more reference curves, or press Enter.)**

Else: Pick first point of rectangular window or [Polygonal]: **(Specify a point or choose an option.)** A selection rectangle displays dynamically. Selected entities display in yellow; candidate guidelines display in blue. (6.1626 on page 4881) Opposite Corner: **(Specify a point. Make sure the selection rectangle overlaps at least one candidate reference curve entity.)** All entities within the selection window will be copied. Linear entities crossing the selection window will be used as reference curves. A copy of the selected entities displays dynamically. Blue arrows indicate the anchor points (3) of the reference curves. (6.1627 on page 4882) Pick to place entities or [Region]**: (Move the selection over a similar location or choose an option.)** The reference curves snap to matching lines under the cursor. (6.1628 on page 4882) **(Move the cursor to the other side of the reference curves to mirror the selection set.)** (6.1629 on page 4882) **(Click to place the copy or type a distance in the dynamic entry fields. Press the TAB key to jump to the other field. Press Enter to confirm the distance.) (Repeat the previous steps to place more copies or press Enter to stop.)** (6.791 on page 4038)

Figure 6.787

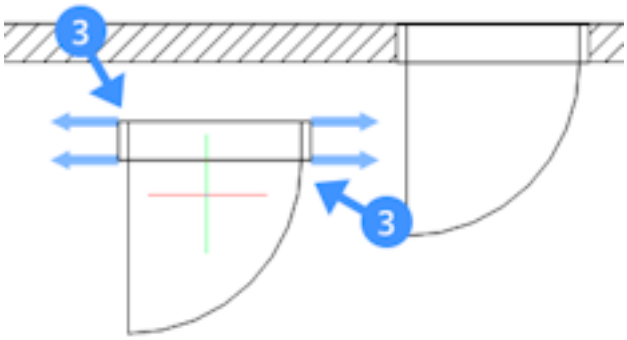

Figure 6.789

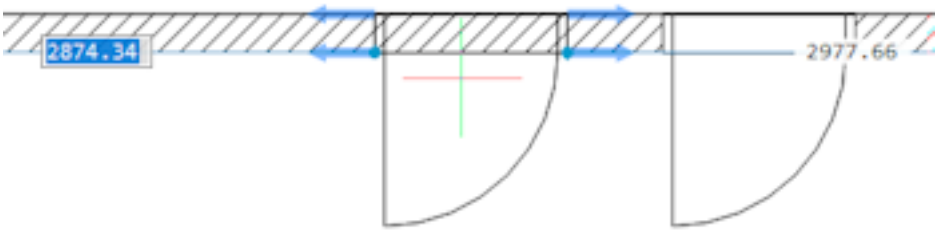

Figure 6.790

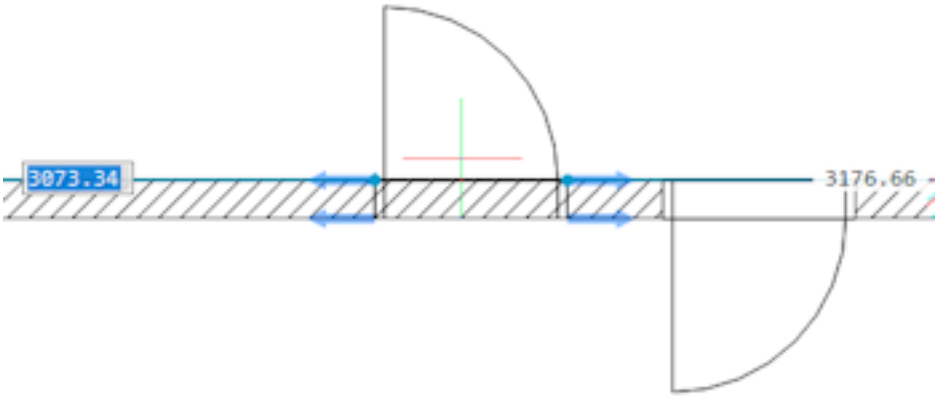

Figure 6.791

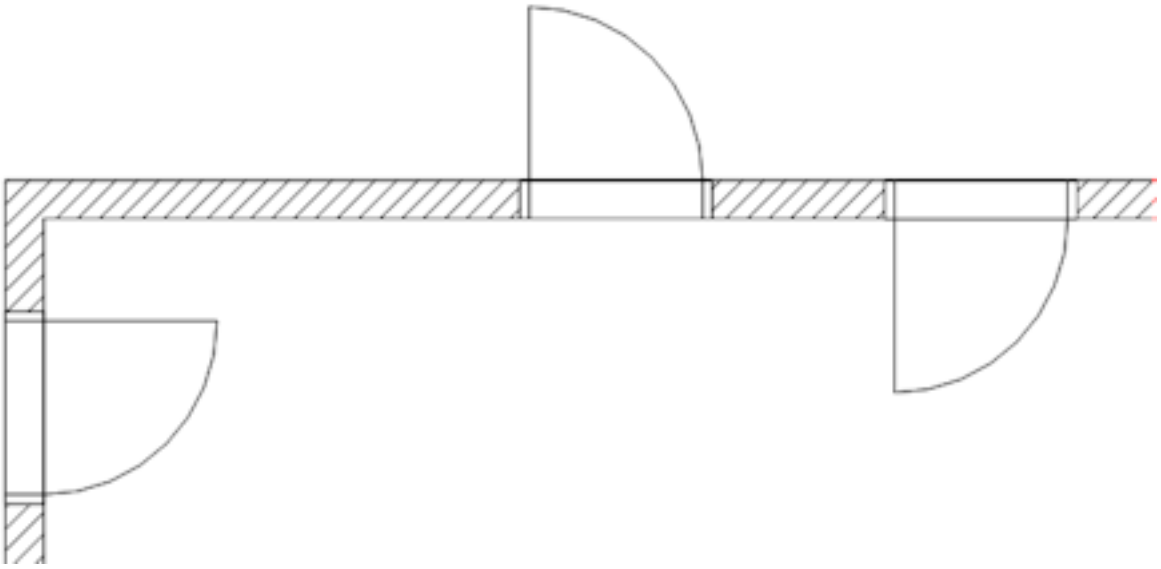

Command Options

Option	Description
Rectangle	Creates a rectangular selection window. Prompts you to specify two opposite points of the selection rectangle.
Polygon	Creates a polygonal selection window. Prompts you to specify multiple points to define the selection polygon. Press Enter or right click to stop adding points.
Entities	Pastes the entities inside the selection window.
Region	Pastes the clipped area inside the selection window.

Related Commands

Copy (6.9.35) - makes copies entities, including repeating ones. CopyClip (6.9.36) - copies selected entities to the Clipboard, which can then be pasted in the same or other drawings. MInsert (6.21.15) - inserts arrayed copies of blocks.

Figure 6.792

6.9.51 CuiUnload

(6.2981 on page 6079) Loads and unloads customization groups from the user interface; operates identically to the **CuiLoad (6.9.56)** command.

Accessing the Command

command bar: **cuiUnload** transparent: **'cuiUnload** aliases: **menuload (6.21.14), cuiunload** : **cuiUnload** Displays a dialog box: (6.1569 on page 4827)

Figure 6.794

6.9.52 CorridorExtract

(6.2880 on page 5977) Extracts a 3D solid, 3D mesh, or 3D polyline from a corridor.

Accessing the Command

Commandline: **CORRIDOREXTRACT** Ribbon: **Civil | Utilities | Extract from Corridor : CorridorExtract Prompts you:** Select corridor: **(select a corridor)** Extract as: [Mesh/Solid/Polylines/outer Boundaries] <Mesh>: **(specify what you want to extract as)** Select [All Shapes/selection options (?)] <All Shapes>: **(select which shapes you want to extract)**

Command Options

Option	Description
Mesh	It creates meshes from the corridor. You are prompted: **Select [All Shapes/selection options (?)] <All Shapes>: (select which shapes you want to extract)**
Solid	It creates solids from the corridor. You are prompted: **Select [All Shapes/selection options (?)] <All Shapes>: (select which shapes you want to extract)**
Polylines	It creates polylines of the corridor. You are prompted: **Select [All Stringlines/selection options (?)]: (select which stringlines you want to extract)** Create dynamic link: [Yes/No] <Yes>:
Boundaries	It creates the outer boundary of the corridor. You are prompted: Create dynamic link: [Yes/No] <Yes>:

Procedures

Creating a road corridor (1.26.12) Displaying the properties of a Corridor (1.26.12) Creating a template of road cross-section with asphalt layer and left and right kerb (1.26.12) Creating a template element of kerb (1.26.12)

Related Commands

Corridor (6.9.41) - Creates a corridor from a corridor template, 3D alignment and/or TIN Surface. CorridorTemplateElement (6.9.44) - Creates a corridor template element from closed polylines. CorridorTemplate (6.9.43) - Creates a corridor template from template elements. CorridorEdit (6.9.42) - Adds or removes regions for a selected corridor. Tin (6.29.14) - Creates a topographical surface from an imported points file or placing new points. Alignment (6.4.5) - Creates horizontal, vertical and 3D alignments to represent a reference system used to position linear objects in space.

Figure 6.795

6.9.53 ConvToSurface

(7.3 on page 6132) Converts the following 2D and 3D entities to 3D surfaces: 2D solids and 3D solids, regions, zero-width open polylines with thickness, lines and arcs with thickness, meshes and planar 3D faces.

Accessing the Command

Keyboard: convtosurface :ConvToSurface **You are prompted:** Select entities: **(Select one or more valid entities)** Entities in set: 1 Select entities: **(Press Enter to finish selecting entities and execute command)** BricsCAD converts the entities to surfaces.

Command Options

Option	Description
Select entities:	Select one or more of the following entities: • 2D and 3D solids • Regions • Zero-width open polylines with thickness • Arcs and lines and arcs with thickness • Meshes and planar 3D faces

Related Commands

ConvToMesh (6.9.33) - converts entities to 3D meshes. ConvToSolid (6.9.34) - converts entities to 3D solids.

Command Options

Option	Description
Select entities in drawing	Allows to select entities in the drawing. Click the **Select** button. The dialog box temporarily closes. Prompts you: **Select entities for block [selection options (?)]:** Select the entities in the drawing, then press Enter or right click.
Entire drawing	Selects all entities in the drawing.
Name	Type a name for the block.
Category	Sets the folder to save the block in. Do one of the following: • Type a name, to create a **new category** folder in the current path. • Click the down arrow at the right hand side of the **Category** field, then select an existing folder. All folders in the current path are available.
Path	Click the down arrow at the right hand side of the **Path** field, then select a path. All paths which are defined in the COMPONENTSPATH system variable are available.
Show Options	Allows to modify default settings: **Base point** and **Insertion units**. Decide what happens to selected entities, once the library block has been created. • **Retain**: Keep the selected entities untouched. • **Convert to block**: Convert the selected entities to a block. • **Delete**: Delete the selected entities.

Related Commands

-CreateLibraryBlock (6.9.45) - Creates a blocks and components from a selection set or drawing and adds them to the library; prompts you in the command line. LIbrayPanelOpen (6.20.23) - Opens the Library panel.

Figure 6.801

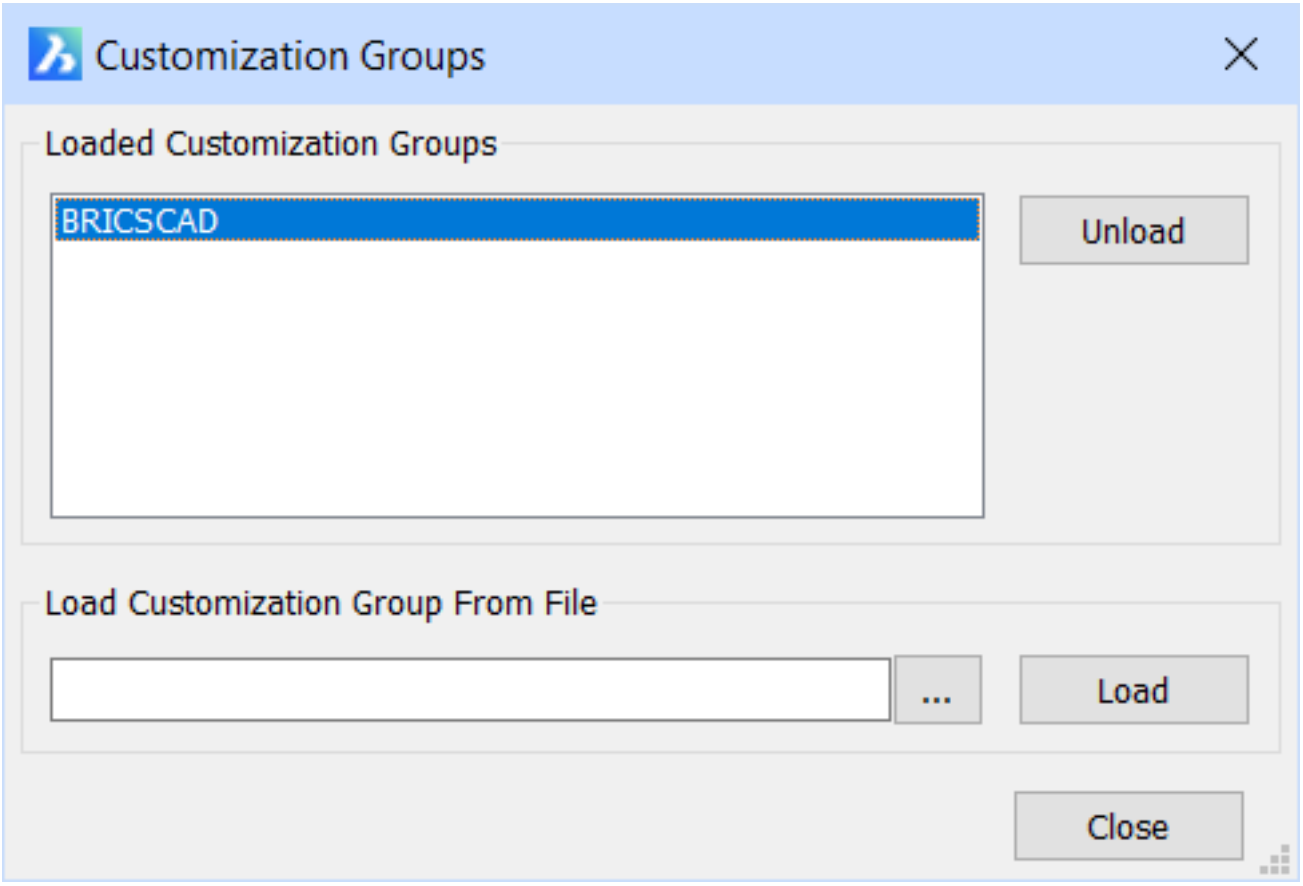
6.9.56 CuiLoad

(6.2981 on page 6079) Loads CUIX and CUI (user interface customization), MNU (menu), MNS (LISP code), and ICM (IntelliCAD menu) files into the program.

Accessing the Command

command bar: **cuiload** transparent: **'cuiload** aliases: **menuload (6.21.14), cuiunload** : **cuiload** Displays a dialog box: (6.1569 on page 4827)

Figure 6.802



Command Options

Option	Description
Loaded Customization Groups	Lists the names of customization files loaded in BricsCAD.
Unload	Unloads the selected customization group. **Caution**: unloading 'BricsCAD' causes most user interface elements to disappear.
...	Displays the Choose a Customization File dialog box. Choose a CUIX, CUI, MNU, MNS, or ICM file, and then click **Open**.
Load	Loads the opened customization file. **Caution**: loading a customization file changes the program's user interface.

Related Commands

AddInMan (6.4.3) - loads and unloads VBA functions through a dialog box. AppLoad (6.4.17) - selects external routines to load when BricsCAD starts. Commands (6.9.23) - lists the names of internal and external commands. CuiUnload (6.9.51) - unloads menu files. Customize (6.9.47) - customizes the user interface. MenuLoad (6.21.14) and MenuUnload (6.21.13) - loads and unloads menu files. Netload (6.22.3) - loads a .NET application. VbaLoad (6.32.2) and -VbaLoad (6.32.3) - loads VBA projects. VbaRun (6.32.6) and -VbaRun (6.32.7) - runs VBA macros. VbaIde (6.32.1) - opens the VBA integrated development environment. VbaMan (6.32.4) - manages VBA projects. VbaUnload (6.32.9) - unloads VBA projects.

Figure 6.803

6.9.57 ComponentsPanelClose

(6.2981 on page 6079) Deprecated. Use LibrayPanelClose (6.20.22) instead.

Figure 6.804

6.9.58 CopyBase

(7.3 on page 6132) Copies entities to the Clipboard with a base point for pasting with the PasteBlock command.

Accessing the Command

command bar: **copybase** keyboard shortcut: **Ctrl+Shift+C** menu bar: **Edit | Copy with Base Point** ribbon: **Home | Edit | Copy | Copy with Base Point** : copybase **You are prompted:** Select base point: **(Pick a point, or enter x,y coordinates)** Select entities to copy to the clipboard: **(Choose one or more entities)** Select entities to copy to the clipboard: **(Choose more entities, or else press Enter to continue)** Use the PasteBlock (6.24.11) command to paste the copied entities into the same or another drawing as a block.

Command Options

Option	Description
Select base point	Specifies the base point for the entities being copied to the Clipboard. Pick a point, or enter x,y coordinates. The PasteBlock command uses these coordinates to paste the entities from the Clipboard into a drawing.
Select entities to copy to the clipboard	Chooses the entities to copy to the Clipboard using any entity selection method.

Procedures

- Using Copybase and Paste to copy entities between drawings (1.32.18)
- Paste a selection as a block in the target drawing (1.32.18)

Related Commands

CopyClip (6.9.36) - copies selected entities to the Clipboard, which can then be pasted in the same or other drawings. CopyHist (6.9.59) - copies all text from the Text window to the Clipboard. CutClip (6.9.48) - cuts (moves) selected entities to the Clipboard. PasteBlock (6.24.11) - pasted entities from the Clipboard as a block at an insertion point. PasteClip (6.24.13) - pastes entities from the Clipboard into the current drawing. PasteOrig (6.24.12) - pastes entities from the Clipboard at the original coordinates. PasteSpec (6.24.14) - displays the Paste Special dialog box for controlling the format of pasted entities.

Figure 6.805

6.9.59 CopyHist

(7.3 on page 6132) Copies the last 254 lines of command history text to the Clipboard.

Accessing the Command

command bar: **copyhist** : **copyhist** Displays no prompt in the command bar. All text in the command bar history is copied to the Clipboard; you can paste the text into another application with Ctrl+V . The **ScrlHist** variable determines how many lines of command history the Pormpt History window retains; its initial value is 256 lines.

Related Commands

CopyClip (6.9.36) - copies selected entities to the Clipboard. CutClip (6.9.48) - cuts (moves) selected entities to the Clipboard. PasteClip (6.24.13) - pastes entities from the Clipboard into the current drawing. PasteOrig (6.24.12) - pastes entities from the Clipboard at the original coordinates. PasteSpec (6.24.14) - displays the Paste Special dialog box for controlling the format of pasted entities.

6.10 D

6.10.1 DataLink

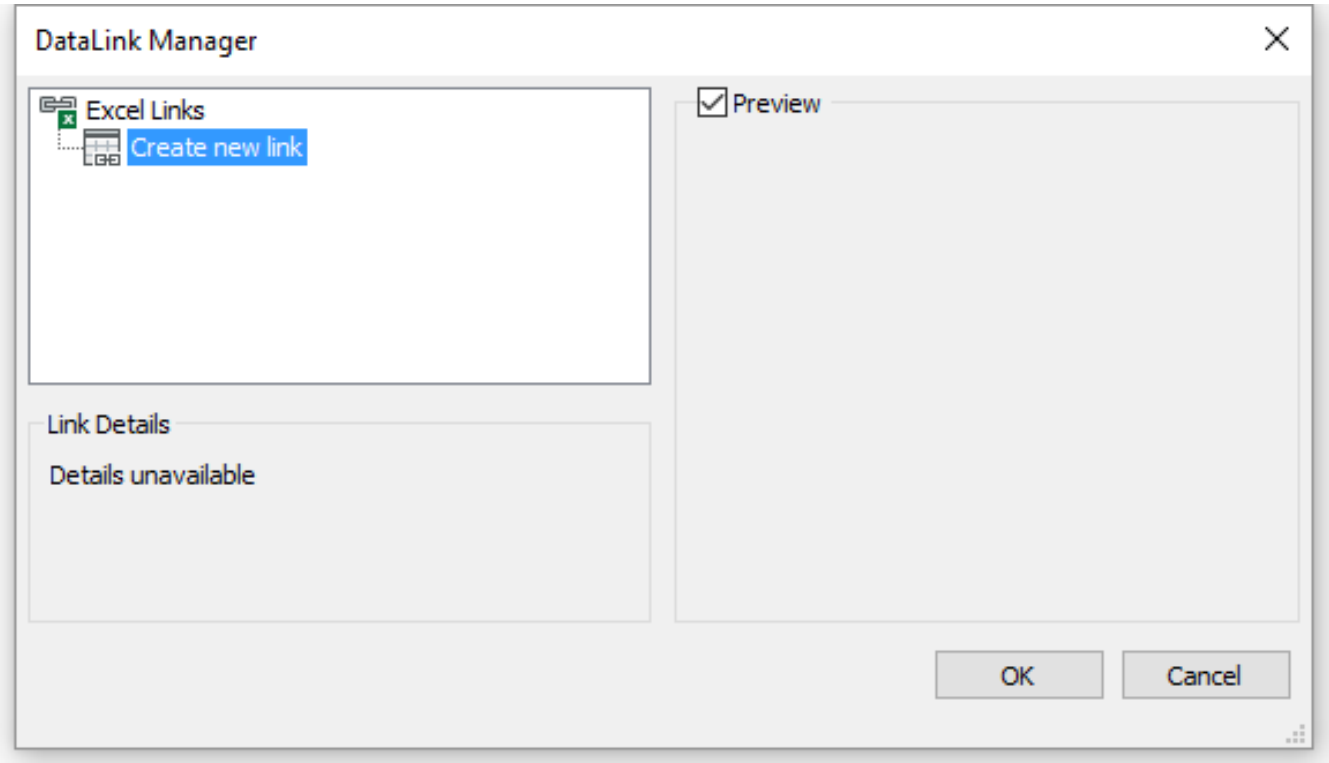
(6.2981 on page 6079) Links data from an Excel spreadsheet directly into drawing tables for bi-directional updating.

Figure 6.806

Accessing the Command

Keyboard: **datalink** Menu: Toolbar: Quad Tab: Ribbon Tab | Panel: **:datalink** Displays a dialog box: (6.807 on the following page)

Figure 6.807



Command Options

Option	Description

Creates a new link. Displays a dialog box: (6.808 on page 4059) Do the following:

1. Click the **Browse** button (), then select a data file. *.xls, *.xlsx and *.csv files are accepted. If selected, a **Preview** of the data file displays.
2. Type a name in the **DataLink Name** field.
3. Choose a **Path type** option. The options are:
   - **Full Path**: BricsCAD searches for the data file in the specified folder only.
   - **Relative Path**: The data file is searched for in a subfolder of the drawing file folder.
   - **No Path**: The data file is searched for in the drawing file folder only.
4. Define the link options. Select a sheet or accept the default (= active sheet).
   - **Link to the entire sheet**: all cells that contain data are linked.
   - **Linked to named range**: links to a named range of cells. Click the button to select a named range.
   - **Link to range**: specify a range of cells. Click the **Preview** button to display the selected range.
5. Choose a cell contents option.
   - **Keep data formats and formulas**: Imports data with formulas and supported data formats.
   - **Keep data formats, solve formulas in Excel**: Imports data formats. Data is calculated from formulas in Excel.
   - **Convert to text, solve formulas in Excel**: Imports data as text with data calculated from formulas in Excel.
   - **Allow writing to Excel**: If checked, the DATALINKUPDATE command uploads changes to linked data in your drawing to the original external spreadsheet.
6. Specify whether Excel cell formatting is used.
   - **Keep table updated to Excel formatting**: Updates any changed formatting when the DATALINKUPDATE command is executed.
   - **Start with Excel formatting. Do not update**: Imports the formatting specified in the original data file. The DATALINKUPDATE command does not affect any changes made to the cell formatting.

Edit Link	Select a data link, then right click and choose **Edit** in the context menu. A dialog box displays: (6.809 on page 4060) The following properties are editable: • DataLink Name • Cell Contents • Cell Formatting
Delete Link	Select a data link, then right click and choose **Delete** in the context menu. The link is deleted without warning.

Related Commands

DataLinkUpdate (6.10.2) - Synchronizes the linked data in tables in the current drawing with data in the linked source file. Table (6.29.2) - Creates a table entity in the drawing through a dialog box.

Figure 6.810

6.10.2 DataLinkUpdate

(6.2981 on page 6079) Synchronizes the linked data in tables in the current drawing with data in the linked source file.

Accessing the Command

Keyboard: **datalinkupdate :datalinkupdate You are prompted:** Select an option[Update data link / Write data link] <Update data link>: **(Choose an option.)** Select objects or [Update all]: **(Select a table entity.)** Entities in set: 1 Select objects or [Update all]: **(Select more table entities or pres Enter.)**

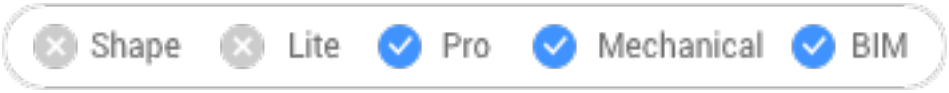
Command Options

Option	Description
Update data link	Updates the linked data in a table in the drawing with data that has been changed in the external source file.
Write data link	Updates the linked data in an external file with data that has been changed in a table in the drawing.
Select objects	Prompts you to select table entities
Update all	Synchronizes all linked data in all tables in the drawing.

Related Commands

DataLink (6.10.1) - Links data from an Excel spreadsheet directly into drawing tables for bi-directional updating.

Figure 6.811



6.10.3 DatasmithExport

(6.1951 on page 5150) Exports a 3D model in the Unreal Engine (*.udatasmith) file format.

Accessing the Command

Keyboard: **datasmithexport : datasmithexport** Displays a File dialog box. The **Save as type** field is set to the Unreal Engine (*.udatasmith) file format. The **File name** field reads: <FileName>.udatasmith Do the following:

- (option) Select a different folder.
- (option) Specify a different file name.
- Click the **Save** button.

Command Options

No command option.

Procedures

Using Twinmotion (1.34.1)

Related Commands

Export (6.13.18) - Exports drawings in a variety of vector and raster formats;.

Figure 6.812

6.10.4 DataExtraction

(6.2981 on page 6079) Exports entity properties, block attributes, and drawing information to an external data file.

How to extract data in BricsCAD BIM Click here (2.12.4) to watch

Accessing the Command

command bar: **dataextraction** menu bar: **Tools | Data Extraction : dataextraction** Displays a 4 page dialog box.

Dialog Box Options

Option	Description

Select (Page 1 of 4)

(6.813 on page 4068) **Create data extraction definition**: Creates a new .dxd (Data eXtraction Definition) file:

1. Turn on the option, then click the **Browse** button* (...).
2. In the file dialog box, select a folder, and then enter a name in the **File name** field.
3. Click the **Save** button.

Based on an existing data extraction definition: Uses an existing .dxd file as the template for the new one.

1. Turn on the option, and then click the **Browse** button* (...).
2. In the file dialog box, select a .dxd file.
3. Click the **Open** button.

* By default .dxd files are saved in the **...\Bim\Schedules** subfolder of the **Support (6.27.59)** folder. Newly created custom *.dxd files can be used to create schedules in the Project Browser (2.7.15). .dxd files can be edited in a text editor such as MS Notepad. **Select entities to extract data from:**

-  - dismisses the dialog box temporarily so that you can select entities in the drawing; enter Ctrl+A to select all entities in the drawing. Press Enter or right click to stop selecting entities.
- **Add Folder** - adds a folder of drawing from which to extract data Double click to open the **Folder Options** dialog box: (6.814 on page 4069)
  - **Folder**: Click te **Browse** (...) button, then select a folder in **Select Folder** dialog box.
  - (option) Check the **Include subfolders** option
  - (option) Check the **Use wildcard** option, then type a text string in the filter field. E.g. House*.dwg includes all files starting with 'House'.
- **Add Drawing** - adds a drawing from which to extract data
- **Add Sheet Set** - adds a sheet set which to extract data

Extract entities from blocks: Includes entities in selected blocks. **Extract entities from Xrefs**: Includes entities in externally referenced drawings. **Add Xrefs to block counts**: Counts selected xrefs as blocks.

Data Extraction - Entities (Page 2 of 4)

Click **Next** for the next page: (6.815 on page 4069)

Controls which entity types are included () or not () in the data extraction procedure. Select multiple items:

- To select more than one item in a row: select an item, and then hold down the **Shift** key while click additional items
- To select multiple items: hold down the **Ctrl** key while selecting multiple entities.
- To unselect items, click them again while holding down the **Ctrl** key.

To sort the list, click the title in the column heading. Click again to sort in reverse order.

- **Entity** - lists the entity types and blocks in the selection, according to the options set in the Data Extraction dialog.
- **Name** - entity names. Accept the default names or type a customized name. The entity type name displays in the default **Name** field in the data extraction export.
- **Type** - reports the type of the selected entity: Non-Block, Block or Block with attributes.

Select All: Selects all items for data extraction. **Select Blocks**: Selects only blocks in the list, because they usually contain attributes. **Back**: Returns back to the **Data Extraction - Select** page.

Data Extraction - Properties (Page 3 of 4)

Click **Next** for the next page: (6.816 on page 4070)
Select the properties to be included in the data extraction file: click the checkbox to check/uncheck a property, which indicates whether it is selected () or not (). Use the same techniques to select more than one item as described in **Data Extraction - Entities** page. To sort the list, click the title in the column heading. Click again to sort in reverse order.

- **Property** - lists of all properties of the selected entities.
- **Name** - lists all names of the selected entities. Accept the default names or type a customized name. The property names display in the column headings in the data extraction export.
- **Category** - reports the category of the selected entities.
- **Additional Format** - Formats the item in the export file. Click to display the dialog box. The layout of the dialog box depends on the selected item, just like the Format section of the Field dialog (1.29.23).
- **Select Attributes** - select only items that contain attributes
- **Show Checked Only** - show only selected items, hiding those that are not selected.
- **Show All** - shows all items, whether checked or not.
- **Move Selected Up** - move the selected item(s) up the list.
- **Move Selected Down** - move the selected item(s) down the list.
- **Combine Equal Rows** - combine rows that contain the same entities.
- **Include Name Column** - toggles the display of the Name column in the exported data.

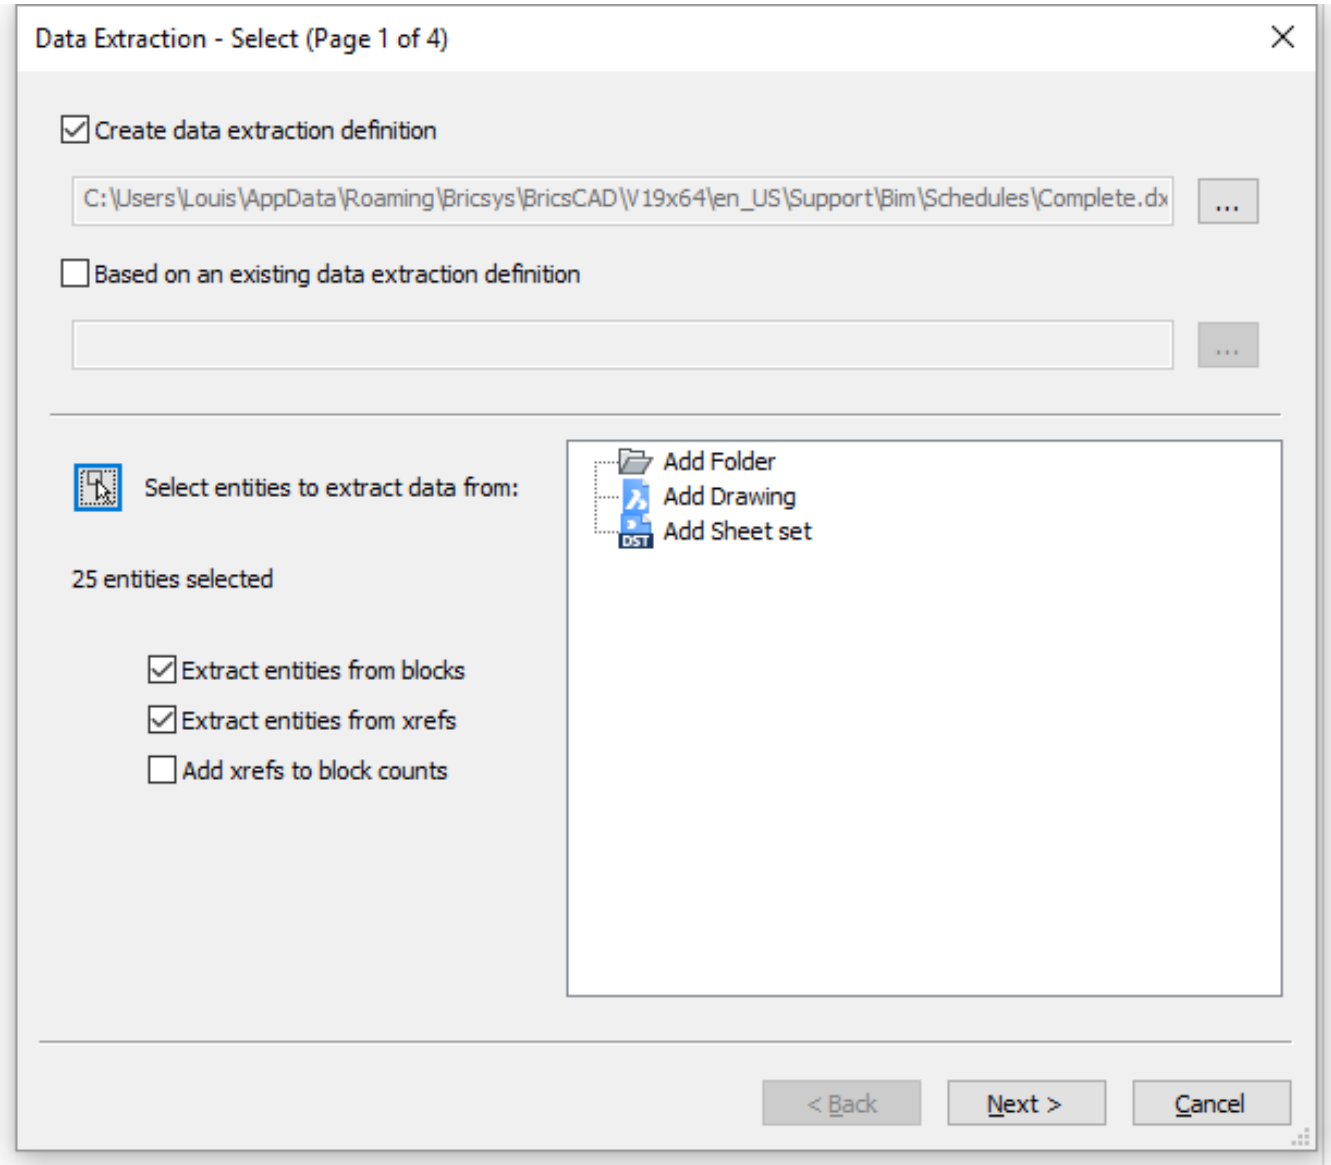
Back: Switches back to the Data Extraction - Entities page.

Data Extraction - Output (Page 4 of 4)	Click **Next** for the next page: (6.817 on page 4071) **Output to CSV**: Exports the data in a delimiter separated format (.csv): Defines the format and name of the exported data file: • **Delimiter** - specifies the separator between fields of data: – **Semicolon** - separates fields with **;** – **Comma*** - separates fields with **,** – **Space** - separates fields with spaces – **Tab** - separates fields with tabs *Multiply composition names contain a comma, therefore do not select comma as the delimiter character in case multiply compositions are processed. • Click the **Browse** button (), give the data file a name, and then click **Save**. If you select an existing .csv file, you will be prompted to overwrite it. **Create Data**: Exports the data in a Table (6.29.2): • **Create table**: Creates a static table. • **Create table with datalink**: Creates a dynamic table. Executing the DataLinkUpdate (6.10.2) command synchronizes the data in table with the model. Save the model first. You will be prompted to save the *.dxd definition file with the table. **Table Style**: • Click the list button and select a table style. • Click the **Table Style** icon (); edit an existing table style or create a new one (see the TableStyle (6.29.6) command). • **Table formatting**: Type a title in the **Title** field.
Finish	Depending on the selected output: • Extracts the data and saves them to the .csv file. The file can be opened in a spreadsheet or database program. • Prompts you to specify an insertion point for the table(s).

Procedure

Editing Data Extraction Definition (.dxd) files (2.13.9)

Figure 6.813



Related Commands

AttDef (6.4.31) - defines attributes through a dialog box. -AttDef (6.4.32) - defines attributes through the command bar. AttDisp (6.4.33) - toggles the display of attribute text. AttEdit (6.4.34) - edits attribute values and properties. -AttExt (6.4.35) - extracts attributes from drawings to data files through the command bar. AttRedef (6.4.36) - redefines a block and updates associated attributes. AttSync (6.4.37) - synchronizes attribute definitions in all block references of a specified block definition. BattMan (6.6.1) - manages the attributes of a block definition. Block (6.6.11) and -Block (6.6.12) - create blocks from attribute definitions and entities. Datalink (6.10.1) - links data from an Excel spreadsheet directly into drawing tables for bi-directional updating. DatalinkUpdate (6.10.2) - synchronizes the linked data in tables in the current drawing with data in the linked source file. EAttEdit (6.13.1) - edits attribute values and most properties. Explode (6.13.16) - reduces attributes to tags. Insert (6.17.13) - inserts blocks and prompts for attribute values through a dialog box. -Insert (6.17.14) - insert blocks and prompts for attribute values through the command bar. Properties (6.24.54) - edits attribute values and properties. RefEdit (6.26.13) - edits blocks and attributes in-place. Table (6.29.2) - creates a table entity in the drawing through a dialog box, either from scratch or from data in an external file or a data link. TableStyle (6.29.6) - creates and edits table styles through the Drawing Explorer.

6.10.5 DbList

(6.2981 on page 6079) Lists information about all entities in the drawing (short for "database listing").

Accessing the Command

command bar: **dblist** : **dblist** Displays data about every entity in the command bar, such as the following: ---------- Line ---------- Handle: 7A Current space: Model Layer: 0 Color: BYLAYER Linetype: ByLayer From point: X= 8 9/16" Y= 4 5/16" Z= 0" To point: X= 9 15/16" Y= 3 13/16" Z= 0" Length: 1 7/16" Angle in UCS XY plane: 339 Delta values: X= 1 5/16" Y= -1/2" Z= 0"

Command Options

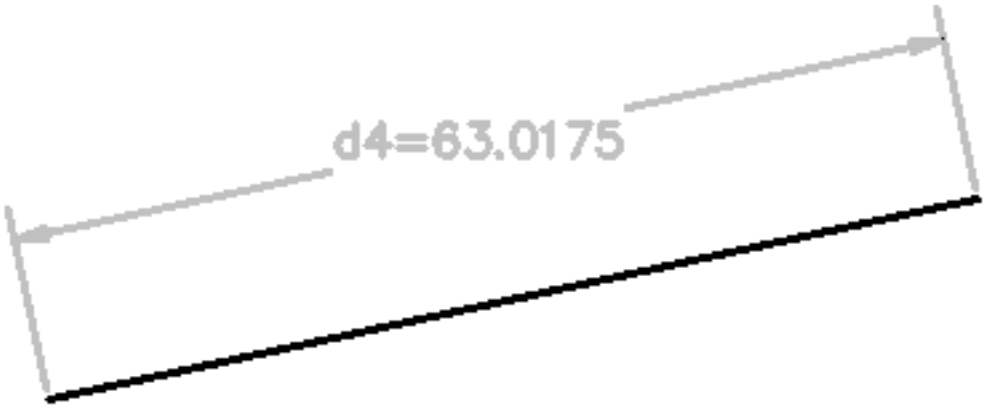
Press **F2** to see the data listed in the Prompt History window. For drawings with many entities, the list can take a long time to finish. Press **Esc** to stop the command.

Related Commands

List (6.20.34) - lists the properties of individual entities in the command bar.. Properties (6.24.54) - lists properties of entities in a palette. Status (6.27.60) - reports the status of the drawing.

Figure 6.819

Figure 6.820



6.10.6 DcAligned

(6.2981 on page 6079) Constrains the distance between two points, or the distance between a point and an entity, or the length of a line or polyline segment. (This command is equivalent to the Aligned (6.10.30) option of the DIMCONSTRAINT (6.10.30) command.) (6.820)

Accessing the Command

 command bar: **dcaligned** menu bar: **Parametric | 2D Constraints | Aligned** toolbar: **2D Constraints |**  **ribbon:** : **dcaligned Prompts you in the command bar.** Specify first constraint point or [Entity/Point/2Lines] <Entity>: **(Select a valid constraint point (6.15.17) or choose an option)** Specify second constraint point: **(Select a valid constraint point (6.15.17).)** Specify dimension line location: **(Select a point to position the dimension line.)** Dimension text <xx.xx>: **(Type a value or press Enter to accept the current value.)** The distance between the two points is constrained, and can be edited directly or with the Parameters panel.

Command Options

Option	Description
Entity	Constraints the length of a line, a polyline segment or the chord of an arc. Prompts you: 1. **Select an entity - (Select a line, polyline segment, or an arc)** 2. **Specify dimension location - (pick a point)** 3. **Dimension text <xx.xx> - (type a value, or else press Enter to accept the current value)** The length of the entity is now constrained, although it can still be moved, rotated, and so on.

Point	Constraints the perpendicular distance between a point and a line or polyline segment. Prompts you: 1. **Specify constraint point or [Line] <Line>** - **(pick a valid constraint point (6.15.17), or else first select the line, polyline segment, or arc, and then select the point)** 2. **Select constraint point** - **(pick a valid constraint point)** 3. **Specify dimension location** - **(pick a point)** 4. **Dimension text <xx.xx>** - **(type a value, or press else Enter to accept the current value)** The distance between the point and the entity is now constrained, and can be edited directly or with the Parameters panel.
2Lines	Constraints the distance between two straight lines and/or straight polyline segments. If the entities are not parallel already, the second entity is rotated around its midpoint to be parallel to the first entity. Prompts you: 1. **Select first line** - **(select a line or polyline segment.)** 2. **Select second line to make parallel** - **(select a line or polyline segment)** 3. **Specify dimension location** - **(pick a point)** 4. **Dimension text <xx.xx>** - **(type a value or press Enter to accept the current value)** The shortcut for this option is 2L. The distance between the two enties is now constrained, and can be edited directly or with the Parameters panel.

Procedures

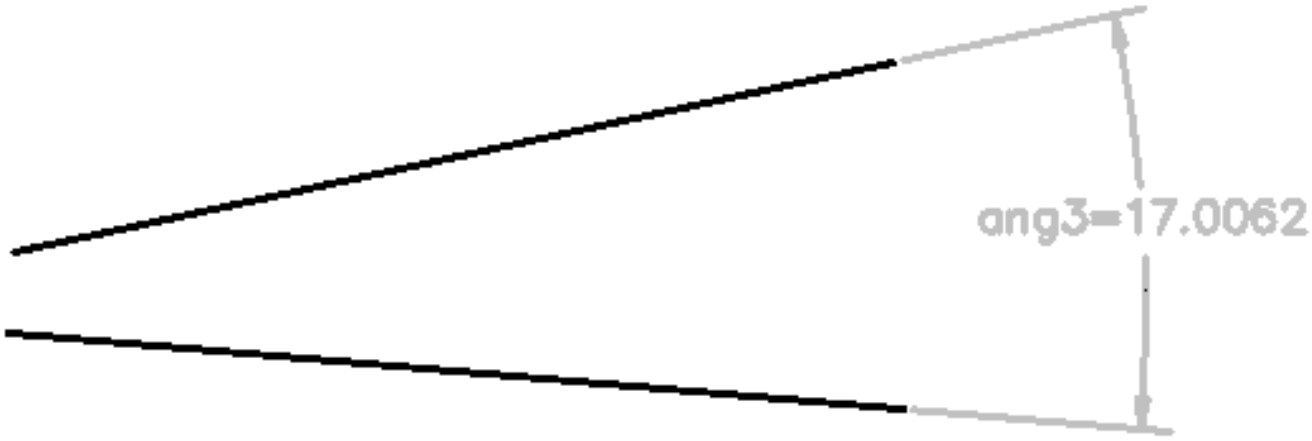
- To edit dimensional constraints (1.21.7)
- Using expressions to define dimensional constraints (1.21.7)

Related Commands

Dimconstraint (6.10.30) - applies a dimensional constraint to an entity or between constraint points on entities; converts associative dimensions to dynamic dimensions. Geomconstraint (6.15.17) - applies geometric relationships between entities and/or valid constraint points on entities. DcAngular (6.10.7) - constrains the angle between two lines or linear polyline segments; the total angle of an arc or an arc polyline segment; or the angle between three points on entities. DcConvert (6.10.18) - converts an associative dimension to a dimensional constraint. DcDiameter (6.10.8) - constrains the diameter of a circle or an arc. DcHorizontal (6.10.10) - constrains the horizontal distance (X-distance) between two points with respect to the current coordinate system. DcLinear (6.10.12) - constrains the horizontal distance (X-distance) or vertical distance (Y-distance) between two points with respect to the current coordinate system. DcRadius (6.10.11) - constrains the radius of a circle or an arc. DcVertical (6.10.15) - constrains the vertical distance (Y-distance) between two points with respect to the current coordinate system. ConstraintBar (6.9.27) - controls the display of the constraint bar of entities. DcDisplay (6.10.9) - allows to set dimensional constraints to be displayed or hidden. Delconstraint (6.10.26) - removes all dimensional and geometrical constraints from an entity. CleanUnusedVariables (6.9.15) - purges variables not used in constraint expressions and not linked to dimensions. -Parameters (6.24.6) - manages 2D dimensional constraint parameters and user variables in the current drawing.

Figure 6.821

Figure 6.822



6.10.7 DcAngular

(6.2981 on page 6079) Constrains the angle between two lines or straight polyline segments; also constrains the angle of an arc or polyline arc. (This command is equivalent to the Angular (6.10.30) option of the DIMCONSTRAINT (6.10.30) command.) (6.822)

Accessing the Command

 command bar: **dcangular** menu bar: **Parametric | 2D Constraints | Angular** ribbon: **Parametric | 2D Constraints | Angular** toolbar: **2D Constraints |** : **dcangular Prompts you in the command bar:** Select first line or arc or [3Point] <3Point>: **(Select a line or straight polyline segment, or an arc or polyline arc segment, or else press Enter to select the 3Point option)** The angle of the entity is now constrained, although the entity can still be moved, rotated, and so on.

Command Options

Option	Description
Select first line	When you select a line or straight polyline segment, prompts you: 1. **Select second line - (select another line or straight polyline segment)** 2. **Specify dimension line location - (pick a point to position the dimension line)** 3. **Dimension text <xx.xx> - (type a value, or elkse press Enter to accept the current value)**

Select arc	When you select an arc or a polyline arc segment, prompts you 1. **Specify dimension line location - (select a point to position the dimension line)** 2. **Dimension text <xx.xx>- (type the dimension text, or else press Enter to accept the current dimension text)**
3Point	Creates an angular constraint between three valid constraint (6.15.17) points. Prompts you: 1. **Specify angle vertex - (pick a point)** 2. **Specify first angle constraint point - (pick a point)** 3. **Specify second angle constraint point - (pick a point)** The abbreviation for this option is 3P.

Procedures

- To edit dimensional constraints (1.21.7)
- Using expressions to define dimensional constraints (1.21.7)

Related Commands

DimConstraint (6.10.30) - applies a dimensional constraint to an entity or between constraint points on entities; converts associative dimensions to dynamic dimensions. Figure 6.823

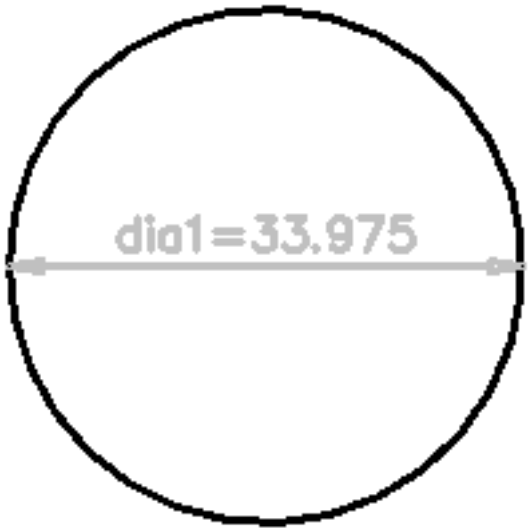
Figure 6.824



6.10.8 DcDiameter

(6.2981 on page 6079) Constrains the diameter of a circle, an arc or an polyline arc segment. (This command is equivalent to the Diameter (6.10.30) option of the DIMCONSTRAINT (6.10.30) command.) (6.824)

Accessing the Command

 command bar: **dcdiameter** menu bar: **Parametric | 2D Constraints | Diameter** ribbon: **Parametric | 2D Constraints | Radius | Diameter** toolbar: **2D Constraints |** : **dcdiameter Prompts you in the command bar.** Select arc, circle or curved polyline segment: **(Select a circle, arc or polyline arc segment)** Specify dimension location: **(Select a point to position the dimension line)** Dimension text <xx.xx>: **(Type a value, or else press Enter to accept the current value)** The diameter of the entity is now constrained, although the entity can still be moved, rotated, and so on.

Command Options

Option	Description
Select arc, circle or curved polyline segment	Select one entity: • Circle • Arc • Polyline arc segment
Specify dimension location	Pick a point to position the dimension line
Dimension text	Enter an option: • Type a value • Press Enter to accept the current value

Procedures

- To edit dimensional constraints (1.21.7)
- Using expressions to define dimensional constraints (1.21.7)

Related Commands

Figure 6.825

6.10.9 DcDisplay

(6.2981 on page 6079) Toggles the display of dimensional constraints between visible and hidden. (Dimensional constraints are always hidden when the drawing is first opened.)

Accessing the Command

command bar: **dcdisplay** menu bar: **Parametric | Show/Hide Dimensional Constraint** toolbar: **Dimensional Constraint |** ribbon: **Parametric | 2D Constraints | Show/Hide** : **dcdisplay Prompts you in the command bar:** Select entities: **(Select one or more entities.)** Entities in set: 1 Select entities: **(Select more entities, or else press Enter to stop selecting)** Enter an option [Show/Hide]<Show>: **(Enter an option)**

Command Options

Option	Description
Show	Dimensional constraints on the selected entities become visible.
Hide	Dimensional constraints on the selected entities no longer display.

Procedures

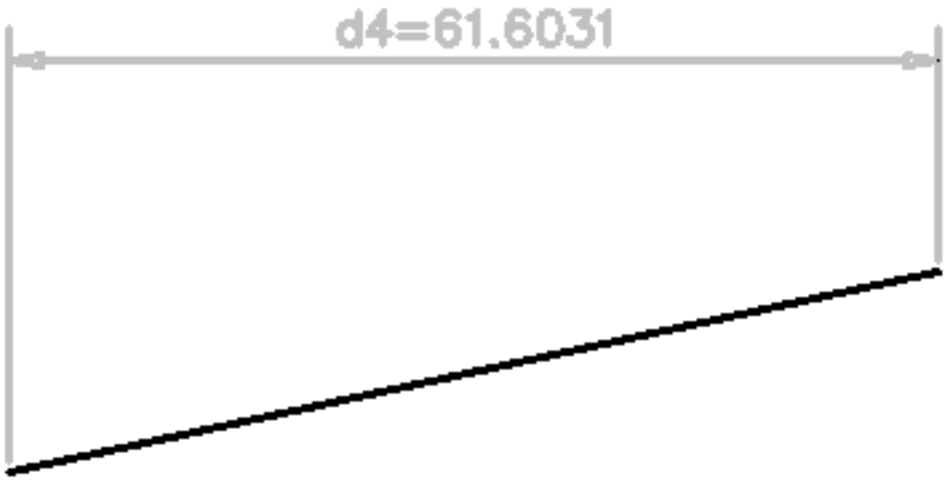
- To set the display of dimensional constraints of a selection of entities (1.21.7)
- To set the visibility of the dimensional constraints of all entities (1.21.7)

Related Commands

ConstraintBar (6.9.27) - controls the display of the constraint bar of entities. Delconstraint (6.10.26) - removes all dimensional and geometrical constraints from an entity.

Figure 6.826

Figure 6.827



6.10.10 DcHorizontal

(6.2981 on page 6079) Constrains the distance between two points, or the length of a single entity, to the horizontal (X direction) in the current coordinate system. (This command is equivalent to the Horizontal (6.10.30) option of the DIMCONSTRAINT (6.10.30) command.) (6.827)

Accessing the Command

command bar: **dchorizontal** menu bar: **Parametric | 2D Constraints | Horizontal** toolbar: **2D Constraints**

| ribbon: **Parametric | 2D Constraints | Linear | Horizontal** : **dchorizontal Prompts you in the command bar.** Specify first constraint point or [Entity] <Entity>: **(Select a valid constraint point (6.15.17), or else press Enter to select an entity.)** Specify second constraint point: **(Select another valid constraint point (6.15.17))** Specify dimension location: **(Select a point to position the dimension line)** Dimension text <xx.xx>: **(Type a value, or else press Enter to accept the current value)** The horizontal distance (parallel to the X-axis of the current coordinate system) between the two points is constrained.

Command Options

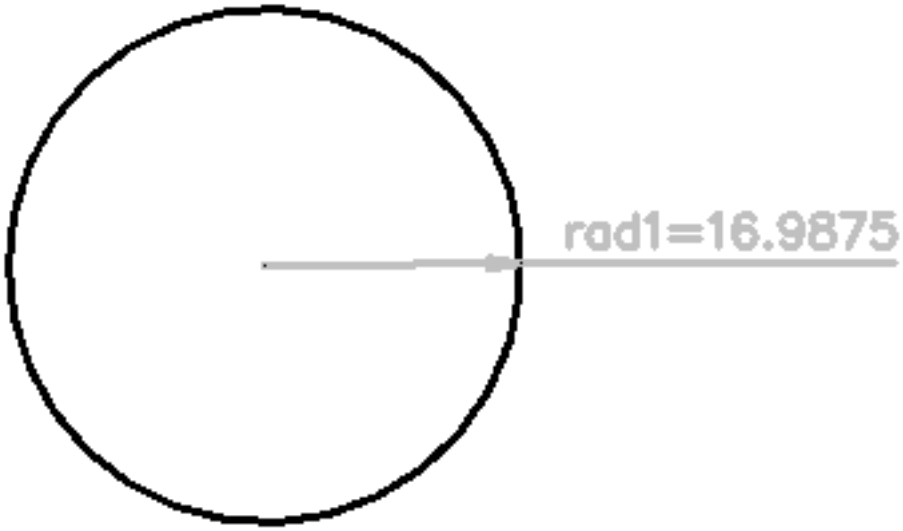
Option	Description
Entity	Constrains the horizontal distance between the endpoints of an entity. Prompts you: 1. **Select an entity** - **(select a line, arc or polyline segment)** 2. **Specify dimension line location** - **(pick a point)** 3. **Dimension text <xx.xx>** - **(type a value or press Enter to accept the current value)** The entity is constrained horizontally (parallel to the X-axis of the current coordinate system), but can continue change its size in other directions.

Procedures

- To edit dimensional constraints (1.21.7)
- Using expressions to define dimensional constraints (1.21.7)

Figure 6.828

Figure 6.829



6.10.11 DcRadius

(6.2981 on page 6079) Constrains the the radius of a circle, an arc, or polyline arc segment. (This command is equivalent to the Radius (6.10.30) option of the DIMCONSTRAINT (6.10.30) command.) (6.829)

Accessing the Command

 command bar: **dcradius** menu bar: **Parametric | 2D Constraints | Radius** toolbar: **2D Constraints |**  ribbon: **Parametric | 2D Constraints | Radius** : **dcradius Prompts you in the command bar:** Select arc, circle or curved polyline segment: **(Select a circle, arc or polyline arc segment)** Specify dimension location: **(Select a point to position the dimension line)** Dimension text <xx.xx>: **(Type a value, or else press Enter to accept the current value)** The radius of the entity is now constrained, although the entity can still be moved, rotated, and so on.

Command Options

Option	Description
Select arc, circle or curved polyline segment:	Select one: • Circle • Arc • Polyline arc segment
Specify dimension location	Move the cursor, and then pick a point to position the dimension line
Dimension text <xx.xx>	Choose one: • Type a value • Press Enter to accept the current value

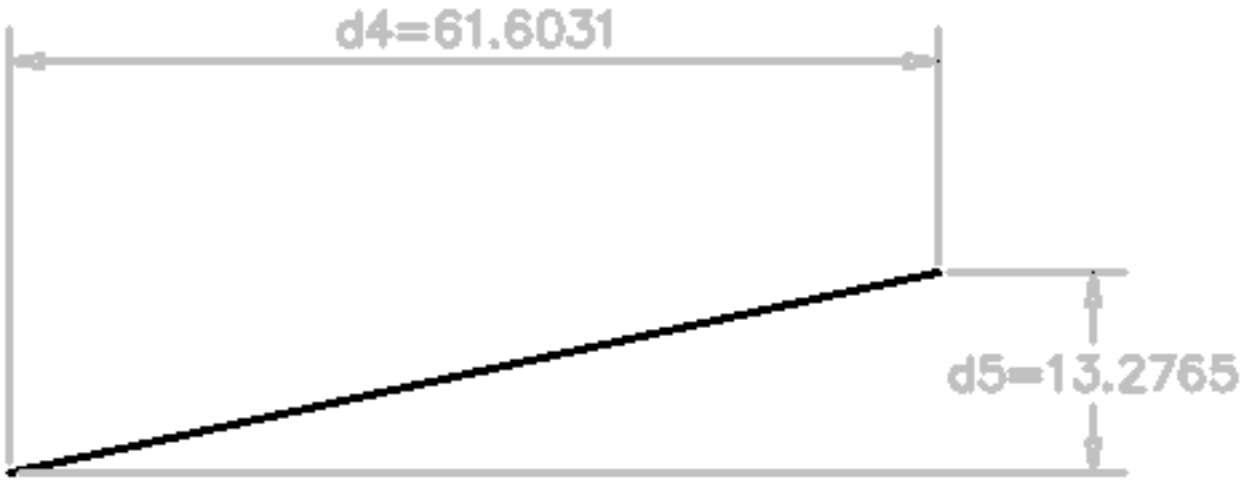
Procedures

- To edit dimensional constraints (1.21.7)
- Using expressions to define dimensional constraints (1.21.7)

Related Commands

Figure 6.830

Figure 6.831



6.10.12 DcLinear

(6.2981 on page 6079) Constrains the distance between two points, or the length of a single entity, to the horizontal (X direction) or vertical distance (Y direction), with respect to the current coordinate system. (This command is equivalent to the Linear (6.10.30) option of the DIMCONSTRAINT (6.10.30) command.) (6.831)

Accessing the Command

command bar: **dclinear** menu bar: **Parametric | 2D Constraints | Linear** toolbar: **2D Constraints |** 
ribbon: **Parametric | 2D Constraints | Linear** : **dclinear Prompts you in the command bar:** Specify first constraint point or [Entity] <Entity>: **(Select a valid constraint point (6.15.17) or, else press Enter to select an Entity)** Specify second constraint point: **(Select another valid constraint point (6.15.17))** Specify dimension line location: **(Move the cursor horizontally or vertically, and then pick a point to position the dimension line)** Dimension text <current>: **(Type the dimension text, or else press Enter to accept the current dimension text)** The horizontal or vertical distance (parallel to the X- or Y-axis of the current coordinate system) between the two points is constrained.

Command Options

Option	Description

Entity	Constrains the horizontal or vertical distance between the endpoints of an entity. Prompts you: 1. **Select an entity - (select a line, arc or polyline segment)** 2. **Specify dimension line location - (Move the cursor horizontally or vertically, and then pick a point to position the dimension line)** 3. **Dimension text <xx.xx> - (type a value, or ekse press Enter to accept the current value)** The entity is constrained horizontally or vertically (parallel to the X- or Y-axis of the current coordinate system), but can continue change its size in other directions.

Procedures

- To edit dimensional constraints (1.21.7)
- Using expressions to define dimensional constraints (1.21.7)

Related Commands

DimConstraint (6.10.30) - applies a dimensional constraint to an entity or between constraint points on entities; converts associative dimensions to dynamic dimensions. GeomConstraint (6.15.17) - applies geometric relationships between entities and/or valid constraint points on entities. DcAligned (6.10.6) - constrains the distance between two points. DcAngular (6.10.7) - constrains the angle between two lines or linear polyline segments; the total angle of an arc or an arc polyline segment; or the angle between three points on entities. DcConvert (6.10.18) - converts an associative dimension to a dimensional constraint. DcDiameter (6.10.8) - constrains the diameter of a circle or an arc. DcHorizontal (6.10.10) - constrains the horizontal distance (X-distance) between two points with respect to the current coordinate system. DcRadius (6.10.11) - constrains the radius of a circle or an arc. DcVertical (6.10.15) - constrains the vertical distance (Y-distance) between two points with respect to the current coordinate system. ConstraintBar (6.9.27) - controls the display of the constraint bar of entities. DcDisplay (6.10.9) - allows to set dimensional constraints to be displayed or hidden. Delconstraint (6.10.26) - removes all dimensional and geometrical constraints from an entity. CleanUnusedVariables (6.9.15) - purges variables not used in constraint expressions and not linked to dimensions. -Parameters (6.24.6) - manages 2D dimensional constraint parameters and user variables in the current drawing.

Figure 6.832

6.10.13 DdEdit

(7.3 on page 6132) Edits single-line text, multi-line text (mtext), dimension text, and leader text (short for "dynamic dialog editor").

Accessing the Command

command bar: **ddedit** alias: **ed** mouse: double-click single-line text, multi-line text (mtext), attribute definition or text, dimension or leader. : **ddedit Prompts you in the command bar:** Select entity to modify: **(Choose a text entity)** Displays a dialog box; edit the text, and then click **OK**. The command repeats: Select entity to modify: **(Choose a text entity, or else press Enter to end the command)** The interface you see for the DdEdit command depends on the value of the **TextEd** system variable:

TextEd Value	Description
0	DdEdit displays the in-place editor, which has no user interface (6.833)
1	DdEdit displays the dialog box editor for text (shown below) or for mtext: (6.834 on the next page)
2 (the initial value)	DdEdit displays the in-place editor, and then repeats the 'Select entity to modify' prompt automatically

Command Options

No options.

Procedures

- To edit a text entity (1.29.16)
- To edit a selection of Mtext entities (1.29.16)
- To select a different multiline text editor (1.29.16)
- To edit tag, prompt or default text of an attribute (1.30.18)
- To edit an attribute definition (1.30.18)

Related Commands

Text (6.29.12) - places single-lines of text in drawings. -Text (6.29.12) - places text and evaluates LISP expressions. MText (6.21.38) and -MText (6.21.40) - places paragraph text. DdAtte (6.10.14) - edits attribute values. Style (6.27.55) - creates and modifies text styles through the Drawing Explorer. -Style (6.27.56) - creates and modifies text styles through the command bar. BmBalloon (6.8.2) - creates associative balloon entities for assembly components in Model Space and for their generated views in a Paper Space layout. Change (6.9.10) - changes the position of text. TxtExp (6.29.36) - explodes text into polylines. Spell (6.27.44) - checks the spelling of text in drawings. Properties (6.24.54) - modifies the properties of text. Find (6.14.8) - finds and replaces text.

Figure 6.833

Figure 6.834

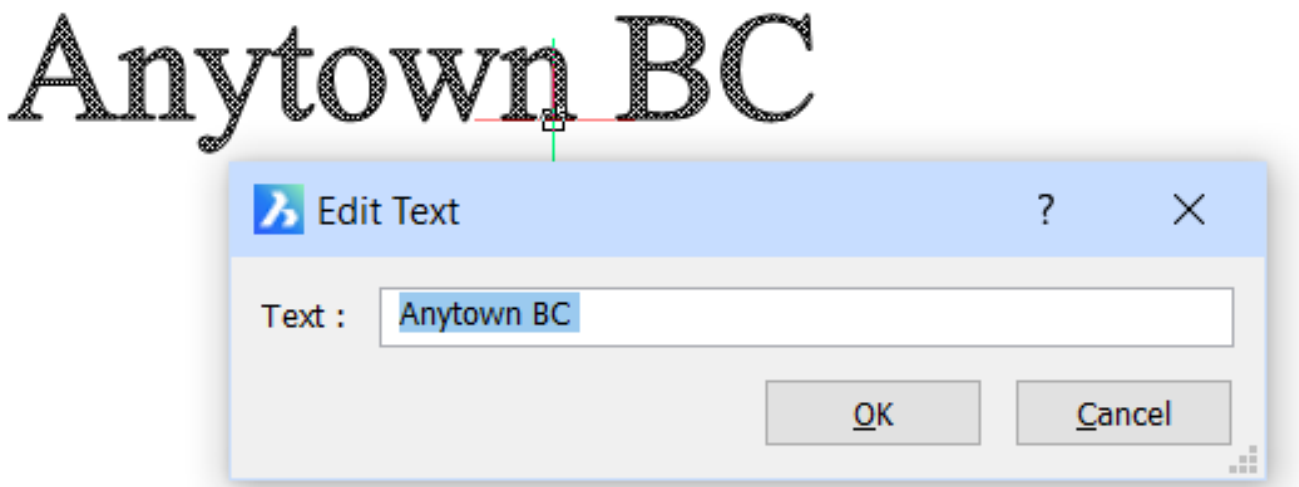


Figure 6.835

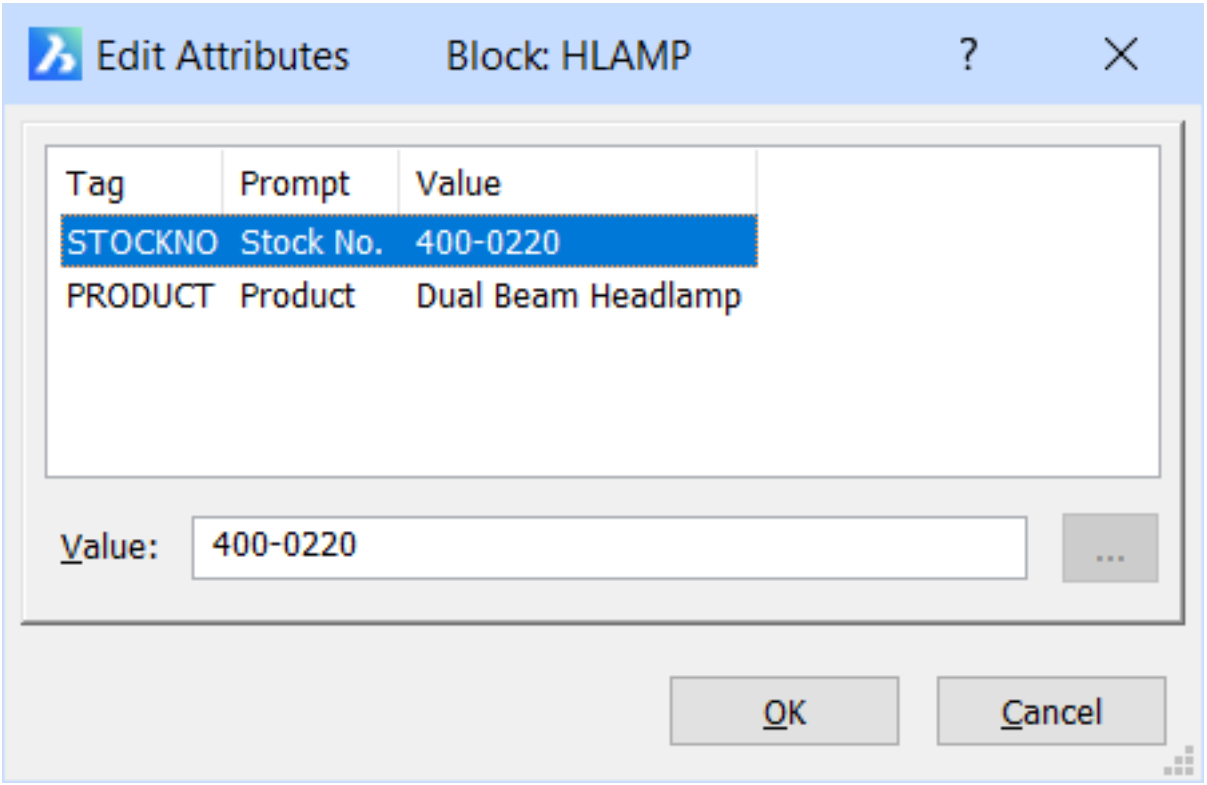
6.10.14 DdAttE

(6.2981 on page 6079) Edits the values of attributes through a dialog box (short for "dynamic dialog attribute editor"). This command is superseded by the **BATTMAN (6.6.1)** command.

Accessing the Command

command bar: **ddatte** : **ddatte Prompts you in the command bar:** Select a block: **(Choose one block)** Displays a dialog box: (6.836 on the next page) Change the value of an attribute, and then click **OK**.

Figure 6.836



Command Options

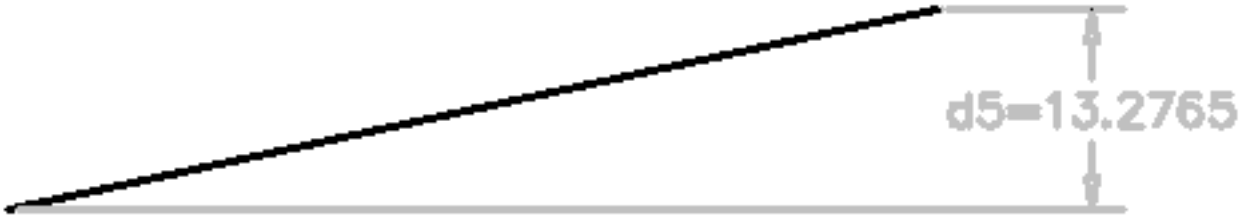
Option	Description
Value	Changes the value of the attribute text. (The ... button is inoperative.)

Related Commands

AttDef (6.4.31) - defines attributes through a dialog box. -AttDef (6.4.32) - defines attributes through the command bar. AttDisp (6.4.33) - toggles the display of attribute text. AttEdit (6.4.34) - edits attribute values and properties. -AttExt (6.4.35) - extracts attributes from drawings to data files through the command bar. AttRedef (6.4.36) - redefines a block and updates associated attributes. AttSync (6.4.37) - synchronizes attribute definitions in all block references of a specified block definition. BattMan (6.6.1) - manages the attribute Block (6.6.11) and -Block (6.6.12) - create blocks from attribute definitions and entities.s of a block definition. EAttEdit (6.13.1) - edits attribute values and most properties. Explode (6.13.16) - reduces attributes to tags. Insert (6.17.13) - inserts blocks and prompts for attribute values through a dialog box. -Insert (6.17.14) - insert blocks and prompts for attribute values through the command bar. InsertAligned (6.17.15) - inserts blocks repeatedly, and inserts mirrored blocks. Properties (6.24.54) - edits attribute values and properties. RefEdit (6.26.13) - edits blocks and attributes in-place.

Figure 6.837

Figure 6.838



6.10.15 DcVertical

(6.2981 on page 6079) Constrains the distance between two points, or the length of a single entity, to the vertical (Y direction) in the current coordinate system. (This command is equivalent to the Vertical (6.10.30) option of the DIMCONSTRAINT (6.10.30) command.) (6.838)

Accessing the Command

command bar: **dcvertical** menu bar: **Parametric | 2D Constraints | Vertical** toolbar: **2D Constraints |** ribbon: **Sketch | 2D Constraints |** : **dcvertical you are prompted:** Specify first constraint point or [Entity] <Entity>: **(Select a valid constraint point (6.15.17), or else press Enter to select an Entity)** Specify second constraint point: **(Select a valid constraint point (6.15.17))** Specify dimension location: **(Select a point to position the dimension line)** Dimension text <xx.xx>: **(Type a value, or else press Enter to accept the current value)** The vertical distance (parallel to the X-axis of the current coordinate system) between the two points is constrained.

Command Options

Option	Description
Entity	Constrains the vertical distance between the endpoints of an entity. Prompts you: 1. **Select an entity - (select a line, arc or polyline segment)** 2. **Specify dimension line location - (pick a point)** 3. **Dimension text <xx.xx> - (type a value, or else press Enter to accept the current value)** The entity is constrained vertically (parallel to the T-axis of the current coordinate system), but can continue change its size in other directions.

Procedures

- To edit dimensional constraints (1.21.7)
- Using expressions to define dimensional constraints (1.21.7)

Related Commands

Dimconstraint (6.10.30) - applies a dimensional constraint to an entity or between constraint points on entities; converts associative dimensions to dynamic dimensions. Geomconstraint (6.15.17) - applies geometric relationships between entities and/or valid constraint points on entities. DcAligned (6.10.6) - constrains the distance between two points. DcAngular (6.10.7) - constrains the angle between two lines or linear polyline segments; the total angle of an arc or an arc polyline segment; or the angle between three points on entities. DcConvert (6.10.18) - converts an associative dimension to a dimensional constraint. DcDiameter (6.10.8) - constrains the diameter of a circle or an arc. DcHorizontal (6.10.10) - constrains the horizontal distance (X-distance) between

Figure 6.839

6.10.16 DdFilter

(6.2981 on page 6079) Creates a selection set of the entities (short for "dynamic dialog filter"). This command is superseded by the **Select (6.27.16)** command.

Accessing the Command

command bar: **ddfilter** alias: **select (6.27.16)**
: **ddfilter Prompts you in the command bar.** Select entities to include in set: **(Choose one or more entities using any selection mode)** S elect entities to include in set: **(Choose more entities, or else press Enter to exit the command)** The selection set is invisible, and so you access it by entering "**P**" (previous) the next time a command prompts you "**Select entities**."

Command Options

Option	Description
Select entities to include in set	Selects one or more entities using any selection mode.

Related Commands

Properties (6.24.54) - filters entities through the Quick Select button. Select (6.27.16) - pre-selects entities based on their location.

Figure 6.840

6.10.17 DdEModes

(6.2981 on page 6079) Sets default values for creating entities (short for "dynamic dialog entity modes"); displays the Entity Creation section of the Settings dialog box. This command is superseded by the **Settings (6.27.25)** command.

Accessing the Command

command bar: **ddemodes** alias: **settings (6.27.25)** : **ddemodes** Displays Settings dialog box at the Entity Creation section: (6.841 on the following page) Change one or more settings, and then click **X**.

6.10.18 DcConvert

(6.2981 on page 6079) Converts an associative dimension to a dimensional constraint.

Accessing the Command

 command bar: **dcconvert** menu bar: **Parametric | 2D Constraints | Convert** toolbar: **2D Constraints |** ribbon: **Parametric | 2D Constraints | Convert** : **dcconvert Prompts you in the command bar:** Select associative dimension to convert: **(Select the associative dimension you want to convert to a dimensional constraint)**

Command Options

Option	Description
Select associative dimension to convert	Select an associative dimension; the program converts it a a dimensional constraint.

Procedures

- To edit dimensional constraints (1.21.7)
- Using expressions to define dimensional constraints (1.21.7)

Related Commands

DimConstraint (6.10.30) - applies a dimensional constraint to an entity or between constraint points on entities; converts associative dimensions to dynamic dimensions. GeomConstraint (6.15.17) - applies geometric relationships between entities and/or valid constraint points on entities. DcAligned (6.10.6) - constrains the distance between two points. DcAngular (6.10.7) - constrains the angle between two lines or linear polyline segments; the total angle of an arc or an arc polyline segment; or the angle between three points on entities. DcDiameter (6.10.8) - constrains the diameter of a circle or an arc. DcHorizontal (6.10.10) - constrains the horizontal distance (X-distance) between two points with respect to the current coordinate system. DcLinear (6.10.12) - constrains the horizontal distance (X-distance) or vertical distance (Y-distance) between two points with respect to the current coordinate system. DcRadius (6.10.11) - constrains the radius of a circle or an arc. DcVertical (6.10.15) - constrains the vertical distance (Y-distance) between two points with respect to the current coordinate system. ConstraintBar (6.9.27) - controls the display of the constraint bar of entities. DcDisplay (6.10.9) - allows to set dimensional constraints to be displayed or hidden. Delconstraint (6.10.26) - removes all dimensional and geometrical constraints from an entity. CleanUnusedVariables (6.9.15) - purges variables not used in constraint expressions and not linked to dimensions. -Parameters (6.24.6) - manages 2D dimensional constraint parameters and user variables in the current drawing.

Figure 6.843

6.10.19 DdSelect

(6.2981 on page 6079) Specifies the properties for selecting entities, through the Settings dialog box (short for "dynamic dialog selection"). This command is superseded by the **Settings (6.27.25)** command.

Accessing the Command

command bar: **ddselect** transparent: **'ddselect** alias: **se, settings (6.27.25) : DdDelect** Displays the Entity Selection section of the Settings dialog box: (6.844 on the next page) Change one or more settings, and then click **X**.

Command Options

Option	Description
Pick Automatic	Toggles whether BricsCAD automatically creates window or crossing selections at the 'Select entities' prompt: • **negative number** - disables window selection when no command is active. Requires a single pick point to select an entity, or the entry of a selection mode option when a command prompts to select entities. • **1** - enables window selection if the mouse is not over an entity when you click • **2** - enables window selection if the mouse is clicked when over an entity and dragged. This option is recommended when working in a rendered 3D model
Pick Box	Specifies the size of the pick box; range is 0 to 50 pixels; initial value = 3 pixels.
Pick Drag	Determines how selection windows are created: • **0** - draws selection window using two points; default • **1** - draws selection window using dragging
Pick First	Determines how entities are selected: • **0** - first issues a command, and then selects entities. • **1** - first select entities, then issues the command; default.

Related Commands

Select (6.27.16) - selects entities. SelGrips (6.27.22) - elects entities and displays grips.

Command Options

Option	Description
AutoSnap	Specifies the look and action of AutoSnap: • **1 AutoSnap Marker** - toggles the display of the AutoSnap marker, which indicates the type of entity snap (6.23.16); default = off • **2 AutoSnap Tooltips** - toggles the display of tooltips adjacent to the entity snap location; default = on • **4 AutoSnap Magnet** - toggles whether AutoSnap jumps to the nearest entity snap geometry; default = on • **8 Polar Tracking** - toggles polar tracking, where BricsCAD shows polar angles; default = off • **16 Entity Snap Tracking** - toggles entity snap (6.23.16) tracking; default = on • **32 Tooltips for Polar Tracking and Entity Snap Tracking** - toggles the display of tooltips; default = off • **64 Tracking line from LASTPOINT** - toggle the display of a tracking line from the most recently specified point; default = off
Polar Angle	Specifies the default polar snap increment; default = 90.
Polar Add Angles	Specifies additional user-defined angles for polar snap; default = none.
Polar Mode	Specifies how polar mode is handled. The value is stored as the sum of the values of the selected options: • **1 Relative** - measures polar angles from selected entities (relative); default • **2 Use polar tracking settings in entity snap settings** - use polar tracking settings in entity snap tracking • **4 Use additional polar tracking angles** - use the tracking angles listed in Polar Add Angles • **8 Press SHIFT to acquire entity snap tracking points** - press the Shift-key to acquire entity snap tracking points
Track Path	Determines how the tracking path is displayed. The options are: • **0** - displays full-screen entity snap tracking path. • **1** - displays entity snap path only between the alignment path and the From point to the cursor location; default. • **2** - does not display polar tracking path. • **3** - does not display polar or entity snap tracking paths.

Related Commands

-OSnap (6.23.13) - toggles entity snap modes at the command line. OSnap (6.23.16) - sets entity snaps through the Settings dialog box.

Command Options

Option	Description
Horizontal	Specifies the horizontal angle from the X-axis. Click a preset angle or type a value in the **Horizontal** field. (6.852 on the next page) (6.853 on the following page) Click at 0°, 45°, 90°, 135°, 180°, 225°, 270° or 315° in the inner circle. The shape of the arrow indicates whether the view is horizontal () or at an angle () (6.854 on the next page)
Vertical	Specifies the vertical angle from the XY plane. Click a preset angle, or else type a value in the **Vertical** field. (6.855 on page 4107) (6.856 on page 4107) Click in the inner half circle. (1) View direction is horizontal. (2) View direction is 45° down (not available if **PresetAngle** = 45°). (1) (6.857 on page 4107) (2) (6.858 on page 4108) View direction is 45° down, except for 0°, 90°, 180° and 270° horizontal angles, which generate orthographic views: front, back, left and right. (1) First select the horizontal arrow, then (2) click the 45° down arrow. (1) (6.859 on page 4108) (2) (6.860 on page 4109)
Angle Preset	Sets markers at 5, 15, or 45 degrees; default = 45.
Plan	Reverts the 3D viewpoint to 2D plan view.
Previous	Reverts to the previous viewpoint.
OK	Sets the viewpoint and exits the dialog box.

Look From control

The Look From control (1.23.7) allows to select a number of preset views such as orthographic views and isometric views.

Related Commands

VPoint (6.31.21) - changes the 3D viewpoint of the drawing through the command bar. DView (6.10.53) - changes the 3D viewpoint interactively, and turns on perspective mode. RtRot (6.26.37) - rotates 3D drawings in real-time.

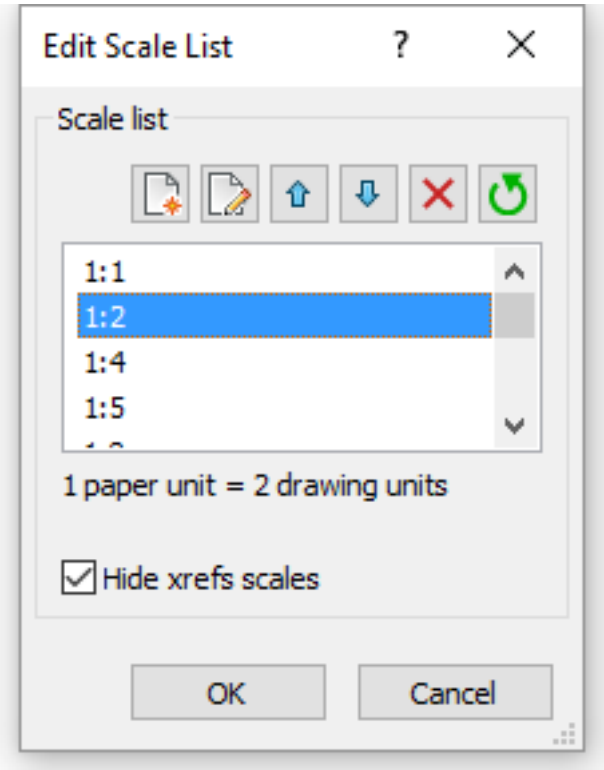
6.10.24 DefaultScaleList

(6.2981 on page 6079) Displays the default list of scale factors provided by the program. **Note:** This command displays all scale factors in the drawing, even those removed by the ScaleListEdit (6.27.7) command.

Accessing the Command

command bar: **defaultscalelist** : **DefaultScaleList** Displays a dialog box: (6.2202 on page 5385)

Figure 6.862



Dialog Box Options

Option	Description
Scale List	Lists the scale factors that are displayed by other commands. To add and remove scale factors, click the buttons: • **Add a New Scale** - adds a scale factor to the list; see below • **Edit Scale** - edits the factors of an existing scale; see below • **Move Up** - moves the selected factor up the list • **Move Down** - moves the selected factor down the list • **Delete the Selected Scale** - deletes the selected factor(s); hold down the **Ctrl** key to select and delete more than one factor at a time • **Reset** - returns the list to its original pristine condition, adding back in the deleted factors and removing those that were added but are not being used

 Add a New Scale	Displays a dialog box: (6.2203 on page 5387) 1. **Name appearing in scale list** - **(type a name , such as the scale factor itself (1:333) or a descriptive name, like Triple-Treat.)** 2. **Scale properties** - **(specify the scale factor in paper (size when plotted) and drawing units)** 3. **OK** - adds the scale to the list
 Edit Scale	Displays a dialog box: (6.2204 on page 5387) 1. **Name appearing in scale list** - **(edit the name)** 2. **Scale properties** - **(change the scale factors in paper (size when plotted) and/or drawing units)** 3. **OK** - save the changes to the list
Hide xrefs scales	Determines if scale factors from xrefs are displayed in this list: • **Yes** - scale factors from externally-referenced drawings are not shown in this list • **No** - scales in the attached xrefs not in the current drawing are listed here. Toggles the HIDEXREFSCALES variable.
OK	Saves the changes made to the list, and then closes the dialog box.
Cancel	Closes the dialog box without saving the changes you made.

Related Commands

ScaleListEdit (6.27.7) - edits the scale list of a drawing in a dialog box. -ScaleListEdit (6.27.20) - edits the scale list of a drawing in the command bar.

Command Options

Option	Description
Grips	Sets the display of grips when entities are selected. Allows to control the display of midpoint grips on polyline segments. • **0** - no grips displayed • **1** - grips displayed; on polyline segments, only the endpoint grips are displayed • **2** - grips displayed; on polyline segments, both endpoint and midpoint grips are displayed (initial value)
Grips in blocks	Toggles the display of grips inside blocks: • **On** - displays all grips on all entities making up the block (initial value) • **Off** - display a singe grip at the block's insertion point
Grip color	Specifies the color of unselected grips; initial value = index color 72 (bright green)
Dynamic grip color	Specifies the color of custom grips for dynamic blocks; initial value= index color 140 (light blue)
Selected grip color	Specifies the color of selected grips; initial value= index color 240 (red)
Hover grip color	Specifies the color of unselected grips when the cursor pauses over it; initial value= index color 150 (dark blue)
Grip size	Specifies the size of grips, in pixels; initial value = 4
Grip object limit	Specifies the maximum number of entities displayed with grips; initial value = 100. When the selection set is of more than 100 entities, no grips are displayed. When set to 0, there is no limit to the number of entities that display grips. Maximum limit is 32,767 grips.
Grip Tips	Determines whether grip tips display when the cursor hovers over grips on custom entities or dynamic blocks that support grip tips (not supported yet)
Grips attraction	Toggles the use of **magnetism** of entity grips, whether the cursor jumps top the grip; initial value = on
Grips attraction distance	Sets the grips attraction distance in pixels; initial value = 4

Related Commands

Select (6.27.16) - selects entities. SelGrips (6.27.22) - elects entities and displays grips.

Figure 6.867

6.10.26 DelConstraint

(6.2981 on page 6079) Removes dimensional and geometrical constraints from selected entities.

Accessing the Command

 command bar: **delconstraint** menu bar: **Assembly | Deletee 2D Constraints** toolbar: **2D Constraints |**  ribbon: **Parametric | 2D Constraints | Delete 2D Constraints** : **DelConstraint Prompts you in the command bar:** Select entities to delete all constraints: **(Select one or more entities, or enter all to select all entities)** Entities in set: 1 Select entities to delete all constraints: **(Select more entities, or else press Enter to complete the command)** The dimensional and geometric constraints of the selected entities are deleted.

Command Options

Option	Description
Select entities to delete all constraints	Selects the entities from which to delete constraints: • **Pick** - one or more entities • Type **all** - selects all entities in the drawing • Press **Enter** - ends the command Both dimensional and geometric constraints are removed from the entities.

Note: To remove individual constraints one at a time:

- **Dimensional constraints** - select the dimensional constraint, and then press **Del**
- **Geometric constraints** - click the tiny **x** on the constraint bar:

Related Commands

-Parameters (6.24.6) - manages 2D dimensional constraint parameters and user variables in the current drawing. Dimconstraint (6.10.30) - applies a dimensional constraint to an entity or between constraint points on entities; converts associative dimensions to dynamic dimensions. Geomconstraint (6.15.17) - applies geometric relationships between entities and/or valid constraint points on entities. ConstraintBar (6.9.27) - controls the display of the constraint bar of entities. DcDisplay (6.10.9) - allows to set dimensional constraints to be displayed or hidden.dimensions.

6.10.27 -DesignTableEdit

===ERROR WITH DOWNLOADED IMAGE=== Edits design tables.

Accessing the Command

command bar: **-designtableedit** : **-DesignRableEdit Prompts you in the command bar:** Design table [eXport/Replace/Delete/C configuration /? to list] <? to list>: **(Choose an option)**

Command Options

Option	Description
Export	Exports the content of a design table entity in .csv format file; prompts you: **Enter design table name <DesignTable_1>** - **(enter the name of the design table you want to export, or else press Enter to accept the default name.)** When the Select design table file dialog box displays, do the following: 1. Type a name in the **Name** field 2. Select a folder 3. Click the **Save** button
Replace	Replaces the content of a design table with data from a .csv format file; prompts you: **Enter design table name <DesignTable_1>** - **(type the name of the design table you want to replace, or else press Enter to accept the default name.)** When the **Select design table** file dialog box displays, do the following: 1. Select a .csv design table file 2. Click the **Open** button
Delete	Deletes a design table; prompts you: **Enter design table name <DesignTable_1>** - **(type the name of the design table you want to delete, or else press Enter to accept the default name.)**
Configurations	Creates, removes, or views configurations; prompts you: **Configuration [Save current/Remove/? to list] <? to list>** - **(choose an option:)** • **Save current** - creates a new configuration as a copy of an existing one. Prompts you: 1. **Enter design table name <v1_2>** - **(type the name of an existing table.)** 2. **Enter new configuration name <v1_2_1>** - **(type a name for the new table or press Enter to accept the default name.)** • **Remove** - removes a configuration. Prompts you: **Enter design table name <v1_2>** - **(type the name of the table to remove.)** • **? to list** - **(list the names of design tables attached to the current drawing): Design tables designtablename Total design tables: 1**

Parameters	Manages parameters; prompts you: **Parameter linked to design table [Unlink/Link/Clear expressions/? to list columns] <? to list columns>** - **(enter an option:)** • **Unlink** - unlinks parameters from the design table • **Link** - links parameters to the design table • **Clear expressions** - clears expressions (values and formulae) from parameters • **? to list columns** - lists parameters
Apply Configuration	Creates a new row using the current values of variables; prompts you: **Enter design table name <>** - **(enter the name of a design table)**
? to list	Lists design tables attached to the current drawing: **Design tables designtablename Total design tables: 1**.

Related Commands

-BmParameters (6.8.25) - allows to list and edit the parameters of inserted components and associative array. -Parameters (6.24.6) - manages dimensional constraint parameters in the current drawing. DesignTable (6.10.31) - creates or imports .csv files containing sets of parameter values. Drop-down lists with the parameters values from the tables are added to the Mechanical Browser (3.3.2) and parametric component properties. Mechanical-BrowserOpen (6.8.32) - opens the Mechanical Browser panel.

Figure 6.868

6.10.28 DelEData

(6.2981 on page 6079) Deletes extended entity data for specific applications from the selected entities (short for "delete entity data").

Accessing the Command

command bar: **deledata** transparent: **'deledata** menu bar: **Tools | Entity Data | Delete Entity Data** toolbar: **Entity Data |**  **: DelEData Prompts you in the command bar:** Delete Entity Data: Name of application or [?]: **(Enter name of application, or else type ? for a list of names)** Select entities to delete Entity Data: **(Choose one or more entities from which to delete entity data)** Entities in set: 1 Select entities to delete Entity Data: **(Select more entities, or else press Enter to end command)**

Command Options

Option	Description
?	Lists names of applications loaded in this session of BricsCAD
Name of Application	Specifies the name of the application associated with the extended entity data
Select Entities to Delete Entity Data	Specifies the entities from which to erase extended entity data

Related Commands

CopyEData (6.9.37) - copies extended entity data to other entities. EditEData (6.13.3) - creates and edits extended entity data. MoveEData (6.21.39) - moves extended entity data to other entities. ReAssocApp (6.26.2) - associates applications with entities.

Figure 6.869

6.10.29 Delay

(6.2981 on page 6079) Delays execution of the next command; meant for use with scripts; see **Script (6.27.9)** command.

Accessing the Command

command bar: **delay** transparent: **'delay** : **Delay Prompts you in the command bar:** Milliseconds to delay: **(Enter a number between 0 and 2,147,483,627 -- approximately 24 days)**

Command Options

Option	Description
Milliseconds to Delay	Specifies the amount of time BricsCAD waits before continuing to the next command in the script; specified in milliseconds (1/1000th of a second).

Related Commands

RecScript (6.26.5) - records scripts to SCR files. StopScript (6.27.62) - stops recording the script, and saves it to an SCR file. Script (6.27.9) - loads and runs a SCR script file. RScript (6.26.34) - reruns the script. Resume (6.26.26) - resumes a stopped script.

Figure 6.870

6.10.30 DimConstraint

(6.2981 on page 6079) Applies a dimensional constraint to an entity or between constraint points on entities; converts associative dimensions to dynamic dimensions.

Accessing the Command

command bar: **dimconstraint** menu bar: **Parametric | 2D Constraints |** toolbar: **2D Constraints |** ribbon: **Parametric | 2D Constraints |** : **DimConstraint Prompts you in the command bar:** Select associative dimension to convert or [LInear / Horizontal / Vertical / Aligned / ANgular / Radial / Diameter] <Aligned>: **(Select an associative dimension, or else choose an option to place a dimensional constraint)**

Command Options

Option	Description
Select associative dimension to convert	Select an associative dimension. The dimension is converted to the dimensional constraint of the same type. This option is equivalent to the DcConvert (6.10.18) command ( ).
Linear	Constrains the horizontal distance (X-distance) or vertical distance (Y-distance) between two points with respect to the current coordinate system. This option is equivalent to the DcLinear (6.10.12) command ( ).
Vertical	Constrains the vertical distance (Y-distance) between two points with respect to the current coordinate system. This option is equivalent to the DcVertical (6.10.15) command ( ).
Horizontal	Constrains the horizontal distance (X-distance) between two points with respect to the current coordinate system. This option is equivalent to the DcHorizontal (6.10.10) command ( ).
Aligned	Constrains the distance between two points. This option is equivalent to the DcAligned (6.10.6) command ( ).
Angular	Constrains the angle between two lines or linear polyline segments; the total angle of an arc or an arc polyline segment; or the angle between three points on entities. This option is equivalent to the DcAngular (6.10.7) command ( ).
Radius	Constrains the radius of a circle or an arc. This option is equivalent to the DcRadius (6.10.11) command ( ).
Diameter	Constrains the diameter of a circle or an arc. This option is equivalent to the DcDiameter (6.10.8) command ( ).

Procedures

- To edit dimensional constraints (1.21.7)
- Using expressions to define dimensional constraints (1.21.7)

Related Commands

AutoConstraint (6.4.40) - automatically applies 2D geometric and dimensional constraints to selected 2D geometry. Geomconstraint (6.15.17) - applies geometric relationships between entities and/or valid constraint points on entities. DcAligned (6.10.6) - constrains the distance between two points. DcAngular (6.10.7) - constrains the angle between two lines or linear polyline segments; the total angle of an arc or an arc polyline segment; or the angle between three points on entities. DcDiameter (6.10.8) - constrains the diameter of a circle or an arc. DcHorizontal (6.10.10) - constrains the horizontal distance (X-distance) between two points with respect to the current coordinate system. DcLinear (6.10.12) - constrains the horizontal distance (X-distance) or vertical distance (Y-distance) between two points with respect to the current coordinate system. DcRadius (6.10.11) - constrains the radius of a circle or an arc. DcVertical (6.10.15) - constrains the vertical distance (Y-distance) between two points with respect to the current coordinate system. CleanUnusedVariables (6.9.15) - purges variables not used in constraint expressions and not linked to dimensions. -Parameters (6.24.6) - manages 2D dimensional constraint parameters and user variables in the current drawing.

6.10.31 DesignTable

===ERROR WITH DOWNLOADED IMAGE=== Imports .csv files that contain sets of parameter values or else creates them from scratch. Parameters are added to the **MechanicalBrowserOpen (3.3.2)** panel and to parametric component properties.

Accessing the Command

 command bar: **designtable** transparent: **'designtable** menu bar:

- **Parametric | Design Table from file**
- **Parametric | Empty Design Table**

toolbar: **Design Table** ribbon panel: **Sheet Metal | Constraints | Design Table : DesignTable Prompts you in the command bar:** Create design table [From file/Empty] <From file>: **(Choose an option)**

Command Options

Option	Description
From file 	Creates a design table by importing a .csv file (comma-separated values file). Please make sure the list separator character on your system is the same as the one used in the CSV file. 1. Displays the Select Design Table File dialog box: (6.871 on page 4126) 2. Select the .csv file 3. Click the **Open** button to open the file in drawing 4. Enter the **MechanicalBrowserOpen** command to view the constraints (6.872 on page 4127)
Empty 	Creates an empty design table from scratch; prompts you: 1. **Enter design table name <DesignTable_1> - (type a name, or else press Enter to accept the default name)** 2. **Enter parameter names ('*' to link all constant parameters) <*>** - specifies names of parameters using one the following methods: • Press Enter to add all parameters that have a constant value (i.e., that do not depend on another parameter) • Enter the names of the parameters to include in the design table; press Enter after each name. Press Enter twice to stop adding names and create the design table.

Procedures

- Creating a Design Table from a .csv file (1.27.1)

- Direct Lookup in a Design Table (1.27.1)
- Reverse Lookup in a Design Table (1.27.1)
- Adding a New Configuration to a Design Table (1.27.1)
- Creating an Empty Design Table (1.27.1)
- Using a Parametric Component with Design Tables (1.27.1)

Related Commands

-DesignTableEdit (6.10.27) - allows to edit design tables. -BmParameters (6.8.25) - allows to list and edit the parameters of inserted components and associative array -Parameters (6.24.6) - manages dimensional constraint parameters in the current drawing. MechanicalBrowserOpen (6.8.32) - opens the Mechanical Browser panel.

Figure 6.875

6.10.33 DgnImport

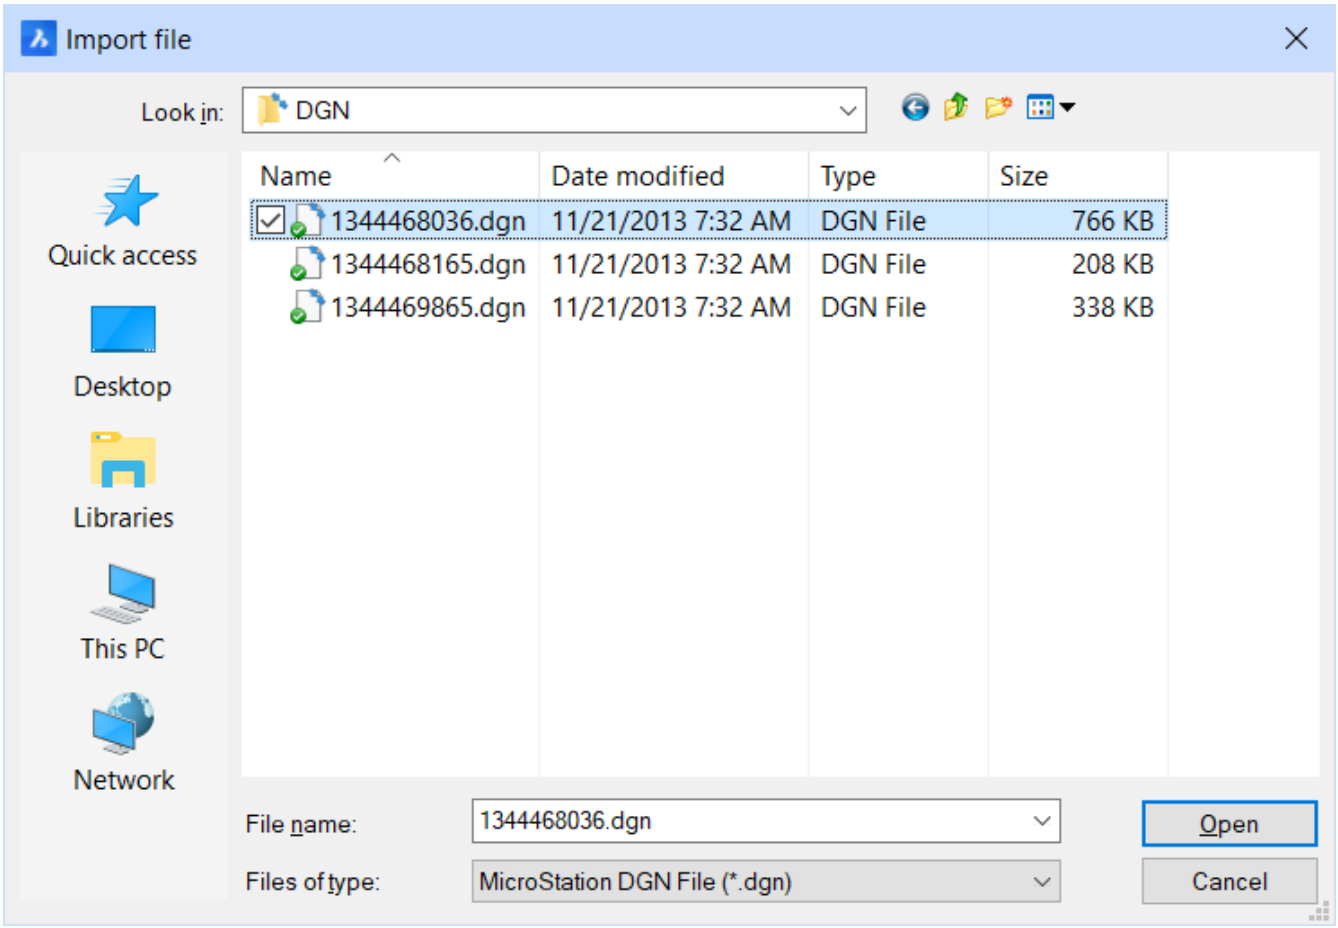
(6.2981 on page 6079) Imports DGN design files (created by Microstation from Bentley Systems) as entities.

Accessing the Command

Keyboard: **dgnimport** Menu: **File | Import**, and then select DGN format **:** **DgnImport** Displays the Import dialog box: (6.876 on the next page)

1. Choose a DGN file.
2. Click **Open**. BricsCAD converts the Microstation elements into BricsCAD entities using the settings described below.

Figure 6.876



Command Options

Option	Description
File name	Chose a DGN file from the dialog box
Open	Opens the selected DGN file in the current drawing as entities, such as lines and blocks
Cancel	Cancels the operation

Microstation Jargon

Microstation has its own vocabulary:

Microstation Term	BricsCAD Equivalent Term
Element	Entity or object
Shape, complex shape	Polyline
Text node	Empty text field to be filled in later
Design model	Model space
Active model	Current view of the model
Sheet model	Paper space
Cell	Block
Level	Layer
Resource files	Support files, such as fonts and line types
Line style	Linetype

If an element (entity) is filled, then BricsCAD makes a hatch of it. Microstation assigns color numbers to colors that are different from BricsCAD's color numbers. and so BricsCAD attempts to match colors from the DGN color table with a color in the DWG color table; if no match is found, the DGN color is saved as an RGB value.

DGN Settings

Settings determine how this command converts design files to DWG format. In the Settings dialog box, search for "DgnImp": (6.877 on page 4134)

DgnImp3dEllipseImportMode

Determines how to convert 3D ellipses:

- 0 - convert to ellipse (default)
- 1 - convert to region

DgnImp3dObjectImportMode

Determines how to convert 3D elements:

- 0 - convert to polyface mesh (default)
- 1 - convert to a 3D solid or body

Microstation uses the word "element" for entities or objects.

DgnImp3dShapeImportMode

Determines how to convert 3D shapes and 3D complex shapes:

- 0 - convert to polyline
- 1 - convert to region (default)
- 2 - convert to polyface mesh

A Microstation "shape" and "complex shape" is like a polyline in BricsCAD.

DgnImpBreakDimensionAssociation

Determines if dimensions loose their associativity upon import:

- 0 - associativity is maintained (default)
- 1 - dimension associations are broken

DgnImpConvertDgnColorIndicesToTrueColors

Determines how Microstation colors are mapped to BricsCAD colors:

- 0 - converts DGN color indices to DWG color indices
- 1 - converts DGN color indices to RGB true colors (default)

Microstation assigns color numbers to colors that are different from BricsCAD:

1. BricsCAD gets the color from the DGN color table
2. Then it attempts to match it with a color in the DWG color table.
3. If no match is found, the DGN color is saved as an RGB (true color index) value.

DgnImpConvertEmptyDataFieldsToSpaces

Determines how empty field values are handled:

- 0 - replaced by underscore symbols (_)
- 1 - replaced by space symbols ( ) (default)

DgnImpEraseUnusedResources

Determines how to import unreferenced elements, such as text styles and linetypes:

- 0 - import unreferenced elements (default)
- 1 - erase unreferenced imported items

DgnImpExplodeTextNodes	Determines how to handle text nodes (empty text fields): • 0 - convert them to multiline text (default) • 1 - convert them to simple entities, such as text and lines Microstation uses text nodes as empty fields that are used to reserve space for text that will be added later, and so the length of the text is not yet known.
DgnImpImportActiveModelToModelSpace	Determines how active spaces are handled: • 0 - import active models to model space first, and then attach the design model from model table • 1 - import the active model to model space (default) Microstation uses the phrase “design model” for model space, and “active model” for the current view of a model.
DgnImpImportInvisibleElements	Determines how invisible elements (entities) are handled: • 0 - skip invisible DGN elements • 1 - import invisible them as invisible entities (default)
DgnImpImportPaperSpaceModels	Determines how to import sheet models (paper space): • 0 - import one DGN model to model space only • 1 - import all DGN sheet models to paper space layouts (default) Microstation uses the phrase “sheet model” for paper space.
DgnImpImportViewIndex	Determines DGN view settings: • 0 through 7 - specifies level mask • -1 - view is not defined Microstation uses the word “level” for layers; a "mask" hides content in areas or levels/layers.
DgnImpRecomputeDimensionsAfterImport	Determines how to handle dimensions: • 0 - create DGN-style dimension geometry blocks (default) • 1 - re-compute all dimensions to create DWG dimension geometry blocks
DgnImpSymbolResourceFiles	Specifies the paths to folders holding DGN and RSC files Microstation uses RSC resource files to store fonts, line styles, and so on.
DgnImpXRefImportMode	Determines how to import reference attachments: • 0 - don't import DGN reference attachments • 1 - convert attached DGN files to DWG-style xref files • 2 - create a block definition of the attached DGN file, then create a block reference (default) • 3 - attach the DGN references as underlays Microstation uses the word “cell” for blocks.

Related Commands

Import (6.17.10) - imports files in a variety of file formats.

Figure 6.878

6.10.34 Distantlight

(7.3 on page 6132) Places distant lights (displayed as glyphs) in drawings for use with rendering. Distant lights represent sources that are far off, such as the sun, 

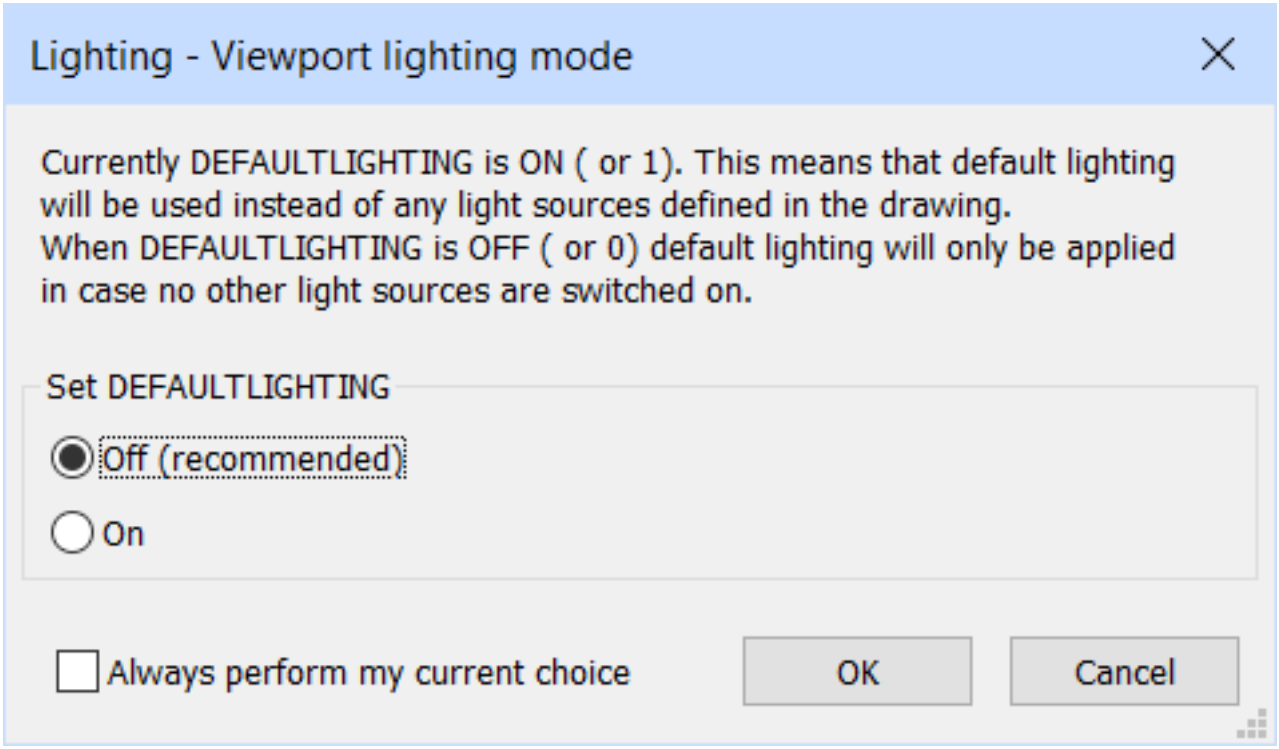
Accessing the Command

 command bar: **distantlight** menu bar: **View | Rendering | Lights | New distant light** toolbar: **Render | Lights |**  ribbon: **View | Lights | Create | Distant Light** : **Distantlight** Displays a dialog box: (6.879 on the facing page) To be able to use distant lights in drawings, you must turn off default lighting. (Default lighting is the light sources the program uses when you have defined no lights yet.)

1. Choose **Off**
2. Click **OK**

Prompts you in the command bar: Specify light direction or [Vector] <0,0,0>: **(Pick a point, enter x,y,z coordinates, press Enter to accept the default, or else type V)** Specify light direction TO <1,1,1>: **(Specify a second point, enter x,y,z coordinates, or else press Enter to accept the default)** Enter an option to change [Name/Intensity factor/ Status/ Photometry/ shadoW/ filterColor/eXit] <eXit>: **(Enter an option, or else press Enter to exit the command)**

Figure 6.879



Command Options

Option	Description
Name	Specifies a name for the light; prompts you: **Enter light name <Distantlight1>** - **(enter a name, or else press Enter to accept the default name)**
Intensity Factor	Specifies the intensity of the light; prompts you: **Enter intensity (0.00 - max float) <1.0>** - **(enter an intensity value of between 0.00 and the maximum supported by your system)**
Status	Toggle the light; prompts you: **Enter status [ON/OFf] <ON>** - **(choose ON to include the light when calculating renderings)**

Photometry Options	Description
Photometric	The Photometric option defines intensity and color characteristics of the light; prompts you: **Enter a photometric option to change [Intensity/Color/eXit] <Intensity>** - **(enter an option.)**

Intensity	The Intensity option defines the brightness of the light by Cd, flux, or illuminance; prompts you: **Enter intensity (Cd) or enter an option [Flux/Illuminance] <1500.0>** - **(enter an option:)** • **Enter intensity (Cd)** - specifies the intensity expressed in Candela (Cd) The candela (symbol: cd) is the SI base unit of luminous intensity; that is, power emitted by a light source in a particular direction, weighted by the luminosity function (a standardized model of the sensitivity of the human eye to different wavelengths, also known as the luminous efficiency function). A common candle emits light with a luminous intensity of roughly one candela • **Enter Flux (Lm)** - specifies the luminous flux expressed in Lumen (Lm) The lumen (symbol: Lm) is the SI unit of luminous flux, a measure of the power of light perceived by the human eye. Luminous flux differs from radiant flux in that luminous flux measurements (such as lumens) are intended to reflect the varying sensitivity of the human eye to different wavelengths of light, while radiant flux measurements (such as watts) indicate the total power of light emitted. The lumen is defined in relation to the candela as: 1 lm = 1 cd·sr • **Enter Illuminance (Lx or Fc) or enter an option [Distance] <9424.8>** - **(specify the illuminance expressed in Lx (lux) or Fc (foot-candle) units) Distance** - **(enter a distance expressed in drawing units)** In photometry, illuminance is the total luminous flux incident on a surface, per unit area. It is a measure of the intensity of the incident light, wavelength-weighted by the luminosity function to correlate with human The foot-candle (Fc) is a non-metric unit of illuminance that is used in photography. The unit is defined as the amount of illumination the inside surface of a 1-foot radius sphere would be receiving if there were a uniform point source of one candela in the exact center of the sphere. Alternatively, it can be defined as the illuminance on a 1-square foot surface of which there is a uniformly distributed flux of one lumen. This can be thought of as the amount of light that actually falls on a given surface. The foot-candle is equal to one lumen per square foot. One foot-candle is equal to approximately 10.764 lux, although in the lighting industry, typically this is approximated as 1 foot-candle being equal to 10 lux. As a full sphere has a solid angle of 4·pi steradians, a light source that uniformly radiates one candela in all directions has a total luminous flux of 1 cd·4pi sr = 4pi ≈ 12.57 lumens. For example, if a candle emits light with a luminous intensity of about 1 candela, the total light emitted is about 12.6 lumens.

The Color option determines the color of the light by light type of degrees Kelvin; prompts you: **Enter color name or enter an option [?/Kelvin] <D65> - (enter an option:)**

- **Enter color name - (specifies the name of a color of light, as listed below)**
- **?** prompts you "**Enter color name(s) to list <*>**" - **(press Enter to see the valid names of light colors:)**

D65 Fluorescent Coolwhite Whitefluorescent daylightfluorescenT Incandescent Xenon Halogen Quartz Metalhalide mErcury Phosphormercury highpressureSodium Lowpressuresodium

- **Enter Kelvin temperature <3600.0> - (enter a color temperature expressed in degrees Kelvin (K))** Color temperature is a characteristic of visible light that has important applications in lighting, photography, videography, publishing, manufacturing, astrophysics, and other fields. The color temperature of a light source is the temperature of an ideal black-body radiator that radiates light of comparable hue to that light source. The temperature is conventionally stated in units of absolute temperature: degrees kelvin (K). Higher color temperatures (5,000 K or more) are called cool colors (blueish white); lower color temperatures (2,700 – 3,000 K) are called warm colors (yellowish white through red).

eXit

Exits this sub-level of command options, and returns to the previous level; prompts you: **Enter a photometric option to change [Intensity/Color/eXit] <Intensity>: (Enter x to exit photometric options) Enter an option to change [Name/Intensity factor/Status/Photometry/shadoW/filterColor/eXit] <eXit>:**

Shadow Options	**Description**
shadoW	Determines the look of shadows cast by lights; prompts you: **Enter shadow settings [Off/Sharp/soFt mapped/soft sAmpled]: <Sharp> - (enter an option)**
Off	Disables the calculation of shadows; this light will cast no shadows, which helps speed up renderings. The command prompt returns to the previous level.
Sharp	Displays shadows with sharp edges; this option renders lights with shadows more quickly than lights with soft (diffuse) shadows. The prompt returns to the previous level.

soFt mapped

Displays realistic shadows with soft edges. Prompts you:

1. **Enter map size [64/128/256/512/1024/2048/4096] <256> (enter a value between 64 and 256.)** The map size determines how diffuse the shadow is at its edges. A larger number is more diffuse (has softer edges) but takes longer to render.
2. **Enter softness (1-10) <1>** - **(enter a value between 1 and 10.)** The software determines the softness of the body of the shadow. A larger number is software, but takes longer to render.

soft sAmpled

Displays realistic shadows with shadows based on extensive options. Prompts you:
Enter an option to change Shape/sAmples/Visible/<eXit> - **(enter an option:)**
Shape - specifies the shape of the shadow; prompts you:

- **Enter shape [Disk/Rect] <Disk>** - **(enter d or r)**

When the shadow has a disk shape, prompts you: **Enter radius <0.0>** - **(enter the radius of the disk)** When the shadow has a rectangular shape, prompts you: **Enter Length <0.0>** - **(enter length of the rectangle) Enter Width <0.0>** - **(enter width of the rectangle) sAmples** - specifies the number of samples to take for the shadow:

- **Enter Shadow Sample <16>** - **(enter a value between 0 and 2147483647)**; a larger samples slows down the rendering speed, but generates a more realistic-looking shadow

Visible - specifies the visibility of the disk or rectangular shadow shape:

- **Enter Shape Visibility [Yes/No] <No>** - (**enter y or n.)**

eXit - exits this sub-level of command options, and returns to the previous level.

filterColor	Specifies the color of the light based on RGB, ACI, or HSL systems; prompts you: **Enter true color (R,G,B) or enter an option [Index color/Hsl]:<255,255,255>** - **(enter an option)** • **True Color (RGB)** - **(enter three integers in the range of 0 to 255, where each number refers to the amount of red, green, and blue, such as 0,0,0 (black), 255,0,0 (red), 255,0,255 (purple), 128,128,128 (gray), or 255, 255,255 (white). Refer to the Color (6.9.19) command's dialog box for the meaning of the RGB numbers.)** • **Index color** - specifies the CAD Color Index color; prompts you: **Enter color name or number (1-255)** - **(enter a value between 1 and 255; refer to the Color (6.9.19) command's dialog box for the meaning of the color numbers.)** • **HSL** - specifies the color using three parameters that determine the amount of hue (color), saturation (strength of color), and lightness (brightness or darkness of color. **Enter HSL number (0,0,24)** - **(enter three values between 1 and 255; refer to the Color (6.9.19) command's dialog box for the meaning of the color numbers.)**
eXit	Exits the the command and places the light in the drawing.

To edit the properties of the light, double-click it.

Related Commands

Light (6.20.30) - creates a new light in the drawing. Lightlist (6.20.36) - displays the Drawing Explorer - Lights dialog window. Pointlight (6.24.47) - creates a point light. Render (6.26.21) - calculates a photorealistic image of the 3D model. Spotlight (6.27.47) - creates a spot light. Sunproperties (6.27.70) - displays the Sun Properties of the Active Viewport editor in the Drawing Explorer - Lights dialog. Weblight (6.33.4) - creates a web light.

Figure 6.880

6.10.35 Dome

(7.3 on page 6132) This command is obsolete, and still exists in the program for backward compatibility only. Please use **Ai_Dome (6.5.19)** instead.

Figure 6.881

6.10.36 Dist

(7.3 on page 6132) Reports the distance and angle between two points (short for distance).

Accessing the Command

Keyboard command bar: **dist** transparent: **'dist** alias: **di** menu bar: **Tools | Inquiry | Distance** toolbar: **Inquiry** ribbon: **Tools | Inquiry | Distance** : **DIST Prompts you in the command bar.** Starting point for distance: **(Specify a point.)** Enter second point or [Multiple points]: **(Specify a point or choose an option.** Sample response: Distance

Figure 6.882

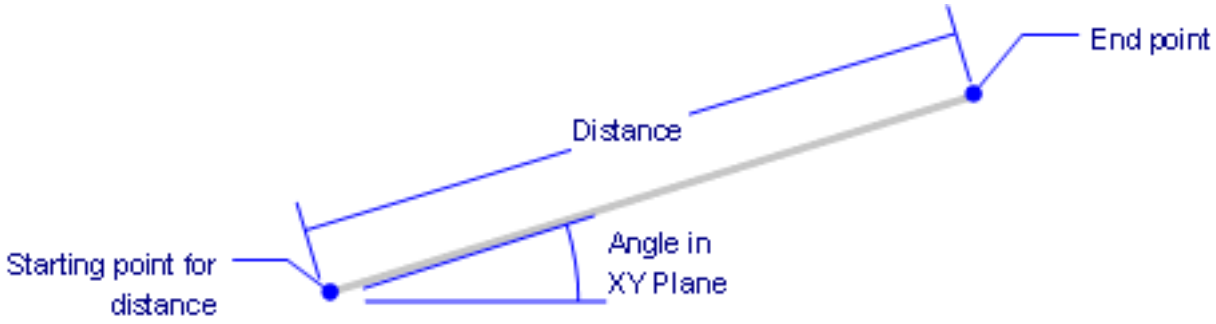


Figure 6.883

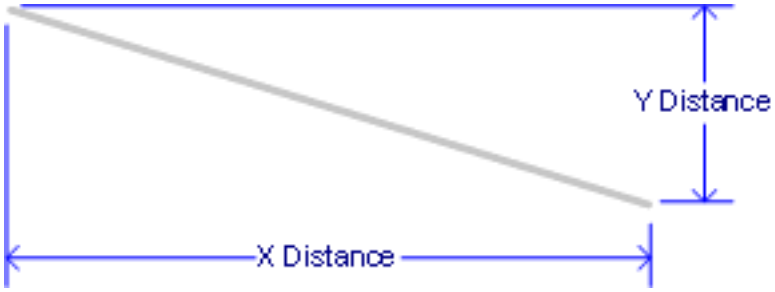

Command Options

Option	Description
Starting Point for Distance	Specifies the first point from which the measurement takes place
Enter second point	Specifies the end point
Multiple points	Allows to measure the total distance between multiple points. Prompts you: **Enter next point or [Arc/Length/Undo/Total] <Total>:** Choose an option: • **Arc**: Allows to specify an arc. Prompts you: **Enter end point of arc or [Angle/CEnter/Direction/Line/Radius/Second point/Undo]:** Enter a point or choose an option. Prompts you: **Enter end point of arc or [Angle/CLose/CEnter/Direction/Line/Radius/Second point/Undo]:** Keep specifying arcs or choose the Line option. • **Length**: Allows to add a distance. Prompts you: **Distance for segment:** Type a value. • **Undo**: Removes the last point. • **Total** : Prints the total length in the command line and concludes the command.

Related Commands

Area (6.4.18) - reports the area, circumference, and perimeter of entities. Id (6.17.4) - reports the x,y,z coordinates of picked points. List (6.20.34) - lists the area and other parameters of entities in the command bar. MassProp (6.21.2) - reports the properties of solid models and regions. Properties (6.24.54) - lists the area and other parameters of entities in a palette.

Figure 6.884

6.10.37 Donut

(6.2981 on page 6079) Draws wide, filled polylines that look like donuts.

Accessing the Command

 command bar: **donut** alias: **do, doughnut** menu bar: **Draw | Donut** toolbar: **Draw | Polygons |** ribbon: **Draw | Draw | Polygons | Donut** : **Donut Prompts you in the command bar:** Inside diameter of donut [2 Point/3 Point/Tangent Tangent Radius] <0.5>: **(Pick a point, enter a value, or enter an option)** Outside diameter of donut <1>: **(Specify a value, or pick two points)** Center of donut: **(Specify coordinates, or pick a point in the drawing)** Center of donut: **(Specify coordinates to draw another donut or pick a point in the drawing, or else press Enter to conclude the command)** (6.890 on page 4150) Donuts are made of two wide polyline arcs. This command was created originally to draw solder pads on printed circuit boards.

Command Options

Option	Description
2Point (6.887 on page 4149)	Defines the donut by two points on its circumference; prompts you: • **Width of donut - (enter a value, or pick two points)** • **First point on diameter - (enter coordinates, or pick a point)** • **Second point on diameter - (enter coordinates, or pick another point)** The abbreviation for this option is 2P.
3Point (6.888 on page 4149)	Defines the donut by three points on its circumference; prompts you: 1. **Width of donut - (enter a value, or pick two points)** 2. **First point on donut - (enter coordinates, or pick a point)** 3. **Second point - (enter coordinates, or pick another point)** 4. **Third point - (enter coordinates, or pick another point)** The abbreviation for this option is 3P .

Tangent Tangent Radius (6.889 on page 4150)	Defines the donut by two points tangent to other entities and a radius; prompts you: 1. **Width of donut - (enter a value, or pick two points)** 2. **Diameter of donut - (enter a value, or pick two points)** 3. **Select first tangent point - (enter coordinates, or pick an entity)** 4. **Select second tangent point - (enter coordinates, or pick another entity)**
Diameter of donut (6.890 on page 4150)	The abbreviation for this option is R, and not TTR. Defines the donut by inner and outer diameter, and a center point; prompts you: 1. **Outside diameter of donut - (specify a value, or pick two points)** 2. **Center of donut - (specify coordinates, or pick a point in the drawing)**

Procedures

Drawing donuts (1.25.28)

Grips Editing

Donuts can be edited directly through grips:

1. Select the donut. Notice that it has four grips.
2. Drag a grip to stretch the donut (increase or decrease its diameter).

(6.885 on the next page)

6.10.38 Drag

(6.2932 on page 6037) Moves 3D solids perpendicular to a selected face by dragging that face. Optionally preserves connections to other solids.

Accessing the Command

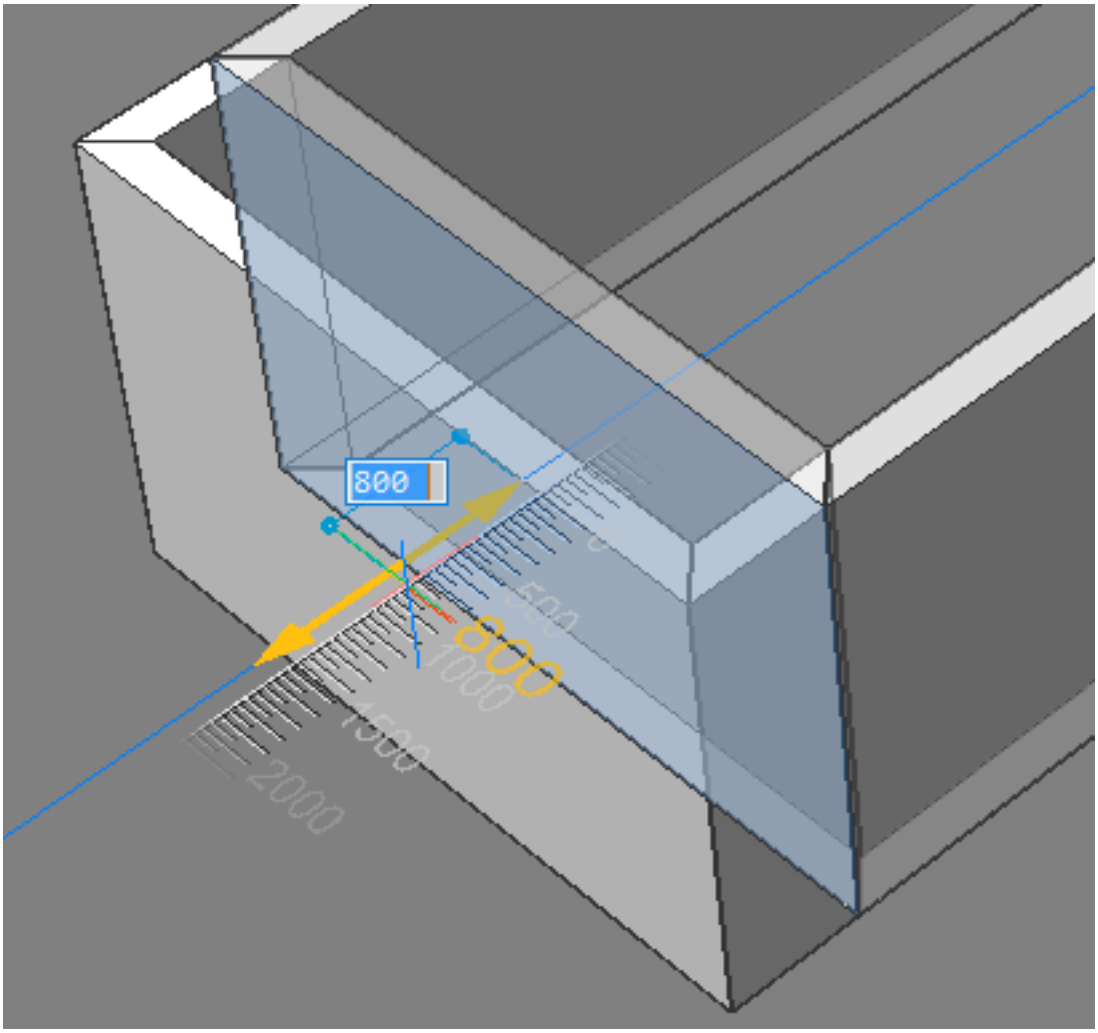
Commandline: **DRAG** Quad: **Select face | Model | Drag** Ribbon: **Home | Modify | Drag** Toolbar: **BIM toolbar | BIM** : **Drag Prompts you in the command bar:** Select planar face(s) [selection options (?)]: **(select a face of a 3D solid)** Entities in set: 1 Select planar face(s) [selection options (?)]:: **(select more faces, then right click or press Enter to stop selecting.)** The selected face(s) move(s) dynamically. The manipulator (6.21.3) displays, the distance from the current position of the selected face displays in the dynamic entry field. (6.892 on the next page) Specify distance to drag solid or [Disable connectivity mode/Enable connectivity mode]: Optionally, do the following:

- Press the Ctrl-key to disable/enable connectivity mode.
- Select a different reference face:
  - * Repeatedly press the TAB key to cycle all parallel faces of the solid being dragged.
  - * Move the cursor to a parallel face of another solid, then repeatedly press the TAB key to select a face of another solid. All parallel faces under the cursor are recognized.

To specify the new position of the solid(s), do one of the following:

- Specify a point.
- Type a value in the dynamic distance field.
- Move the cursor to adjust the value in the dynamic distance field, then click. Optionally zoom in/out to set the snap increment size of the ruler (1.32.10).

Figure 6.892



Command Options

Option	Description
Connectivity mode	(6.893) The options are: •  : Disable connectivity (default) •  : Enable connectivity Do one of the following: • Press the Ctrl-key to toggle the connectivity mode. • Type **d+Enter** to disable connectivity • Type **e+Enter** to enable connectivity

Procedures

Using BIM Drag on a 3D Solid (2.5.18) Setting the distance between parallel solids (2.5.4) Using the MEP Modeling tools to alter profiles (2.5.14)

Related Commands

DmPushPull (6.12.25) - adds or removes volume from a solid by moving a face. DmMove (6.12.16) - moves the selected solids, or faces or edges of a solid using a vector. BimFlowConnect (6.7.19) - Creates a connection between flow segments, such as pipes or HVAC ducts.

Figure 6.894

Shape Classic Pro Platinum Mechanical BIM

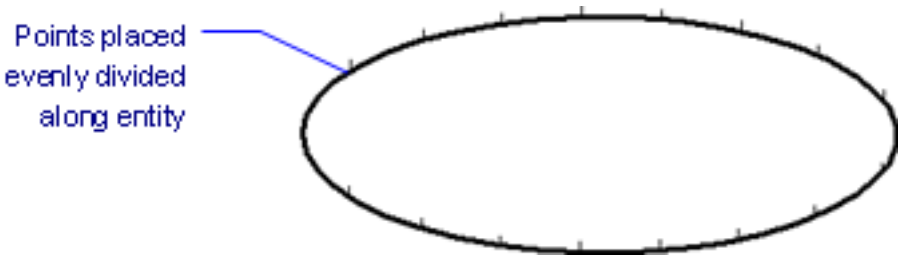
6.10.39 Divide

(6.2981 on page 6079) Places a specific number of points or blocks spaced equally along an entity.

Accessing the Command

 command bar: **divide** alias: **div** menu bar: **Modify | Divide** toolbar: **Modify |**  ribbon: **Draw | Draw | Points | Divide** : **Divide Prompts you in the command bar:** Select entity to divide: **(Choose a line, polyline, spline, arc, circle, or ellipse)** Number of segments [insert Block]: **(Enter a number, or type B)** (6.895)

Figure 6.895



Command Options

Option	Description
Select entity to divide	Choose a single entity; this command works with the following entities: • Line • Polyline • Spline • Arc • Circle • Ellipse
Number of segments	Specifies the number of "segments," which means equally-divided distances between points. Prompts you: • **Number of segments - (type an integer between 2 to 32767)**; the larger the number, the shorter the segments over the length of the entity Entering **2** for the number of segments places a single point or block at the midpoint of the entity, as the entity is divided into two segments. There is always one more segment than points placed, as no point or block is placed at the start or endpoints of the entity. Points on an entity are essentially invisible, so you can use the **DdPType (6.10.20)** command to change their look and make them larger. After points are placed on the entity, you can use the **NODe** entity snap to attach other entities to them
Blocks	Places equally-spaced blocks along the entity, instead of points. Prompts you: 1. **Name of block to insert [? to list] - (type the name of the block, or else press ? to list the available blocks.)** 2. **Align blocks with entity? [Yes-align blocks/No-do not align] <Yes-Align blocks> - (enter an option)**: • **Yes** - rotates blocks to match the local orientation of the entity, such as along an arc • **No** - does not rotate blocks, so that they maintain their orientation **Number of segments - (type an integer between 2 to 32767)**

Procedures

- To divide an entity using points (1.32.41)
- To divide an entity using blocks (1.32.41)

Related Commands

Measure (6.21.11) - places equi-distant points along entities. Point (6.24.30) - places points in drawings. DdPType (6.10.20) - specifies the look and size of point entities through the Settings dialog box.

Figure 6.896

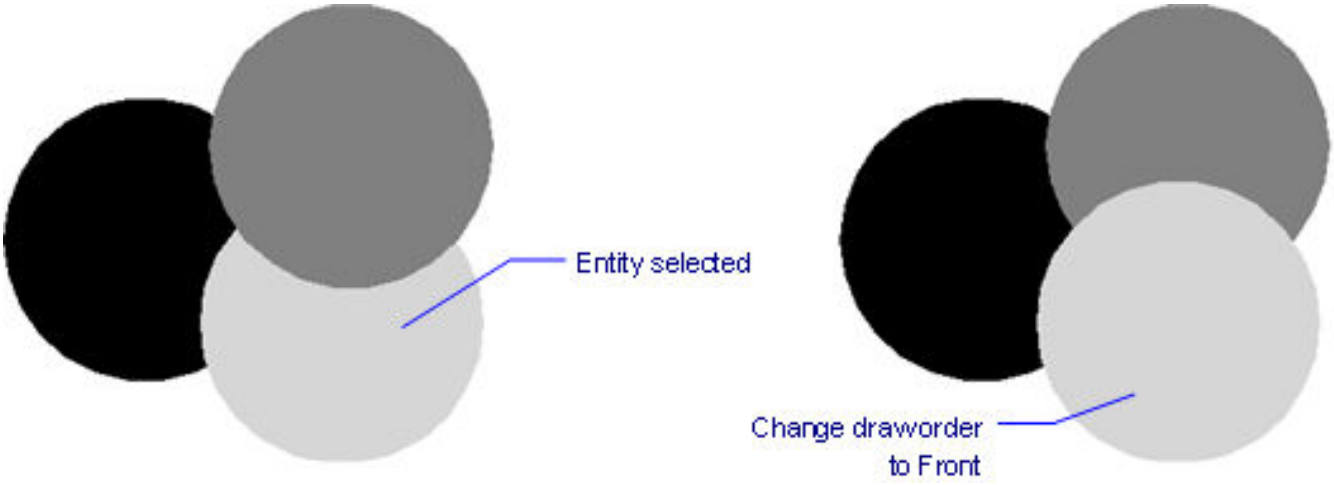
6.10.40 DrawOrder

(6.2981 on page 6079) Changes the display order of overlapping entities. Use this command to displayed entities over top other entities that would otherwise overlap or even hide them. Hatches and text entities have handy commands that controlling their display order: **HatchToBack (6.16.6)** places all hatching below all other entities, and **TextToFront (6.29.13)** displays all text above them all entities.

Accessing the Command

command bar: **draworder** alias: **dr** menu bar: **Tools | Draw Order** toolbar: **Draw Order |** ribbon: **Change | Arrange | Draw Order |** : **DrawOrder Prompts you in the command bar:** Select entities to change draw order: **(Select one or more entities; when entities overlap, press the Tab key to select the one you want)** Entities in set: 1 Select entities to change draw order: **(Select one or more entities, or press Enter)** Change draw order [Above/Under/Clear all orders/bring to Front/send to Back] <Send to back>: **(Enter an option)** (6.897)

Figure 6.897



Command Options

Option	Description
Select Entities to Change Draw Order	Selects one or more entities. This command is meant to work with overlapping objects. While this command works with non-overlapping entities, it has no effect on them.
Above	Visually moves the display of selected entities "one level" above other entities; this option does not necessarily move them to the top (front) of display order.
Under	Moves the entities below other entities, but not necessarily to the bottom (back) of display order.
Clear all orders	Clears assigned display orders; entities are displayed as they were originally created. This means that the last created entity is displayed on top of one created earlier.
Bring to Front	Moves the selected entities' display order above all other overlapping entities.
Send to Back	Moves the selected entities' display order below all other overlapping entities.

Procedures

- Adjusting the Draw Order (1.32.8)

Related Commands

DrawOrderByLayer (6.10.41) - sets draw order of overlapping objects through layer names. HatchToBack (6.16.6) - sets the draw order of all hatch entities in the drawing to display behind all other entities. TextToFront (6.29.13) - sets the draw order of all texts and dimensions in the drawing to display in front of all other entities. BHatch (6.6.5) and Hatch (6.16.3) - set the draw order of hatch patterns relative to other entities through a dialog box.

Figure 6.898

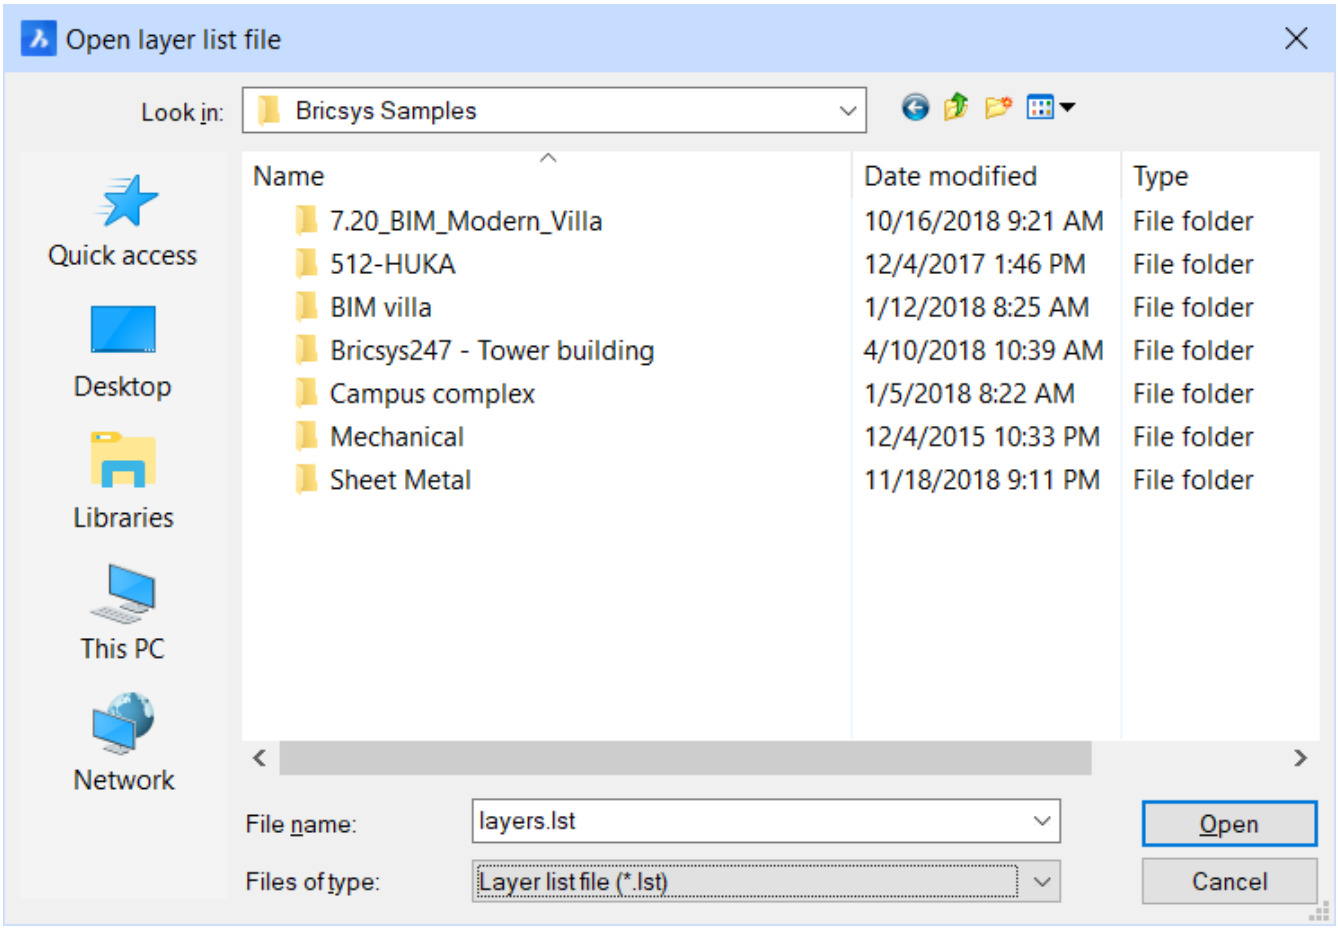
6.10.41 DrawOrderByLayer

(6.2981 on page 6079) Controls the display order of overlapping objects through a list of layer names in a LST file.

Accessing the Command

command bar: **draworderbylayer** : **DrawOrderByLayer** Displays a dialog box: (6.899 on the facing page) Choose a *.lst layer list file, and then click **Open**. The *.lst file is an ASCII text file that you (or someone else) wrote with a text editor, such as Notepad, and holds a list of layer names, one per line, such as LayerName1 LayerName2 ... LayerNameN The command displays entities on layers in the order defined by the *.lst file. The display order is the reverse of the draw order: first the entities on layer LayerName1 are drawn, then the entities on LayerName2 are drawn on top of the first ones, and so on. The entities on LayerNameN end up on top. Wildcard characters (6.13.17) are supported in layer names. All entities on layers that match the selection criteria are drawn at the same display level. Caution: A specific filter preceded by a general filter does nothing, such as filter at* listed after filter a* has no effect because all entities on layers starting with 'a' are already drawn. But filter a* listed after at* first draws all entities on layers starting with 'at', and then all entities on the remaining layers starting with 'a'.

Figure 6.899



Command Options

Option	Description
Open	Opens the *.lst file.

Related Commands

DrawOrder (6.10.40) - sets draw order of overlapping objects through the command bar. BHatch (6.6.5) and Hatch (6.16.3) - set the draw order of hatch patterns relative to other entities through a dialog box. -BHatch (6.6.6) and -Hatch (6.16.1) - set the draw order of hatch patterns relative to other entities through the command bar.

Orthogonal mode
Controls whether cursor movement is constrained to the perpendicular. When on, the cursor can be moved horizontally or vertically only, relative to the current UCS and grid rotation angle as defined by SNAPANG.

Command Options

Coordinate Input Description Orthogonal Mode Toggles orthogonal mode:

- **On** - constrains cursor movement to the vertical and horizontal
- **Off** - moves cursor freely

Hold down the **Shift** key to turn on ortho mode temporarily; alternatively, double-click **ORTHO** on the status bar. Tablet Mode Toggles tablet mode:

- **Digitizing mode** - uses tablet for drawing input
- **Command selection mode** - uses tablet for command input

Snap/Grid Options Description Grid Mode Toggles the grid display:

- **On** - displays the grid
- **Off** - does not display the grid

To toggle the grid display, you can click GRID on the status bar. Grid Unit Specifies the spacing between grid dots:

- **X** - specifies the distance in the x direction
- **Y** - specifies the distance in the y direction

Grid Major Specifies the frequency of manor gridlines versus minor gridlines. Grid Display Specifies how the grid is displayed.

- **Display beyond limits area -** when checked, the grid displays on the entire drawing
- **Adaptive grid display** - turn on or off: **On** - (checked) the number of grid lines is adapted to the zoom **Off** - (unchecked) the grid does not display if the grid is too dense, and a warning displays in the command bar: "The grid spacing is too small to display in this view".
- **Allow subdivision below grid spacing** - when checked, extra grid lines display when zooming in closely
- **Follow dynamic UCS** - when checked, the grid displays in the XY-plane of the dynamic UCS

Grid Style Specifies whether the grid is displayed with dots or lines in model space, block editor, and layouts. Grid Axis Color Sets the color of the grid lines on the X-axis and Y-axis of the current coordinate system; default = index color 251. Grid Major Color Sets the color of the major grid lines; default = index color 252. Grid Minor Color Sets the color of the minor grid lines: default = index color 253. Grid XYZ tint Specifies whether the grid axis lines, the major grid lines and/or the minor grid lines display in the color of the X-axis (**COLORX**) and the Y-axis (**COLORY**). Snap Angle Rotates the snap and grid relative to the current UCS. Snap Base Locates the origin of the snap and grid relative to the current UCS:

- **X** - specifies the x coordinate.
- **Y** - specifies the y coordinate.

Snap Isometric Pair Specifies the current isometric plane:

- Left
- Top
- Right

To switch isoplanes in the drawing, press **Ctrl+E**. Snap Mode Toggles snap mode:

- **On** - constrains cursor movement to the snap distance
- **Off** - allows the cursor to move freely

To toggle snap mode, click **SNAP** on the status bar. Snap Style Specifies the snap style:

- **Rectangular snap** - sets snap and grid to rectangular.
- **Isometric snap** - sets snap and grid to isometric; adds the Isocircle option to the Ellipse (6.13.5) command.

Snap Type Specifies the snap type:

- **Grid snap** - restricts cursor movement to x and y snap distances.
- **Polar snap** - restricts cursor movement to angles.

Snap Unit Specifies the spacing between snap points:

- **X** - specifies the distance in the x direction
- **Y** - specifies the distance in the y direction

Adaptive Grid Step Size Sets the adaptive grid spacing in pixels for the Manipulate (6.21.3) command, so that the snap varies with the zoom level; default = 4 pixels and range to 2 to 100. Polar Distance Specifies the polar distance; effective only when Snap Type is set to Polar Snap.

Related Commands

DdSetVar (6.10.21) - changes the values of system variables through a dialog box. SetVar (6.27.28) - changes system variables through the command bar.

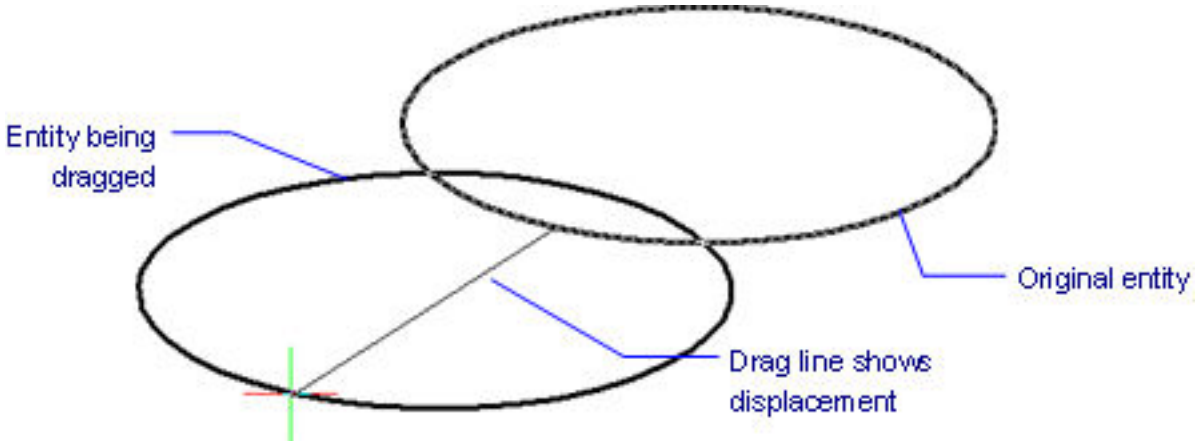
6.10.45 DragMode

(6.2981 on page 6079) Controls the appearance of objects while being dragged. The command is no longer necessary, and is kept only for compatibility. This command was useful in the early days of CAD when computers of the 1980s and early 1990s were so slow at processing vector graphics that they had difficulty updating the screen quickly enough to show objects being dragged.

Accessing the Command

command bar: **dragmode** transparent: **'dragmode : DragMode Prompts you in the command bar:** [ON/OFf/Auto] <Auto>: **(Enter an option)** (6.905)

Figure 6.905



Command Options

Option	Description
ON	Turns on dragmode; same as Auto mode.
OFF	Turns off dragmode; dragged objects and the dragline are never shown on the screen.
Auto	Turns on drag mode; dragged objects are always shown.

Related Command

Settings (6.27.25) - sets drag mode through the Drawing Display section of the Settings dialog box.

Figure 6.906

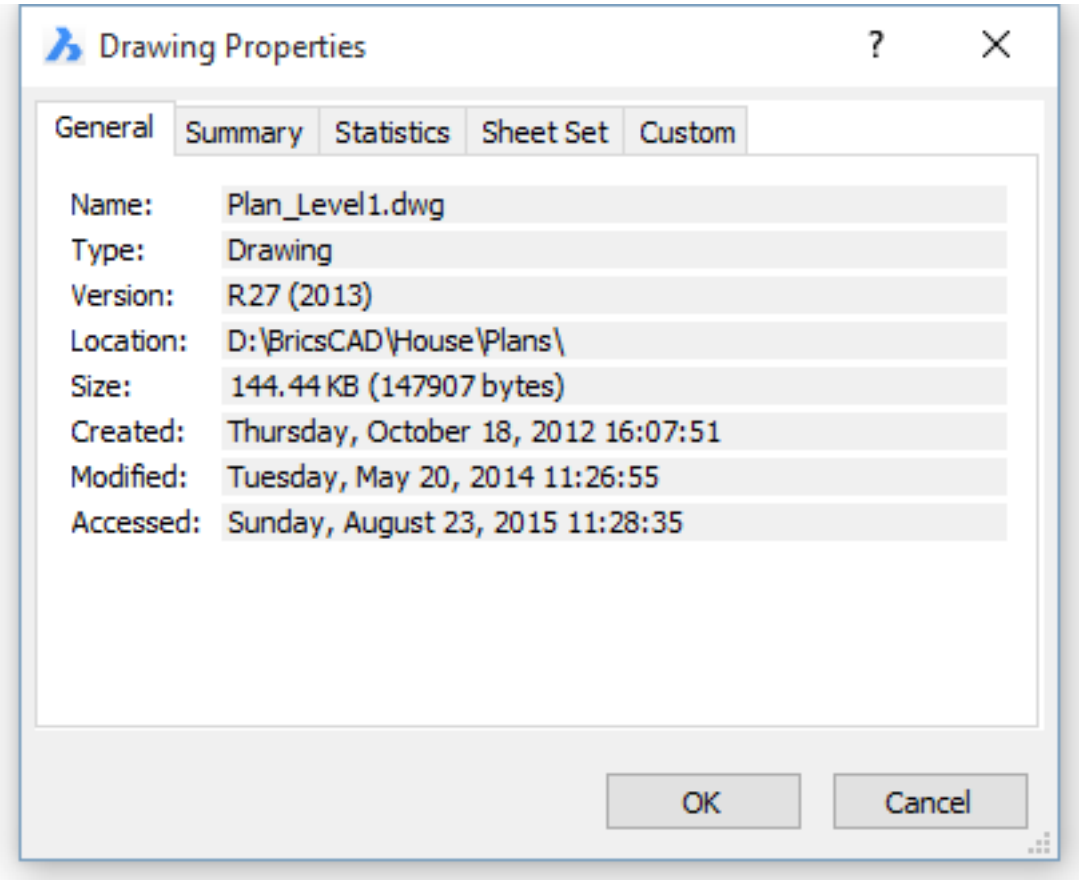
6.10.46 DwgProps

(7.3 on page 6132) Opens the Drawing Properties dialog box, showing the general information about the drawing and user-defined properties.

Accessing the Command

command bar: **dwgprops** menu bar: **File| Drawing Properties** : **DwgProps** Displays a dialog box: (6.907 on the facing page)

Figure 6.907



Command Options

Option	Description
General	Displays the general properties of the drawing, such as creation date and time.
Summary	Lets you define the summary properties of the drawing, such as subject and keywords. This data can be searched for by EDMS (engineering data management software) to find drawings in large collections. (6.908 on the next page)
Statistics	Displays statistical information about the drawing, such as when it was last saved. (6.909 on the following page)
SheetSet	Displays sheetset data when the drawing is associated with a sheetset. (6.910 on page 4171) Click **Remove Association** button to remove the association of this drawing with the sheetset collection.
Custom	Displays the custom properties of the drawing. Click the **Add** button to add a new property. (6.911 on page 4171) Click the **Edit** button to edit the selected property. Click the **Delete** button to delete the selected property.

Procedures

- To open the Drawing Properties dialog (1.19.4)
- Defining default properties (1.19.4)
- Adding custom properties (1.19.4)

Related Commands

Field (6.14.7) - inserts a field. SecurityOptions (6.27.15) - sets a password to protect a drawing SheetSet (6.27.38) - manages sheet sets. Opens the **Sheet Sets** panel. WhoHas (6.33.8) - reports the ownership of a drawing file.

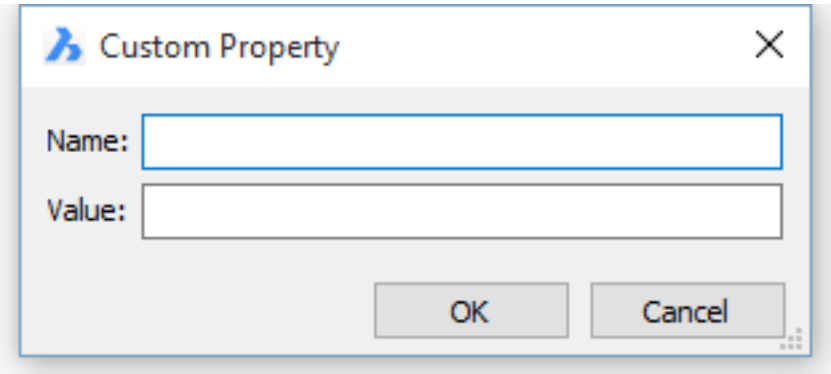

Figure 6.912

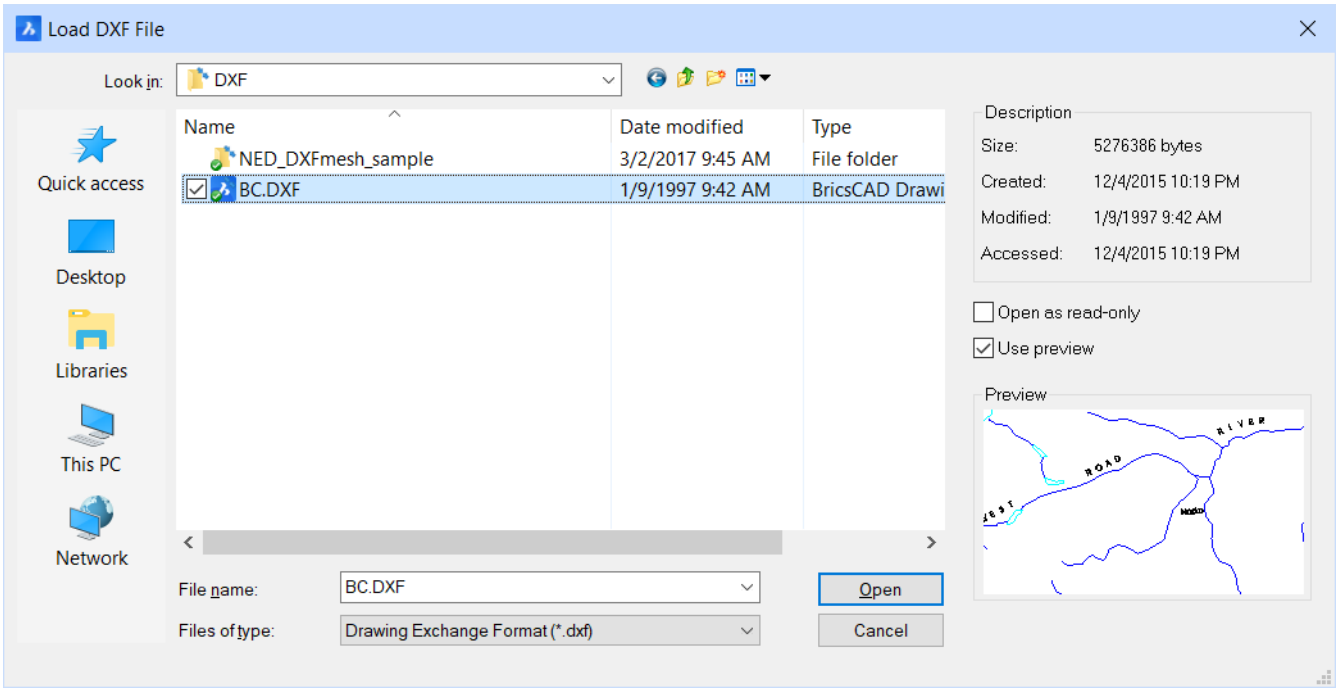
6.10.47 DxfIn

(6.2981 on page 6079) Imports DXF files (short for "drawing exchange format input"), which is the one of the earliest exchange formats.

Accessing the Command

command bar: **dxfin** : **DxfIn** Displays a dialog box: (6.913 on the facing page) Choose a DXF file, and then click **Open**. The file is opened in a new drawing.

Figure 6.913



Related Commands

Export (6.13.18) - exports drawings in a variety of formats. DxfOut (6.10.49) - exports drawings in DXF format.

Figure 6.914

6.10.48 DwfOut

(7.3 on page 6132) Saves the drawing in DWF and other formats (short for "drawing Web format output"). DwfOut is an alias for the Export (6.13.18) command.

Accessing the Command

command bar: **dwfout** alias: **Export** menu bar: **File | Export** : **DwfOut** See the Export (6.13.18) command. DWF files can be viewed with the DesignReview software, available free from www.autodesk.com/designreview.

Related Commands

Export (6.13.18) - exports drawings in a variety of formats. DxfOut (6.10.49) - exports drawings in DXF format.

Figure 6.915

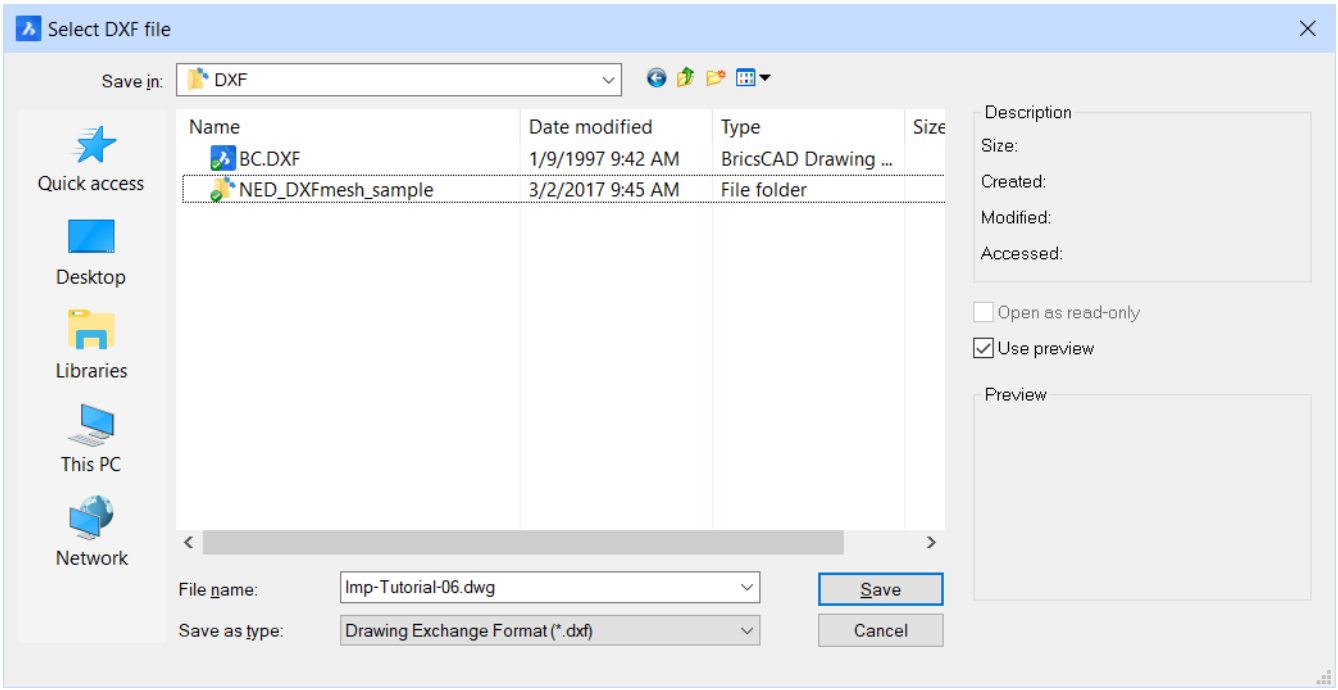
6.10.49 DxfOut

(6.2981 on page 6079) Exports selected entities from the current drawing in DXF format (short for "drawing interchange format output").

Accessing the Command

command bar: **dxfout** alias: **dx** : **DxfOut** Displays a dialog box: (6.916 on the next page) Enter a file name, and then click **Save**. **Prompts you in the command bar:** Enter decimal places of accuracy (0-16) [Entities/Binary/Version] <6>: **(Enter an option)**

Figure 6.916



Command Options

Option	Description
Enter decimal places of accuracy(0-16)	Specifies the accuracy of real numbers in the DXF file; default = 6. **(enter a number between 0 (no decimal places) and 16 or press Enter to accept the default value.)** Note: Some CNC (computerized numerical control) machines require 4 decimal places in DXF files.
Entities	Select the entities you want exported to the DXF file; prompts you: **Select entities to export - (choose the entities to export; press Ctrl+A to select all entities in the drawing)**
Binary	Exports the drawing in binary DXF format; otherwise, the DXF file is in ASCII (text) format.
Version	Specifies the DXF version number in which to save the drawing; prompts you: **File version R2.5/R2.6/R9/R10/R11/R12/R13/R14/A2000/A2004/A2007 -(enter a version number.)** Caution: exporting to an older version can cause some entities or properties to be lost.

Related Commands

Export (6.13.18) - exports drawings in a variety of formats. DwfOut (6.10.48) - exports drawings in DWF format.

Figure 6.917

6.10.50 DwgCodePage

(6.2981 on page 6079) Changes the language code-page for text in drawings.

Accessing the Command

command bar: **dwgcodepage** transparent: **'dwgcodepage** : **DwgCodePage Prompts you in the command bar:** This command sets DWGCODEPAGE to a new value. Characters will not be converted to unicode. ?=List/New code page <ANSI_1252> : **(Enter a code page number, or type ?)** Code pages included with BricsCAD: For Unix: 0: undefined 1: ascii $20-$7F,%%c,%%d,%%p Only 2: iso8859_1 Western Europe (Unix) $20-$FF,%%c,%%d,%%p 3: iso8859_2 Central Europe (Unix) 4: iso8859_3 Eastern Europe (Unix) 5: iso8859_4 Baltic (Unix) 6: iso8859_5 Cyrillic (Unix) 7: iso8859_6 Arabic (Unix) 8: iso8859_7 Greek (Unix) 9: iso8859_8 Hebrew (Unix) 10: iso8859_9 Turkish (Unix)

Command Options

Option	Description
? = List	Lists code pages available in the program.
New Code Page	Specifies the number of another code page.

Figure 6.918

6.10.51 DwgCompare

(6.2981 on page 6079) Compares a selected drawing with the current drawing, showing the differences between the two.

Accessing the Command

command bar: **dwgcompare** menu bar: **Tools | DWG Compare** toolbar: **Compare |**  : **DwgCompare Prompts you in the command bar:** CMPDIFFLIMIT = 10000000. Select the file to compare with or [Limit]: **(Press Enter to open a File dialog box or enter the Limit option)** A file dialog box is displayed: (6.919 on the facing page) Select a drawing with which to compare the current drawing, then click the **Open** button. The command looks for differences in the same entities between the current drawings and the drawing opened for comparison. When no differences are found, the program reports: **No differences found.** When the program finds differences, entities are shown in these colors:

- Entities added - green (color is set by variable CMPCLRNEW)
- Entities removed - red (set by variable CMPCLRMISS)
- Entities changed in the original drawing - gray (by variable CMPCLRMOD1)
- Entities changed in the comparison drawing - yellow (variable CMPCLRMOD2)

The colors are set by the Settings dialog box; search for variables that begin with CMPCLR. As well, you can see a list of differences in the Structure (6.27.54) panel. Open it with the **StructurePanel** command, and ensure the Default CST configuration file is loaded (see Load a configuration file (1.32.15).) Expand the **Comparison** node in the Structure panel: (6.920 on the next page) You must run the **ENDCOMPARE (6.13.6)** command to unload the comparison drawing.

Figure 6.919

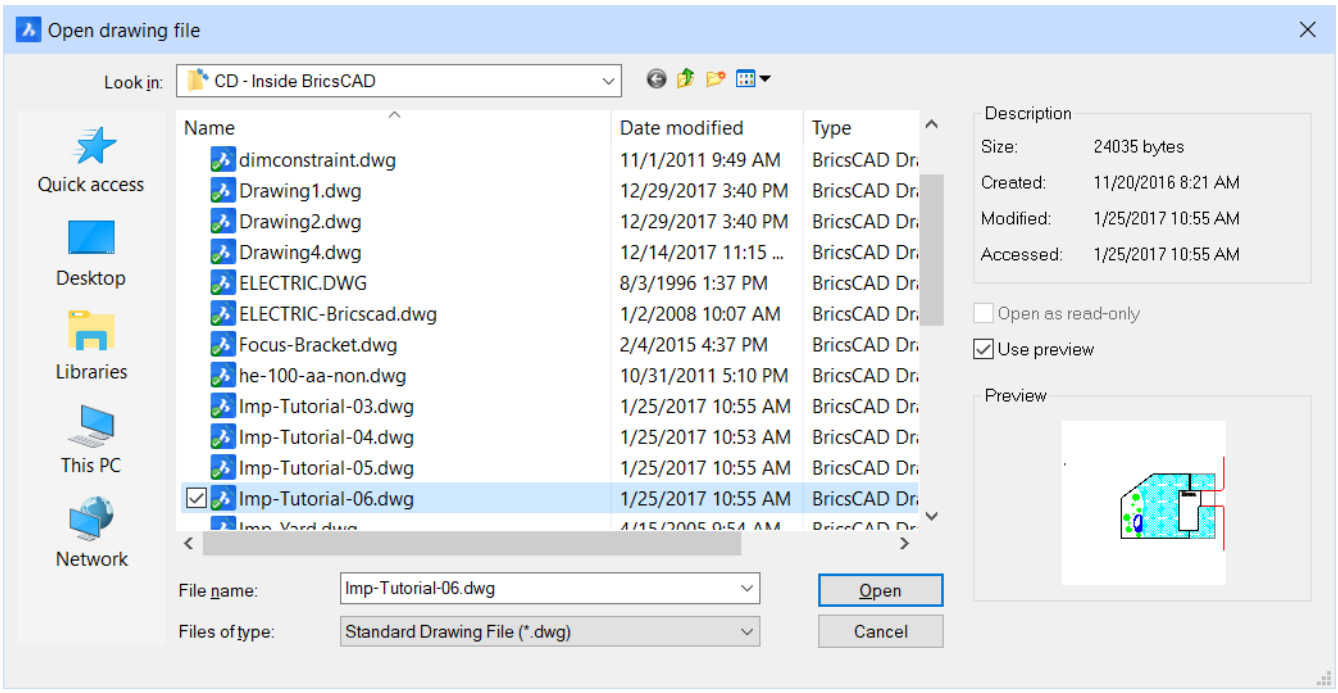

Figure 6.920

Command Options

Option	Description
Limit	Sets the limit on how many entities to compare in the drawings. Prompts you: **New value for CMPDIFFLIMIT <10000000>** - **(enter a value between 1 and 10000000 (ten million), or press Enter to accept the current value.)** The current value is held in the **CMPDIFFLIMIT** variable; initial value is 10000000

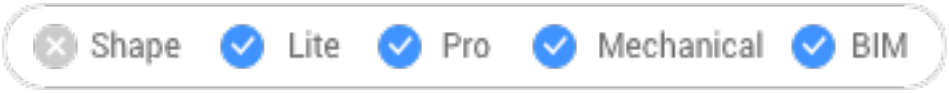
Procedures

- Setting the comparison system variables (1.19.10)
- Executing a comparison session (1.19.10)
- Analyzing the comparison in the Structure panel (1.19.10)
- Merging the compared drawings (1.19.10)

Related Commands

3dCompare (6.3.3) - executes a geometrical comparison between solids and surfaces in 2 drawing files. The result is shown in a new drawing and reported in the Mechanical Browser panel. EndCompare (6.13.6) - exits a drawing comparison setting, started by the DwgCompare command. KeepMe (6.19.1) - allows to merge the compared drawings visually. StructurePanel (6.27.54) - opens the Structure panel.

Figure 6.921



6.10.52 DetailsPanelOpen

(6.2947 on page 6049) Opens the Details panel.

Accessing the Command

Keyboard: **detailspanelopen : detailspanelopen** The details panel displays. No command prompts.

Command Options

No command options.

Procedures

Working in the Details panel (2.9.9) Managing dockable panels (1.15.7)

Related Commands

DetailsPanelClose (6.10.44) - closes the Details panel.

Figure 6.922

6.10.53 DView

(6.2981 on page 6079) Changes the 3D viewpoint interactively and turns on perspective mode (short for "dynamic view").

Accessing the Command

 command bar: **dview** alias: **dv** menu bar: **View | Define View** toolbar: **View |**  ribbon: **View | View | Viewpoint | Define View** : **DView Prompts you in the command bar:** Select entities or <use DVIEWBLOCK>: **(Press Enter to display the DVIEWBLOCK, or select entities)** DView: CAmera/ TArget/ TWist/ Distance/ POints/ CLip/ Off/ Hide/ PAn/ Zoom/ Undo/<eXit>: **(Enter an option, or press Enter to exit the command)**

Command Options

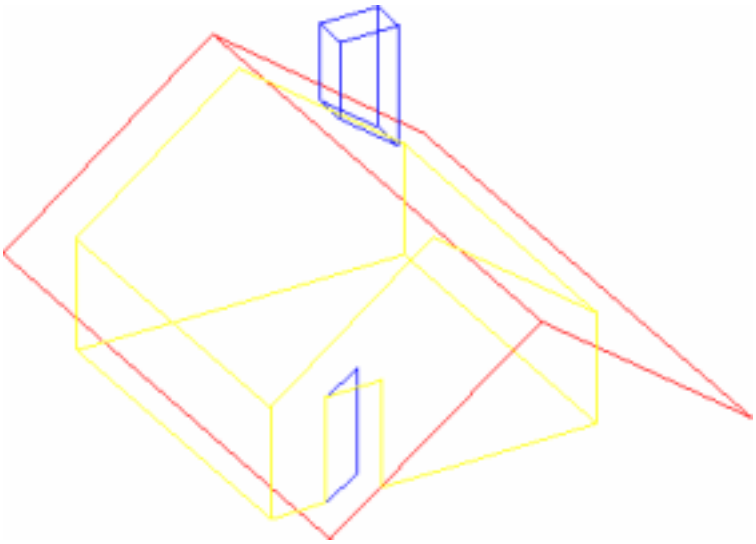
Option	Description
Use DVIEWBLOCK	Displays a built-in 3D block: (6.923 on the facing page)
Select Entities To See In Preview	Select one or more entities to be previewed during this command. This command first appeared when computers were slow, and so could not interactively redraw many vector entities.
CAmera	Specifies the camera (eye) location; prompts you: **Specify camera location, or enter angle from XY plane, or [Toggle (angle in)] <current angle>** - **(enter an option)**: • Move the mouse to specify the camera location, click to confirm • Enter a value for the angle from the XY plane • Press **T** to toggle to angle in XY plane
TArget	Specifies the target (look at) location; prompts you: **Specify camera location, or enter angle from XY plane, or [Toggle (angle in)] <current angle>** - **(enter an option)**: • Move the mouse to specify the target location, and then click to confirm • Enter a value for the angle from the XY plane • Press **T** to toggle to angle in XY plane
TWist	Sets the twist (view rotation about Z axis) angle; prompts you: **New view twist <current angle>** - **(move the mouse to specify the camera location, click to confirm; or specify the angle.)**
Distance	Specifies the camera to target distance; prompts you: **New camera-to-target distance <current distance>** - **(move the mouse to specify the camera to target distance, click to confirm; or key in the distance.)** This option turns on perspective mode.

POints	Specifies the camera and target location; prompts you: 1. **Enter target point - (specify the point using the mouse, or enter x,y,z coordinates)** 2. **Enter camera point - (specify the point using the mouse, or enter x,y,z coordinates)**
CLip	Sets the clipping distances, which cut off the front and back parts of the model; prompts you: **Enter clipping option: Front/Back/<Off> - (type F, B, or O.)**
Off	Turns off perspective mode. Use the Distance option to turn perspective mode on. The **Perspective** system variable toggles the perspective property of a view.
Hide	Removes hidden lines from the model.
PAn	Interactively pans around the drawing; prompts you: 1. **Displacement base point - (specify the first point to pan from, or enter x,y,z coordinates.)** 2. **Second point - (specify another point to pan towards, or enter x,y,z coordinates.)**
Zoom	Zooms in and out interactively; prompts you: **View size - (enter a number to change the zoom level)**
Undo	Undoes the last view change
eXit	Exits the command

Related Commands

Camera (6.9.1) - creates perspective views. DdVPoint (6.10.23) - changes the 3D viewpoint of the drawing through a dialog box. VPoint (6.31.21) - changes the 3D viewpoint of the drawing through the command bar. RtRot (6.26.37) - rotates 3D drawings in real-time.

Figure 6.923



6.11 Dimensions

6.11.1 Dim

(6.2981 on page 6079) Creates multiple dimension types in a single workflow. Dimensions are created on the layer which is specified by the DIMLAYER system variable.

Figure 6.924

Accessing the Command

keyboard: dim **alias:** dimension **menu**: Dimension | Dimension **toolbar**: Dimensions | **ribbon**: Annotate | Dimensions | Dimension : **dim Prompts you:** Dimensioning command [HORizontal/VErtical/ALigned/ANgular/Leader/OBlique dimensions/variable STatus/OVerride/SEttings.../LAyer]: Choose an option or do the following:

1. Hover over an entity, then click when the entity highlights. Depending on the entity under the cursor, an appropriate dimension entity displays dynamically.
2. Click to position the dimension entity.
3. Repeat the previous steps to create more dimension entities.

Command Options

Dimension Options	**Description**
HORizontal	Places horizontal linear dimensions; see DimLinear (6.11.12).
VErtical	Places vertical dimensions; see DimLinear (6.11.12).
ALigned	Places linear dimensions that are aligned to entities; see DimAligned (6.11.3).
ANgular	Places angular dimensions that measure angles; see DimAngular (6.11.4).
Leader	Places leaders; see DimLeader (6.11.13) command.
CEnter	Places marks at the centers of circles and arcs; see DimCenter (6.11.7).
Diameter	Places diameter dimensions on circles and arcs; see DimDiameter (6.11.9).
RAdius	Places radial dimensions on circles and arcs; see DimRadius (6.11.16).
Baseline	Places multiple linear and angular dimensions from the same base point; see DimBaseline (6.11.6).
COntinue	Continues linear and angular dimensions from the last endpoint; see DimContinue (6.11.8).
ORdinate	Places x and y ordinate measurements from an origin point; see DimOrdinate (6.11.14).
Dimension Editing Options	**Description**
OBlique	Changes the angle of extension lines; see DimEdit (6.11.11).
ROtated	Places linear dimensions at an angle; see DimLinear (6.11.12).
Position	Repositions the dimension text; see DimTEdit (6.11.23).
DIStribute	Spaces selected dimensions equally; prompts you: **Specify option to distribute dimensions** [Equal/Offset] <Offset> - **enter an option**: • Equal - prompts you Select dimensions to distribute - select one or more dimensions, and then press Enter • Offset - prompts you 1. Select base dimension or [Offset] - pick the dimension from which the other ones will be distributed, or type o to specify the offset distance 2. Select dimensions to distribute - select one or more dimensions to be spaced

UPdate dimensions	Applies the current dimension style to a selection of dimension entities; see **Apply** option of -DimStyle (6.11.21).
variable STatus	Lists the status of all dimension variables in the Prompt History (6.29.16) window.
OVerride	Overrides the values of the current dimension style; see DimOverride (6.11.15).
SEttings...	Displays the Drawing Explorer | Dimension Styles dialog box; see DimStyle (6.11.19).
LAyer	Sets a different layer for the default layer on which dimensions are drawing; prompts you: **New value for DIMLAYER, or . for use current /<"use current">** - enter an option: • New value for DIMLAYER - enter a new name for the layer • . for use current - use the current layer

Related Commands

DimStyle (6.11.19) - creates and edits dimension styles through the Drawing Explorer. -DimStyle (6.11.21) - saves and applies dimensions styles at the command line. Style (6.27.55) - sets the text style used by dimensions. DimOverride (6.11.15) - overrides the values of the current dimension style. DimLinear (6.11.12) - places linear dimensions in drawings: horizontal, vertical, and rotated. DimAligned (6.11.3) - places aligned dimensions. DimArc (6.11.5) - Places arc length dimensions. DimBaseline (6.11.6) - places additional dimensions from a common baseline. DimContinue (6.11.8) - continues dimensions. DimDiameter (6.11.9) - places diameter dimensions. DimRadius (6.11.16) - places radius dimensions. DimCenter (6.11.7) - places center marks. DimAngular (6.11.4) - places angular dimensions. DimLeader (6.11.13) and Leader (6.20.21) - places leaders with text, blocks, entities, or tolerances. DimOrdinate (6.11.14) - places x and y ordinate dimensions. Tolerance (6.29.26) - places tolerance tags in drawings. DimEdit (6.11.11) - changes the wording and angle of dimension text; changes the angle of extension lines. DimTEdit (6.11.23) - changes the position of dimension text. DdEdit (6.10.13) - edits dimension text. Properties (6.24.54) - edits the properties of dimensions through a palette.

Figure 6.925

6.11.2 Dim1

(6.2981 on page 6079) Executes a single dimension command at the 'Dimensioning command:' prompt. Dimensions are created on the layer which is specified by the DIMLAYER system variable.

Accessing the Command

command bar: **dim1** : **dim1 Prompts you in the command bar:** Dimensioning command [HORizontal/VErtical/ALigned/ANgula
dimensions/variable STatus/OVerride/SEttings.../LAyer]: **(Enter a dimension command)**

Command Options

Dimension Drawing Options	Description
ALigned	Places linear dimensions that are aligned to entities; see **DimAligned (6.11.3)**.
ANgular	Places angular dimensions that measure angles; see **DimAngular (6.11.4)**.
Baseline	Places multiple linear and angular dimensions from the same base point; see **DimBaseline (6.11.6)**.
CEnter	Places marks at the centers of circles and arcs; see **DimCenter (6.11.7)**.
COntinue	Continues linear and angular dimensions from the last endpoint; see **DimContinue (6.11.8)**.
Diameter	Places diameter dimensions on circles and arcs; see **DimDiameter (6.11.9)**.
HORizontal	Places horizontal linear dimensions; see **DimLinear (6.11.12)**.
Leader	Places leaders; see **DimLeader (6.11.13)** command.
ORdinate	Places x and y ordinate measurements from an origin point; see **DimOrdinate (6.11.14)**.
RAdius	Places radial dimensions on circles and arcs; see **DimRadius (6.11.16)**.
ROtated	Places linear dimensions at an angle; see **DimLinear (6.11.12)**.
VErtical	Places vertical dimensions; see **DimLinear (6.11.12)**.
Dimension Editing Options	
DIStribute	Spaces selected dimensions equally; prompts you: **Specify option to distribute dimensions [Equal/Offset] <Offset>** - enter an option: • Equal - prompts you Select dimensions to distribute - select one or more dimensions, and then press Enter • Offset - prompts you 1. Select base dimension or [Offset] - pick the dimension from which the other ones will be distributed, or type o to specify the offset distance 2. Select dimensions to distribute - select one or more dimensions to be spaced

LAyer	Sets a different layer for the default layer on which dimensions are drawing; prompts you: **New value for DIMLAYER, or . for use current /<"use current">** - enter an option: • New value for DIMLAYER - enter a new name for the layer • . for use current - use the current layer
Oblique	Changes the angle of extension lines; see **DimEdit (6.11.11)**.
POsition	Moves and reorients dimension text; see **DimTEdit (6.11.23)**.
Dimensioning Utility Options	
OVerride	Overrides settings of dimension variables; see **DimOverride (6.11.15)**.
Settings	Displays the Dimension Style section of the Drawing Explorer; see **DimStyle (6.11.21)**
variable STatus	Reports the current values of dimension variables, including those overriding the current style; see **-DimStyle (6.11.21)**.

Related Commands

DimStyle (6.11.19) - creates and edits dimension styles through the Drawing Explorer. -DimStyle (6.11.21) - saves and applies dimensions styles at the command line. Style (6.27.55) - sets the text style used by dimensions. DimOverride (6.11.15) - overrides the values of the current dimension style. DimLinear (6.11.12) - places linear dimensions in drawings: horizontal, vertical, and rotated. DimAligned (6.11.3) - places aligned dimensions. DimArc (6.11.5) - Places arc length dimensions. DimRadius (6.11.16) - places radius dimensions. DimCenter (6.11.7) - places center marks. DimAngular (6.11.4) - places angular dimensions. DimLeader (6.11.13) and Leader (6.20.21) - places leaders with text, blocks, entities, or tolerances. DimOrdinate (6.11.14) - places x and y ordinate dimensions. Tolerance (6.29.26) - places tolerance tags in drawings. DimEdit (6.11.11) - changes the wording and angle of dimension text; changes the angle of extension lines. DimTEdit (6.11.23) - changes the position of dimension text. DdEdit (6.10.13) - edits dimension text. Properties (6.24.54) - edits the properties of dimensions through a palette.

Figure 6.926

Shape Classic Pro Platinum Mechanical BIM

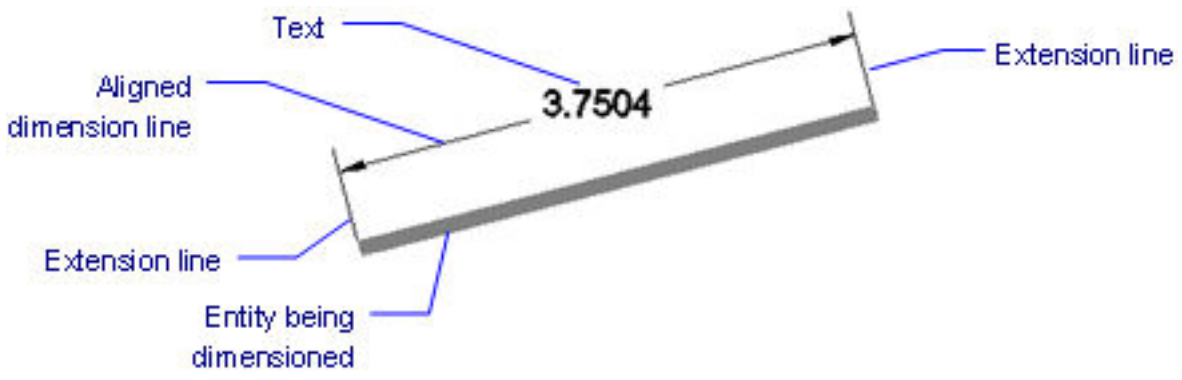
6.11.3 DimAligned

(6.2981 on page 6079) Draws dimensions parallel to (aligned with) lines and polyline segments. it also works with polyarcs, arcs, and circles, but dimensions their diameters. Dimensions are created on the layer which is specified by the DIMLAYER system variable.

Accessing the Command

 command bar: **dimaligned** alias: **dal, dimali** menu bar: **Dimension | Aligned** toolbar: **Dimensions |**  ribbon: **Draw | Dimensions | Aligned**
: **dimaligned Prompts you in the command bar:** Origin of first extension line <Select entity>: **(Pick a point, or else press Enter to select an entity to dimension without specifying extension lines)** Origin of second extension line: **(Pick another point)** Location of dimension line [Angle/Text]: **(Pick a point, or else choose an option)** (6.927)

Figure 6.927



Command Options

Option	Description
Select entity	Dimensions the length of the selected entity. Prompts you: 1. **Select entity to dimension - select an entity. Lines, polyline segments, arcs, circles and edges of 3D solids in the XY-plane of the current UCS are accepted.** 2. **Location of dimension line [Angle/Text] - pick a point or choose an option.**
Angle	Specifies the angle of the text; useful for keeping text horizontal with inclined dimension lines. Prompts you: **Angle of dimension text - type a value**.
Text	Specifies the text; useful for overriding the default measurement generated by the program. Prompts you: **Dimension text <xx.xx> - type a text or press Enter to accept the default text**. You can use two angle brackets -- like these **<>** ones -- to located the program-generated dimension value in amongst other text on the dimension text, such as "Length of line = <>".

Procedures

- To create an aligned linear dimension (1.29.7)
- To create a horizontal or vertical linear dimension (1.29.7)
- To create a rotated linear dimension (1.29.7)

Grips Editing

Aligned dimensions can be edited directly through grips:

1. Select the aligned dimension. Notice the grips.
2. Drag the grips to perform the following actions:
    - Drag either grip on the dimension line to move the dimension line.
    - Drag the grip on the text to relocate it.
    - Drag either grip on extension lines to rotate and stretch the dimension.

(6.928 on the next page) Move the dimension line by dragging either grip near the arrowhead: (6.929 on the facing page) Relocate the text and dimension line by dragging the grip centered on the dimension line (the leader is added automatically, if required): (6.930 on the next page) Rotate and stretch the dimension by dragging either grip located at the base of the extension lines: (6.931 on page 4192)

Figure 6.928

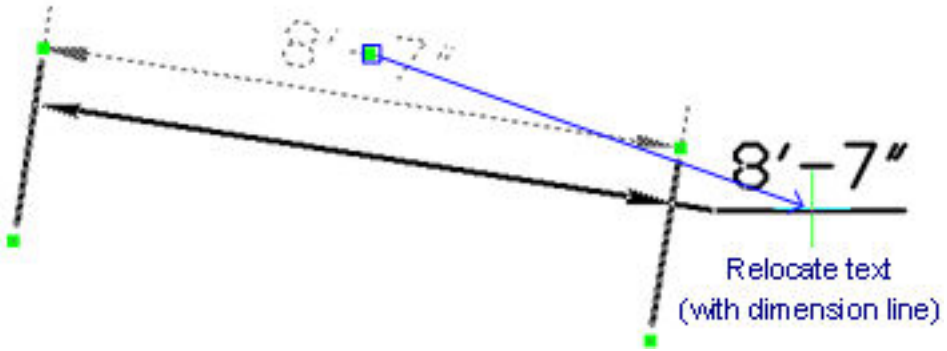

Figure 6.931

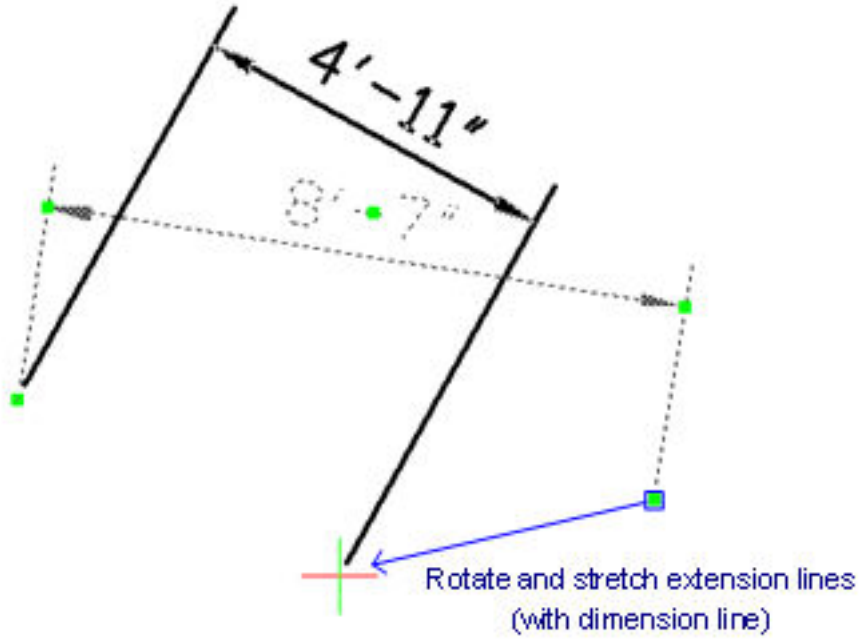

Related Commands

DimArc (6.11.5) - Places arc length dimensions. DimLinear (6.11.12) - places linear dimensions in drawings: horizontal, vertical, and rotated. DimBaseline (6.11.6) - places additional dimensions from a common baseline. DimContinue (6.11.8) - continues dimensions. DimDiameter (6.11.9) - places diameter dimensions. DimRadius (6.11.16) - places radius dimensions. DimCenter (6.11.7) - places center marks. DimAngular (6.11.4) - places angular dimensions. DimLeader (6.11.13) and Leader (6.20.21) - places leaders with text, blocks, entities, or tolerances. DimOrdinate (6.11.14) - places x and y ordinate dimensions. Tolerance (6.29.26) - places tolerance tags in drawings. Dim (6.11.1) - places and edits dimensions at the 'Dimensioning command:' prompt. Dim1 (6.11.2) - places and edits a single dimension at the 'Dimensioning command:' prompt. AiDimFlipArrow (6.5.3) - flips individual arrows of a dimension. AiDimPrec (**??**) - changes the displayed precision of existing dimensions. DimEdit (6.11.11) - changes the wording and angle of dimension text; changes the angle of extension lines. DimTEdit (6.11.23) - changes the position of dimension text. DdEdit (6.10.13) - edits dimension text. Properties (6.24.54) - edits the properties of dimensions through a palette. DimStyle (6.11.19) - creates and edits dimension styles through the Drawing Explorer. -DimStyle (6.11.21) - saves and applies dimensions styles at the command line. Style (6.27.55) - sets the text style used by dimensions. DimOverride (6.11.15) - overrides the values of the current dimension style.

Figure 6.932

6.11.4 DimAngular

(6.2981 on page 6079) Dimensions the angle between two lines or two points. Also find the angle of arcs, circles, and polyarcs. Dimensions are created on the layer which is specified by the DIMLAYER system variable.

Accessing the Command

 command bar: **dimangular** alias: **dan, dimang** menu bar: **Dimension | Angular** toolbar: **Dimensions |**  ribbon: **Draw | Dimensions | Circle | Angular** : **dimangular Prompts you in the command bar:** Select line, arc, or circle <Press ENTER to specify angle>: **(Select a line, polyline segment, arc, polyarc, or circle; or else press Enter to specify the angle by three points)**

Command Options

Option	Description
Select line, arc, or circle	Dimensions the angle between two line segments, or of arcs and circles. The prompt you see depends on the entity you selected: Picking a line or polyline segment prompts you: 1. **Other line for angular dimension - pick another line segment** 2. **Location of dimension arc [Angle/Text] - pick a point or enter an option** Picking a circle prompts you: (6.934 on page 4195) 1. **Other side of angle - pick another point** 2. **Location of dimension arc [Angle/Text] - pick a point or enter an option** Picking an arc or polyarc prompts you: (6.935 on page 4196) 1. **Angle/Text/<Location of dimension arc> - pick a point to locate the dimension arc, or else enter an option:** • **Angle** specifies the angle of the dimension text. • **Text** specifies different text for the dimension line. The program end the command by reporting the angle: **Dimension text: = 242**

Press ENTER to Specify Angle	Specifies the angular dimension by three points. Prompts you: (6.936 on page 4196) 1. **Vertex of Angle - pick a point to specify the first point, which is the vertex of the angle** 2. **First Side of Angle - pick a point to specify the second point, which is one leg of the angle** 3. **Other Side of Angle - pick a point to specify the third point, which is the second leg of the angle** 4. **Location of Dimension Arc - pick a point to locate the position of the dimension arc**

Procedures

- To dimension an angle between two lines (1.29.8)
- To dimension an angle encompassed by an arc (1.29.8)
- To create an angular dimension defined by a vertex and two endpoints (1.29.8)

Grips Editing

Angular dimensions can be edited directly through grips:

1. Select the angular dimension. Notice the grips.
2. Drag the grips to perform the following actions:
   - Drag the grip on the text to relocate it.
   - Drag the grip on the dimension arc to move it.
   - Drag either grip on extension lines to move and stretch the dimension.
   - Drag the grip at the vertex to move it.

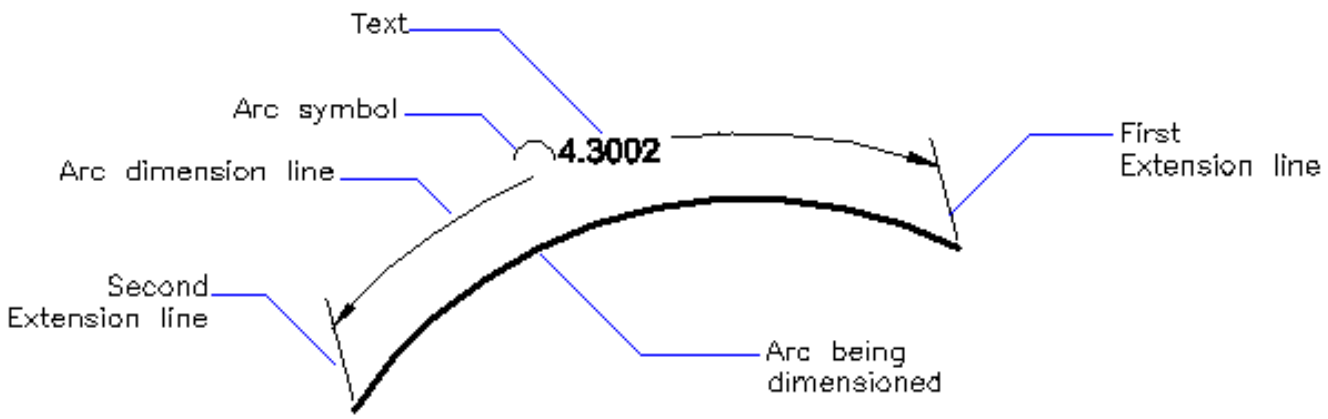
6.11.5 DimArc

(6.2981 on page 6079) Places dimensions that measure the lengths of arcs and polyarcs. Dimensions are created on the layer which is specified by the DIMLAYER system variable.

Accessing the Command

command bar: **dimarc** menu bar: **Dimension | Arc** toolbar: **Dimensions |** ribbon: **Draw | Dimensions | Circle | Arc** : **dimarc Prompts you in the command bar:** Select arc or polyline arc segment: **(Click an arc or polyline arc segment)** Location of dimension arc [Angle/Text/Partial/Leader]: **(Pick a point to locate the dimension arc away from the entity; or else choose an option)** (6.938)

Figure 6.938



Command Options

Option	Description
Select arc or polyline arc segment	Select one entity, either an arc or a polyarc.
Angle	Specifies the angle of the text. Prompts you: **Angle of dimension text - enter the rotation angle of the text, or else pick two points**
Text	Specifies the text; useful for overriding the default measurement generated by the program. Prompts you: **Dimension text - enter the replacement text**
Partial	Dimensions part of the selected arc or polyline arc segment. Prompts you: 1. **Specify first point for arc length dimension - pick a point to position the first extension line** 2. **Specify second point for arc length dimension - pick another point on the arc or polyline segment to position the second extension line** It can be helpful to use entity snaps, such as **NEArest** or **MIDpoint** to snap right on the arc.
Leader	Adds a leader, which points from the dimension text to the arc. Prompts you: **Angle/Text/Partial/No leader/<Location of dimension arc> - pick a point to locate the dimension arc, or else choose an option**
No leader	Removes the leader; this option works only during the command, after you chose the Leader option. Returns to the previous prompt: **Angle/Text/Partial/Leader/<Location of dimension arc> - Pick a point to locate the dimension arc or choose an option.**

Procedures

- To create an arc length dimension (1.29.7)

Grips Editing

Arc length dimensions can be edited directly through grips:

1. Select the arc length dimension. Notice the grips.
2. Drag the grips to perform the following actions:

(6.939 on the facing page)

Figure 6.940

6.11.6 DimBaseline

(6.2981 on page 6079) Places multiple linear and angular dimensions, all starting at the same base point of an existing dimension. This command works only when at least one other dimension already exists in the drawing. Dimensions are created on the layer which is specified by the DIMLAYER system variable.

Accessing the Command

command bar: **dimbaseline** aliases: **dba, dimbase** menu bar: **Dimension | Baseline** toolbar: **Dimensions |**  ribbon: **Draw | Dimensions | Continue | Baseline** : **dimbaseline Prompts you in the command bar.** Baseline: ENTER to select starting dimension/<Origin of next extension line>: **(Pick a point to locate the second extension line, or else press Enter to pick a new starting point)** Dimension text = xx.xx Baseline: ENTER to select starting dimension/<Origin of next extension line>: **(Pick another point, or else press Esc to exit the command)** Baseline dimensions applied to a linear dimension: (6.941 on the facing page) Baseline dimensions applies to an angular dimension: (6.942 on the next page)

Figure 6.941

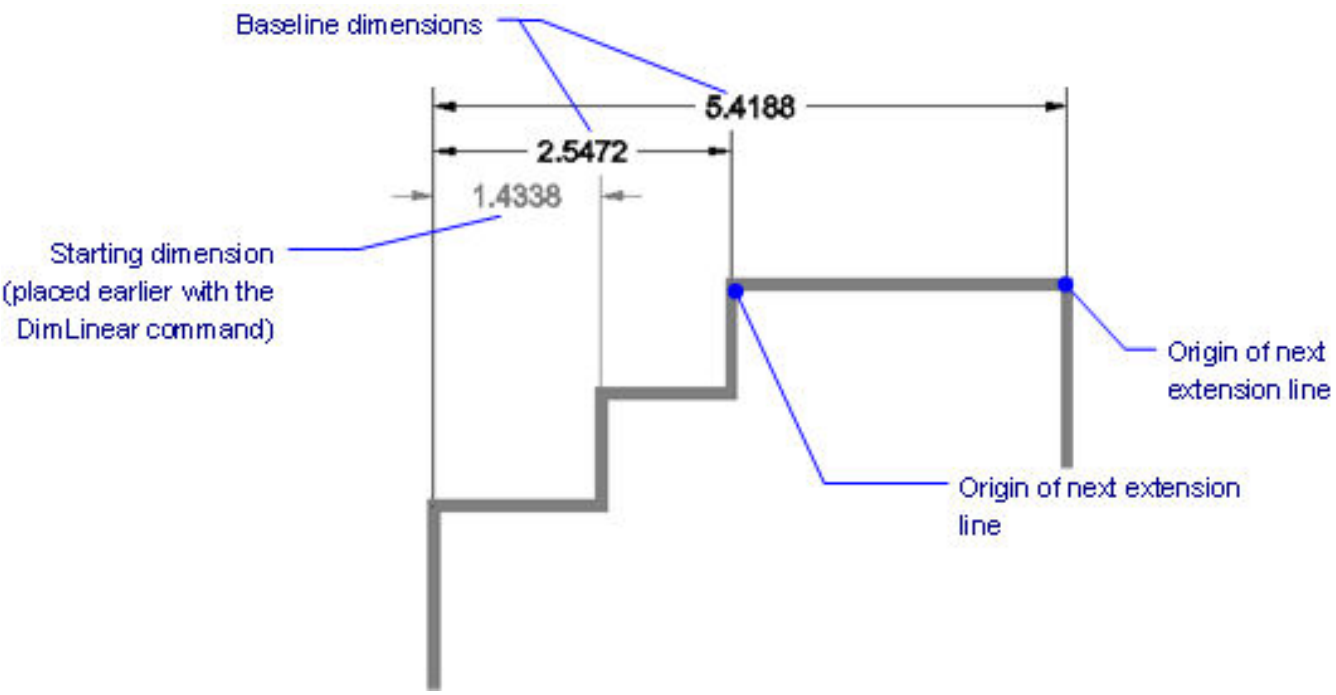

Figure 6.942

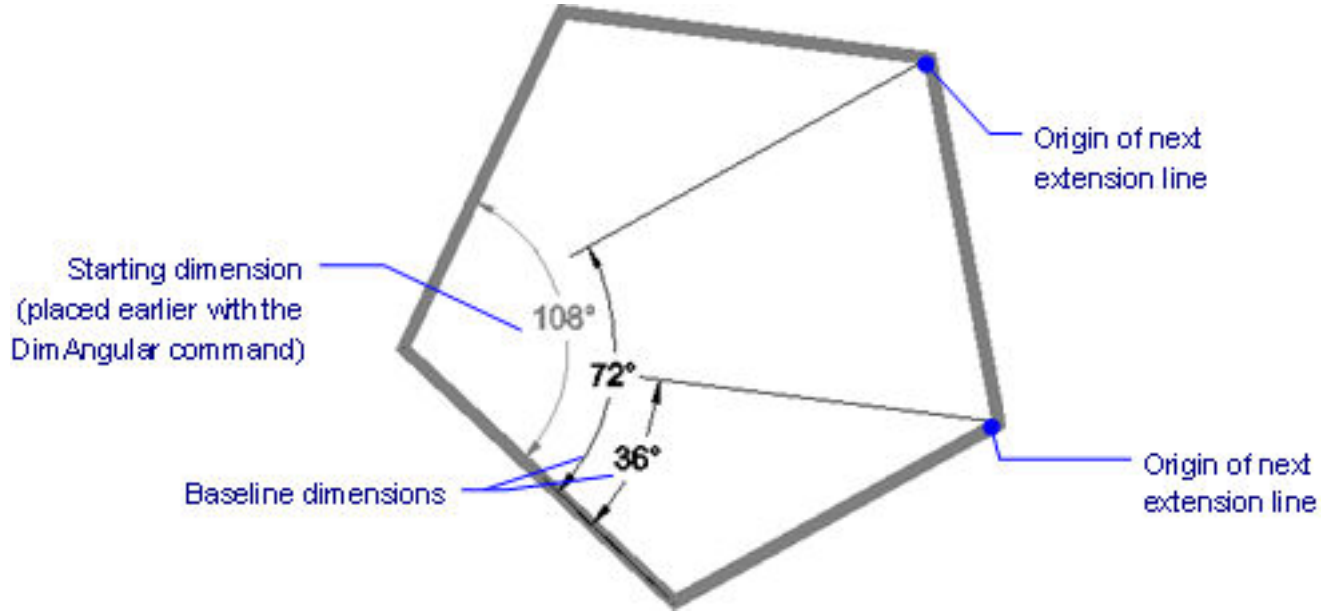

Command Options

Option	Description
ENTER to Select Starting Dimension	Chooses the linear or angular dimension from which to continue dimensioning.
Origin of Next Extension Line	Locates the endpoint of the second extension line; the first extension line is co-located with the first extension of the starting dimension. The command repeats this prompt until you press Esc.

Procedures

- To create baseline dimensions (1.29.7)

Grips Editing

Baseline dimensions can be edited directly through grips:

1. Select the baseline dimension. Notice the grips.
2. Drag the grips to perform the following actions:
   - Drag either grip on the dimension line to move the dimension line; the extension lines change length.
   - Drag the grip on the text to relocate it; the dimension line moves along, and a leader line is added, if required.
   - Drag either grip on the extension lines to move the extension line; the dimension line changes length.

Style (6.27.55) - sets the text style used by dimensions. DimOverride (6.11.15) - overrides the values of the current dimension style.

Figure 6.946

6.11.8 DimContinue

(6.2981 on page 6079) Places a chain of dimensions by continuing linear or angular dimensions from the endpoint of the previous dimension. Dimensions are created on the layer which is specified by the DIMLAYER system variable.

Accessing the Command

command bar: **dimcontinue** aliases: **dco, dimcont** menu bar: **Dimension | Continue** toolbar: **Dimensions |** ribbon: **Draw | Dimensions | Continue** : **DimContinue Prompts you in the command bar:** Continue: ENTER to select starting dimension/<Origin or next extension line>: **(Choose a point for the endpoint of the second extension line, or press Enter to start at another dimension)** Dimension text = xx.xx Continue: ENTER to select starting dimension/<Origin or next extension line>: **(Choose another point, or press Enter to exit command)** (6.947 on the facing page) Continue dimensions applied to a linear dimension (6.948 on the next page) Continue dimensions applies to an angular dimension

Figure 6.947

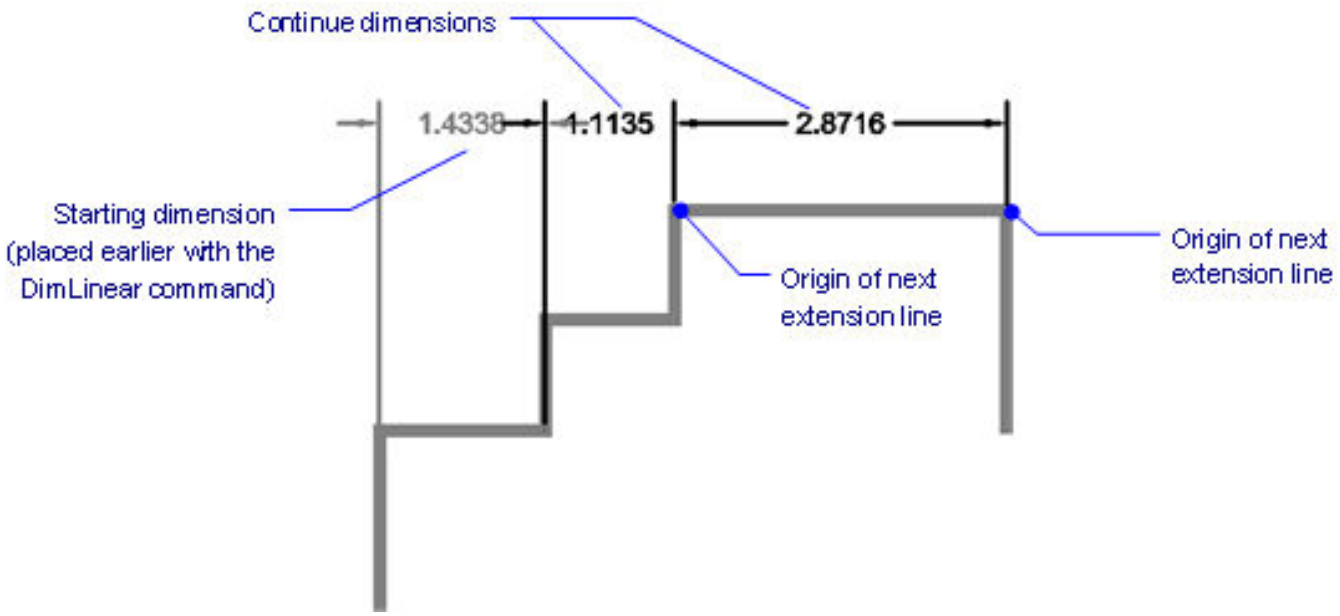

Figure 6.948

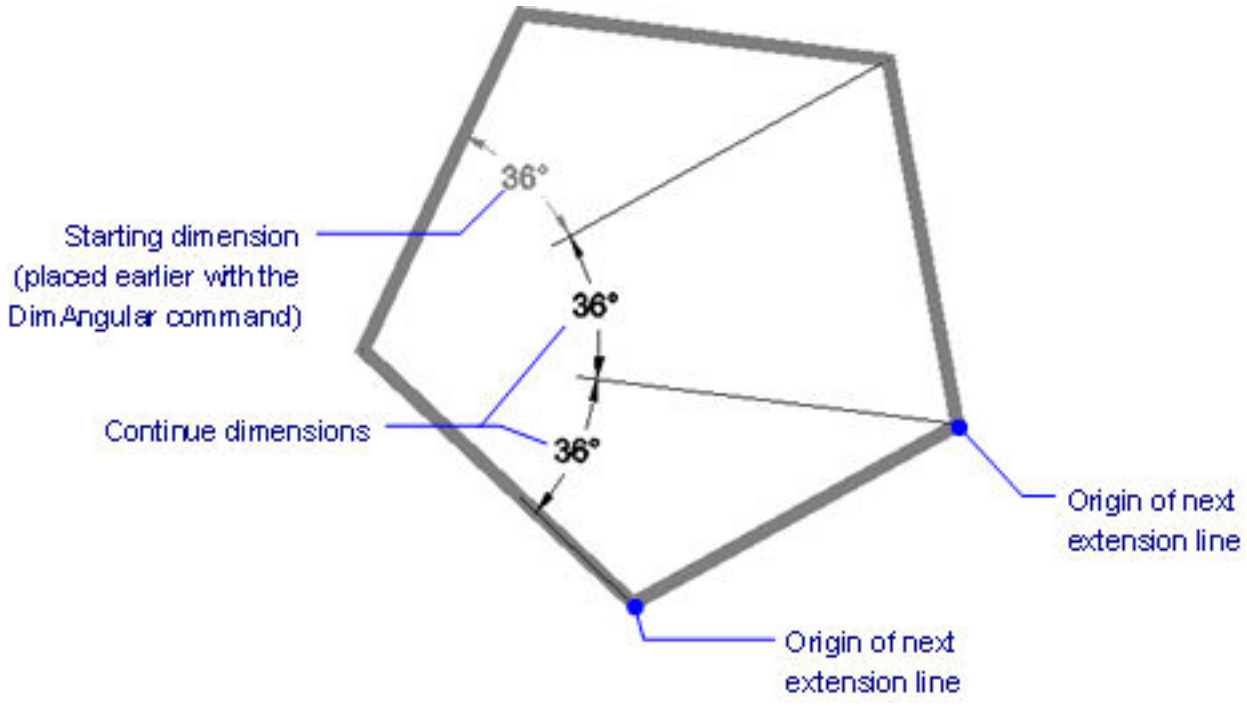

Command Options

Option	Description
ENTER to Select Starting Dimension	Choose the linear or angular dimension from which to continue dimensioning.
Origin of Next Extension Line	Locates the endpoint of the second extension line; the first extension line is co-located with the second extension of the previous dimension. The command repeats this prompt until you press Esc.

Procedures

- To create continued dimensions (1.29.7)

Grips Editing

Continued dimensions can be edited directly through grips:

1. Select the continued dimension. Notice the grips.
2. Drag the grips to perform the following actions:

- Drag either grip on the dimension line to move the dimension line; the extension lines change length.
- Drag the grip on the text to relocate it; the dimension line moves along, and a leader line is added, if required.
- Drag either grip on the extension lines to move the extension line; the dimension line changes length.

Figure 6.950

6.11.9 DimDiameter

(6.2981 on page 6079) Dimensions the diameter of circles, arcs,and polyarcs, and places the center mark. Dimensions are created on the layer which is specified by the DIMLAYER system variable.

Accessing the Command

command bar: **dimdiameter** aliases: **ddi, dimdia** menu bar: **Dimension | Diameter** toolbar: **Dimensions |** ∅ ribbon: **Draw | Dimensions | Circle | Diameter** : **DimDiameter Prompts you in the command bar:** Select arc or circle to dimension: **(Choose an arc, polyline arc segment, or circle)** Dimension text = xx.xx Location of dimension line [Angle/Text]: **(Position the dimension test, or else enter an option to change the text)** A circle with diameter dimension placed outside: (6.951) An arc with diameter dimension placed inside: (6.952 on the next page)

Figure 6.951

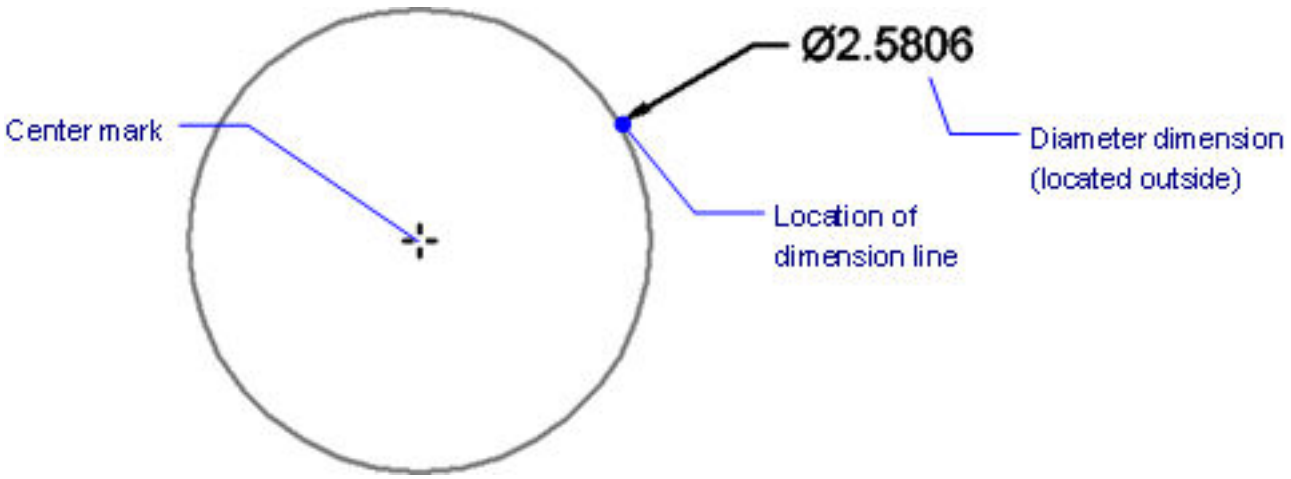

Figure 6.952

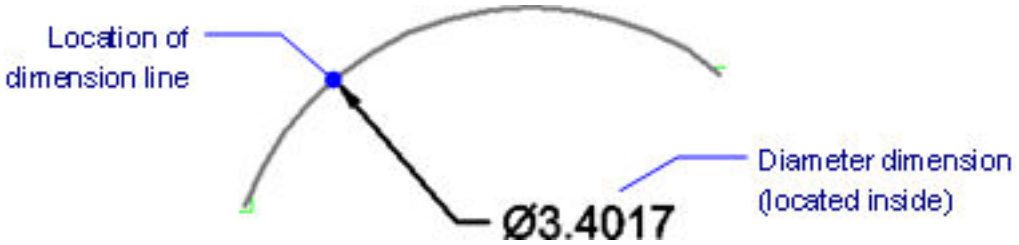

Command Options

Option	Description
Select arc or circle to dimension	Choose an arc, polyline arc segment, or circle
Angle	Changes the angle of the text.
Text	Edits the the default dimension text that had been generated by the program.

Procedures

- To create a diametrical dimension (1.29.9)
- Creating center marks or center lines (1.29.9)
- To create a radial dimension (1.29.9)

Grips Editing

Diameter dimensions can be edited directly through grips:

1. Select the diameter dimension. Notice the grips.
2. Drag the grips to perform the following actions:

- Drag either grip on the circle to rotate the dimension around the circle.
- Drag the grip on the leader to relocate it and the associated text.

Figure 6.954

6.11.10 DimDisassociate

(6.2981 on page 6079) Removes the associativity from selected dimension entities.

Accessing the Command

command bar: **dimdisassociate** menu: **Dimension | Disassociate Dimensions** : **DimDisassociate Prompts you in the command bar:** Select dimensions to disassociate: **(Select one or more dimensions, or enter all to select all dimensions in the current drawing)** Entities in set: 1 Select dimensions to disassociate: **(Select more dimensions, or else press Enter to exit the command)** xx disassociated.

Command Options

Option	Description
Select dimensions to disassociate	Enter one of the following • Select one or more dimensions • Enter **all** to select all dimensions in the current drawing • Press Enter to exit the command

Related Commands

DimReassociate (6.11.18) - reassociates or associates dimensions to entities or points on entities.

Figure 6.955

6.11.11 DimEdit

(6.2981 on page 6079) Edits the position, angle, and wording of dimension text, and changes the angle of extension lines.

Accessing the Command

command bar: **dimedit** aliases: **ded, dimed** menu bar: **Dimension | Make Oblique Dimension | Edit Dimension Text Dimension | Rotate Dimension Text Dimension | Reposition Dimension Text Dimension | Restore Text Position** toolbar: **Dimensions |** ribbon: **Draw | Dimensions | Edit : DimEdit Prompts you in the command bar:** Edit dimension [Edit/Oblique/Rotate/REstore] <REstore text>: **(Enter an option, or press Enter to restore the dimension text to its default position)**

Command Options

Option	Description
Edit	Changes the text; prompts you: 1. **New dimension text <>** - **(specify the new text.)** 2. **Selection dimensions to replace with new text** - **(choose one or more dimensions; prompt repeats until you press Enter.)** (6.956 on the next page) Use the **<>** symbols indicate the default text, so that you can insert text in front or behind the default, such as "Adjust to <> inches."
Oblique	Rotates (obliques or slants) the extension lines; useful for creating isometric dimensions. Prompts you: (6.957 on page 4216) 1. **Select linear dimensions to make oblique** - **(choose one or more linear dimensions; prompt repeats until you press Enter.)** 2. **Enter obliquing angle** - **(specify the angle.)** The angle is measured counter clockwise from the positive x-axis.
Rotate	Rotates dimension text; prompts you: (6.958 on page 4216) 1. **Angle of dimension text** - specifies the angle. The angle is measured counter clockwise from the positive x-axis. 2. **Select entities to rotate text** - **(choose one or more dimensions; prompt repeats until you press Enter.)**

Restore Text	Restores the text to its original position; this option does not restore edited text or obliqued extension lines. Prompts you: **Select dimensions to restore text to default position - (choose one or more dimensions; prompt repeats until you press Enter.)**

Procedures

- Using grips to edit a linear dimension (1.29.14)
- Editing the dimension text (1.29.14)
- To rotate the dimension text (1.29.14)
- To reposition the dimension text (1.29.14)
- To restore the text position (1.29.14)
- To make the extension lines oblique (1.29.14)

Related Commands

AiDimFlipArrow (6.5.3) - flips individual arrows of a dimension. DimTEdit (6.11.23) - changes the position of dimension text. DdEdit (6.10.13) - edits dimension text. Figure 6.959

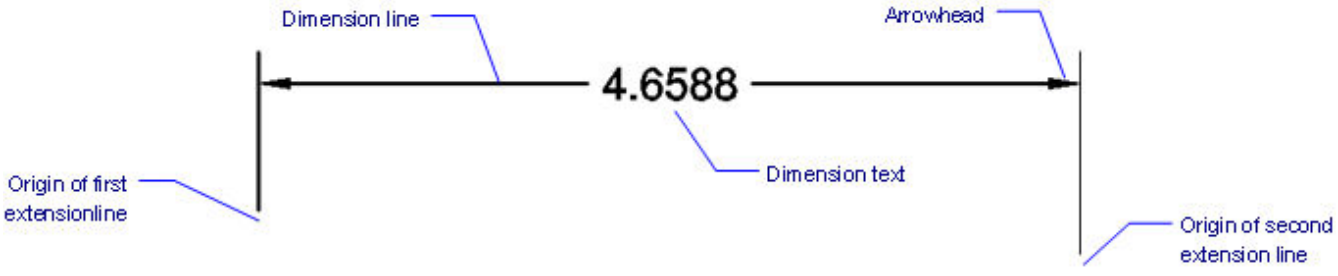
6.11.12 DimLinear

(6.2981 on page 6079) Places linear dimensions horizontally, vertically, or rotated. Dimensions are created on the layer which is specified by the DIMLAYER system variable.

Accessing the Command

command bar: **dimlinear** aliases: **dimlin, dli, dimhorizontal, dimrotated, dimvertical** menu bar: **Dimension | Linear** toolbar: **Dimensions |** ribbon: **Draw | Dimensions | Leader** : **DimLinear Prompts you in the command bar:** Origin of first extension line <Select entity>: **(Pick a point, or else press Enter to dimension an entity directly)** Origin of second extension line: **(Pick another point)** [Angle/Text/Horizontal/Vertical/Rotated]: **(Position the dimension line, or else enter an option)** Dimension text = xx.xx (6.960)

Figure 6.960



Command Options

Option	Description
Select entity	Dimensions an entity. Prompts you: 1. **Select entity to dimension - (select a line, polyline segment, arc or circle to dimension; other entities cannot be dimensioned with this option.)** 2. **[Angle/Text/Horizontal/Vertical/Rotated] - (position the dimension line or choose an option.)** (6.962 on the facing page)
Angle	Specifies the angle of the text; useful for keeping text horizontal with inclined dimension lines. Prompts you: **Angle of dimension text - (specify the rotation angle of the text.)**
Text	Specifies the text; useful for overriding the default measurement generated by the program. Prompts you: **Dimension text - (specifies the replacement text.)**
Horizontal	Forces the dimension to be horizontal. prompts you: **Location of dimension line [Angle/Text] - (positions the dimension line or choose an option.)**
Vertical	Forces the dimension to be vertical. prompts you: **Location of dimension line [Angle/Text] - (positions the dimension line or choose an option.)**
Rotated	Rotates the dimension by a specified angle. Prompts you: **Angle of dimension line <0.0> - (specifies the angle of the dimension line.)**

Procedures

- To create a horizontal or vertical linear dimension (1.29.7)
- To create an aligned linear dimension (1.29.7)
- To create a rotated linear dimension (1.29.7)

Grips Editing

Linear dimensions can be edited directly through grips:

1. Select the linear dimension. Notice the grips.
2. Drag the grips to perform the following actions:

- Drag either grip on the dimension line to move the dimension line; the extension lines change length.
- Drag the grip on the text to relocate it; the dimension line moves along, and a leader line is added, if required.
- Drag either grip on the extension lines to move the extension line; the dimension line changes length.

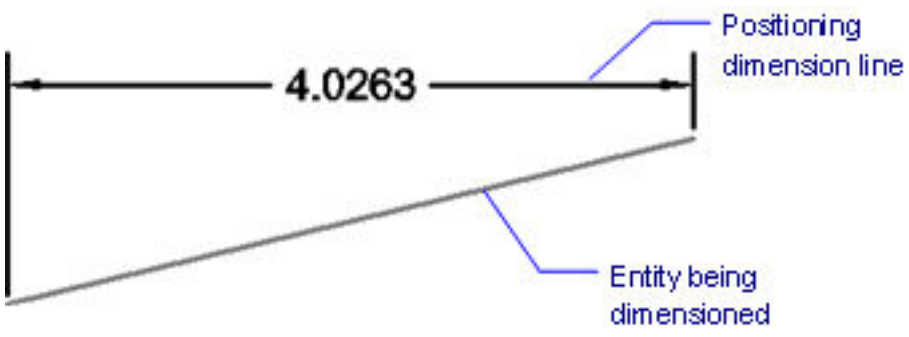

Figure 6.963

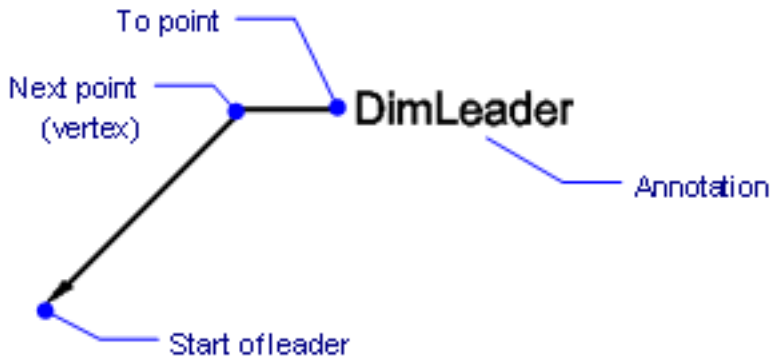
Figure 6.964



6.11.13 DimLeader

(6.2981 on page 6079) Draws leaders. (6.964) Dimensions are created on the layer which is specified by the DIMLAYER system variable.

Accessing the Command

command bar: **dimleader** aliases: **lead, leader** ribbon: **Annotate | Dimension | Leader** : **DimLeader Prompts you in the command bar:** Start of leader: **(Choose the starting point of the leader)** Next point: **(Choose the location of the first vertex)** To point [Format/Undo/Annotation] <Annotation>: **(Choose another vertex, enter an option, or press Enter to enter text)** First line of annotation text <options>: **(Enter text, or press Enter to specify annotation options)** Next line of annotation text: **(Enter additional text, or else press Enter to exit the command)**

Command Options

Option	Description
Start of Leader	Locates the leader's arrowhead, and starts the leader line.
Next Point	Locates the first end point of the leader, or vertex.
To Point	Locates the next end point.
Format	Formats the leader line. Prompts you: **[Arrow/None/SPline/STraight/Exit] <Exit> - (choose an option)**: • **Arrow** - draws the arrowhead • **None** - does not draw the arrowhead • **Spline** - draws the leader line as a spline • **Straight** - draws the leader line as straight segments • **Exit** - exits the Format options
Undo	Undoes the last segment.

Annotation	Adds the leader's annotation. Prompts you: (6.966 on the following page) 1. **First line of annotation text <options>** - **(type the annotation text at the command prompt or press Enter to specify the annotation options.)** 2. **Next line of annotation text** - **(type the next line of the annotation text or press Enter to exit the command)**
Options	Specifies the type of annotation. Prompts you: **Dimension text options [Block/Copy/None/Tolerance/Mtext] <Mtext>** - **(enter an option)**: • **Block** - uses a block as the annotation; prompts you: **? to list blocks in drawing/~ to open the file dialog/<Block to insert>** - **(type the name of a block in the drawing or enter ? (to list the names of blocks in the current drawing, or enter ~ to displays a file dialog box from which you can choose a .dwg file to use as the block for the annotation.)** • **Copy** - copies an entity in the drawing to use as the annotation; prompts you: **Select an entity** - **(select an mtext, text, block reference or tolerance entity.)** • **None** - eaves out the annotation • **Tolerance** - uses tolerance specification as the annotation; displays the Geometric Tolerance dialog box; see the **Tolerance (6.29.26)** command • **Mtext** - uses MText as the annotation and displays the Multiline Text dialog box; see the **MText (6.21.38)** command

Procedures

- To create a leader and an annotation (1.29.11)
- To create a leader only (1.29.11)

Grips Editing

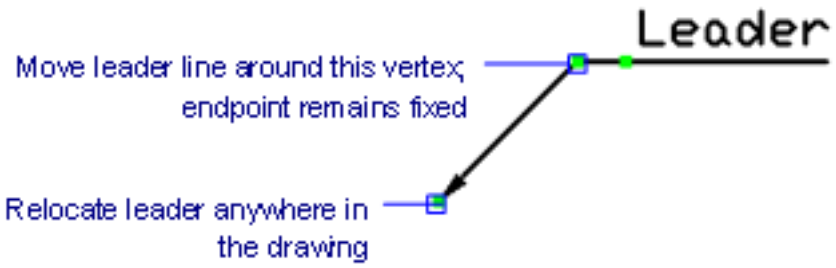
Leaders can be edited directly through grips:

1. Select the leader. Notice the grips.
2. Drag the grips to perform the following actions:

- Drag a grip on a vertex of the leader line to stretch the line segments on either side of the vertex.
- Drag the grip at the arrowhead to move the leader anywhere in the drawing. (The text is independent of the leader line.)

(6.965 on the next page)

Figure 6.965



Related Commands

Leader (6.20.21) - places leaders with text, blocks, entities, or tolerances. QLeader (6.25.3) - draws leaders. Lets you specify the properties of the leader through a dialog box and reuse them for a series of leaders. MLeader (6.21.19) - creates multileader entities using the current multileader style. DimArc (6.11.5) - Places arc length dimensions. DimLinear (6.11.12) - places linear dimensions in drawings: horizontal, vertical, and rotated. DimAligned (6.11.3) - places aligned dimensions. DimBaseline (6.11.6) - places additional dimensions from a common baseline. DimContinue (6.11.8) - continues dimensions. DimDiameter (6.11.9) - places diameter dimensions. DimRadius (6.11.16) - places radius dimensions. DimCenter (6.11.7) - places center marks. DimAngular (6.11.4) - places angular dimensions. DimOrdinate (6.11.14) - places x and y ordinate dimensions. Tolerance (6.29.26) - places tolerance tags in drawings. Dim (6.11.1) - places and edits dimensions at the 'Dimensioning command:' prompt. Dim1 (6.11.2) - places and edits a single dimension at the 'Dimensioning command:' prompt. DimEdit (6.11.11) - changes the wording and angle of dimension text; changes the angle of extension lines. DimTEdit (6.11.23) - changes the position of dimension text. DdEdit (6.10.13) - edits dimension text. Properties (6.24.54) - edits the properties of dimensions through a palette. DimStyle (6.11.19) - creates and edits dimension styles through the Drawing Explorer. -DimStyle (6.11.21) - saves and applies dimensions styles at the command line. Style (6.27.55) - sets the text style used by dimensions. DimOverride (6.11.15) - overrides the values of the current dimension style.

Figure 6.966

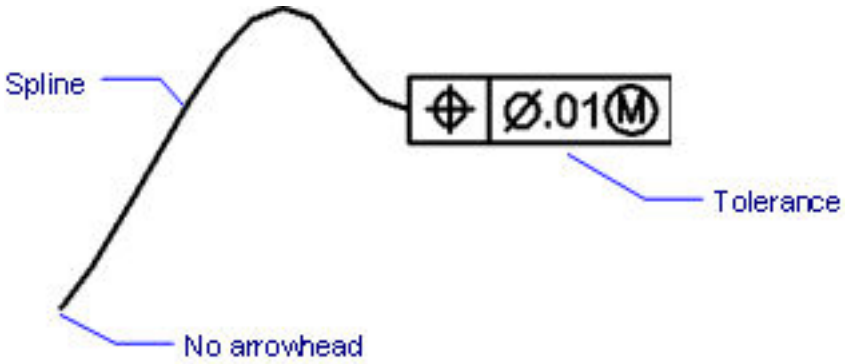


Figure 6.967

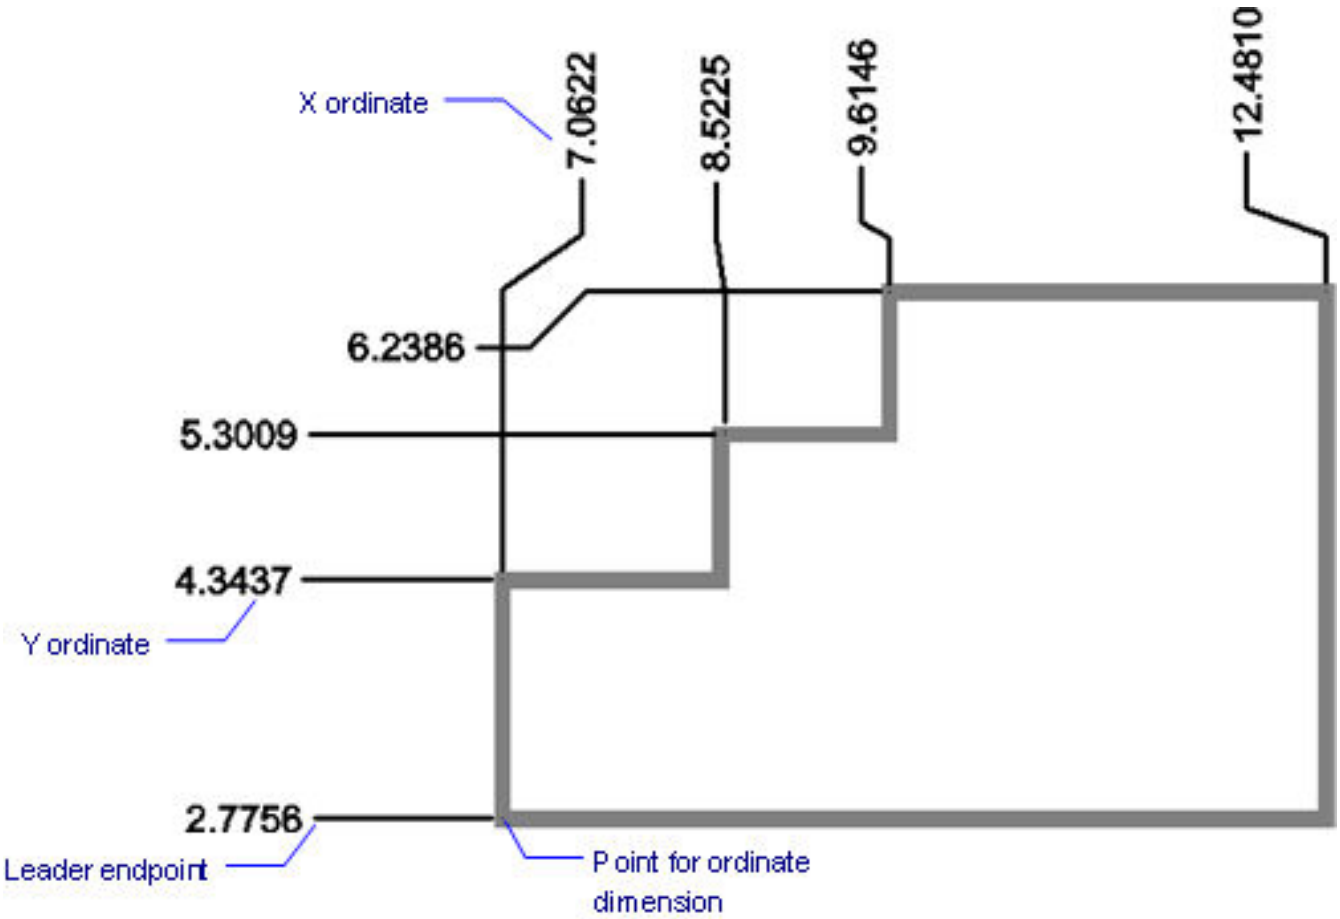
6.11.14 DimOrdinate

(6.2981 on page 6079) Dimensions in the x and y distances from the current UCS origin to the specified point in the drawing. Dimensions are created on the layer which is specified by the DIMLAYER system variable.

Accessing the Command

command bar: **dimordinate** aliases: **dor, dimord** menu bar: **Dimension | Ordinate** toolbar: **Dimensions |**  ribbon: **Draw | Dimensions | Continue | Ordinate** : **DimOrdinate Prompts you in the command bar:** Select point for ordinate dimension: **(Pick a point)** Leader endpoint [Xdatum/Ydatum/Text/Angle]: **(Pick an endpoint for the leader, or enter n option.)** Dimension text: = xx.xx The distance is measured from the origin (0,0) of the current UCS. (6.968 on the next page)

Figure 6.968



Command Options

Option	Description
X datum	Forces the ordinate dimension to measure the x distance; the distance is measured from the origin of the current UCS.
Y datum	Forces the ordinate dimension to measure the y distance; the distance is measured from the origin of the current UCS.
Angle	Specifies the angle of the text; useful for keeping text horizontal with inclined dimension lines. Prompts you: **Angle of dimension text - (specify the rotation angle of the text.)**
Text	Specifies the text; useful for overriding the default measurement generated by BricsCAD. Prompts you: **Dimension text - (specify the replacement text.)**

Procedures

- To create an ordinate dimension (1.29.12)

Grips Editing

Ordinate dimensions can be edited directly through grips:

1. Select an ordinate dimension. Notice the grips.
2. Drag the grips to perform the following actions:
   - Drag the grip at the end point to relocate the endpoint; the leader and text remain fixed.
   - Drag the grip on the leader to relocate it and the associated text.
   - Drag the grip at the center of the text to relocate the entire dimension anywhere in the drawing.

Related Commands

DimArc (6.11.5) - Places arc length dimensions. DimLinear (6.11.12) - places linear dimensions in drawings: horizontal, vertical, and rotated. DimAligned (6.11.3) - places aligned dimensions. DimBaseline (6.11.6) - places additional dimensions from a common baseline. DimContinue (6.11.8) - continues dimensions. DimDiameter (6.11.9) - places diameter dimensions. DimRadius (6.11.16) - places radius dimensions. DimCenter (6.11.7) - places center marks. DimAngular (6.11.4) - places angular dimensions. DimLeader (6.11.13) and Leader (6.20.21) - places leaders with text, blocks, entities, or tolerances. Tolerance (6.29.26) - places tolerance tags in drawings. Dim (6.11.1) - places and edits dimensions at the 'Dimensioning command:' prompt. Dim1 (6.11.2) - places and edits a single dimension at the 'Dimensioning command:' prompt. DimEdit (6.11.11) - changes the wording and angle of dimension text; changes the angle of extension lines. DimTEdit (6.11.23) - changes the position of dimension text. DdEdit (6.10.13) - edits dimension text. Properties (6.24.54) - edits the properties of dimensions through a palette. DimStyle (6.11.19) - creates and edits dimension styles through the Drawing Explorer. -DimStyle (6.11.21) - saves and applies dimensions styles at the command line. Style (6.27.55) - sets the text style used by dimensions. DimOverride (6.11.15) - overrides the values of the current dimension style.

Figure 6.970

6.11.15 DimOverride

(6.2981 on page 6079) Overrides the values of the current dimension style. This command is superseded by the Override function of the **DimStyle (6.11.19)** command.

Accessing the Command

command bar: **dimoverride** aliases: **dor, dimover** : **DimOverride Prompts you in the command bar:** Select Dimension variable to override or [Clear]: **(Enter the name of a dimension variable, or else type C)** DimVar is now <"xx.xx">. New value: **(Enter a new value the dimension variable)** Dimension variable to override: **(Enter the name of another dimension variable, or else press Enter to continue)** Select dimensions to use new value(s): **(Choose one or more dimensions)** Entities in set: 1 Select dimensions to use new value(s): **(Choose more dimensions, or eles press Enter to exit command)**

Command Options

Option	Description
Clear Overrides	Resets the values of dimension variables, clearing the overrides. Prompts you: 1. **Select dimensions to clear overrides - (choose the dimensions whose settings should be reset.) Entities in set: 1** 2. **Select dimensions to clear overrides - (choose more dimensions or press Enter to exit the command.)**

Related Commands

DimStyle (6.11.19) - creates and edits dimension styles through the Drawing Explorer. -DimStyle (6.11.21) - saves and applies dimensions styles at the command line. Shape Classic Pro Platinum Mechanical BIM

6.11.16 DimRadius

(6.2981 on page 6079) Dimensions the radii of arcs. polyarcs, and circles. Dimensions are created on the layer which is specified by the DIMLAYER system variable.

Accessing the Command

command bar: **dimradius** aliases: **dimrad, dra** menu bar: **Dimension | Radius** toolbar: **Dimensions |** ribbon: **Draw | Dimensions | Circle | Radius** : **DimRadius Prompts you in the command bar:** Select arc or circle to dimension: **(Choose an arc, a polyline arc, or a circle)** Dimension text = xx.xx Location of dimension line [Angle/Text]: **(Position the dimension, or enter an option)** A circle with radius dimension placed outside: (6.972) An arc with radius dimension placed inside: (6.973 on the following page)

Figure 6.972

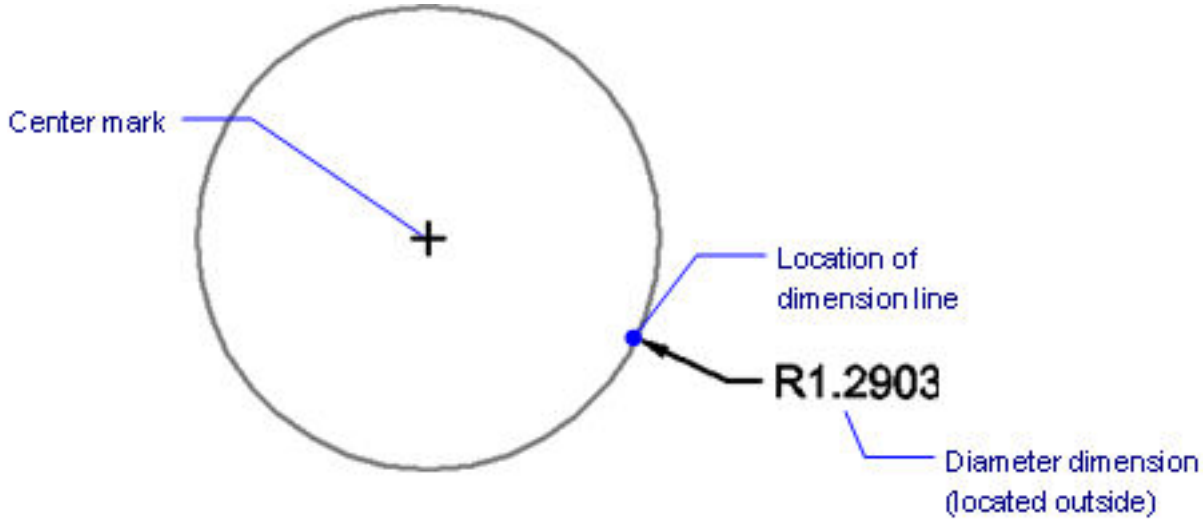

Figure 6.973

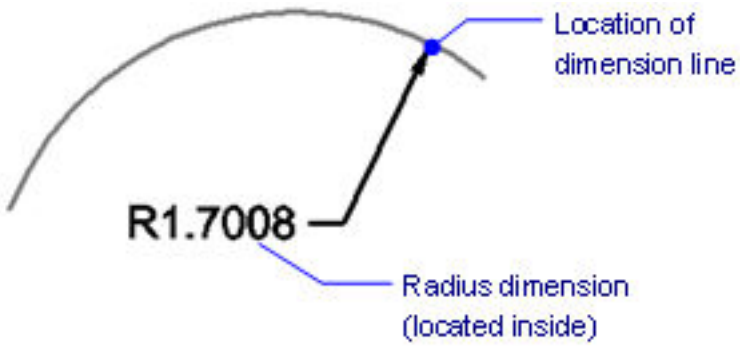

Command Options

Option	Description
Angle	Specifies the angle of the text. Prompts you: **Angle of dimension text** - **(specify the rotation angle of the text.)**
Text	Specifies the text; useful for overriding the default measurement generated by the program. Prompts you: **Dimension text** - **(specifies the replacement text.)**

Procedures

- To create a radial dimension (1.29.9)
- Creating center marks or center lines (1.29.9)
- To create a diametrical dimension (1.29.9)

Grips Editing

Radial dimensions can be edited directly through grips:

1. Select the radius dimension. Notice the grips.
2. Drag the grips to perform the following actions:
   - Drag the grip on the circle to rotate the leader and text around the circle.
   - Drag the grip on the leader to relocate it and the associated text.
   - Drag the grip at the center of the circle to relocate the dimension anywhere in the drawing.

Style (6.27.55) - sets the text style used by dimensions. DimOverride (6.11.15) - overrides the values of the current dimension style.

Figure 6.975

6.11.17 DimBreak

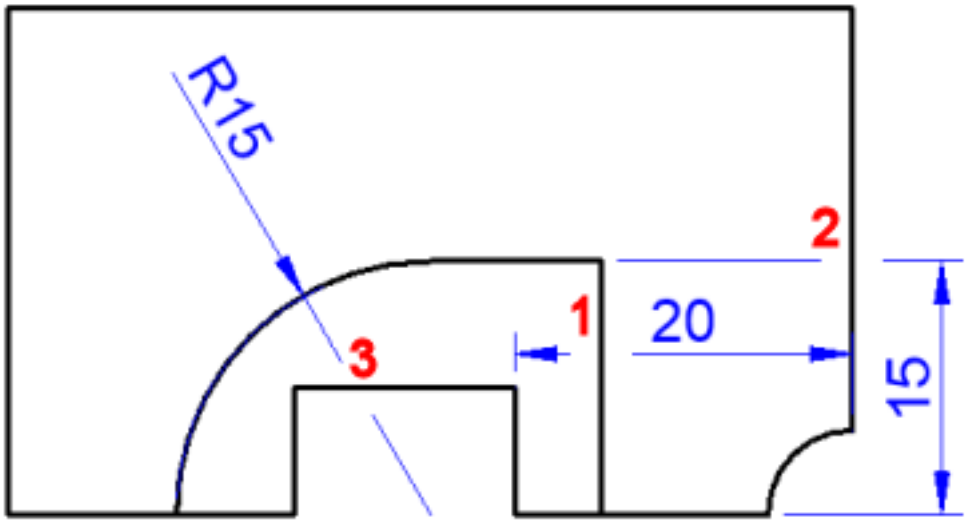
(6.2981 on page 6079) Breaks dimension lines, extension lines, and leaders at locations where they cross other entities; also removes breaks.

Accessing the Command

command bar: **dimbreak** menu bar: **Break Dimension** toolbar: **Dimensions** : **dimbreak Prompts you in the command bar:** Select dimension to add/remove break or [Multiple]: **(Select a dimension entity)** Select object to break dimension or [Auto/Manual/Remove]: **(Select an entity that crosses the dimension)** Select object to break dimension: **(Select an entity, or else press Enter to end the command)** The dimension line and extension lines of the selected dimension are broken at the selected entity or entities. The size of the gap is defined by the **DimBreakSize** variable of the current dimension style. (6.976 on the next page)

1. Dimension break on dimension line
2. Dimension break on extension line
3. Dimension break on leader

Figure 6.976



Command Options

Option	Description
Multiple	Selects multiple dimension entities. Prompts you: 1. **Select dimensions to add/remove break- select a dimension entity, or enter all to select all dimensions in the drawing Entities in set: 1** 2. **Select dimensions to add/remove break - select more dimension entities, and then press Enter to start selecting breaking entities**
Auto	Breaks selected dimensions at all intersections found with other entities.
Manual	Manually defines the width of the dimension break. You are prompted to specify two points: 1. **Specify first break point - pick a point on the dimension** 2. **Specify second break point - pick another point on the dimension** This option is not available in Auto mode.
Remove	Removes all dimension breaks from the selected dimension(s).

Related Commands

Break (6.6.21) - removes a portion of an entity.

Figure 6.977

6.11.18 DimReassociate

(6.2981 on page 6079) Reassociates or associates dimensions to entities or points on entities.

Accessing the Command

command bar: **dimreassociate** menu: **Dimension | Reassociate Dimensions** : **DimReassociate Prompts you in the command bar:** Select entities or [Disassociated]: **(Select one or more dimension entities or type D, then press Enter.)** Entities in set: 1 Select entities or [Disassociated]: **(Select more dimension entities or type D, then press Enter or press Enter to stop selecting.)** Dimension entities in the selection set highlight one by one and you are prompted to specify association points or entities for the currently highlighted dimension entity. A marker displays at the current position of the edited dimension point:

- Indicates a non-associated dimension point.
- Indicates an associated dimension point.

Depending on the dimension entity types in the selection set, the following prompts display:

Linear (rotated and aligned dimensions): Specify first extension line origin or [Select entity] <next>: **(Use an appropriate entity snap to specify the first extension line origin, type S then press Enter to select an entity or press Enter to skip to the next prompt.)** Specify second extension line origin <next>: **(Use an appropriate entity snap to specify the second extension line origin or press Enter to skip to the next prompt.)**

Diameter Select arc, circle or polyline arc <next>: (**Select an arc, circle or polyline arc segment or press Enter to skip to the next prompt.)**

Radius Select arc, circle or polyline arc <next>: **(Select an arc, circle are polyline arc segment or press Enter to skip to the next prompt.)**

Angular 2 Lines: Select first line <next>: **(Select a line or press Enter to skip to the next prompt.)** Select second line <next>: **(Select a line or press Enter to skip to the next prompt.)** 3 Points: Specify angle vertex or [Select arc, circle or polyline arc] <next>: **(Use an appropriate entity snap to specify the angle vertex or press Enter to skip to the next prompt.)** Specify first angle endpoint <next>: **(Use an appropriate entity snap to specify the first angle endpoint or press Enter to skip to the next prompt.)** Specify second angle endpoint <next>: **(Use an appropriate entity snap to specify the second angle endpoint or press Enter to skip to the next prompt.)** Arc or Circle: Specify angle vertex or [Select arc, circle or polyline arc] <next>: **(Type S, then press Enter or press Enter to skip to the next prompt.)** Select arc, circle or polyline arc <next>: **(Select an arc, polyline arc segment or circle or press Enter to skip to the next prompt.)**

Ordinate Specify feature location <next>: **(Use an appropriate entity snap to specify the new dimension point or press Enter to skip to the next prompt.)**

Leader Specify leader association point <next>: **(Use an appropriate entity snap to specify the new leader association point or press Enter to skip to the next prompt.)**

Command Options

Option	Description
Disassociated	Prompts to reassociate all disassociated dimension entities in the drawing. All disassociated dimensions highlight one by one.

Related Commands

DimDisassociate (6.11.10) - removes the associativity from the selected dimension entities. DimLinear (6.11.12) - places linear dimensions in drawings: horizontal, vertical, and rotated. DimAligned (6.11.3) - places aligned dimensions. DimDiameter (6.11.9) - places diameter dimensions. DimRadius (6.11.16) - places radius dimensions. DimAngular (6.11.4) - places angular dimensions. DimOrdinate (6.11.14) - places x and y ordinate dimensions. DimLeader (6.11.13) and Leader (6.20.21) - places leaders with text, blocks, entities, or tolerances. BmBalloon (6.8.2) - creates associative balloon entities for assembly components in Model Space and for their generated views in a Paper Space layout. DimEdit (6.11.11) - changes the wording and angle of dimension text; changes the angle of extension lines. DimTEdit (6.11.23) - changes the position of dimension text. DdEdit (6.10.13) - edits dimension text. Properties (6.24.54) - edits the properties of dimensions through a palette.

Figure 6.978

6.11.19 DimStyle

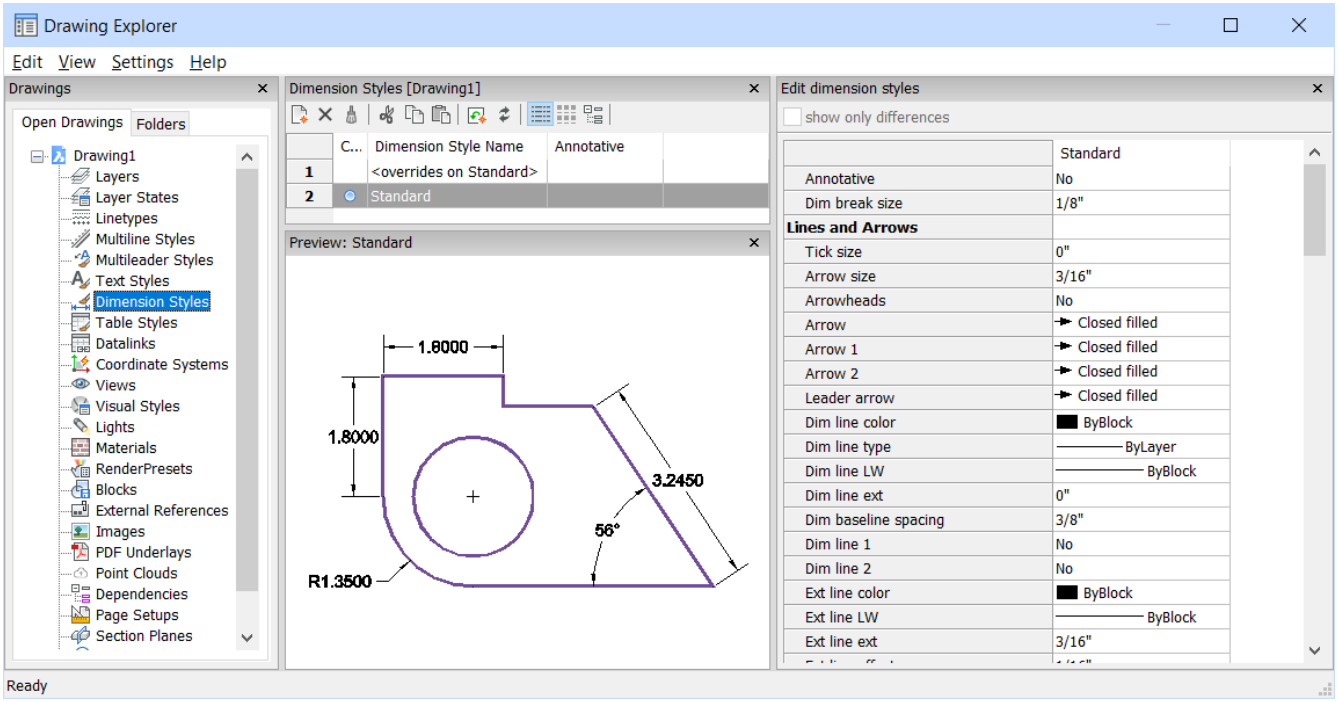
(6.2981 on page 6079) Creates and modifies dimension styles, through the Drawing Explorer.

Accessing the Command

command bar: **dimstyle** aliases: **d, ddim, dimsty, ds, dst, expdimstyles, setdim** menu bar: **Tools | Drawing Explorer | Dimension Styles...** status bar: **Standard** (or name of other current dimension style) toolbar: **Dimensions** | ribbon: **Draw | Dimensions | Dimension Variable Status** : **DimStyle** Displays the Drawing Explorer at the Dimension Styles section: (6.979 on the facing page) Create or edit dimension styles, and then click **X**.

- **<Overrides>** - overrides the values of individual dimension variables without creating a new style
- **Standard** - lists the dimension settings for the dimension style named "Standard"

Figure 6.979



Command Options

Option	Description
Name	Names of the dimension style; all styles can be renamed and deleted, except for the Standard style.
Current	Indicates whether the style is current or not.
Annotative	Sets the annotative property of the dimension style.
Dim break size	Sets the value the gap created by the DimBreak (6.11.17) command.
Show only differences	If multiple styles are selected, compares the selected styles (1.29.3) and shows the differences only.

Dimension Child Styles A dimension style can have up to 6 child styles: **Linear**, **Angular**, **Radius**, **Diameter**, **Ordinate**, and **Leader**. If defined, then the child style is used for the corresponding dimension type. Right click the dimension style name, then choose **New child** style in the context menu and select a child style type. (6.980 on page 4237) Dimension child styles share all settings with the parent style, except for the properties that are defined explicitly differently.

Lines and Arrows Options
(6.983 on page 4245)

Arrow 1	Specifies the style of arrowhead for the starting end of the dimension line; choose from one of the following types: (6.984 on page 4246)
Arrow 2	Specifies the style of arrowhead for the other end of the dimension line.
Arrow Size	Specifies the length of the arrowhead; the width is scaled proportionately.
Leader Arrow	Specifies the style of arrowhead for the starting end of the leader line.
Dim Line Color	Specifies the color of the dimension line; choose from: • Any Index Color • Any True Color • ByBlock • ByLayer
[illegible]	Specifies the line type of the dimension line; choose from any line type loaded into the current drawing. To access additional linetypes, click **Load**, and then

Ext Line type	Specifies the line type of both extension lines; choose from any line type loaded into the current drawing. To access additional linetypes, click **Load**, and then choose one from the Load Linetypes dialog box.
Ext Line LW	Specifies the lineweight of the extension line; choose from any lineweight supported by the program.
Ext Line Ext	Specifies the distance that the extension lines extend beyond the dimension line.
Ext Line Offset	Specifies the offset distance between the object and the start of the extension lines.
Ext Line 1	Toggles the display of the first extension line.
Ext Line 2	Toggles the display of the second extension line.
Ext line type 1	Specifies the line type of the first extension line; choose from any line type loaded into the current drawing. To access additional linetypes, click **Load**, and then choose one from the Load Linetypes dialog box.
Ext line type 2	Specifies the line type of the second extension line; choose from any line type loaded into the current drawing. To access additional linetypes, click **Load**, and then choose one from the Load Linetypes dialog box.
Ext line fixed length	Specifies the length of fixed-length extension lines.
Center Mark	Specifies the type of center mark: • Mark • Line • None
Center Mark Size	Specifies the size of the center mark.
Arc length symbol	Specifies the location of the arc length symbol: • Preceding dimension text • Above dimension text • Not displayed
Jog angle	Specifies the angle of the jog; default is 45 degrees. Enter another angle.

(6.985 on page 4247)

Text Style	Specifies the style for dimension text; can use only styles created with the Style (6.27.55) command.
Text Color	Specifies the color of the text; choose from: • Any Index Color • Any True Color • ByBlock • ByLayer
Text Fill	Determines whether the dimension text has a rectangular background filled with color. (6.986 on page 4247) Choose from: • **No fill** - does not apply a background fill • **Background** - uses the background color of the drawing, usually white or black • **Color** - uses the color specified by the Text Fill Color option
Text Fill Color	Specifies the background fill color when Text Fill is set to Color. Choose a color from the drop list, or click **Select Color** to access the Select Color dialog box.
Text Height	Specifies the height of the text.
Draw Frame Around Text	Toggles a rectangle around the text.
Text Pos Vert	Justifies the text vertically relative to the dimension line: • **Centered** - centers the text on the dimension line • **Above** - places the text above the dimension line • **Outside** - places text outside of the extension lines • **JIS** - generally places text above the dimension line, according to the Japanese Industry Standard
Text Pos Hor	Justifies the text horizontally relative to the extension lines: • **Centered** - centers the text between the extension lines • **First Extension Line** - places the text near the first extension line • **Second Extension Line** - places the text near the second extension line • **Over First Extension** - places the text over the first extension line • **Over Second Extension** - places the text over the second extension line
Text Offset	Specifies the size of gap between the dimension line and the text.

Text Inside Align	Justifies text when located between extension lines: • **Aligned with Dimension Line** - aligns text with dimension line • **Horizontal** - forces text to be always horizontal
Text Outside Align	Justifies text when located outside of the extension lines: • **Aligned with Dimension Line** - align text with dimension line • **Horizontal** - forces text to be always horizontal

Fit Options
(6.987 on page 4247)

Arrow and Text Fit	Specifies where text and arrows should be located when there is insufficient space for both between the extension lines: • **Text and Arrows** - forces both text and arrows between the extension lines • **Arrows Only** - forces arrows to stay within extension lines; moves text outside when there is insufficient space • **Text Only** - forces text to stay within extension lines; moves arrows outside when there is insufficient space • **Best F**it - requires the program to figure out where to place text and arrows, depending on the space between extension lines
Text Inside	Toggles whether the text is forced between extension lines: • **On** - forces text between extension lines • **Off** - draws text outside, if insufficient space between extension lines
Dim Line Inside	Toggles whether the dimension line is forced between extension lines: • **On** - forces dimension line always between extension lines • **Off** - draws dimension line outside, if insufficient space between extension lines
Text Movement	Specifies what happens when text is moved away from its default location: • **Keep dim line with text** - moves dimension line with the text, stretching the extension lines. • **Move text, add leader** - draws a leader between the text and the dimension line. • **Move text, no leader** - does not draw a leader.

Dim Scale Overall	Specifies the overall scale factor for dimensions; this affects the size of arrows and text only. This setting is not editable for annotative dimension styles. It is recommended to set Dim Scale Overall = 1 for annotative dimension styles.
Place Text Manually	Toggles whether the user must always specify the text location when creating dimensions.
Dim Line Forced	Forces the dimension line to be always drawn; forces leaders to be drawn with the **DimDiameter** and **DimRadius** commands.

Primary Units Options
(6.988 on page 4248)

Dim Units	Specifies the display units for dimensions: • **Scientific** - scientific notation, such as 1.2345E+01 • **Decimal** - metric, such as 1.2345 • **Engineering** - feet and decimal inches, such as 1'-2.3456" • **Architectural** - feet and fractional inches, such as 1'-2 1/16" • **Fractional** - fractional inches only; no feet, such as 14 1/16" • **Windows Desktop** - uses the units set by Windows
Dim Precision	Specifies the precision of units, either decimal places or fractional accuracy.
Fractional Type	Specifies how fractions are stacked: • **Horizontal** - stacks fractions vertically, with a horizontal separator line • **Diagonal** - stacks diagonally, with a diagonal separator line • **None** - does not stack fractions, placed horizontally with a slash separator
Decimal Separator	Specifies the character used to indicate the decimal point; can be any character. North American countries use the period; European countries use the comma.
Dim Round	Specifies the rounding of decimal numbers; range is none to 8 decimal places.
Dim Prefix	Specifies prefix text that appears in front of the dimension text, if any.
Dim Suffix	Specifies suffix text that appears after the dimension text, if any.
Dim sub-units suffix*	Specifies suffix text in case the sub unit is used. For example, enter 'cm' to display .96 as 96cm.
Dim Scale Linear	Specifies the multiplier for dimension values, such as 25.4 for changing inches to millimeters.
Dim sub-units scale*	Sets the scale factor for the sub-units. E.g. enter 10 if the drawing unit is cm, and the sub-unit suffix is mm.
Suppress Leading Zeros	Toggles the display of zeros in front of the decimal point; for example, 0.23 is displayed as: • **On** - suppresses the leading zero, such as .23 • **Off** - permits the leading zero, such as 0.23

Suppress Trailing Zeros	Toggles the display of zeros after the decimal point; for example, 1.2300 is displayed as: • **On** - suppresses trailing zeros, such as 1.23 • **Off** - allows trailing zeros, such as 1.2300
Suppress Zero Feet	Toggles the display of zero feet; for example, 0'-3" is displayed as: • **On** - suppresses zero feet, such as 3" • **Off** - allows zero feet, such as 0'-3"
Suppress Zero Inches	Toggles the display of zero inches; for example, 1'-0" is displayed as: • **On** - suppresses the display of zero inches, such as 1' • **Off** - allows zero inches, such as 1'-0"
Dim Angle Units	Specifies the format of units in angular dimensions: • **Decimal Degrees** - 360 degrees in a circle; for example, 123.45 degrees • **Deg/Min/Sec** - degrees, minutes, seconds; for example, 123d 12' 45.67" • **Grads** - 400 grads in a circle; for example, 230g • **Rads** - 2pi radians in a circle; for example, 1.5r
Dim Angle Precision	Specifies the number of decimal places; range is from 0 to 8.
Suppress Angle Leading Zeros	Toggles the display of zero degrees; for example, 0.1234 degrees is displayed as: • **On** - suppresses zero degrees, such as .1234 • **Off** - allows zero degrees, such as 0.1234
Suppress Angle Trailing Zeros	Toggles the display of zeros after degrees; for example, 0.1200 degrees is displayed as: • **On** - suppresses trailing zeros, such as 0.12 • **Off** - allows trailing zeros, such as 0.1200

* Suppress leading zeros must be set to **Yes** to display dimension distances less than one unit in sub units

Alternate Units Options
(6.989 on page 4248)

Alternate Enabled	Toggles the display of alternative units: • **On** - second, alternative units displayed to the right of primary units • **Off** - only primary units are displayed

Alt Units	Specifies the display units for dimensions: • **Scientific** - scientific notation, such as 1.2345E+01. • **Decimal** - metric, such as 1.2345 • **Engineering** - feet and decimal inches, such as 1'-2.3456" • **Architectural** - feet and fractional inches, such as 1'-2 1/16" • **Fractional** - fractional inches only; no feet, such as 14 1/16" • **Windows Desktop** - uses the units set by Windows
Alt Precision	Specifies the precision of units, either decimal places or fractional accuracy.
Alt Scale Factor	Specifies the multiplier for alternate values, such as 25.4 for showing millimeters (alternate units) next to inches (primary units).
Alt Round	Specifies the rounding of alternate numbers; range is none to 8 decimal places.
Alt Prefix	Specifies prefix text that appears in front of the alternate text, if any.
Alt Suffix	Specifies suffix text that appears in after the alternate text, if any.
Alt Leading Zeros	Toggles the display of zeros in front of the decimal point; for example, 0.23 is displayed as: • **On** - suppresses the leading zero, such as .23 • **Off** - permits the leading zero, such as 0.23
Alt Trailing Zeros	Toggles the display of zeros in front of the decimal point; for example, 1.2300 is displayed as: • **On** - suppresses trailing zeros, such as 1.23 • **Off** - allows trailing zeros, such as 1.2300
Alt Zero Feet	Toggles the display of zero feet; for example, 0'-3" is displayed as: • **On** - suppresses zero feet, such as 3" • **Off** - allows zero feet, such as 0'-3"
Alt Zero Inches	Toggles the display of zero inches; for example, 1'-0" is displayed as: On • **On** - suppresses the display of zero inches, such as 1' • **Off** - allows zero inches, such as 1'-0"

Tolerances Options
(6.990 on page 4249)

Tolerance Display	Toggles the display of tolerance text.
Tolerance Precision	Specifies the display precision of tolerance text; range is 0 to 8 decimal places or 1/1 to 1/256 inch.
Tolerance Limit Lower	Specifies the value of the upper tolerance.
Tolerance Limit Upper	Specifies the value of the lower tolerance.
Tolerance Text Height	Specifies the height of tolerance text.

Tolerance Pos Vert	Locates the tolerance text relative to the dimension text: • **Bottom** - aligns tolerance text with the bottom of the dimension text • **Middle** - aligns tolerance text with the middle of the dimension text • **Top** - aligns tolerance text with the top of the dimension text
Tolerance Suppress Leading Zeros	Toggles the display of zeros in front of the decimal point.
Tolerance Suppress Trailing Zeros	Toggles the display of zeros behind the decimal point.
Tolerance Suppress Zero Feet	Toggles the display of zero feet.
Tolerance Suppress Zero Inches	Toggles the display of zero inches.
Alt Tolerance Precision	Specifies the number of decimal places for tolerances in alternate units.
Alt Tolerance Suppress Leading Zeros	Toggles the display of zeros in front of the decimal point.
Alt Tolerance Suppress Trailing Zeros	Toggles the display of zeros behind the decimal point.
Alt Tolerance Suppress Zero Feet	Toggles the display of zero feet.
Alt Tolerance Suppress Zero Inches	Toggles the display of zero inches.

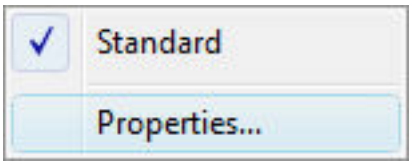
Status Bar Menu

Right-click Standard (or other dimension style name) on the status bar for the shortcut menu: (6.2741 on page 5846) (6.2440 on page 5595)

Shortcut Menu	Description
Standard	Chooses the default dimension style. When the drawing contains additional dimension styles, their names are listed here.
Properties	Opens the Dimension Styles section of the Drawing Explorer.

Figure 6.981

Figure 6.982



Procedures

- Exploring dimension styles (1.29.3)
- Comparing dimension styles (1.29.3)
- To list the current status of the dimension variables (1.29.4)
- To create a new dimension style (1.29.5)
- To edit a dimension style (1.29.5)
- To define dimension style overrides (1.29.5)
- To rename a dimension style (1.29.5)
- To set a dimension style current (1.29.5)
- Using the status bar to set a dimension style current (1.29.5)
- To copy a dimension style between drawings (1.29.5)
- To move a dimension style between drawings (1.29.5)
- To delete a dimension style (1.29.5)

Related Commands

AiDimStyle - creates Dimension Styles based on the properties of selected Dimension, Tolerance or Leader entities. -Dimstyle (6.11.21) - creates and modifies dimension styles at the command line. Explorer (6.13.15) - opens the Drawing Explorer dialog box.

6.11.20 DimRegen

(6.2981 on page 6079) Updates associative dimensions (short for "dimension regeneration").

Accessing the Command

command bar: **dimregen** menu bar: **Dimension | Reassociate Dimenions** : **DimRegen** Displays no prompt in the command bar.

Command Options

No options.

Figure 6.992

6.11.21 -DimStyle

(6.2981 on page 6079) Creates and modifies dimensions styles at the command line.

Accessing the Command

command bar: **-dimstyle** transparent: **'-dimstyle** alias: **-dst** menu bar: **Dimension | Apply Dimension Style Dimension | Save Dimension Style Dimension | Restore Dimension Style Dimension | Dimension Variable Status** ribbon: **Draw | Dimensions | Apply Dimension Style** : **-DimStyle Prompts you in the command bar:** Current dimension style: Standard Annotative: No Dimension styles or [?/ANnotative/Apply/Save/STatus/Variables/Restore] <Restore>: **(Enter an option)**

Command Options

Option	Description
?	Lists the names of all dimension styles loaded into the current drawing, other than Standard. Prompts you: **Dimension style(s) to list <*>** - **(enter a name or press Enter for all.)**
Annotative	Sets the annotative property of the dimension style.
Apply	Changes or restores the style of existing dimensions by applying the current style. Prompts you: **Select dimensions to apply the current style** - **(choose one or more dimensions.)**
Save	Saves the current dimension settings as a style; useful for saving overrides as a style. Prompts you: **Save style: ? to list style names/Name for new dimension style** - **(specifies the name of the style.)**
STatus	Displays the current value of every dimension variable.
Variables	Lists the values of dimension variables belonging to the selected dimension. Prompts you: **? to list styles/ENTER to select dimension/<Dimension style>** - **(enter an option)**: • **? to list styles** - lists the names of styles currently loaded in the drawing. • **ENTER to select dimension** - prompts you to chose a dimension to use as the current style. • **Dimension style** - lists the values of the style whose name you supply, as well as override values.

Restore	Resets the values of dimension variables to those of the selected dimension. Prompts you **? to list styles/ENTER to select dimension/<Dimension style>** - **(enter an option)**: • **? to list styles** - lists the names of styles currently loaded in the drawing. • **ENTER to select dimension** - prompts you to choose a dimension whose values you want to use as the current style. • **Dimension style** - lists the values of the style whose name you supply.

Procedures

- To apply the current dimension style (1.29.6)
- To save a dimension style (1.29.6)
- To restore a dimension style (1.29.6)
- To list the settings in the current dimension style (1.29.6)

Related Commands

AiDimStyle - creates Dimension Styles based on the properties of selected Dimension, Tolerance or Leader entities. DimStyle (6.11.19) - creates and modifies dimension styles, through the Drawing Explorer.

Figure 6.993

6.11.22 DimStyleSet

(6.2981 on page 6079) Reports the current dimension style in the command bar.

Accessing the Command

command bar: **dimstyleset : DimStyleSet** Dimension style set to <name of current dimension style>. The name of the current dimension style also displays in the Current Dimension Style (1.15.2) field in the Status bar.

Command Options

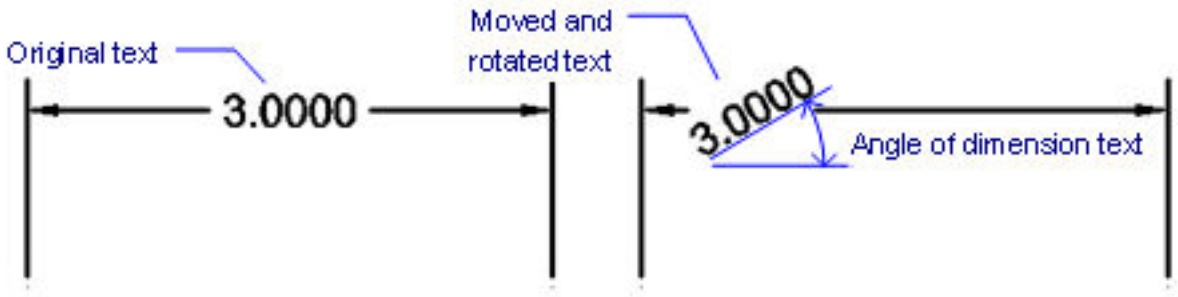
No options

Related Commands

DimStyle (6.11.19) - creates and modifies dimension styles through the Drawing Explorer. -DimStyle (6.11.21) - creates and modifies dimensions styles at the command line.

Figure 6.994

Figure 6.995



6.11.23 DimTEdit

(6.2981 on page 6079) Changes the position of dimension text. (6.995)

Accessing the Command

command bar: **dimtedit** alias: **dimted** menubar: **Dimension | Reposition Dimension Text** toolbar: **Dimensions |** ribbon: **Draw | Dimensions | Edit | Reposition Dimension Text : DimTEdit Prompts you in the command bar:** Select dimension to reposition text: **(Choose a dimension)** Specify or enter text location [Angle/Left/Center/Right/REstore]: **(Drag the text to its new location, or else enter an option)**

Command Options

Option	Description
Restore ( )	Resets the rotation angle to 0 degrees; does not change repositioned text.
Angle ( )	Rotates the dimension text. Prompts you: **Angle of dimension text - (specify the angle of the text; measured counter-clockwise from the positive x axis.)**
Left	Moves the text next to the left extension line.
Center	Centers the text between the two extension lines.
Right	Moves the text next to the left extension line.

Procedures

- Editing the dimension text (1.29.14)
- To rotate the dimension text (1.29.14)
- To reposition the dimension text (1.29.14)
- To restore the text position (1.29.14)

Related Commands

DimEdit (6.11.11) - changes the wording and angle of dimension text; changes the angle of extension lines. DdEdit (6.10.13) - edits dimension text. Properties (6.24.54) - edits the properties of dimensions through a palette. DimArc (6.11.5) - Places arc length dimensions. DimLinear (6.11.12) - places linear dimensions in drawings: horizontal, vertical, and rotated. DimAligned (6.11.3) - places aligned dimensions. DimBaseline (6.11.6) - places additional dimensions from a common baseline. DimContinue (6.11.8) - continues dimensions. DimDiameter (6.11.9) - places diameter dimensions. DimRadius (6.11.16) - places radius dimensions. DimCenter (6.11.7) - places center marks. DimAngular (6.11.4) - places angular dimensions. DimLeader (6.11.13) and Leader (6.20.21) - places leaders with text, blocks, entities, or tolerances. DimOrdinate (6.11.14) - places x and y ordinate dimensions. Tolerance (6.29.26) - places tolerance tags in drawings. DimStyle (6.11.19) - creates and edits dimension styles using the Drawing Explorer. -DimStyle (6.11.21) - saves and applies dimensions styles at the command line. Style (6.27.55) - sets the text style used by dimensions. DimOverride (6.11.15) - overrides the values of the current dimension style.

6.12 Dm (Direct Modeling)

6.12.1 DmAngle3d

(6.2673 on page 5786) DmAngle3d creates an angle constraint between faces and/or edges of 3D solids, WCS subentities, and subentities of a coordinate system of a block. Creates a Planar Angle constraint by default: coordinate planes of the WCS are used as third reference objects whenever possible. It also allows you to control the top angle of a cone.

Figure 6.996

Accessing the Command

===ERROR WITH DOWNLOADED IMAGE=== **Angle** ===ERROR WITH DOWNLOADED IMAGE=== **Cone angle** command bar: **dmangle3d** menu bar: **Parametric | 3D Constraints | Angle** toolbar: **3D Constraints | Angle** ribbon:

- Modeling Workspace
  - **Home | Parametrize | Angle** and **Cone angle**
  - **Solid | Parametrize | Angle** and **Cone angle**
  - **Parametric | Parametrize | Angle** and **Cone angle**
- Mechanical Workspace

  - **Surface | Parametrize | Angle** and **Cone angle**
  - **Sheet Metal | Parametrize | Angle** and **Cone angle**
  - **Assembly | 3D Constraints | Angle** and **Cone angle**
- BIM Workspace
  - **Parametric | Parametrize | Angle** and **Cone angle**

Quad cursor menu: **Constraints | Angle** and **Cone angle** : **dmAngle3d Prompts you in the command bar:** Select first entity or specify [cone Angle constraint/World/Block]: **(Select a face or an edge.)** Select second entity [WOrld/BLock]: **(Select a face or an edge or select an option.)** Specify angle value (reference: Global XY plane) or [Set reference entity/Geometry-driven] <90.00>: **(Either press Enter to accept the current value, type a new value, select reference entity, or create geometry-driven constraint.)** Hit the TAB key to select obscured geometry.

Command Options

Option	Description
cone Angle constraint	Allows you to control the top angle of a cone (6.9.46) by specifying the angle between the axis and the cone face (= cone half angle). Prompts you: **Select a cone face:** - **(Select the face of a cone.) Specify angle value [Geometry-driven] <xx.xx>:** - **(Either hit Enter to accept the current value or type a new value. Values must be greater than 0° and smaller than 90°.)**
World	Allows you to select the WCS subentity as an argument. Prompts you: **Select reference coordinate system subentity [X axis/Y axis/Z axis/XY plane/YZ plane/ZX plane]:** - **(Select a reference coordinate system subentity as an argument.)**
Block	Allows you to choose, as an argument, the subentity of the coordinate system of the block. Prompts you: **Select block reference** - **(Select a block reference of which the reference coordinate system will be used as an argument.) Select reference coordinate system subentity [X axis/Y axis/Z axis/XY plane/YZ plane/ZX plane]** - **(Select a reference coordinate system subentity as an argument.)**

Set reference entity	Allows you to manually specify the reference entity. Prompts you: **Select reference entity** [Keep as is/WOrld/BLock/None]: • **Keep as is** : allows you to keep the proposed reference object; • **WOrld** : allows you to select the WCS subentity as an argument; • **BLock** : allows you to choose as an argument the subentity of the coordinate system of the block; • **None** : creates Angle constraint instead of Planar Angle constraint, without third argument.
Geometry-driven	Accepts the current value and creates a geometry-driven constraint (1.27.3).

Related Commands

MechanicalBrowserOpen (6.8.32) - displays the Mechanical Browser. DmConstraint3D (6.12.6) - applies geometric relationships and dimensional constraints between subentities (faces, surfaces, edges, etc) of 3D entities. DmUpdate (6.12.34) - Forces 3D constraints to update. DmCoincident3d (6.12.5) - applies a coincident constraint between two edges, two faces or an edge and a face of two different solids. DmConcentric3d (6.12.8) - applies a concentric constraint between two cylindrical, spherical or conical surfaces. DmDistance3d (6.12.10) - applies a distance constraint between two subentities of a solid or of different solids. DmFix3d (6.12.15) - Applies a fixed constraint to a solid or to the edge or face of a solid. DmParallel3d (6.12.18) - applies a parallel constraint between two faces of a single solid or two different solids. DmPerpendicular3d (6.12.20) - applies a perpendicular constraint between two faces of a solid or of different solids. DmRadius3d (6.12.22) - applies a radius constraint to cylindrical surfaces or circular edges. DmRigidSet3d (6.12.23) - Allows you to define a set of entities or subentities as a rigid body. DmTangent3d (6.12.32) - applies a tangent constraint between a face and a curved surface of different solids.

Figure 6.997

6.12.2 DmAudit

(6.2880 on page 5977) Fixes inconsistencies in 3d geometry supported by ACIS kernel (3D solids, surfaces). DmAudit is a powerful tool to analyze and automatically fix problems in 3D geometry, which are caused by incorrect operations or if geometry was created in another CAD package and imported using the Import (6.17.10) command. It is recommended to run DmAudit whenever 3D geometry is imported if the Import (6.17.10) command is not set up to do this automatically. After fixing 3D geometry using **DmAudit,** operations such as Boolean operations, direct modeling, and generating drawing views are possible. The DMAUDITLEVEL (1.17.10) system variable controls whether certain types of errors are reported by DmAudit or not. If set to 1 then modeling kernel dynamic range errors are ignored. If DMREPORTPANEL (1.17.10)= ON, BricsCAD reports the results in the Mechanical Browser / Report (6.8.35) panel instead of the command bar.

Accessing the Command

command bar: **dmaudit** menu bar: **Model | Direct Modeling | Audit** toolbar: **Direct Modeling | Audit** ribbon:

- Modeling Workspace
  - **Home | Direct Modeling | Audit**
  - **Solid | Direct Modeling | Audit**
  - **Surface | Direct Modeling | Audit**
- Mechanical Workspace
  - **Home | Solid editing | Audit**
  - **Solid | Edit | Audit**
  - **Sheet Metal | Heal | Audit**
- BIM workspace
  - **Modeling | Model Integrity | Audit**

Quad cursor menu: **Model | Audit** : **dmaudit Prompts you in the command bar.** Select entities to audit [Entire model] <Entire model>: **(Select an entity to include in the operation or press Enter to analyze the entire model.)** Entities in set: 1 Select entities to audit [Entire model] <Entire model>: **(Select more entities or press Enter.)** Entities in set: xx Choose action [Check/Fix/Settings] <Fix>: **(Choose an option or press Enter.)**

Command Options

Option	Description
Check	Checks the 3D geometry in the drawing for errors without attempting to fix them. Can be used to check whether a model has problems which prevent processing.
Fix	Checks the 3D geometry in the drawing for errors and attempts to fix them.

Settings	Prompts you: **Select setting [Back/report Panel/copy to File/audit Level/Coincident faces/Nested blocks] <Back>:** • Back: Returns to the main prompt of the command. • Report Panel: Redirects the output of the command to the Report (6.8.35) panel. • Copy to File: Reports the output of the command in a file. • audit Level: Allows to set the strictness of the check. Prompts you: **Set audit level [Low/Medium/High] <Medium>:** – The "Low" setting runs basic analysis (e.g., catching blatantly fatal topology errors). – The "High" setting goes deep (e.g., catching self-intersections in solid bodies). – The default audit level is "Medium". • Coincident faces: Checks and fixes coincident faces (requires audit level set to High). • Nested blocks: Checks and fixes entities in nested blocks.

Related Commands

DmAuditAll (6.12.3) - checks and heals flaws in drawings inserted as external references. DmSimplify (6.12.27) - simplifies the geometry and topology of 3d solid entities. DmSimplifyAll (6.12.35) - simplifies the geometry and topology of solids, within drawings inserted as external references. DmStitch (6.12.29) - converts a set of region and surface entities that bound a watertight area to a 3d solid. Import (6.17.10) - imports the geometry from external files into the current drawing.

Figure 6.998

6.12.3 DmAuditAll

(6.2880 on page 5977) Fixes inconsistencies in 3d geometry supported by ACIS kernel (3D solids, surfaces) in drawings inserted as external references. DmAuditAll is a powerful tool to analyze and automatically fix problems in 3D geometry in the file and in drawings inserted as external references. It is recommended to run DmAuditAll whenever 3D geometry is imported if the Import (6.17.10) command is not set up to do this automatically. After fixing 3D geometry using **DmAuditAll,** operations such as Boolean operations, direct modeling and generating drawing views are possible. The DMAUDITLEVEL (1.17.10) system variable controls whether certain types of errors are reported by DmAudit or not. If set to 1 then modeling kernel dynamic range errors are ignored. If DMREPORTPANEL (1.17.10)= ON, BricsCAD reports the results in the Mechanical Browser / Report (6.8.35) panel instead of the command bar.

DmSimplifyAll (6.12.35) - simplifies the geometry and topology of solids, within drawings inserted as external references. DmStitch (6.12.29) - converts a set of region and surface entities that bound a watertight area to a 3d solid. Import (6.17.10) - imports the geometry from external files into the current drawing.

Figure 6.999

6.12.4 DmChamfer

(6.2932 on page 6037) Creates equal distance and variable chamfers between adjacent faces sharing a sharp edge.

Accessing the Command

 **Chamfer**  **Constant asymmetrical chamfer**  **Constant angular chamfer**  **Variable symmetrical chamfer**  **Variable asymmetrical chamfer**  **Variable angular chamfer** command bar: **dmchamfer** menu bar: **Model | Direct Modeling | Chamfer | Chamfer, Constant asymmetrical chamfer, Constant angular chamfer, Variable symmetrical chamfer, Variable asymmetrical chamfer,** and **Variable angular chamfer** toolbar:

- **Direct Modeling | Chamfer | Chamfer, Constant asymmetrical chamfer, Constant angular chamfer, Variable symmetrical chamfer, Variable asymmetrical chamfer,** and **Variable angular chamfer**
- **Chamfer | Chamfer, Constant asymmetrical chamfer, Constant angular chamfer, Variable symmetrical chamfer, Variable asymmetrical chamfer, and Variable angular chamfer**

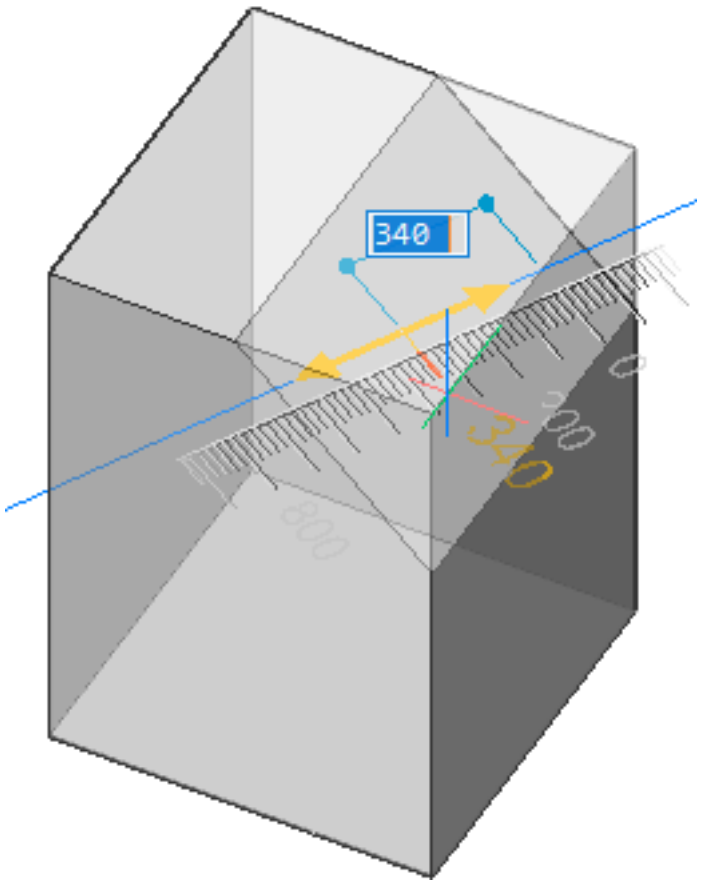
ribbon:

- Modeling Workspace
  - **Home | Direct modeling | Chamfer, Constant asymmetrical chamfer, Constant angular chamfer, Variable symmetrical chamfer, Variable asymmetrical chamfer,** and **Variable angular chamfer**
  - **Solid | Direct modeling | Chamfer, Constant asymmetrical chamfer, Constant angular chamfer, Variable symmetrical chamfer, Variable asymmetrical chamfer,** and **Variable angular chamfer**
  - **Surface | Direct modeling | Chamfer, Constant asymmetrical chamfer, Constant angular chamfer, Variable symmetrical chamfer, Variable asymmetrical chamfer,** and **Variable angular chamfer**
- Mechanical Workspace
  - **Home | Solid editing | Chamfer, Constant asymmetrical chamfer, Constant angular chamfer, Variable symmetrical chamfer, Variable asymmetrical chamfer,** and **Variable angular chamfer**
  - **Solid | Edit | Chamfer, Constant asymmetrical chamfer, Constant angular chamfer, Variable symmetrical chamfer, Variable asymmetrical chamfer,** and **Variable angular chamfer**
  - **Surface | Edit | Chamfer, Constant asymmetrical chamfer, Constant angular chamfer, Variable symmetrical chamfer, Variable asymmetrical chamfer,** and **Variable angular chamfer**

Quad cursor menu: **Model | Chamfer** : **dmchamfer Prompts you in the command bar:** Select edges to create chamfer or [Enable advanced mode/selection options (?)]: (Select the edges you want to chamfer. Press and hold the TAB key to select hidden geometry. Press Enter to stop selecting.) Specify constant symmetrical offset or [Enable advanced mode]: **(Specify the chamfer offset or choose an option.)** The chamfer is applied dynamically; the manipulator displays. (6.1000 on the next page) To specify the chamfer offset, do one of the following:

- Click to accept the current value in the ruler.
- Type a value, then press Enter.

Figure 6.1000



Command Options

Option	Description
Selection Options (?)	See the SELECT (6.27.16) command.

Enable advanced mode	Allows to create variable chamfers. The options are available in the **Chamfer** toolbar: (6.1001) Prompts you: **Specify dimensions kind [ASymmetrical/ANgular/Variable Symmetrical/VAriable aSymmetrical/VAriable aNgular]:** - choose an option. All advanced mode chamfer procedures start by creating a symmetrical offset, which is then modified by specifying offsets and/or angles. Before specifying the final value you can press the TAB key to modify previously specified values. • **Asymmetrical**: prompts you to specify two offsets. • **Angular**: prompts you to specify an offset and an angle. • **Variable Symmetrical**: prompts you to specify two offsets. • **Variable Asymmetrical***: prompts you to specify four offsets. • **Variable Angular***: prompts you to specify two pairs of an offset and an angle. * Creates a curved chamfer face.

Related Commands

Erase (6.13.8) - erases entities from the drawing and erases the faces and edges of 3D solids. DmExtrude (6.12.14) - creates a 3D solids by extruding closed 2D entities or regions. DmFillet (6.12.13) - creates a smooth fillet between adjacent faces sharing a sharp edge. DmMove (6.12.16) - moves the selected faces or edges of a solid using a vector. DmPushPull (6.12.25) - adds or removes volume from a solid by moving a face or surface. DmRevolve (6.12.21) - Creates 3D solids by revolution of closed 2D entities or regions about an axis. DmRotate (6.12.24) - rotates faces of a solid around an axis. Chamfer (6.9.9) - creates chamfers; adds an angle to intersections. Fillet (6.14.6) - fillets intersections; joins intersecting lines with an arc of any suitable radius.

Figure 6.1001

Figure 6.1002

6.12.5 DmCoincident3d

(6.2673 on page 5786) Applies a coincident constraint between two edges, two faces or an edge and a face of two different solids; as well as between a point and a spline, helix, ellipse, polyline, cylinder, and sphere.

Accessing the Command

 and command bar: **dmcoincident3d** menu bar: **Parametric | 3D Constraints | Coincident** toolbar: **3D Constraints | Coincident** ribbon:

Quad: **Constraints | Coincident** : **dmCoincident3d Prompts you in the command bar:** Select a pair of subentities or [Autoconstrain/WOrld/BLock] <Autoconstrain>: **(Select the first edge or face or press Enter.)** Select second subentity [WOrld/BLock]: **(Select the second edge or face.)** Press the TAB key to select obscured geometry.

Command Options

Option	Description
Autoconstrain	Automatically creates a coincident constraint between each pair of connected faces in selection of solids. Prompts you: **Select a set of entities: (Select at least two solids.)** Entities in set: 2 **Select a set of entities: (Select more solids or press Enter.)** You can check which constraints are created in the Mechanical Browser (3.3.2) panel.
World	Allows you to select the WCS subentity as an argument; prompts you: **Select reference coordinate system subentity [Origin/X axis/Y axis/Z axis/XY plane/YZ plane/ZX plane]** - **(Select a reference coordinate system subentity as an argument.)**
Block	Allows you to choose as an argument the subentity of the coordinate system of the block; prompts you: **Select block reference** - **(Select a block reference of which the reference coordinate system will be used as an argument.) Select reference coordinate system subentity [Origin/X axis/Y axis/Z axis/XY plane/YZ plane/ZX plane]** - **(Select a reference coordinate system subentity as an argument.)**

Related Commands

DmUpdate (6.12.34) - Forces 3d constraints to update. DmAngle3d (6.12.1) - applies an angle constraint between two faces of a solid or of different solids. DmConcentric3d (6.12.8) - applies a concentric constraint between two cylindrical, spherical or conical surfaces. DmDistance3d (6.12.10) - applies a distance constraint between two subentities of a solid or of different solids. DmFix3d (6.12.15) - Applies a fixed constraint to a solid or to an edge or a face of a solid. DmParallel3d (6.12.18) - applies a parallel constraint between two faces of a solid or of different solids. DmPerpendicular3d (6.12.20) - applies a perpendicular constraint between two faces of a solid or of different solids. DmRadius3d (6.12.22) - applies a radius constraint to cylindrical surfaces or circular edges. DmRigidSet3d (6.12.23) - Allows to define a set of entities or subentities as a rigid body. DmTangent3d (6.12.32) - applies a tangent constraint between a face and a curved surface of different solids.

Figure 6.1003

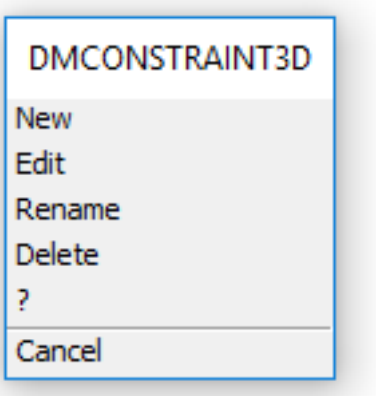
6.12.6 DmConstraint3d

(6.2673 on page 5786) Applies geometric relationships and dimensional constraints between subentities (faces, surfaces, edges, ...) of 3D entities.

Accessing the Command

command bar: **DmConstraint3d** : **dmconstraint3d Prompts you in the command bar:** Enter option [New/Edit/Rename/Delete/? <?>: **(select an option or press Enter to list the constraints in the Prompt History window.)** (6.1004)

Figure 6.1004



Command Options

Option	Description
New	Allows to create a new parameter; prompts you: **Specify 3D constraint type [Fix /Coincident /PAth /CONcentric /Parallel /PErpendicular /Tangent /RIgidset /Distance /Radius /Angle]: - (Type a 3D constraint type.)** • **Fix** : Applies a fixed constraint to a solid or to an edge or a face of a solid. The option is equivalent to the DmFix3d (6.12.15) command (===ERROR WITH DOWNLOADED IMAGE===). • **Coincident:** Applies a coincident constraint between two edges, two faces, or an edge and a face of two different solids. The option is equivalent to the DmCoincident3d (6.12.5) command (===ERROR WITH DOWNLOADED IMAGE===). • **PAth** : Allows a point to move along a curve by specifying the curve's parameters with an expression. The option is equivalent to the DmPath3D (6.12.19) command (===ERROR WITH DOWNLOADED IMAGE===). • **CONcentric** : Applies a concentric constraint between two cylindrical, spherical or conical surfaces. The option is equivalent to the DmConcentric3d (6.12.8) command (===ERROR WITH DOWNLOADED IMAGE===). • **Parallel** : Applies a parallel constraint between two faces of a solid or of different solids. The option is equivalent to the DmParallel3d (6.12.18) command (). • **PErpendicular** : Applies a perpendicular constraint between two faces of a solid or of different solids. The option is equivalent to the DmPerpendicular3d (6.12.20) command (). • **Tangent** : Applies a tangent constraint between a face and a curved surface of different solids. The option is equivalent to the DmTangent3d (6.12.32) command (). • **RIgidset** : Allows to define a set of entities or subentities as a rigid body. The option is equivalent to the DmRigidSet3d (6.12.23) command (). • **Distance** : Applies a distance constraint between two subentities of a solid or of different solids. The option is equivalent to the DmDistance3d (6.12.10) command (). • **Radius** : Applies a radius constraint to cylindrical surfaces or circular edges. The option is equivalent to the DmRadius3d (6.12.22) command (). • **Angle** : Applies an angle constraint between to faces of a solid or of different solids. The option is equivalent to the DmAngle3d (6.12.1) command ().

Edit	Allows to edit the selected constraint; prompts you: **Enter constraint name: - (Type the name of a constraint.) Enter option [Enable/Value/eXpose/Geometry-driven/Properties]: - (choose an option)** • **Enable** : toggles the selected constraint ON/OFF. • **Value** : type a value in the command bar. • **eXpose** : choose whether the parameter is visible and can be modified when the component is inserted in an assembly; prompts you: **Set expose mode [ON/OFF/Auto] <Auto>: - (choose an option):** – **Auto** : the parameter is exposed only if it does not depend on other parameters. – **ON** : the parameter is always exposed. – **OFF** : the parameter is never exposed. • **Geometry-driven** : for parametric constraints, choose whether the constraint is ordinary or geometry-driven; Prompts you: **Specify whether the constraint should be geometry-driven [Yes/No]** • **Properties** : allows to edit properties of the selected constraint; prompts you: – **Select property [Use as/Placements]:** or **Select property [Placements/Directions]: - (choose an option)**: * **Use as - (chose which geometry is used in a 3D constraint to measure; prompts you)**: **Specify how to use the first argument [Boundary/Center] <Center>: - (choose an option or press Enter to keep the Center option.)** · Boundary means that the constraint is applied to the boundary of the argument; · Axis is applied to an argument that has axis, namely: circle, cylinder, cone, or torus; · Center is applied to an argument that has central point, namely: circle, sphere, or torus; · Vertex can be applied to the cone vertex only. * **Placements - (specify how to place an argument with respect to another argument of the same constraint)**; prompts you: **Specify placement of the first argument [Any /Outside /Inside /Keep] <Keep>: - (choose an option or press Enter to keep the current placement of the argument.)** · Outside - argument placement outside of another argument; · Inside - argument placement inside of another argument; · Any - both Outside and Inside placement is suitable for user's intentions; · Keep - keep the current placement of the argument. By default Keep option is used.

Rename	Allows to rename a constraint; prompts you: **Enter constraint name:** - **(Type the name of a constraint.)** **Enter new constraint name:** - **(Type the new name of a constraint.)**
Delete	Allows to delete a constraint; prompts you: **Enter constraint name:** - **(Type the name of a constraint.)**

You can use the Mechanical Browser (3.3.2) to edit 3D Constraints Properties. (1.27.4)

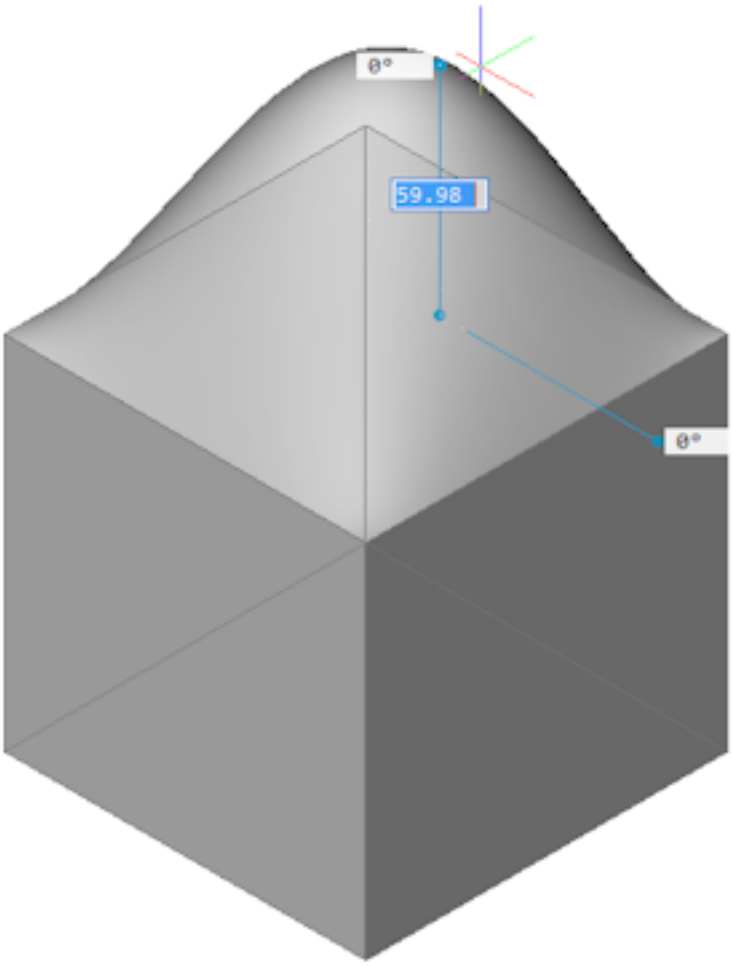
Figure 6.1009



Command Options

Option	Description
Change Parameters	Prompts you: **Change parameter [Alpha/Beta/Gamma/Delta] <done>:** • **Alpha** : Specifies the resistance to stretching. It is a second order tensor which can be described with three numbers. Each value must be either 0 or a positive number: – alpha U: U-direction resistance, – alpha V: V-direction resistance, – alpha theta: the angle between U and V principal directions of the surface and the material property directions. • **Beta** : Specifies the resistance to bending. Similarly to Alpha, Beta is defined as a triple: beta U, beta V, beta theta. Each value must be either 0 or a positive number. • **Gamma** : Specifies the resistance to the rate of change in bending. The value must be either 0 or a positive number. • **Delta** : Specifies the resistance to deviations from the default shape. The value must be either 0 or a positive number.
Set Target Point	Prompts you: **Specify deformation target point: - (Specify a point.)** The entities are deformed towards the specified point.
Set Direction	Prompts you: **Select axial entity or define direction by [2Points/Xaxis/Yaxis/Zaxis] <2Points>: (Choose an option or press Enter to define the extrusion direction by specifying two points.)** The selected entities are deformed dynamically in the specified direction. Prompts you: **Specify deformation value or [set Target point/set Direction/change Base point]: - (Specify a point or type a value or choose an option.)**
Change Base Point	Prompts you: **Specify new deformation point: - (Specify a point.)** Prompts you: **Specify deformation value or [set Target point/set Direction/change Base point]: - (Specify a point or type a value or choose an option.)**

Press Enter to stop selecting.)** Specify radius to fillet edges or [Variable radius mode]: **(Specify the fillet radius or choose an option.)** The fillet is applied dynamically. To define the fillet radius, do one of the following:

- Click to accept the current value in the ruler.
- Type a value and press Enter.

Command Options

Option	Description
Selection Options (?)	See the SELECT (6.27.16) command.

Variable radius 

Allows to create a variable fillet between adjacent faces that share a sharp edge(s). Prompts you: **Specify first radius to fillet edges or [Constant radius mode/Second radius]** - specify a value or choose an option.

- **Constant Radius**: switch to constant radius mode.
- **Second Radius**: define the second radius first.

Specify second radius to fillet edges or [Constant radius mode/First radius] - specify a value or choose an option.

- **Constant Radius**: switch to constant radius mode.
- **First Radius**: go back to the first radius.

To specify the value of a radius do one of the following:

- Click to accept the current value in the ruler.
- Type a value and press Enter.

Related Commands

DmChamfer (6.12.4) - creates equal distance and variable chamfers between adjacent faces sharing a sharp edge. DmDelete - deletes faces and solids. DmExtrude (6.12.14) - creates a 3D solids by extruding closed 2D entities or regions. DmMove (6.12.16) - moves the selected faces or edges of a solid using a vector. DmPushPull (6.12.25) - adds or removes volume from a solid by moving a face or surface. DmRevolve (6.12.21) - Creates 3D solids by revolution of closed 2D entities or regions about an axis. DmRotate (6.12.24) - rotates faces of a solid around an axis. Chamfer (6.9.9) - creates chamfers; adds an angle to intersections. Fillet (6.14.6) - fillets intersections; joins intersecting lines with an arc of any suitable radius.

Figure 6.1016

6.12.14 DmExtrude

(6.2932 on page 6037) Creates 3D solids or surfaces by extruding open or closed 2D entities, faces of 3D solids, regions or closed boundaries. Optionally adds volume to solids or removes volume from solids.

Accessing the Command

 **Solid mode**  **Surface mode** command bar: **dmextrude** menu bar: **Model | Direct Modeling | Extrude solid** and **Extrude surface** toolbar: **Direct Modeling | Extrude solid** and **Extrude surface** ribbon:

- Modeling Workspace
  - **Home | Direct Modeling | Extrude solid**
  - **Solid | Direct Modeling | Extrude solid**
  - **Surface | Direct Modeling | Extrude surface**
- Mechanical Workspace
  - **Home | Model | Extrude solid**
  - **Solid | Create | Extrude solid**
  - **Surface | Create | Extrude surface**
  - **Sheet Metal | Edit | Extrude solid**
- BIM Workspace
  - **Home | Modify| Extrude solid**
  - **Modeling | Modify | Extrude solid**

Quad cursor menu: **Model | Extrude solid** and **Extrude surface** : **dmExtrude** When launched from the command bar, menu bar, toolbar or ribbon: **Prompts you in the command bar:** Select entities/subentities to extrude or set [MOde]: **(Select a region or a closed 2D entity (closed polylines, circles and ellipses are accepted) or a face of solid.)** Entities in set: 1 Select entities/subentities to extrude or set [MOde]: **(Select another entity or subentity or press Enter to stop selecting entities.)** When launched from the Quad cursor menu: First select the entity, entities or boundary to be extruded. Closed 2D entities (1)(2) and regions (3) are accepted. Closed boundaries in the XY-plane of the current coordinate system (4) or on the face of a solid (5) are recognized automatically if the **Select detected boundaries** option () on the **Selection Modes** toolbar is active.

(6.1020 on page 4288)	(6.1021 on page 4288)	(6.1022 on page 4288)	(6.1023 on page 4289)	(6.1024 on page 4289)
1	2	3	4	5

Do one of the following:

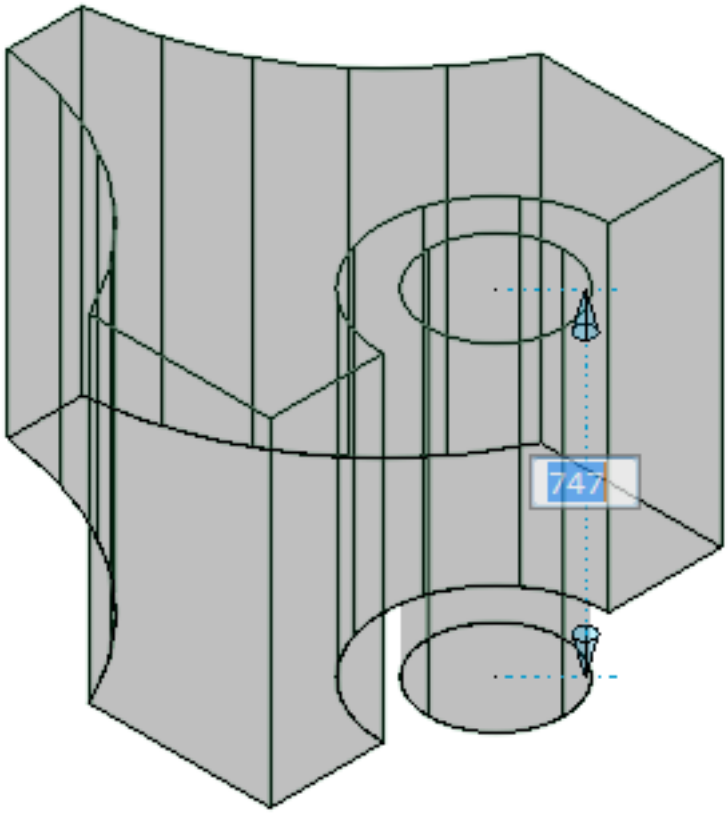
- Launch the command when the desired entity or boundary highlights.
- To extrude multiple entities: compose a selection set, then launch the command. Click to add the highlighted entity to the selection.

Solid mode: Specify height of extrusion or [Auto(subtract or create)/Create/SUbtract/Unite/Both sides/Taper angle/Direction/Limit] <Auto>: The selected entities are extruded dynamically. **(Move the mouse to specify the extrusion direction.)** The extrusion direction is perpendicular to the selected entity or entities. Do one of the following to define the height of the extrusion:

- Specify a point in the drawing.
- Type a value in the dynamic entry field.
- Choose the Limit option.

(6.1017 on the next page)

Figure 6.1017



Surface mode: Specify height of extrusion or set [Auto/Create/Slice/Both sides/Taper angle/Direction] <Auto>: The selected entities are extruded dynamically. Move the mouse to specify the extrusion direction. The extrusion direction is perpendicular to the selected entity or entities unless the **Direction** option is selected. Do one of the following to define the height of the extrusion:

- Specify a point in the drawing.
- Type a value in the dynamic entry field.

Command Options

Option Description Mode Allows to create either solids or surfaces. Prompts you: **Choose type of created entity [SOlid/SUrface] <Solid>:**

- Solid : creates solids.
- Surface: creates surfaces.

The **Extrude** tool ( ) starts the command in **Solid** mode. The **Extrude Surface** tool ( ) starts the command in **Surface** mode. Select Entities Click an entity or choose an option in the dmExtrude prompt menu. Depending on the value of the DELOBJ (1.17.10) (Delete Object) system variable, the defining entities are either retained or deleted or you are prompted whether to keep or delete the source entities. Taper Angle Specifies the taper angle for the extrusion. Prompts you: **Specify taper angle value in degrees - (type a value in the command bar.)** The angle is measured from the extrusion direction. A negative value tapers outwards. This option allows to create (truncated) pyramids and cones. (6.1025 on page 4289) If **Dynamic Dimensions** are ON, press the TAB key to jump to the **Taper Angle** field, then type the desired value and press the TAB key again to apply the new value. (6.1026 on page 4290) Direction Allows to specify the extrusion direction. Prompts you: **Select axial entity or define direction by [2Points/Xaxis/Yaxis/Zaxis] <2Points>:** Select an option:

- 2 Points: Define the extrusion direction by specifying two points.
- X axis: Sets the extrusion direction parallel to the X axis of the current UCS.
- Y axis: Sets the extrusion direction parallel to the Y axis of the current UCS.
- Z axis: Sets the extrusion direction parallel to the Z axis of the current UCS.

Limit Allows to limit the extrusion by the face of a solid. Prompts you: **Select face or 3d solid to limit extrude: (Move the cursor over a face, then click when the face highlights.)**

Figure 6.1018

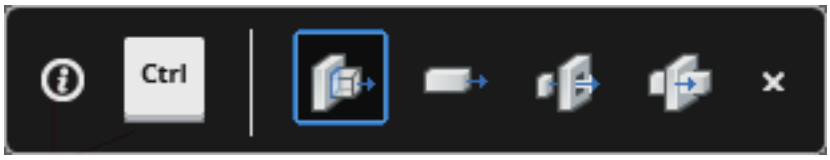


Figure 6.1019

(6.1027 on page 4290) 1. Select entities. 2. Launch DMEXTRUDE.	(6.1028 on page 4290) 3. Choose Limit option. 4. Select cylindrical face.	(6.1029 on page 4291) Result

The SELECTIONPREVIEW (1.17.10) system variable must be set to 2 or 3 to highlight faces. Press the TAB key to subsequently highlight overlapping faces. Auto* The result depends on the extrusion direction of the 3D solid and the value of the DMEXTRUDEMODE (1.17.10) system variable.

- when extruded inside the existing solid, the new solid is subtracted from the existing solid (right). (6.1030 on page 4291)
- when extruded outside the existing solid (left) the result depends on the value of the DMEXTRUDEMODE (1.17.10) system variable, which is stored as the sum of the value of the selected options.
- 0 : the new solid is unified with the existing solid. There is no interaction with intersecting solids. This is the default option for 3D Modelling.
- 1 : a separate solid is created which is unified with intersecting solids.
- 2 : the new solid is unified with the existing solid and subtracted from intersecting solids.
- 3 : a separate solid is created and subtracted from intersecting solids. This is the default option for BIM.
- 4 : the new solid is unified with the existing solid, intersecting solids left intact.
- 5 : a separate solid is created, intersecting solids are left intact.

Create* Regardless of the extrusion direction, a new 3D solid is created. Subtract* The 3D solid is subtracted from each interfering existing solid. Unite* The new 3D solid is unified with each interfering existing solid. Slice* The extruded surface cuts through solids, much like the Slice (6.27.40) command. Both Sides Extrudes the selected boundary (solid mode) or linear entities (surface mode) symmetrically at both sides. * Repeatedly hit the CTRL key during the dynamic display of the extrusion to cycle the various options:

- Auto / Create / Subtract / Unite (solid mode)
- Auto / Create / Slice (surface mode)

The behavior of the **Auto** option is controlled through the DMEXTRUDEMODE (1.17.10) system variable. The value of the variable is the sum of the selected bitcodes.

- **1**: Set **OFF** to unite with, or **ON** to create a new solid when extruding a contour lying on the face of a solid, away from that solid.
- **2**: Set **OFF** to unite with, or **ON** to subtract from solids which intersect with the created volume.
- **4**: Set **ON** to modify solids which intersect with the created volume.

If the Hotkey Assistant (HKA) is ON the Hotkey Assistant widget displays: Solid Mode: (6.1038 on page 4300)

- ===ERROR WITH DOWNLOADED IMAGE=== : Auto
- ===ERROR WITH DOWNLOADED IMAGE=== : Create
- ===ERROR WITH DOWNLOADED IMAGE=== : Subtract
- ===ERROR WITH DOWNLOADED IMAGE=== : Unite

Surface Mode: (6.1019)

- ===ERROR WITH DOWNLOADED IMAGE=== : Auto
- ===ERROR WITH DOWNLOADED IMAGE=== : Create
- ===ERROR WITH DOWNLOADED IMAGE=== : Slice

6.12.15 DmFix3d

(6.2673 on page 5786) Applies a fixed constraint to a solid or to an edge or a face of a solid.

Accessing the Command

 command bar: **dmfix3d** menu bar: **Parametric | 3D Constraints | Fix** toolbar: **3D Constraints | Fix** ribbon:

- Modeling Workspace
  - **Home | Parametrize | Fix**
  - **Solid | Parametrize | Fix**
  - **Parametric | Parametrize | Fix**
- Mechanical Workspace
  - **Home | Parametrize | Fix**
  - **Solid | Parametrize | Fix**
  - **Surface | Parametrize | Fix**
  - **Sheet Metal | Parametrize | Fix**
  - **Assembly | 3D Constraints | Fix**
- BIM Workspace
  - **Parametric | Parametrize | Fix**

Quad cursor menu: **Constraints | Fix** : **dmFix3d Prompts you in the command bar:** Select an edge, face or 3D solid or [Multiple/BLock]: **(Select a solid, or an edge or a face of a solid.)** Press the TAB key to select obscured geometry.

Command Options

Option	Description
Solid	All faces and edges of the solid are fixed.
Face	The selected face is fixed and cannot be moved or rotated.
Edge	The selected edge is fixed. The adjacent faces can be rotated, but not moved.
Multiple	Allows to select multiple entities or subentities; prompts you: **Select edges, faces or 3D entities - (Select a solid, or an edge or a face of a solid)** Entities in set: 1 **Select edges, faces or 3D entities - (Select more solids, edges or faces of solids or press Enter.)**
Block	Allows you to choose as an argument the subentity of the coordinate system of the block; prompts you: **Select block reference - (Select a block reference of which the reference coordinate system will be used as an argument.) Select reference coordinate system subentity [Origin/X axis/Y axis/Z axis/XY plane/YZ plane/ZX plane] - (Select a reference coordinate system subentity as an argument.)**

Related Commands

MechanicalBrowserOpen (6.8.32) - displays the Mechanical Browser. DmConstraint3D (6.12.6) - applies geometric relationships and dimensional constraints between subentities (faces, surfaces, edges, ...) of 3D entities. DmUpdate (6.12.34) - Forces 3d constraints to update. DmCoincident3d (6.12.5) - applies a coincident constraint between two edges, two faces or an edge and a face of two different solids. DmConcentric3d (6.12.8) - applies a concentric constraint between two cylindrical, spherical or conical surfaces. DmParallel3d (6.12.18) - applies a parallel constraint between two faces of a solid or of different solids. DmPerpendicular3d (6.12.20) - applies a perpendicular constraint between two faces of a solid or of different solids. DmRigidSet3d (6.12.23) - Allows to define a set of entities or subentities as a rigid body. DmTangent3d (6.12.32) - applies a tangent constraint between a face and a curved surface of different solids. DmAngle3d (6.12.1) - applies an angle constraint between two faces of a solid or of different solids. DmDistance3d (6.12.10) - applies a distance constraint between two subentities of a solid or of different solids. DmRadius3d (6.12.22) - applies a radius constraint to cylindrical surfaces or circular edges.

Figure 6.1032

6.12.16 DmMove

(6.2932 on page 6037) Moves solids, faces, edges, or vertices of a solid, or inserts using a vector.

Accessing the Command

 command bar: **dmmove** menu bar: **Model | Direct Modeling | Move** toolbar: **Direct Modeling | Move** ribbon:

- Modeling Workspace
  - **Home | Direct modeling | Move**
  - **Solid | Direct modeling | Move**
  - **Surface | Direct modeling | Move**
- Mechanical Workspace
  - **Home | Modify | Move**
  - **Solid | Edit | Move**
  - **Surface | Edit | Move**
  - **Sheet Metal | Edit | Move**
  - **Assembly | Transform | Move**
- BIM Workspace
  - **Modeling | Modify | Move**

Quad cursor menu: **Model | Move** : **dmmove Prompts you in the command bar:** Select several entities/subentities: **(Select the geometry you want to move. Press and hold the TAB key to select hidden geometry. Press Enter to stop selecting)** Enter base point <0,0,0>: **(Specify the base point for the move operation.)** Enter second point: **(Specify the endpoint for the move operation.)** The selected geometry moves dynamically. To specify the endpoint, do one of the following:

- Click the left mouse button.
- Type a value in the dynamic input field.

Related Commands

Align (6.4.7) - aligns one entity with another through moving, rotating, and scaling. DmChamfer (6.12.4) - creates an equal distance chamfer between adjacent faces sharing a sharp edge. DmDelete - deletes faces and solids. DmExtrude (6.12.14) - creates a 3D solids by extruding closed 2D entities or regions. DmFillet (6.12.13) - creates a smooth fillet between adjacent faces sharing a sharp edge. DmPushPull (6.12.25) - adds or removes volume from a solid by moving a face or surface. DmRevolve (6.12.21) - Creates 3D solids by revolution of closed 2D entities or regions about an axis. DmRotate (6.12.24) - rotates faces of a solid around an axis.

Figure 6.1033

6.12.17 DmGroup

(6.2673 on page 5786) Creates group features, which are named persistent collections of faces and edges of 3D solids and surfaces. A group feature can be coupled with its description, which can be used to store manufacturing instructions or any other information with your model. Group features usually survive after modification of 3D solids/surfaces and can be accessed or created in Lisp scripts and BRX applications.

Accessing the Command

command bar: **dmgroup** : **dmgroup Prompts you in the command bar:** Enter parameter option [New/Edit/Dissolve] <New>: **(Press Enter to create a new group or choose an option.)** Enter name for new group <Group_1>: **(Enter name* of the new group feature or press Enter to accept the Group_xx default name.)** Select entities: **(Select faces or edges of solids.)** Entities in set: 1 Select entities: **(Select more faces or edges of 3D solids or press Enter to stop selecting)** Enter description for new group: **(Type a description. which appears in the Description field of the feature in Mechanical browser (6.8.32) or press Enter to keep the description field empty.)**

Command Options

Option	Description
Edit	Allows to edit an existing group feature. Prompts you: **Enter name of group** * - **(type the name of the group to be edited.) Select entities** - **(Select faces or edges of solids.)** Entities in set: 1 **Select entities** - **(Select more faces or edges of 3D solids or press Enter to stop selecting.)** The new selection replaces the previous collection.
Dissolve	Allows to delete an existing group feature. Prompts you: **Enter name of group** * - **(type the name of the group to be removed.)** The group feature is deleted.

* Group feature names are case sensitive.

Related Commands

Group (6.15.26) - creates and modifies named groups of entities. DmSelect (6.12.28) - selects edges and faces of 3D solids or surfaces based on their geometric properties. DmSelectEdges (6.12.26) - selects the edges of faces and solids. SmSelect (6.28.32) - selects hard edges or form features.

Figure 6.1034

6.12.18 DmParallel3d

(6.2673 on page 5786) Applies a parallel constraint between two faces of a solid or of different solids.

Accessing the Command

command bar: **dmparallel3d** menu bar: **Parametric | 3D Constraints | Parallel** toolbar: **3D Constraints | Parallel** ribbon:

Figure 6.1037

6.12.21 DmRevolve

(6.2932 on page 6037) Creates 3D solids or surfaces by revolution of open or closed 2D entities or regions about an axis.

Accessing the Command

 **Revolve solid**  **Revolve surface** command bar: **dmrevolve** menu bar: **Model | Direct Modeling | Revolve** toolbar: **Direct Modeling | Revolve solid** and **Revolve surface** ribbon:

- Modeling Workspace
  - **Home | Direct Modeling | Revolve solid**
  - **Solid | Direct Modeling | Revolve solid**
  - **Surface | Direct Modeling | Revolve surface**
- Mechanical Workspace
  - **Home | Model | Revolve solid**
  - **Solid | Create | Revolve solid**
  - **Surface | Create | Revolve surface**

Quad cursor menu: **Model | Revolve solid** and **Revolve surface** : **dmRevolve** When launched from the command bar, menu bar, toolbar, or ribbon: **Prompts you in the command bar:** Select entities/subentities to revolve: Select planar entities/subentities to revolve or set [MOde]: **(Select a region or a closed 2D entity (closed polylines, circles, and ellipses are accepted) or a face of solid.)** Entities/subentities in set: 1 Select planar entities/subentities to extrude or set [MOde]: **(Select another entity or subentity or press Enter to stop selecting entities.)** When launched from the Quad cursor menu: First select the entity, entities or boundary to be extruded. Closed 2D entities (1)(2) and regions (3) are accepted. Closed boundaries in the XY-plane of the current coordinate system (4) or on the face of a solid (5) are recognized automatically if the **Select detected boundaries** option () on the **Selection Modes** toolbar is active.

(6.1039 on page 4301) 1	(6.1040 on page 4301) 2	(6.1041 on page 4301) 3	(6.1042 on page 4301) 4	(6.1043 on page 4302) 5

Do one of the following:

- Launch the command when the desired entity or boundary highlights.
- To revolve multiple entities: compose a selection set, then launch the command.

Solid mode: Select axial entity or define axis by [2Points/Xaxis/Yaxis/Zaxis] <2Points>: **(Select a linear entity, or select an option, or right click to define the axis by two points.)** The selected entities are revolved dynamically. Move the mouse to specify the angle direction. Specify angle of revolving or [Auto/Create/SUbtract/Unite] <Auto>: **(Choose an option, then specify the angle.)**

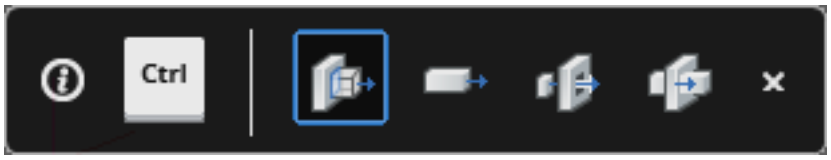
Surface mode: Select axial entity or define axis by [2Points/Xaxis/Yaxis/Zaxis] <2Points>: **(Select a linear entity, or select an option, or right click to define the axis by two points.)** The selected entities are revolved dynamically. Move the mouse to specify the angle direction. Specify angle of revolving or [Auto/Create] <Create>:

Command Options

Option Description Mode Allows to create either solids or surfaces. Prompts you: **Choose type of created entity [SOlid/SUrface] <Solid>:**

- Solid: creates solids.
- Surface: creates surfaces.

Figure 6.1038



The **Revolve** tool ( ) starts the command in **Solid** mode. The **Revolve Surface** tool ( ) starts the command in **Surface** mode. Select Entities/Subentities to extrude Click an entity or choose an option in the dmRevolve prompt menu. Depending on the value of the DELOBJ (1.26.1) (Delete Object) system variable, the defining entities are either retained or deleted or you are prompted whether to keep or delete the source entities. Select a linear (sub)entity as axis or define axis by <2Points>/Xaxis/Yaxis/Zaxis: Select a line or an edge of a solid. Edges of a solid can only be selected if the **Edges** option of the SELECTIONMODES (1.17.10) system variable is set. Click the **Edges** tool button ( ) on the **Selection Modes** toolbar to toggle this setting. A pressed button indicates the option is set. 2Points Specify start point of axis <0,0,0>: Specify the start point of the axis or press Enter to accept the origin point of the current UCS. Specify endpoint of the axis or <use axis parallel to view direction>: Specify the end point of the axis or press Enter to set the axis parallel to the view direction (= perpendicular to the screen). Zaxis Uses the x axis of the current UCS as the axis of revolution Yaxis Uses the y axis of the current UCS as the axis of revolution. Xaxis Uses the z axis of the current UCS as the axis of revolution. Press the CTRL key to cycle the various options. Auto* The result depends on the extrusion direction of the 3D solid and the value of the DMEXTRUDEMODE (1.17.10) system variable.

- when revolved inside the existing solid, the new solid is subtracted from the existing solid.
- when revolved outside the existing solid:
- If DMEXTRUDEMODE = 0: the new solid is unified with the existing solid (Auto (Subtract or Unite))
- If DMEXTRUDEMODE = 1: a separate solid is created (Auto (Subtract or Create))

Create* Regardless of the revolving direction, a new 3D solid is created. Subtract* The 3D solid is subtracted from each interfering existing solid. Unite* The new 3D solid is unified with each interfering existing solid. * Repeatedly hit the CTRL key during the dynamic display of the extrusion to cycle the various options: Auto / Create / Subtract / Unite showing the result of the currently selected option. If Hotkey Assistant (HKA) is ON the Hotkey Assistant widget displays : Solid mode: (6.1038)

- ===ERROR WITH DOWNLOADED IMAGE=== : Auto

Figure 6.1046

6.12.24 DmRotate

(6.2932 on page 6037) Rotates solids, faces, edges, or vertices of a solid around an axis.

Access the Command

command bar: **dmrotate** menu bar: **Model | Direct Modeling | Rotate** toolbar: **Direct Modeling | Rotate** ribbon:

- Modeling Workspace
  - **Home | Direct Modeling | Rotate**
  - **Solid | Direct Modeling | Rotate**
  - **Surface | Direct Modeling | Rotate**
- Mechanical Workspace
  - **Home | Modify | Rotate**
  - **Solid | Edit | Rotate**
  - **Surface | Edit | Rotate**
  - **Assembly | Transform | Rotate**
- BIM Workspace
  - **Modeling | Modify | Rotate**

Quad cursor menu: **Model | Rotate** : **dmrotate Prompts you in the command bar: Select several entities/subentities: (Select the solids, faces, edges, or vertices of a solid you want to rotate. Press and hold the TAB key to select hidden geometry. Hit Enter to stop.) Click to start rotation, select axial entity or define axis by [2Points/Xaxis/Yaxis/Zaxis/Start] <Start>: (Click to start the rotation, select an axial entity or choose an option)** The rotation axis (blue) and a rotation arc display. **Specify rotation angle:** (**Click a point or type a value in the dynamic angle field**.) or if vertices are rotated **Specify rotation angle or [Triangulation/Rotate]:** (**Click a point, type a value in the dynamic angle field, or choose an option**.)

Command Options

Option Description Select axial entity Allows to select any linear entity in the model as the rotation axis. To select the rotation axis, do one of the following:

- Hover over a line or linear polyline segment. Click when the entity highlights.
- Hover over a 3D solid face, then move the cursor close to the edge you want to use as the rotation axis. A rotation arc and the rotation axis (blue) display dynamically. Click to accept the rotation axis.

(6.1047 on the facing page) 2Points Prompts you in the command bar. **Specify start point of axis <0,0,0>** - **(Specify a point or right-click to use the origin of the current coordinate system.) Specify end point of axis or <use axis parallel to view direction>** - **(Specify a point or right-click to define the axis parallel to the current view direction - perpendicular to the screen.)** Xaxis Rotates the selection around the X-axis of the current coordinate system. Yaxis Rotates the selection around the Y-axis of the current coordinate system. Zaxis Rotates the selection around the Z-axis of the current coordinate system. Start Allows you to select the axial entity (if the cursor is over a linear edge) or define orientation dynamically (if the cursor is over a planar face). When rotating vertices Triangulation Allows to rotate a vertex with triangulation of adjacent faces. ===ERROR WITH DOWNLOADED IMAGE=== Rotate Rotates a vertex without triangulation of adjacent faces. ===ERROR WITH DOWNLOADED IMAGE=== If the Hotkey Assistant (HKA) is ON the Hotkey Assistant widget displays during vertex rotating: ===ERROR WITH DOWNLOADED IMAGE===

- ===ERROR WITH DOWNLOADED IMAGE=== : Triangulation
- ===ERROR WITH DOWNLOADED IMAGE=== : Rotate

DmChamfer (6.12.4) - creates an equal distance chamfer between adjacent faces that share a sharp edge. DmDelete - deletes faces and solids. DmExtrude (6.12.14) - extrudes closed 2D entities or regions to create 3D solids. DmFillet (6.12.13) - creates a smooth fillet between adjacent faces that share a sharp edge. DmMove (6.12.16) - moves the selected faces or edges of a solid with a vector. DmPushPull (6.12.25) - moves a face or surface to add or remove a volume from a solid. DmRevolve (6.12.21) - revolves closed 2D entities or regions about an axis to create 3D solids.

Figure 6.1048

6.12.25 DmPushPull

(6.2932 on page 6037) Adds or removes volume from a solid by moving/offsetting a face. The command can also be used to edit faces of a surface.

Accessing the Command

Command bar: **dmpushpull** Menu bar:**Model | Direct Modeling | Push/Pull** Toolbar:**Direct Modeling | Push/Pull** Ribbon:

- Modeling Workspace
  - **Solid | Direct Modeling | Push/Pull**
  - **Surface | Direct Modeling | Push/Pull**
- Mechanical Workspace
  - **Home | Solid Editing | Push/Pull**
  - **Solid | Edit | Push/Pull**
  - **Surface | Edit | Push/Pull**
  - **Sheet metal | Edit | Push/Pull**
- BIM Workspace
  - **Home | Modify | Push/Pull**
  - **Modeling | Modify | Push/Pull**

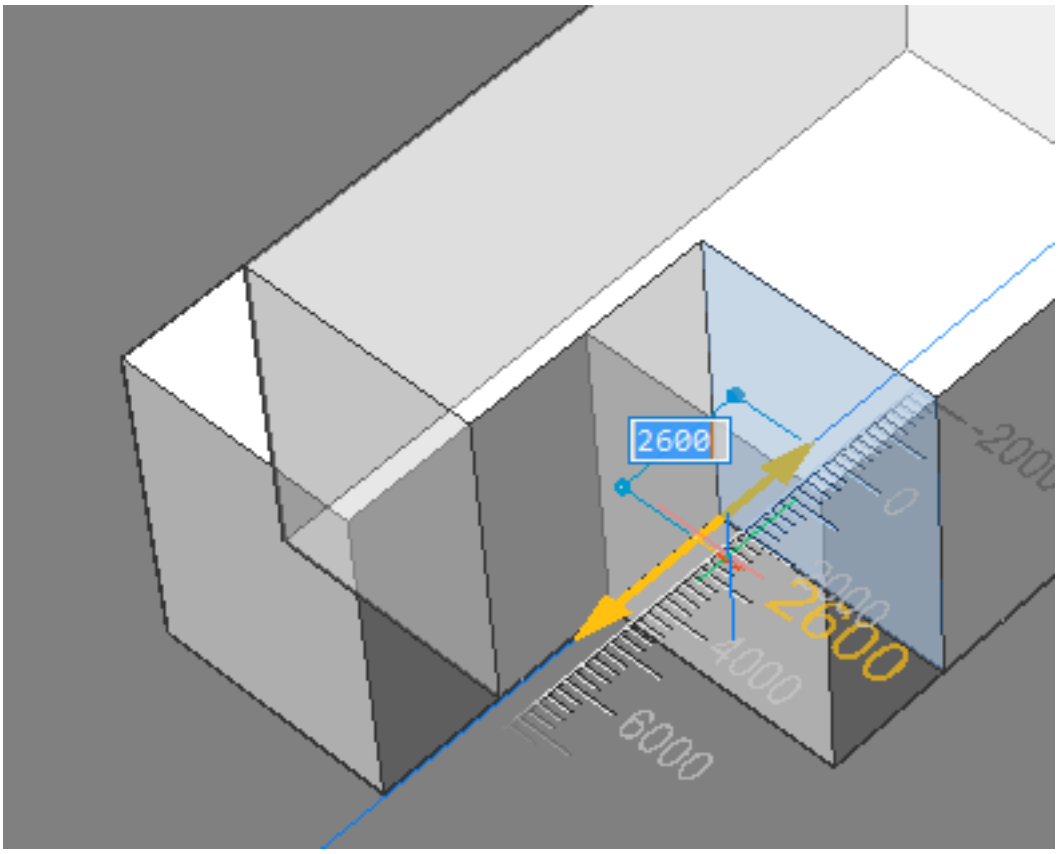
Quad: **Model | Push/Pull** : **dmpushpull Prompts you in the command bar:** Select faces* to push/pull: **(Select a face or detected boundary on the same or different solids.)** Entities in set: 1 Select faces to push/pull: **(Select more faces or detected boundaries; hit the TAB key to select hidden geometry. Press Enter to stop selecting geometry.)** Specify distance or [Enable subtract]:**(Specify a point or type a distance or choose an option.)**

NOTE	BIM: Plies of multiply compositions are selectable if the **Display Composition** property is YES, and the **Select Faces** option of the SELECTIONMODES (1.17.10) system variable is set.

The selected geometry moves dynamically; the Manipulator displays: (6.1049 on the facing page) Do one of the following:

- (option) The current reference face highlights. Hit the TAB key to select a different reference face. All faces which are parallel to the face being pushpulled are recognized, the nearest first. Press and hold the SHIFT key when hitting the TAB key to cycle reference faces in reverse order. To select a reference face on a different solid: move the cursor over that face, then hit the TAB key. The selected face highlights.
- Click a point in the model.
- Type a value in the dynamic distance field.
- Move the cursor to adjust the value in the dynamic distance field, then click. Optionally zoom in/out to set the snap increment size of the ruler.

Figure 6.1049



Command Options

Option	Description
Enable subtract	Solids being pushpulled are subtracted from other 3D solids they intersect. Prompts you: **Specify distance or [Disable subtract]: - (Specify a point or type a distance or choose an option.)**
Disable subtract	Solids being pushpulled are not subtracted from other 3D solids they intersect. Prompts you: **Specify distance or [Enable subtract]: - (Specify a point or type a distance or choose an option.)**

Command Arguments

Argument	Description
Planar faces	The faces are moved, thus adding or removing volume from the solid(s). The value of the movement vector displays in the dynamic entry field.
Cylindrical and spherical faces	Edits the radius. The current radius displays in the dynamic entry field.
Toroidal faces	Edits the tube radius of the torus. The current radius displays in the dynamic entry field.
Spline faces	Creates offset faces and replaces selected faces with these offset faces, thus adding or removing volume from the solid(s). The current offset distance displays in the dynamic entry field.

Note: When DMPUSHPULLSUBTRACT = 1, the solid being pushpulled is subtracted from interfering solids. Pressing the Ctrl key allows to override the DMPUSHPULLSUBTRACT system variable. If the Hotkey Assistant (HKA) is ON the Hotkey Assistant widget displays, indicating whether the command is in subtract mode or not. ===ERROR WITH DOWNLOADED IMAGE===

- ===ERROR WITH DOWNLOADED IMAGE=== : Disable subtract
- ===ERROR WITH DOWNLOADED IMAGE=== : Enable subtract

Figure 6.1050

6.12.26 DmSelectEdges

(6.2932 on page 6037) Selects the edges of faces and solids.

Accessing the Command

 command bar: **dmselectedges** menu bar: **Model | Smart Selection | Edges** toolbar: **Direct Modeling | Edges** ribbon:

- Modeling Workspace
  - **Mechanical | Select | Edges**
- Mechanical Workspace
  - **Home | Select | Edges**
  - **Solid | Select | Edges**

  - **Solid | Edit | Simplify**
  - **Sheet Metal | Heal | Simplify**
- BIM workspace
  - **Modeling | Model Integrity | Simplify**

Quad cursor menu: **Model | Simplify** : **dmsimplify Prompts you in the command bar:** Select entities to simplify or [Entire model/SEttings] <Entire model>: **(Select entities or press Enter to select the entire model)**

- Geometry simplified
- Topology simplified

Command Options

Option	Description
Settings	Allows to access the command settings; prompts you in the command bar: **Simplify [Geometry/Topology]/<Back>:** • Geometry: define the Geometry settings • Topology: define the Topology settings • Back: return to the default command prompt
Geometry	Prompts you in the command bar: **Select geometric simplification tolerance or [ON/OFF/Topology] <1e-7>:** Choose an option: • Type a value to set the simplification tolerance. • ON : switches geometrical simplification on. • OFF : switches geometrical simplification off. • Topology : define the Topology settings.

Topology	Prompts you in the command bar: **Select topology simplification mode [ON/OFF/Geometry] <ON>:** Choose an option: • ON : switches topological simplification on. • OFF : switches topological simplification off. • Geometry : define the geometrical settings.

Related Commands

Import (6.17.10) - imports the geometry from external files into the current drawing. DmStitch (6.12.29) - converts a set of region and surface entities that bound a watertight area to a 3d solid. DmAudit (6.12.2) - fixes inconsistencies in 3d geometry supported by ACIS kernel (3D solids, surfaces). DmAuditAll (6.12.3) - checks and heals flaws in drawings inserted as external references. DmSimplifyAll (6.12.35) - simplifies the geometry and topology of solids, within drawings inserted as external references. Erase (6.13.8) - erases entities from the drawing. Deletes 3D solid faces and face edges.

Figure 6.1052

6.12.28 DmSelect

(6.2932 on page 6037) Selects edges and faces of 3D solids or surfaces based on their geometric properties. The command allows to select a group of faces, which form a geometric feature, such as a protrusion, a depression, a blend, or a blend network. You can combine different options of this command, e.g. select all blends, which radius is less than given value.

Accessing the Command

command bar: **dmselect** menu bar: **Model | Smart Selection** toolbar: **Smart Selection** ribbon:

- Modeling Workspace
  - **Mechanical | Select command group**
- Mechanical Workspace
  - **Home | Select command group**
  - **Solid | Select command group**
  - **Sheet metal | Select command group**

Quad cursor menu: **Select command group** : **dmselect Prompts you in the command bar:** Select [Selection/Attribute/Relation/<Finish>: **(Select an option.)** If a selection set of faces or edges is present, the initial prompt is: Use preselection as [sUbset/Sample/sEed] <Sample>: **(Select an option.)** Selecting Cancel in a sub-prompt or pressing the Esc button returns to main prompt.

Command Options

Option	Description
Selection	Allows to select a set of subentities; prompts you: **Select [sUbset/Sample/sEed] <Sample>:** • **Subset** : only faces/edges in the subset can be selected. • **Sample** : the preselected set of faces/edges should be considered as samples, of which the geometric characteristics (length, area, radius) will be used as parameters for the selection. • **Seed** : the preselected set of faces /edges be should be considered as seed elements for the selection of features such as blends, blend networks, protrusion or depressions.

Attribute	Prompts you: **Select [Radius/Area/Length/Type/Exclude short fillets] <Radius>:** • **Radius** : selects faces/edges by radius. • **Area** : selects faces by area. • **Length** : selects edges by length. • **Type** : selects faces/edges by their geometric type. If you choose any of the above options, you are promted: **Select [Current sample/Value] <Current sample> :** • **Current sample** : Press <ENTER> to use the value of the sample face/edge. • **Value** : type a value in the command bar. In case of a non-zero value, you are prompted: **Is [Less/Less or eQual(LQ)/Equal/Greater or eQual(GQ)/Greater] <Equal>: (Select an option.)** • **Exclude short fillets** : excludes short fillets from the selection, which might be useful when working with imported sheet metal parts.
Relation	Prompts you: **Select [Coincident/Parallel/coAxial/Smooth] <Parallel>:** • **Coincident** : selects coincident faces/edges. • **Parallel** : selects parallel faces/edges. • **Coaxial** : selects coaxial faces/edges. • **Smooth** : selects the smooth side of a part.
Primitive	Prompts you: **Select [Face/Edge/Loop/edge Network] <Face>:** • **Face** : selects faces. • **Edge** : selects edges. • **Loop** : selects edge loops. Please, not that the preselection will determine the result. It is necessary to select a set of connected faces. The command will then select all edges, which describe the border of the selection set; internal edges will be skipped. If the result contains multiple loops and you want only one, the preselection should contain a set of connected faces one edge of the desired output loop. If none of the loops of the selection set contains the selected edge, the output will be empty. • **Edge Network** : finds an adjacent edge which has similar convexity for a given input edge.

feaTure	Prompts you: **Select [Protrusion/Depression/Blend/blend Network] <blend Network>:** • **Protrusion** : selects protrusions. • **Depression** : selects depressions. • **Blend** : selects blends. • **Blend Network** : selects blend networks.
Finish	Concludes the command and selects faces/edges according to the selected options.

Related Commands

QSelect (6.25.6) - composes a selection set using filters. Select (6.27.16) - selects one or more entities; can be accessed later with the Previous option. SelectAlignedFaces (6.27.17) - selects all faces in a model which are coplanar with a selected face. SelectAlignedSolids (6.27.19) - selects all solids in a model of which a face is coplanar with a selected face.. SelectConnectedSolids (6.27.27) - selects all faces in a model which are connected to a selected face. SelectSimilar (6.27.23) - selects all entities of the same type as the current selection, based on a set of matching properties, stored in the SELECTSIMILARMODE (1.17.10) system variable. BimMultiselect (6.7.25) - Selects linear solids with coplanar and/or parallel axes.

Figure 6.1053

6.12.29 DmStitch

(6.2932 on page 6037) Converts a set of region and surface entities that bound a watertight area to a 3d solid. If DMREPORTPANEL (1.17.10)= ON, BricsCAD reports the results in the Report (6.8.35) panel instead of the command bar.

Accessing the Command

 command bar: **dmstitch** menu bar: **Model | Direct Modeling | Stitch** toolbar: **Direct Modeling| Stitch** ribbon:

- Modeling Workspace
  - **Solid | Direct modeling | Stitch**
  - **Surface | Direct modeling | Stitch**
- Mechanical Workspace
  - **Home | Solid editing | Stitch**
  - **Solid | Edit | Stitch**
  - **Surface | Edit | Stitch**
  - **Sheet metal | Heal | Stitch**

Quad cursor menu: **Model | Stitch** : **dmstitch Prompts you in the command bar:** Select surfaces to stitch or choose [validation MOde] <Auto>: **(Select regions or surfaces.)** Entities in set: XX Select surfaces to stitch or choose [validation MOde] <Auto>: **(Select more regions or surfaces or right click.)** Created valid 3D solid.

Command Options

Option	Description
Validation Mode	Allows to set the validation mode either manual or automatic. Prompts you: **Choose validation mode [Auto/Manual] <Auto>:** - **(Select a validation mode.)** The command reports success or failure. In automatic validation mode, the command creates only valid 3d solid entities without free or non-manifold edges. If you want to create an invalid 3d solid or understand the reason of a failure, run the command in manual validation mode. The command then reports problems (free or non-manifold edges) and highlights them. You can either accept the invalid 3d solid by pressing Enter or refuse it by pressing Cancel. The selected validation mode is stored and re-used for future calls of the command.

Related Commands

DmExtrude (6.12.14) - creates 3D solids by extruding closed 2D entities, regions or closed boundaries. DmSimplify (6.12.27) - simplifies the geometry and topology of 3d solid entities. DmAudit (6.12.2) - fixes inconsistencies in 3d geometry supported by ACIS kernel (3D solids, surfaces).

Figure 6.1054

6.12.30 DmThicken

(6.2932 on page 6037) Creates 3D solids by thickening (i.e. adding thickness to) surfaces, their faces, faces of 3D solids, regions and wire entities. The following wire entities are accepted: lines, polylines, circles, ellipses, arcs, helices, splines.

Accessing the Command

command bar: **dmthicken** menu bar: **Model | Direct Modeling | Thicken** toolbar: **Direct Modeling | Thicken** ribbon:

- Modeling Workspace
  - **Solid | Direct Modeling | Thicken**
  - **Surface | Direct Modeling | Thicken**
- Mechanical Workspace
  - **Home | Model | Thicken**
  - **Solid | Create | Thicken**

Quad cursor menu: **Model | Thicken** : **dmthicken Prompts you in the command bar:** Select entities/subentities to thicken: **(Select a face of a solid, a surface or a wire entity.)** Entities in set: 1 Select entities/subentities to thicken: **(Select more solid faces or surfaces or press Enter.)** S pecify thickness value: **(Specify a point or type a value.)** The thickening direction is perpendicular at every point to the selected entity or entities. If you thicken a multi-face surface of several adjacent faces of one 3D solid/surface, then the corresponding faces remain adjacent on the opposite side of the new 3D solid(s). This differs the DmThicken command from DmExtrude (6.12.14). (6.1055) From left to right: extruded faces of a prism - thickened faces of a prism - thickened face of a cylinder - thickened fillets. When a wire entity is selected, a circle with the radius of the specified thickness value is swept along the wire: (6.1056 on the next page)

6.12.32 DmTangent3d

(6.2673 on page 5786) Applies a tangent constraint between a face and a curved surface of different solids.

Accessing the Command

command bar: **dmtangent3d** menu bar: **Parametric | 3D Constraints | Tangent** toolbar: **3D Constraints | Tangent** ribbon:

- Modeling Workspace
  - **Home | Parametrize | Tangent**
  - **Solid | Parametrize | Tangent**
  - **Parametric | Parametrize | Tangent**
- Mechanical Workspace
  - **Home | Parametrize | Tangent**
  - **Solid | Parametrize | Tangent**
  - **Surface | Parametrize | Tangent**
  - **Sheet Metal | Parametrize | Tangent**
  - **Assembly | 3D Constraints | Tangent**
- BIM Workspace
  - **Parametric | Parametrize | Tangent**

Quad cursor menu: **Constraints | Tangent** : **dmtangent3d Prompts you in the command bar:** Select first subentity [WOrld/BLock]: **(Select the first cylindrical (circular or elliptical), spherical or conical surface or choose an option. Press the TAB key to select obscured geometry.)** Select second subentity [WOrld/BLock]: **(Select the second cylindrical (circular or elliptical), spherical or conical surface or choose an option.)**

Command Options

Option	Description
World	Allows you to select the WCS subentity as an argument; prompts you: **Select reference coordinate system subentity [Origin/X axis/Y axis/Z axis/XY plane/YZ plane/ZX plane]** - **(Select a reference coordinate system subentity as an argument.)**
Block	Allows you to choose as an argument the subentity of the coordinate system of the block; prompts you: **Select block reference** - **(Select a block reference of which the reference coordinate system will be used as an argument.) Select reference coordinate system subentity [Origin/X axis/Y axis/Z axis/XY plane/YZ plane/ZX plane]** - **(Select a reference coordinate system subentity as an argument.)**

Related Commands

MechanicalBrowserOpen (6.8.32) - displays the Mechanical Browser. DmUpdate (6.12.34) - Forces 3d constraints to update. DmCoincident3d (6.12.5) - applies a coincident constraint between two edges, two faces or an edge and a face of two different solids. DmConcentric3d (6.12.8) - applies a concentric constraint between two cylindrical, spherical or conical surfaces. DmFix3d (6.12.15) - Applies a fixed constraint to a solid or to an edge or a face of a solid. DmParallel3d (6.12.18) - applies a parallel constraint between two faces of a solid or of different solids. DmPerpendicular3d (6.12.20) - applies a perpendicular constraint between two faces of a solid or of different solids. DmRigidSet3d (6.12.23) - Allows to define a set of entities or subentities as a rigid body. DmAngle3d (6.12.1) - applies an angle constraint between two faces of a solid or of different solids. DmDistance3d (6.12.10) - applies a distance constraint between two subentities of a solid or of

Figure 6.1062

6.12.33 DmTwist

(6.2932 on page 6037) Modifies a 3D solid, surface or region by twisting a portion defined by two points around an axis.

Accessing the Command

 command bar: **dmtwist** menu bar: **Model | Direct Modeling | Deform | Twist** toolbar: **Deform | Twist** ribbon:

- Modeling Workspace
  - **Home | Direct Modeling | Twist**
  - **Solid | Direct Modeling | Twist**
  - **Surface | Direct Modeling | Twist**
- Mechanical Workspace
  - **Home |Solid editing | Twist**
  - **Solid | Deform | Twist**
  - **Surface | Deform | Twist**

Quad cursor menu: **Model | Twist** : **dmtwist Prompts you in the command bar:** Select object to twist: **(Select a solid, a surface or a region.)** Entities in set: 1 Select object to twist: **(Select more objects or right click.)** Enter start point of twisting axis: **(Specify a point where the twisting deformation will start.)** Enter end point of twisting axis: **(Specify a point where the twisting deformation will end.)** Pick start point of twisting: **(Specify a point.)** Specify twist angle or set [Continuity]: (**Specify an angle dynamically or type a value or type C to set the Continuity.)**

Command Options

Option	Description
Continuity	Allows to control whether the transition between the deformed and non-deformed part is sharp or smooth. Prompts you: **Specify Continuity [G0/G1/G2]** - **(Choose an option.)** (6.1063 on the facing page) G0: No continuity (left), G1: Tangent Faces (middle) and G2: Curvature continuity (right)

Related Commands

DmDeformCurve (6.12.7) - deforms one or more connected faces of a 3D solid/surface by replacing their edges with given curves. DmDeformMove (6.12.11) - deforms one or more connected faces of a 3D solid/surface by moving and rotating their edges. DmDeformPoint (6.12.9) - deforms a region, one or more connected faces of a 3D solid or a surface by moving a point lying on one of them in arbitrary 3D direction. Loft (6.20.37) - creates 3D solids passing through two or more cross sections.

Figure 6.1063

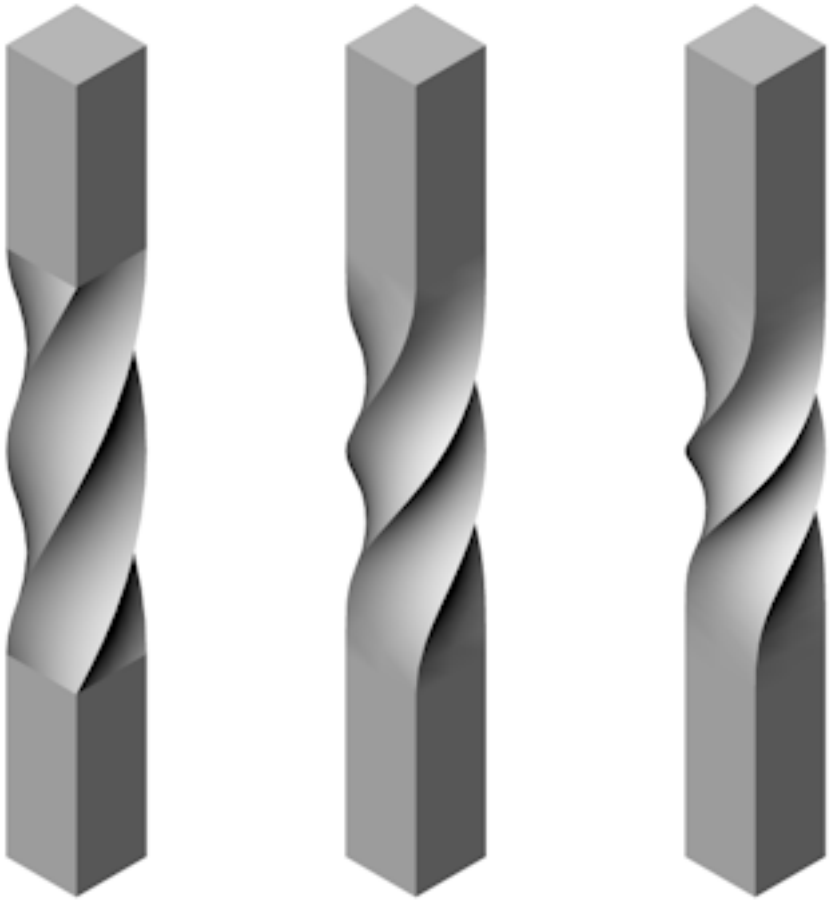

Figure 6.1064

6.12.34 DmUpdate

(6.2673 on page 5786) Forces 3d constraints to update.

Accessing the Command

command bar: **dmupdate** toolbar:

- **3D Constraints | Update**
- **Direct modeling | Update**

: **dmUpdate**

Command Options

DmRadius3d (6.12.22) - applies a radius constraint to cylindrical surfaces or circular edges.

Figure 6.1065

6.12.35 DmSimplifyAll

(6.2932 on page 6037) Simplifies the geometry in solids, within drawings inserted as external references. DmSimplifyAll removes unnecessary edges and vertices, merges seam edges, and replaces the geometry of faces and edges by analytic surfaces and curves, if possible within the user-specified tolerance. It is recommended to always run this command on imported drawings with inserted external references.

Accessing the Command

command bar: **dmsimplifyall** : **dmsimplifyall Prompts you in the command bar:** Select entities to simplify or [Entire model/SEttings] <Entire model>: **(Select entities or press Enter to select the entire model)** Geometry simplified Topology simplified

Command Options

Option	Description
Settings	Allows to access the command settings; prompts you in the command bar: **Simplify [Geometry/Topology]/<Back>:** • Geometry: define the Geometry settings • Topology: define the Topology settings • Back: return to the default command prompt
Geometry	Prompts you in the command bar: **Select geometric simplification tolerance or [ON/OFF/Topology] <1e-7>:** Choose an option: • Type a value to set the simplification tolerance. • ON : switches geometrical simplification on. • OFF : switches geometrical simplification off. • Topology : define the Topology settings.
Topology	Prompts you in the command bar: **Select topology simplification mode [ON/OFF/Geometry] <ON>:** Choose an option: • ON : switches topological simplification on. • OFF : switches topological simplification off. • Geometry : define the geometrical settings.

Related Commands

Import (6.17.10) - imports the geometry from external files into the current drawing. DmStitch (6.12.29) - converts a set of region and surface entities that bound a watertight area to a 3d solid. DmAudit (6.12.2) - fixes inconsistencies in 3d geometry supported by ACIS kernel (3D solids, surfaces). DmAuditAll (6.12.3) - checks and heals flaws in drawings inserted as external references. DmSimplify (6.12.27) - simplifies the geometry and topology of 3d solid entities. Erase (6.13.8) - erases entities from the drawing. Deletes 3D solid faces and face edges.

6.13 E

6.13.1 EAttEdit

(6.2981 on page 6079) Edits the values and most properties of all attributes contained in a single block, through a dialog box (short for "enhanced attribute editor"). 

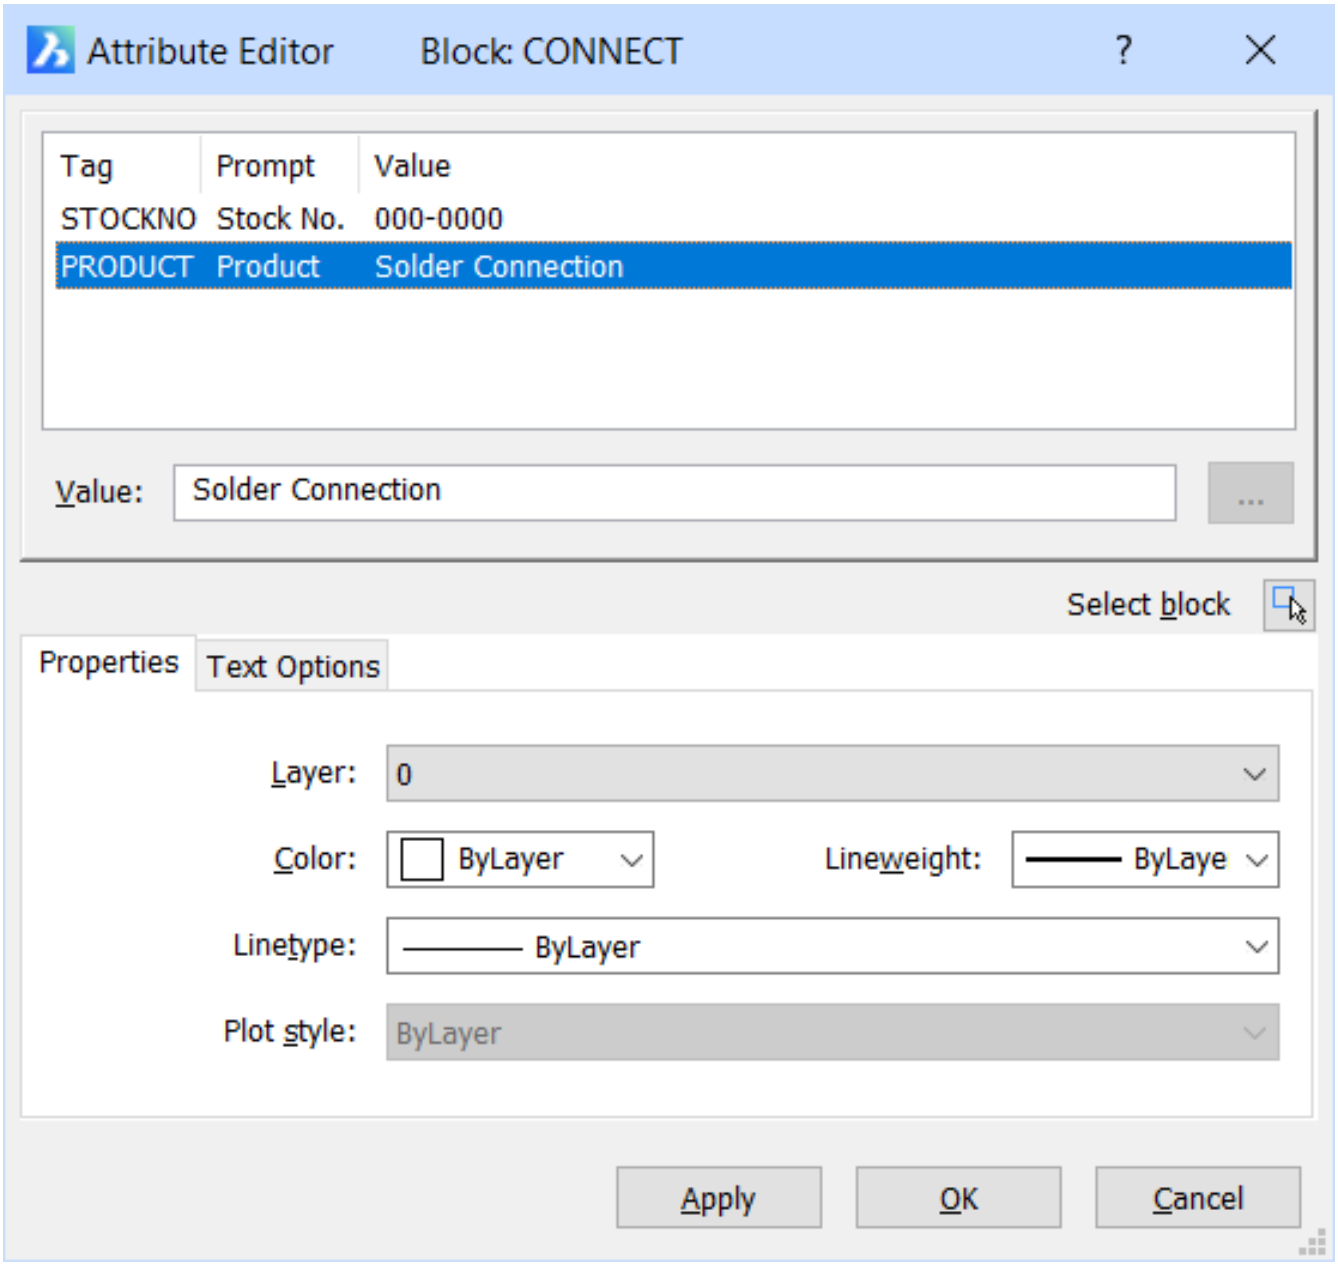
Figure 6.1066

Shape Classic Pro Platinum Mechanical BIM

Accessing the Command

command bar: **eattedit** alias: **ate** menu bar: **Tools | Attributes | Edit Block Attributes** ribbon: **Insert | Blocks | Edit Attributes | Edit Block Attributes** toolbar: **Attributes |**  : **EAttEdit Prompts you in the command bar:** Select a block: (**Choose a block that contains at least one attribute)** Displays a dialog box: (6.1067 on the following page) Change the values and/or properties of the attributes, and then click **OK**. The changes you made apply only to the attributes in the block you selected; the changes are not applied globally. Click the **Apply** button to apply the changes to the attributes, and then click the **Select Block** button to choose another block, this time one with entities. When you select a block with no attributes, the command displays the dialog box, but with no entries for attributes and you cannot add attributes; click the **Select Block** button to choose another block, this time one with entities. When you select an entity that is not a block, the program reports, "The selected entity is not a block," and then returns to the command prompt.

Figure 6.1067



Command Options

Option	Description
Value	Edits the value of the attribute.
Select Block	Chooses another block.
Properties Tab	(6.1068 on the next page)
Layer	Specifies the layer name; to change it, choose another one from the droplist.
Color	Specifies the color; to change it, choose another one from the droplist, or else click **Select Color** to access the Color dialog box.
Lineweight	Specifies the lineweight; to change it, choose another one from the droplist.
Linetype	Specifies the linetype; to change it, choose another one from the droplist, or else choose **Load** to access the Drawing Explorer dialog box to load additional linetypes
Plot Style	Specifies the plot style; to change it, choose another one from the droplist. (This option is available only when plot styles are enabled in the drawing; otherwise, the droplist is grayed-out.)
Text Options Tab	(6.1069 on the following page)
Text Style	Specifies the text style name; to change it, choose another one from the droplist.
Justification	Specifies the justification; to change it, choose another one from the droplist.
Height	Specifies the height of the text.
Rotation	Specifies the rotation angle of the text.
Upside Down	Toggles whether the text is displayed upside down.
Backwards	Toggles whether the text is displayed backwards.
Width Factor	Specifies the width of the characters; use a value of less than 1.0 (such as 0.85) to squeeze more text into a small space.
Oblique Angle	Specifies the slant of the characters; can be used to mimic italic text.
Annotative	Toggles whether the text follows annotative scaling.
Apply	Applies the changes you made, without leaving the dialog box. Click **Select Block** to edit the attributes of another block.
OK	Applies the changes you made to the attribute, and then exists the dialog box.
Cancel	Exits the dialog box, discarding the changes you made to the attribute.

Procedures

- Using the Attribute Editor (1.30.14)
- Editing attributes in the Properties bar (1.30.14)

Figure 6.1070

6.13.2 EdgeSurf

(6.2981 on page 6079) Creates 3D Coons mesh surface patches between four entities (short for "edge-defined surface").

Accessing the Command

command bar: **edgesurf** ribbon: **Model | Meshes | Coons Surface** toolbar: **Meshes | 3D Mesh Surfaces |** : **EdgeSurf Prompts you in the command bar:** Select the first of four connected linear entities for edge surface: **(Pick an entity)** Select second edge: **(Pick a second entity)** Select third edge: **(Pick a third entity)** Select last edge: **(Pick a fourth entity)** (6.1071) (6.1072 on the next page)

Figure 6.1071

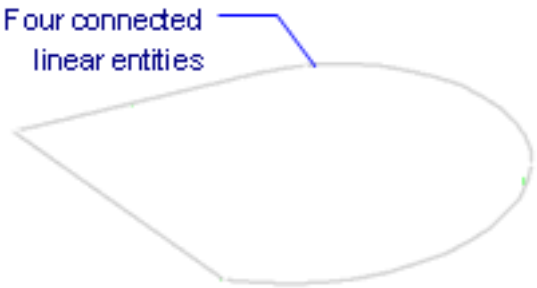

Figure 6.1072

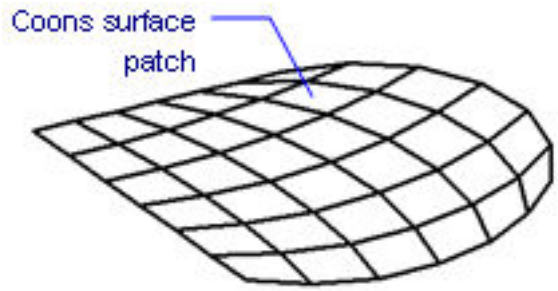

Command Options

Select the first of four connected linear entities for edge surface	Pick an entity. The entities must be: • Linear - open entities, such as lines, arcs, open splines, and open polylines • Connected - touching or overlapping, so that they form a closed area
Select second edge	Pick a second entity
Select third edge	Pick a third entity
Select last edge	Pick a fourth entity

Grips Editing

Edge meshes can be edited directly through grips:

1. Select the mesh. Notice that it has several grips.
2. Drag a grip to stretch the adjacent faces.

(6.1073)

RevSurf (6.26.28) - draws revolved surfaces as mesh surfaces. RuleSurf (6.26.51) - draws ruled surfaces as mesh surfaces. Ai_Sphere (6.5.17) - draws 3D spheres as mesh surfaces. TabSurf (6.29.7) - draws tabulated surfaces as mesh surfaces. Ai_Torus (6.5.20) - draws 3D donuts as mesh surfaces. Ai_Wedge (6.5.21) - draws 3D wedges as mesh surfaces.

Figure 6.1074

6.13.3 EditEData

(6.2981 on page 6079) Creates, edits, and deletes extended entity data (short for "edit entity data").

Accessing the Command

command bar: **editedata** transparent: **'editedata** menu bar: **Tools | Entity Data | Create or Edit Entity** toolbar: **Entity Data |**  : **EditEData Prompts you in the command bar:** Select entity to create or edit Entity Data: **(Choose any entity in the drawing)** Displays a dialog box: (6.1075 on the facing page) Click **Insert**, and then select entity data types from the menu. (6.1076 on page 4338) Select **Application Name**, and then the other data fields become available.

Figure 6.1075

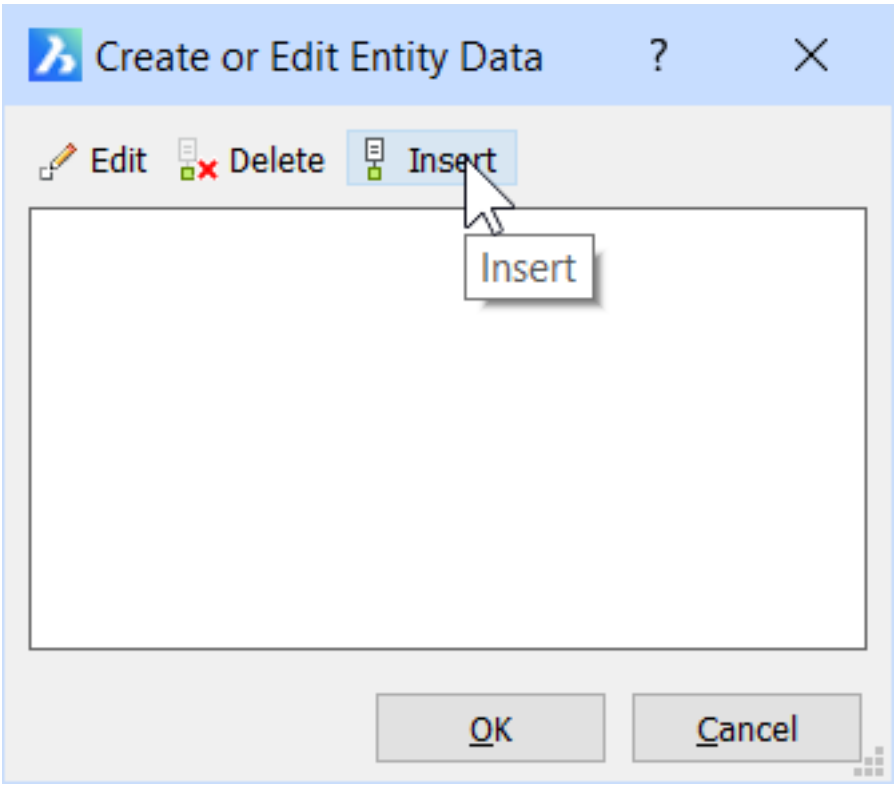

Figure 6.1076

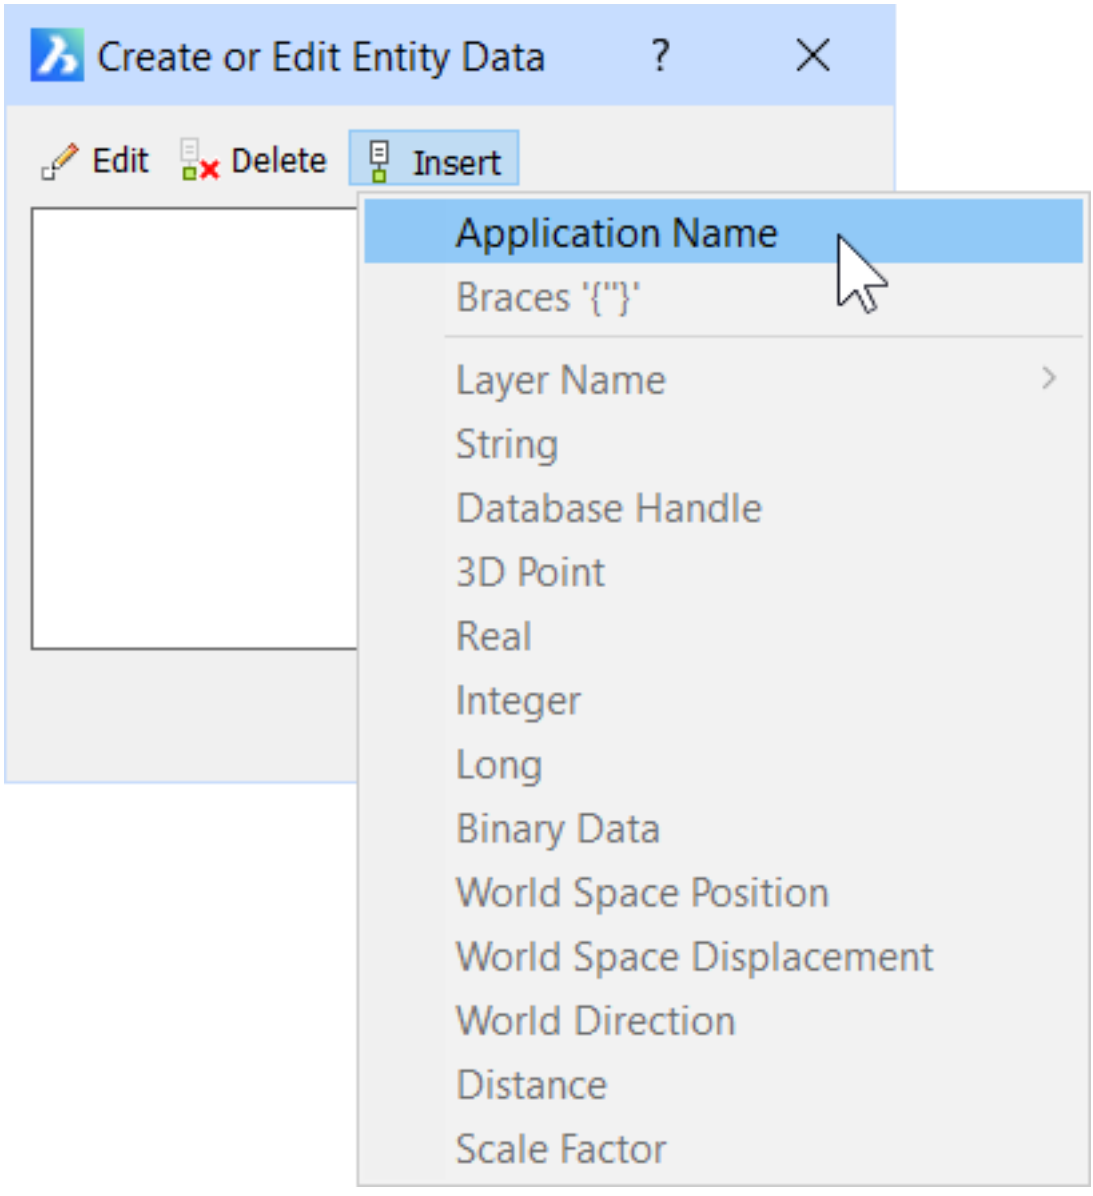


Command Options

Option	Description
Select entity to create or edit Entity Data	Chooses any entity in the drawing.

Dialog Box Menu Bar	Description
Edit	Edits the selected parameter.
Delete	Erases the selected parameter.
Insert	Inserts extended entity data; displays a menu of data options.

Insert Menu Options	Description
Application Name	Specifies the name of the application; this name identifies the "owner" of the data, and is used by other edata commands, such as DelEData.
Braces	Inserts a pair of braces {} to create subsets of data.
Layer Name	Specifies the layer; choose a layer name from the sub menu. The layer must already exist in the drawing.
String	Inserts a text string.
Database Handle	Inserts the handle (DWG database identifier) of an entity; prompts you: **Select entity - (pick any entity in the drawing.)**
3D Point	Inserts a 3D coordinate.
Real	Inserts a real number.
Integer	Inserts an integer (8-bit).
Long	Inserts a long (16-bit) integer.
Binary Data	Inserts binary data; useful for storing images.
World Space Position	Inserts x,y,z coordinates picked in the drawing; prompts you: **Select 3D World Space Position Point - (pick a point in the drawing, or enter x,y,z coordinates. "World" refers to WCS, the world coordinate space.)**
World Space Displacement	Inserts x,y,z coordinates picked in the drawing; prompts you: **Select 3D World Space Displacement Point - (pick a point in the drawing, or enter x,y,z coordinates.)**
World Direction	Inserts x,y,z coordinates picked in the drawing; prompts you: **Select 3D World Direction Point - (pick a point in the drawing, or enter x,y,z coordinates.)**
Distance	Inserts x,y,z distance between two points picked in the drawing; prompts you: 1. **Distance - (pick a point in the drawing, or enter x,y,z coordinates.)** 2. **Second point - (specify another point.)**
Scale Factor	Inserts a scale factor.

Related Commands

CopyEData (6.9.37) - copies extended entity data to other entities. DelEData (6.10.28) - erases extended entity data from entities. MoveEData (6.21.39) - moves extended entity data to other entities. ReAssocApp (6.26.2) - associates applications with entities.

Figure 6.1077

6.13.4 Elev

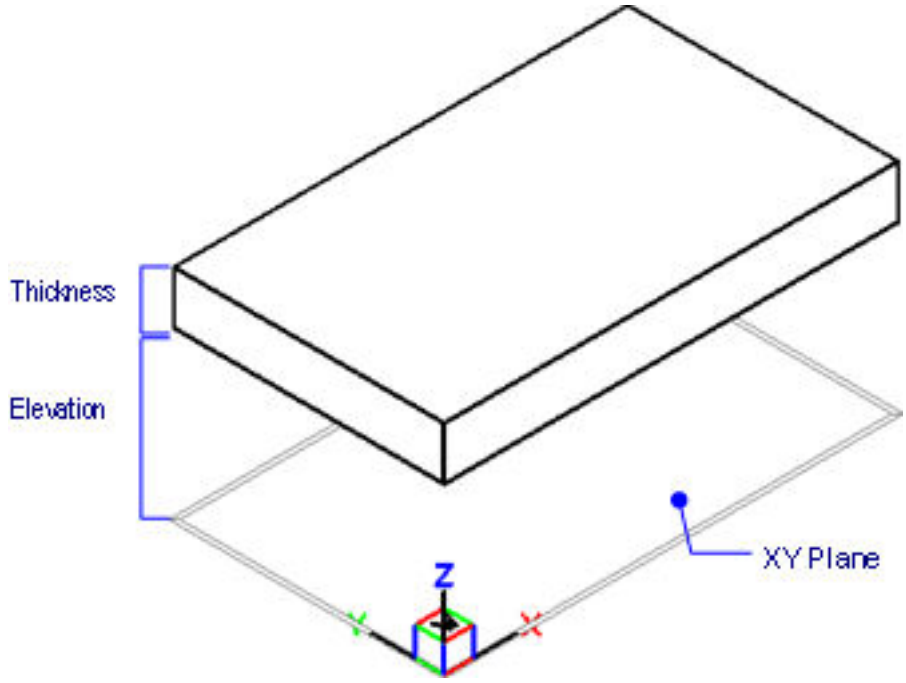
(6.2981 on page 6079) Changes the elevation (as measured from the x,y-plane in the z direction) and thickness (as measured from the elevation) of selected entities.

Accessing the Command

command bar: **elev** transparent: **'elev** alias: **elevation** menu bar: **Settings | Elevation** ribbon: **Settings | Elevation** toolbar: **Settings |**

: **Elev Prompts you in the command bar:** New current elevation <0.0000>: **(Enter a new value, or press Enter to keep the current value)** New current thickness <0.0000>: **(Enter a new value, or press Enter to keep the current value)** (6.1078 on the next page)

Figure 6.1078



Command Options

Option	Description
New current elevation	Specifies the elevation above or below the x,y-plane; enter a negative value for a negative elevation. The elevation is reported on the status bar as the z coordinate.
New current thickness	Specifies the thickness: the thickness begins at the elevation; enter negative values for thicknesses that are drawn downwards (negative z direction). The thickness is the extrusion distance (in the z direction) of non-3D entities, such as points, lines, polylines, arcs and circles. When thickness is not 0: • Points become vertical lines • Lines and open polylines become vertical planes • Arcs become curved surfaces • Circles become open-ended cylinders • Closed polylines become open-ended tubes

Related Commands

Flatten (6.14.12) - Flattens 2D and 3D entities: projects the entities onto the XY-plane of the current view. Change (6.9.10) - changes the elevation and thickness of entities through the command bar. Properties (6.24.54) - changes the elevation (z coordinate) and elevation through a palette. Settings (6.27.25) - sets the default elevation and thickness through the 3D section of the Settings dialog box.

Figure 6.1079

6.13.5 Ellipse

(7.3 on page 6132) Draws ellipses and elliptical arcs.

Accessing the Command

command bar: **ellipse** alias: **el** menu bar: **Draw | Ellipse Draw | Elliptical Arc** ribbon: **Draw | Draw | Ellipses** toolbar: **Draw |**  **Draw |**  : **Ellipse Prompts you in the command bar:** First end of ellipse axis or [Arc/Center]: **(Pick a point, or else enter an option)** Second end of axis: **(Pick another point)** Set Other axis or [Rotation]: **(Pick a third point, or enter R)** (6.1087 on page 4345) All methods to draw ellipses can be found in the **Draw | Ellipse** menu: (6.1080) All methods to draw elliptical arcs can be found in the Draw | Elliptical Arc menu: (6.1081 on the next page)

Figure 6.1080

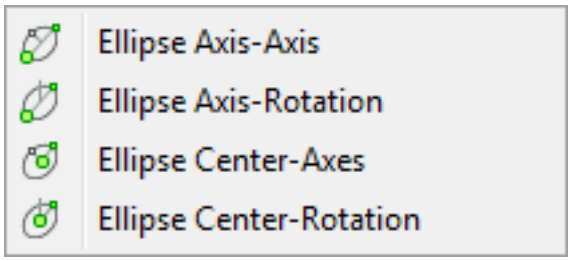


Figure 6.1081

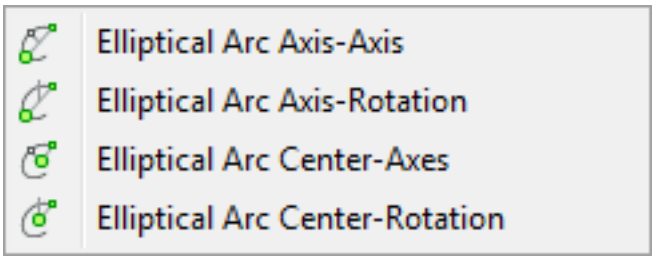


Command Options

Option	Description
First End of Ellipse Axis (6.1084 on page 4345)	Specifies the first endpoint of the first axis. Ellipses are defined by the length of two axes, or one axis and an angle of rotation.
Second End of Axis	Specifies the other end of the first axis.
Other Axis	Specifies the endpoint of the second axis, measured from the center of the first axis. The longer of the two axes is called the "major axis"; the shorter one is called the "minor axis."
Arc (6.1085 on page 4345)	Draws elliptical arcs; prompts you: 1. **Center** - **(specify the center point of the elliptical arc.)** 2. **First end of ellipse axis** - **(specify the endpoint of the elliptical arc's first axis.)**
Parameter	Specifies parameters for the parametric formula that crafts the elliptical arc: p(b) = c + a * cos(u) = b * sin(u) where: a = major axis. b = minor axis. c = center of the ellipse. u = point along the arc. Cos and Sin are the trigonometric cosine and sine functions.
Start Angle of Arc	Specifies the start angle, creating the arc's starting point. The angles are measured counter-clockwise from the positive x axis.
End Angle	Specifies the end angle, creating the arc's endpoint.
Included	Specifies the included angle, measured from the starting point.
Center (6.1086 on page 4345)	Draws the ellipse starting with a center point; prompts you: **Center of ellipse** - **(pick a point, or enter x, y coordinates.)**
Endpoint of Axis	Specifies the endpoint of one axis, measured from the center point.
Other Axis	Specifies the endpoint of the other axis, also measured from the center point.
Rotation (6.1087 on page 4345)	Specifies the angle of the ellipse; prompts you: **Rotation around major axis** - **(pick a point, or enter an angle between 0 and 89.9 degrees. An angle of 0 degrees draws a circle; 89.9 draws a very thin ellipse.)**

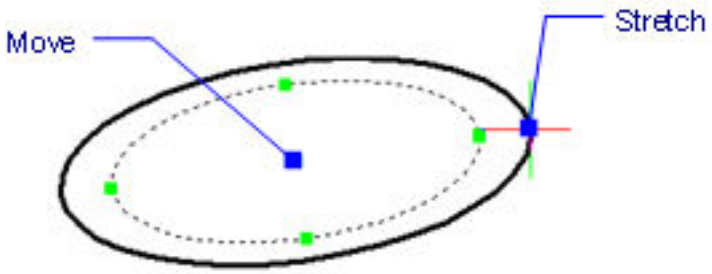
Procedures

- Setting the Polyline Ellipse (PELLIPSE) variable (1.25.21)
- General procedure to draw an elliptical arc (1.25.16)
- Editing an ellipse (1.25.21)
- Editing an elliptical arc (1.25.16)

Grips Editing

Ellipses can be edited directly through grips:

Figure 6.1082



Related Commands

Arc (6.4.21) - draws circular arcs. Isoplane (6.17.21) - change the working isoplane for drawing isometric entities, including isocircles, which are made from ellipses Properties (6.24.54) - changes the properties of ellipses through a palette.

Mtp (6.21.35) - allows to specify a point as the midpoint between two points. Nearest (6.22.2) - toggles nearest snap mode. Node (6.22.7) - toggles node (point) snap mode. None (6.22.8) - turns off all entity snap modes. Parallel (6.24.5) - toggles parallel snap mode. Perpendicular (6.24.25) - toggles perpendicular snap mode. Quadrant (6.25.7) - toggles quadrant snap mode. Tangent (6.29.10) - toggles tangent snap mode. Zvertex (6.35.9) - toggles the 3D vertex entity snap. Snaps to the closest vertex of a 3d entity.

Figure 6.1091

6.13.8 Erase

(7.3 on page 6132) Erases entities from the drawing; erases the faces and edges of 3D solids.

Accessing the Command

 command bar: **erase** shortcut: **Del** key on keyboard alias: **delete, e** menu bar: **Edit | Erase** ribbon: **Home | Edit | Erase** toolbar: **Standard |**  Quad: **Model |**  : **Erase Prompts you in the command bar:** Select entities, edges or faces: **(Select one or more entities)** Entities in set: 1 Select entities, edges or faces: **(Select more entities, or else press Enter)**

Command Options

Option	Description
Entities	Selected entities are erased from the drawing.
Edges	Select the edges of an opening in a surface to delete the opening. Select the edge(s) between coplanar faces of a 3D solid to remove the edges. Alternatively use dmSimplify to remove redundant edges.
Faces	Select the interior faces of an opening in a 3D solid to remove the opening.

Procedures

- Deleting holes (1.26.2)
- To remove edges between coplanar faces (1.26.2)

Related Commands

Break (6.6.21) - erases a portion of an entity. DmSimplify (6.12.27) - simplifies the geometry and topology of 3d solid entities. Oops (6.23.7) - returns erased entities. Overkill (6.23.14) - Deletes duplicate entities and overlapping lines, arcs or polylines and unifies partly overlapping or contiguous ones. Purge (6.24.60) - removes unused named entities from drawings, such as unused layers and linetypes. Trim (6.29.35) - removes portions of entities. U (6.30.3) - unerases erased entities. Undo (6.30.5) - unerases erased entities.

Figure 6.1092

6.13.9 eTransmit

(6.2981 on page 6079) Creates a package consisting of the drawing file and all its dependencies, such as external references, images, font files, plot configuration files, plot style tables, and font map files.

Accessing the Command

 command bar: **etransmit** menu bar:

- **File| eTransmit**
- **Tools | Drawing Explorer | Dependencies**

ribbon:

- **Home | Settings | Drawing Explorer | Dependencies**
- **Home | Transmit | eTransmit**

: **eTransmit** Displays the **Drawing Explorer** dialog box at the **Dependencies** node, listing the dependencies of the current drawing: (6.1093 on the facing page) Optionally click the **New File** () button in the toolbar to add another drawing to the eTransmit procedure. A File dialog displays to let you choose a drawing. Click **eTransmit** () in the toolbar to start the eTransmit procedure. A dialog box lists the files to include: (6.1094 on the next page) Select the files to be included in the eTransmit package (usually all of them), and then click the **Transmit** button. A dialog box displays options: (6.1095 on page 4352) Adjust the settings, and then click the **Transmit** button. Displays a report: (6.1096 on page 4353)

Tutorial: Package Your Drawings with eTransmit Click here (1.14.10) to watch

eTransmit Command Options

Option	Description
Destination folder	Specifies the output folder for the eTransmit package. If the destination folder does not exist, you are prompted to create the folder.
Save format	Specifies the format of the drawing files in the eTransmit package; choose an option from the droplist: (6.1097)
If file exists	Specifies what to do if a file already exists in the output folder; choose an option from the droplist: (6.1098 on the next page)
Output	Specifies whether to create a ZIP file or copy the files to the output folder; choose an option from the droplist: (6.1099 on the facing page)
Send email:	When checked, sends an email with the zipped eTransmit package in attachment. This option is available only when the eTransmit output is a ZIP file only.
ZIP file	Specifies what to do when a ZIP file of the same name already exists in the output folder; choose an option from the droplist: (6.1100 on the next page)
Update image paths	When checked, the saved paths for image files are updated, according to the new location.
Update xrefs paths	When checked, then the saved paths to externally-referenced files are updated, according to the new location.
All files in one folder	All files in the eTransmit package are copied to the destination folder.
Organized folder structure	A hierarchical folder tree is created in the destination folder
Keep files and folders as is	Keeps the folder structure of all files in the eTransmit package. This procedure allows to easily install the package on another computer using the folder structure of the source system.
Source root folder	Specifies the source root folder for relative paths of drawing-dependent files, such as xrefs or image files.

Procedures

To use Etransmit (**??**)

Related Commands

CloudUpload (**??**) - uploads the current drawing to Bricsys 24/7. Explorer (6.13.15) - Opens the Drawing Explorer dialog box.

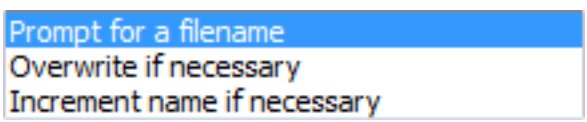

Figure 6.1101

6.13.10 -eTransmit

(6.2981 on page 6079) Creates a package ZIP file at the command line, consisting of the current drawing file and all its dependent files.

Accessing the Command

command bar: **-etransmit** : **-eTransmit Prompts you at the command line:** Transmittal package [Create/Settings] <Create>: **(Enter an option)** A File dialog box displays. Select a folder and type a name for the .zip file in the File Name field.

Command Options

Option	Description
Create	Packages the drawing and its support files into a ZIP file. Displays a File dialog box to let you select a folder and specify a filen name. When the drawing is not saved, prompts you: **There are unsaved document changes. Save them so to proceed with -ETRANSMIT? [Yes/No] <Yes>** - **(enter an option)**: • **Yes** - displays the Save As dialog box; choose a folder and enter a file name, and then click **Save** • **No** - command continues to the 'Transmittal package [Create/Settings]' option

Settings	Prompts you for changes to the settings in the command line: **Transmittal settings [Save format/Output format/FOlder structure/FIle list] - (enter an option)**: • **Save format** - specifies the format of the drawing files in the eTransmit package; choose an option: **File save version [keep Current/autocad 14 (R14)/autocad LT 95/autocad 2000/autocad 2004/autocad 2007/autocad 2010/autocad 2013/autocad 2018] <keep Current> - (enter a version.)** • **Output format** - specifies whether to create a ZIP file or copy the files to the output folder; choose an option: **Transmittal output format [Folder/Zip file] <Zip> - (choose to save files in a folder or in a ZIP file.)** • **FOlder structure** - specifies how files are organized into folders: **Transmittal folder structure [all files in ONe folder/Organized folder srtucture/Keep files and folders as is] <One folder> - (choose a storage method.)** • **FIle list** - determines which files are induced in the transmittal package: **Transmittal file types [eXternal references/Font files/Plotstyle files/Image files/Material texture files] - (choose the file types to include.)**

Procedures

- To use Etransmit (**??**)

Related Commands

eTransmit (**??**) - packages drawings and support files through a dialog box. CloudUpload (**??**) - uploads the current drawing to Bricsys 24/7.

Figure 6.1102

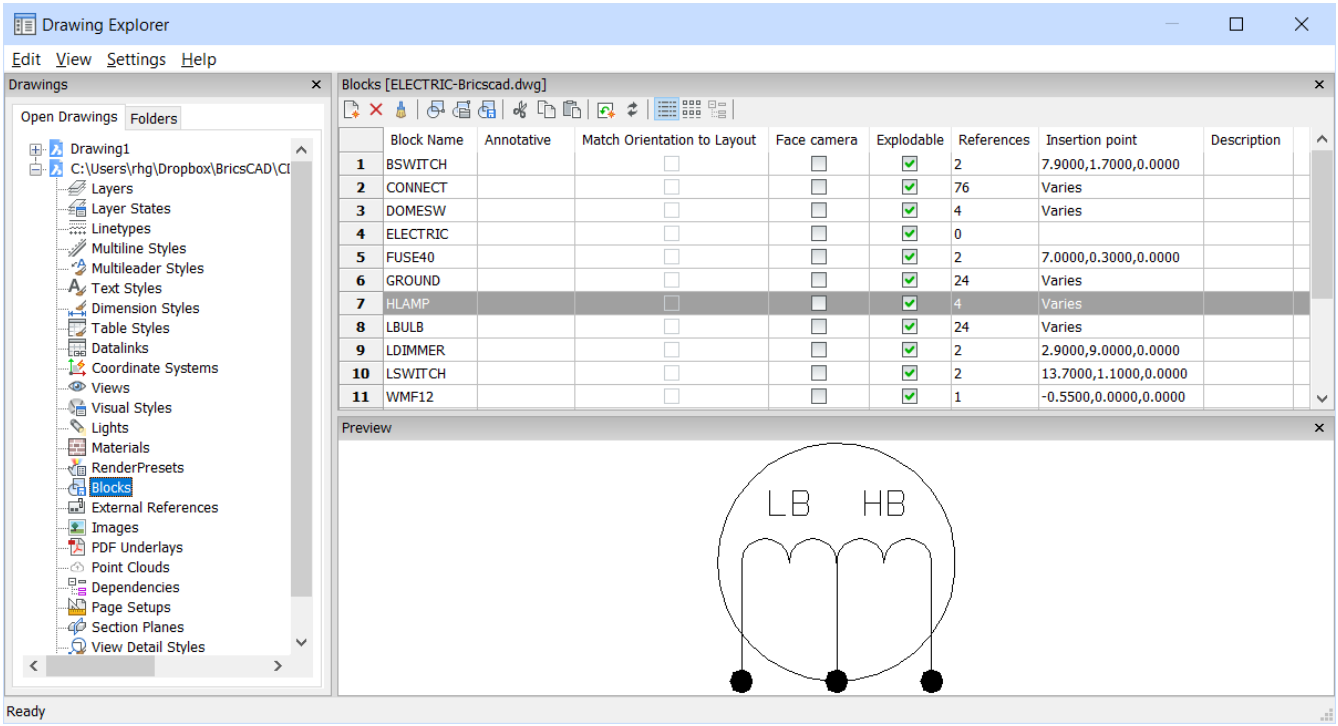
6.13.11 ExpBlocks

(6.2981 on page 6079) Opens the Blocks section of the Drawing Explorer dialog box (short for "explorer blocks") for inserting, deleting, and creating blocks.

Accessing the Command

command bar: **expblocks** alias: **xb, explorer** menu bar: **Tools | Drawing Explorer | Blocks** ribbon: **Home | Settings | Drawing Explorer | Blocks** : **ExpBlocks** Displays the Blocks section of the Drawing Explorer dialog box: (6.1103 on the facing page) Insert, create, delete, or edit blocks, and then click **X**. Press F1 to access help.

Figure 6.1103



Command Options

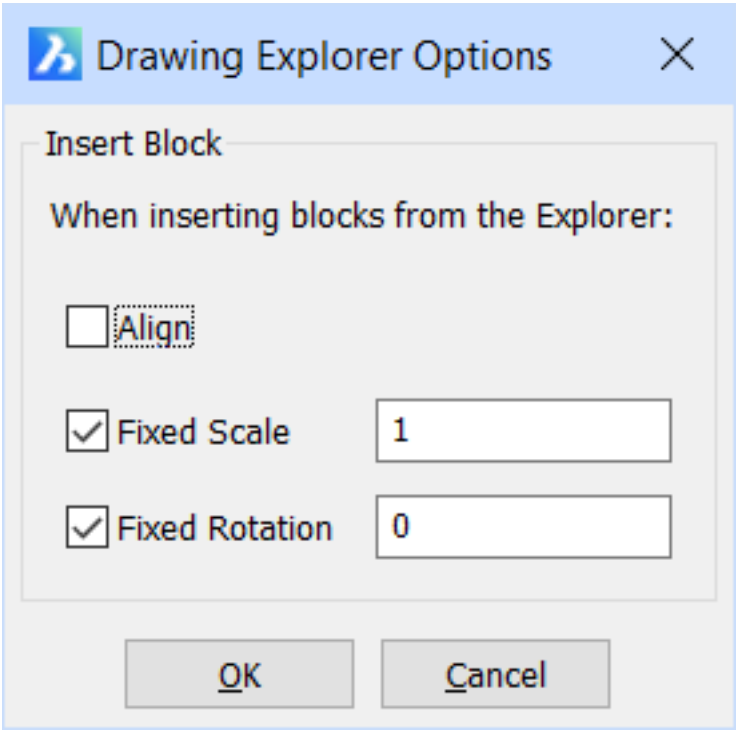
Option	Description
Block Name	Specifies the name of the block; click to rename.
Annotative	When checked, sets the Annotative property.
Match Orientation to Layout	When checked, sets the Match Orientation property of annotative blocks.
Face Camera	When checked, inserts the block to face the camera; currently not implemented. See the Camera (6.9.1) command.
Explodable	When checked, blocks of this definition can be exploded into its component parts by the Explode (6.13.16) command. Non-Uniformly scaled blocks can be exploded only if EXPLMODE=ON.
References	Reports the number of insertions of the block in the current drawing; number is set by the program, and so you cannot change it.
Insertion Point	Reports the insertion point of the block; reports "Varies" when the block has been inserted in the drawing more than once.
Description	Optional description of the block.
Toolbar Buttons	
New	Creates new blocks; dismisses the Drawing Explorer dialog box, and the starts the -Block command. See Block (6.6.12) command.
Delete	Deletes the block definition; available only for those block definitions not inserted in the drawing.
Purge	Purges selected blocks from the drawing; available only for those block definitions that are not inserted in the drawing.
Insert	Inserts the selected block; dismisses the Drawing Explorer dialog box, and the starts the -Insert command. See -Insert (6.17.14) command.

Insert External Blocks	Inserts DWG files as blocks; starts the Insert (6.17.13) command, and then displays the Insert Block dialog box. See Insert command.
Save Block	Exports the selected block as a DWG file; displays the Save Block dialog box.

Right-click a block to display the shortcut menu, and then choose **Options**. (6.1104 on the next page) Choose options to preset for inserting blocks, and then click OK.

Options Dialog Box	Description
Align	When on, aligns blocks with the snapped entity.
Fixed Scale	When on, specifies the scale factor to be used for all block insertions
Fixed Rotation	When on, specifies the rotation angle to be used for all block insertions

Figure 6.1104



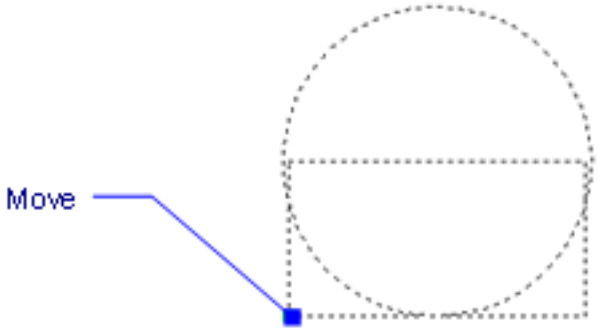
Grips Editing

Blocks can be edited directly through grips:

1. Select the block. Notice that it has one grip located at the insertion point.
2. Drag the grip to move the block.

(6.1105)

Figure 6.1105



Procedures

- Open the Blocks Explorer (1.30.11)
- Open the Detail View of the Blocks Explorer (1.30.11)
- Open the Icon View of the Blocks Explorer (1.30.11)
- To rename a block (1.30.11)
- To insert a block from an unopened drawing (1.30.5)

Related Commands

-Block (6.6.12) - creates blocks at the command line. Block (6.6.11) - creates blocks through a dialog box. Blockify (6.6.13) - Automatically detects equally shaped solids in a model and replaces them by block references. Searches the drawing for an identical set of entities (2D and 3D) and replaces them by block references. Optionally replaces block patterns by arrays. Explorer (6.13.15) - Opens the Drawing Explorer dialog box. Insert (6.17.13) - inserts blocks through a dialog box. -Insert (6.17.14) - inserts blocks through the command bar.

Figure 6.1106

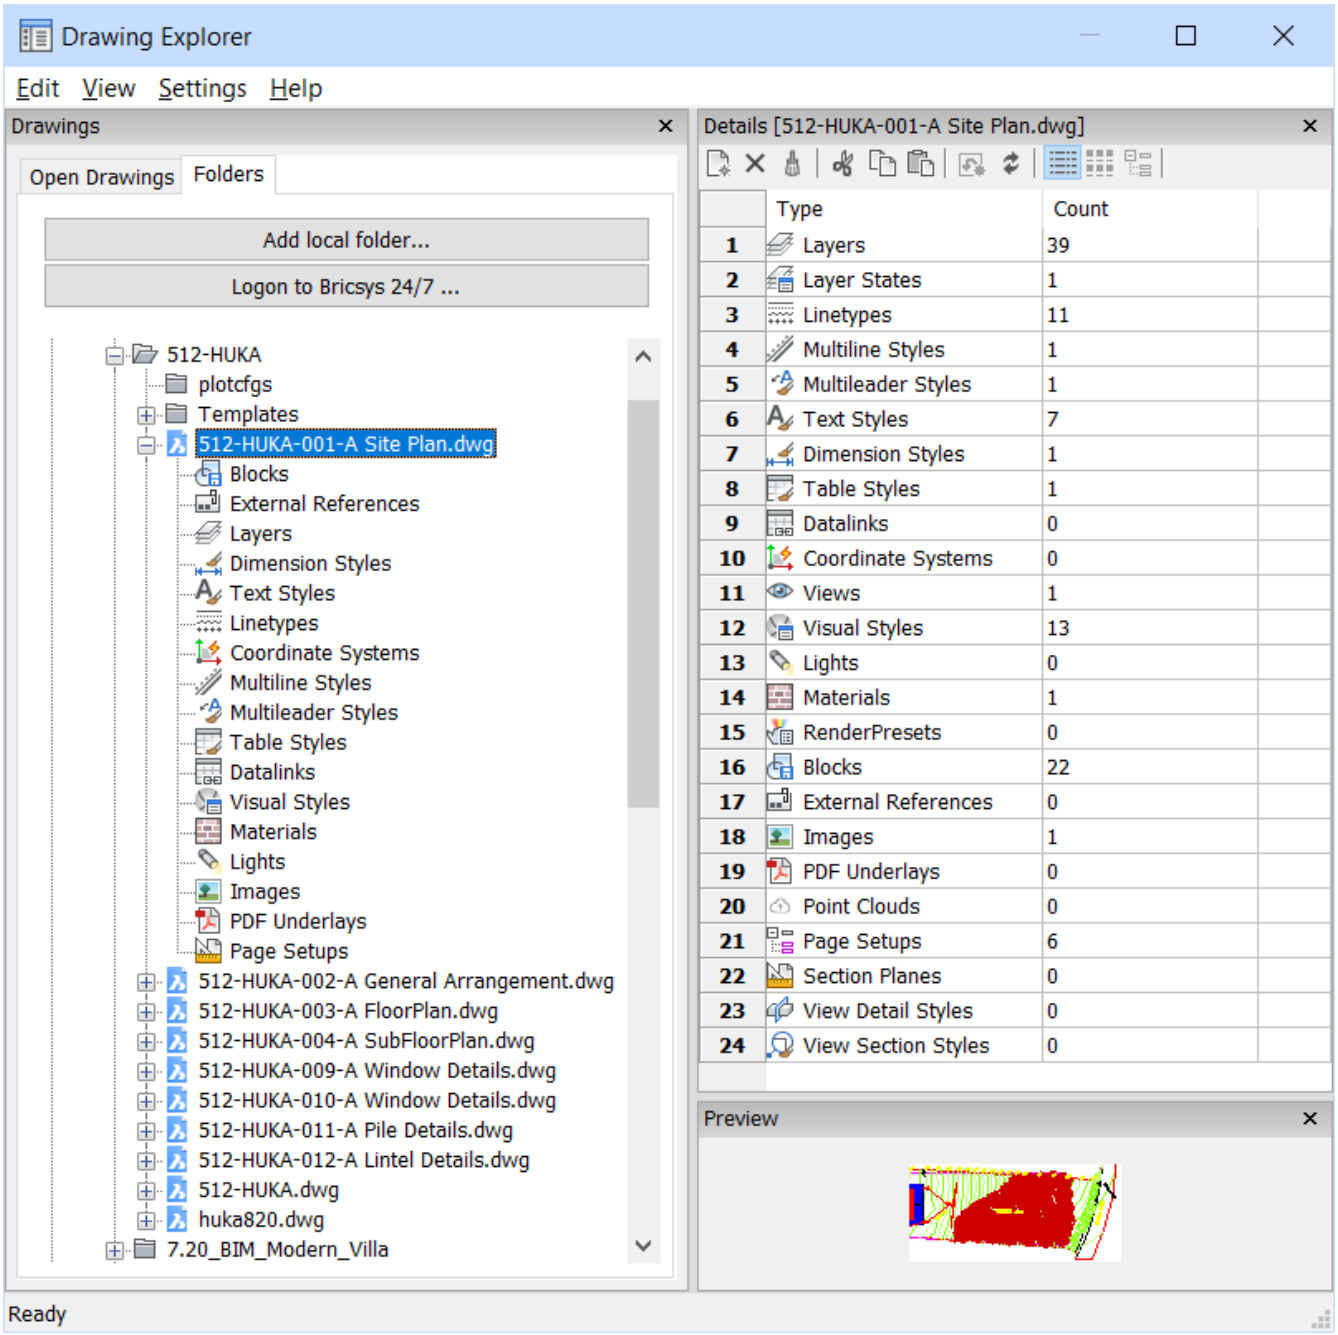
6.13.12 ExpFolders

(6.2981 on page 6079) Accesses files by opening the Drawing Explorer at the Folders tab.

Accessing the Command

command bar: **expfolders** menu bar: **Tools | Drawing Explorer | Folders** ribbon: **Home | Settings | Drawing Explorer | Folders** : **ExpFolders** Displays the Drawings Folders tab of the Drawing Explorer dialog box: (6.1107 on the following page)

Figure 6.1107



Command Options

Option	Description
Add Local Folder	Opens the Choose a Folder dialog box: 1. Navigate to a folder 2. Click **Select Folder**
Logon to Bricsys 24/7	Displays the Bricsys 24/7 dialog box: 1. Click **Log in** 2. Enter the user name and password of a valid account See the CloudOpen (**??**) command.

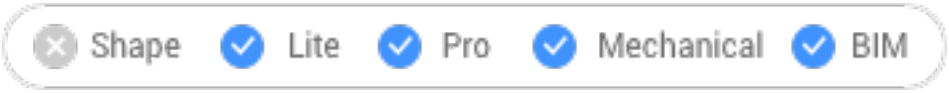
Procedures

- Adding a drawing folder (1.19.2)
- To insert a block from an unopened drawing (1.19.2)

Related Commands

Explorer (6.13.15) - Opens the Drawing Explorer dialog box. CloudOpen (**??**) - Logs into and then opens a drawing from 24/7.

Figure 6.1108



6.13.13 ExpImages

(6.2947 on page 6049) Attaches and adjusts images attached to drawings through the Drawing Explorer; supports the following formats: **BMP** - Windows bitmap **ECW** - Enhanced Compressed Wavelet format **GIF** - CompuServe graphic image format **JPG**, **JPEG**, and **JPEG2000** (JP2, j2k) - Joint Photographic Experts Group (common among digital cameras) **MTI** - Multi-resolution Tiled Image (Bricsys raster format for large images) **PCX** - PC Paintbrush **PNG** - Portable network graphics **SID** - MrSID is an acronym for Multi-resolution Seamless Image Database **TGA** - Targa

Accessing the Command

command bar: **expimages** menu bar: **Tools | Drawing Explorer | Images** : **expimages** Displays the Drawing Explorer, opened to the Images node. When no images are loaded into the current drawing, then the Images section is blank. (6.1109 on the facing page) Drawing Explorer when one or more images are attached to the current drawing: (6.1110 on the next page) Press **F1** to access help. **Note:** You can control all attachments through the AttachmentsPanelOpen (6.4.29) command, and adjust the properties of images with the Properties (6.24.54) command.

Figure 6.1109

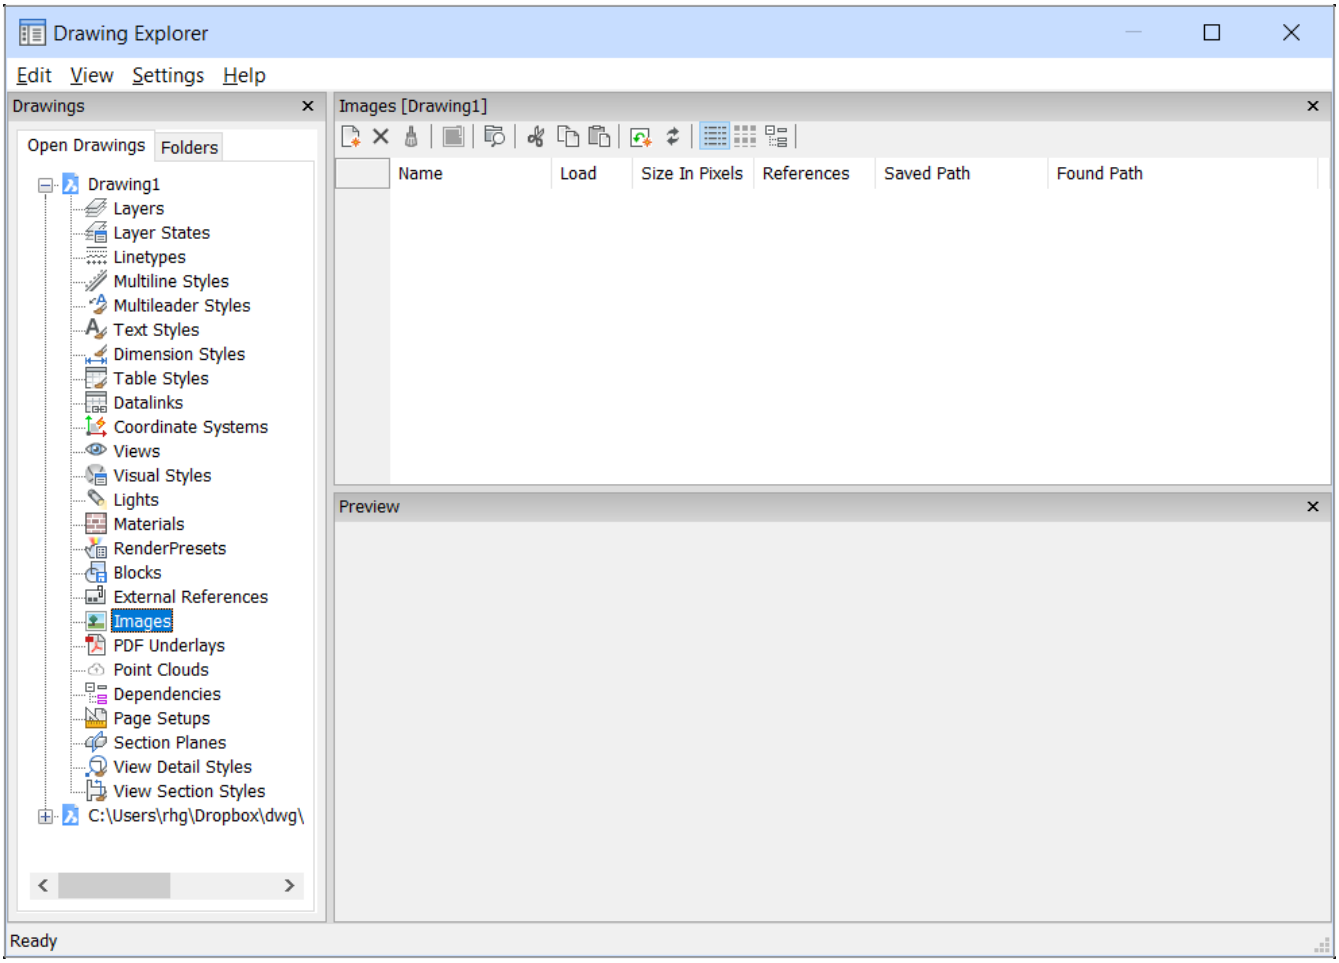


Figure 6.1110

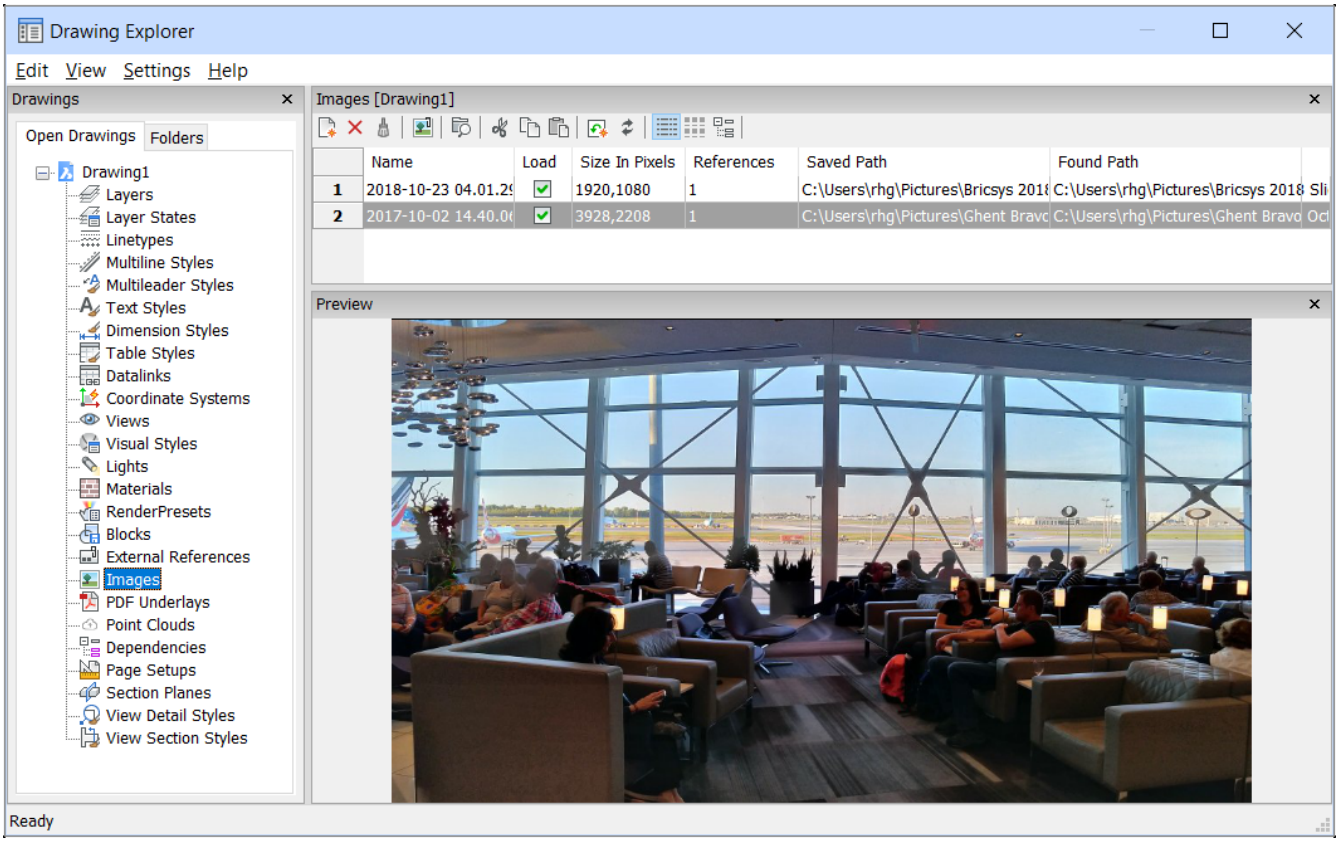


Command Options

Toolbar Option	Description
 New	Attaches raster image files to the drawing: 1. Click **New**. 2. In the Select Image File dialog box, choose an image file, and then click **Open**. 3. In the Attach Raster Image dialog box, modified the properties, and then click **OK**. 4. To close the Drawing Explorer, click **X**. See ImageAttach (6.17.6) command.
 Delete	Removes the image from the drawing. You may need to use the Regen (6.26.23) command to update the screen.
 Insert	Inserts more images in the drawing, like the New button; displays the Attach Raster Image dialog box. See ImageAttach (6.17.6) command.
Extended Search	Runs an extended search for missing attachments. (Not implemented.)
 Cut	Cuts the image to the Clipboard, and removes it from the current drawing: 1. Choose the image file 2. Select **Cut** 3. Switch to the Image section of another drawing in the Drawing Explorer 4. Select **Paste**
 Copy	Copies the image to the Clipboard. You can paste it in the Drawing Explorer's Image section of another drawing.
 Paste	Pastes images and related data.
 Regen	Updates the drawing to reflect changes made in this dialog box.
 Regen Toggle	Toggles automatic drawing updates: • **On** - updates drawing automatically • **Off** - updates drawing only when the Redraw button is clicked
 Details	Displays the details of each image. (6.1112 on page 4370)
 Icons	Displays the image files as small icons, hiding their details. Not implemented.
 Tree	Displays the relationship between files in an Explorer tree-like fashion. "Current" refers to the current drawing. (6.1113 on page 4371)

Detail View Options	Description
Name	Specifies the name of the image. This usually is the image's file name.
Load	Toggles whether the image is displayed in the drawing: • **On** - displays the image in the drawing • **Off** - displays only the image's frame, which is turned off by the ImageFrame (6.17.9) command
Size in Pixels	Reports the size of the image in pixels, horizontally and vertically.
References	Reports the number of times the image occurs in the drawing.
Saved Path	Specifies the path to the image file to attach a different version of the image or to find an image disconnected from the drawing: • ... button - changes the path
Found Path	Reports the path to the image file

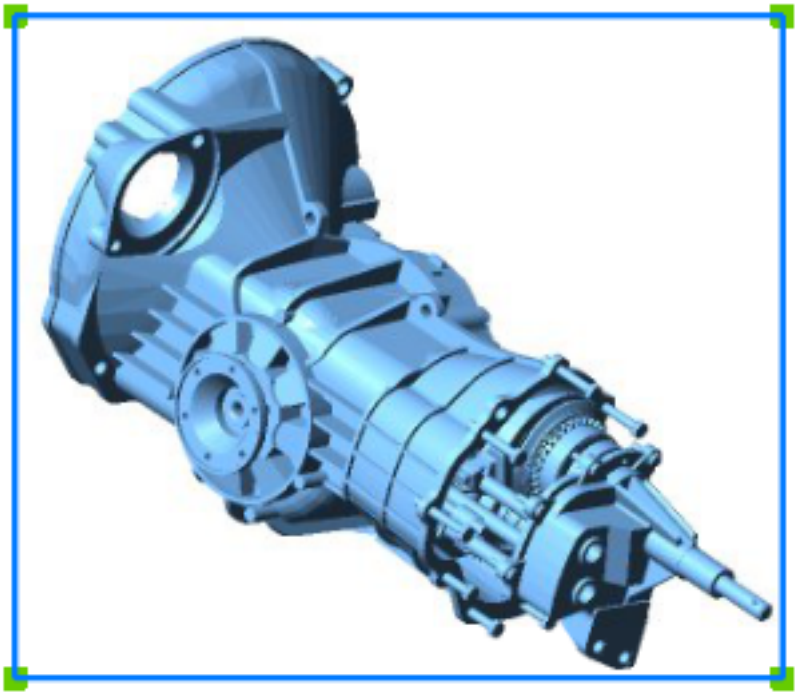
Grips Editing

Images can be edited directly through grips:

1. Select the image. Notice that its frame has four grips.
2. Drag a grip to stretch (resize) the image.

(6.1111 on the following page)

Figure 6.1111



Procedures

- Open the Images Explorer (1.31.1)
- Images Explorer display options (1.31.1)
- Placing images in a drawing (1.31.1)
- To load / Unload images (1.31.1)
- Detaching images (1.31.1)

Related Commands

ImageAttach (6.17.6) - places raster images in drawings. -ImageAttach (6.17.5) - attaches raster images to the drawing; displays prompts in the command bar. ImageAdjust (6.17.3) - changes the properties of images through the Properties palette. ImageClip (6.17.7) - clips images. ImageFrame (6.17.9) - toggles the display of the frame around images. ImageQuality (6.17.8) - toggles the quality of the image. Transparency (1.25.9) - toggles the transparency of monotone images. Explorer (6.13.15) - Opens the Drawing Explorer dialog box.

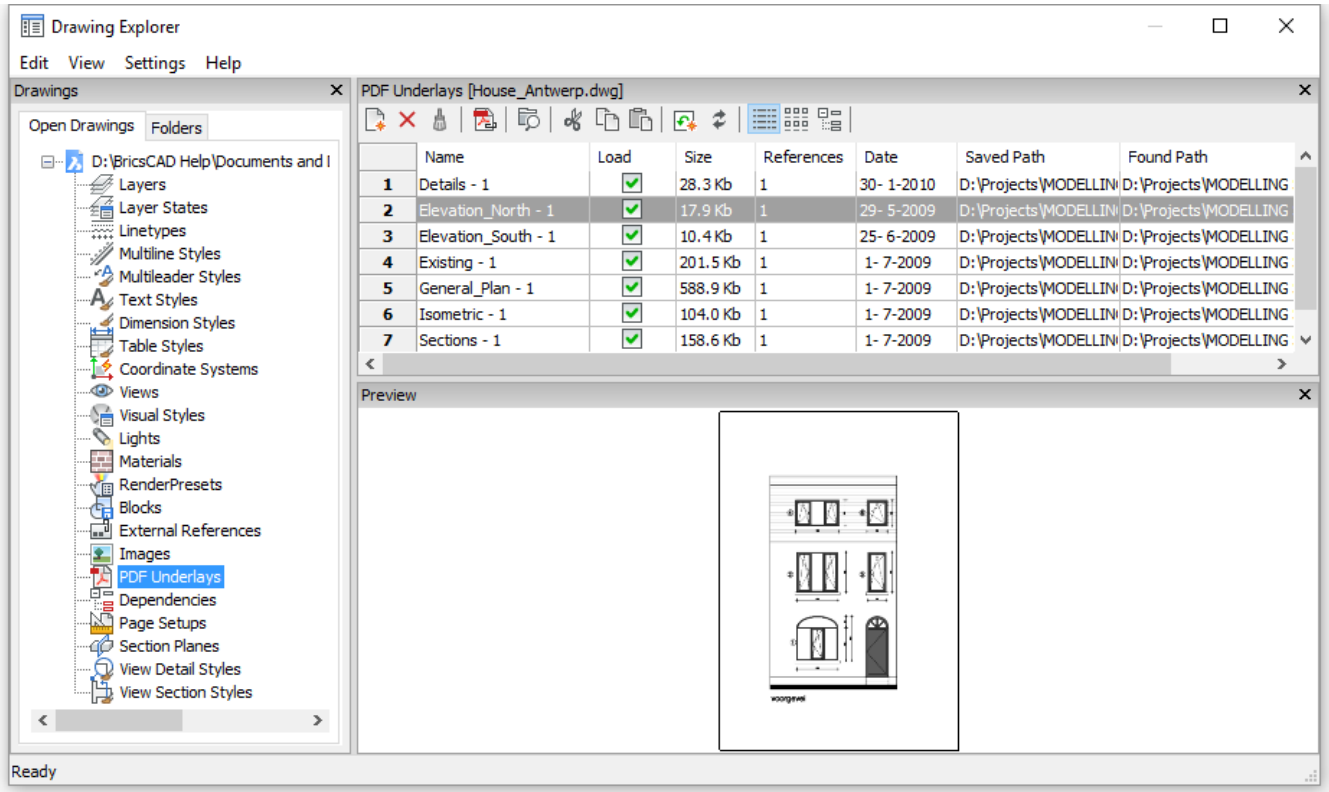
6.13.14 ExpPdfs

(6.2947 on page 6049) Attaches PDF files as underlays to the current drawing through the Drawing Explorer. **Note:** To import PDF files as drawing entities, use the PdfImport (6.24.29) command.

Accessing the Command

command bar: **exppdfs** menu bar: **Tools | Drawing Explorer | PDF Underlays** ribbon: **Insert | Pdfs| PDF Underlays**
: **exppdfs** Displays the PDF Underlays section of the Drawing Explorer: (6.1115 on the facing page)

Figure 6.1115



Command Options

Toolbar Option	Description
New	Attaches a PDF file to the current drawing: 1. Displays the Select PDF Underlay File dialog box; select a PDF file. 2. Click **Open**. 3. Displays the Attach PDF Underlay dialog box; specify parameters. 4. Click **OK**. 5. Prompts you in the command line: **Insertion point - (pick a point to locate the lower-left corner of the PDF.)** See the PdfAttach (6.24.16) command.
Delete	Detaches the selected PDF attachments without warning.

Insert	Attaches additional pages from a multi-page PDF file already attached to the current drawing: 1. Displays the Attach Pdf Underlay dialog box; choose a page number from the **Page** droplist (6.1116 on the next page) 2. Fill out the parameters 3. Click **OK**. 4. Prompts you in the command line: **Insertion point - (pick a point to locate the lower-left corner of the PDF.)** 5. The added page appears in Drawing Explorer with the page number as a suffix to its name: (6.1117 on the facing page)
Cut Copy Paste	Cuts or copies information about the PDF attachment to the Clipboard so that it can be pasted into another drawing; you cannot paste the data into the current drawing.
Detail View	Displays the details of attached PDF files, as shown below.
Tree View	Displays the relationships between the current drawing and attached PDF files in a dendritic view: (6.1118 on the next page)

PDF Underlays Option	Description
Name	Reports the name of the PDF insert. This name is generated by the program, and be edited by you: • Click the name twice slowly • Right-click, and then choose **Rename** from the shortcut menu
Loaded	Toggles loading of the PDF: • **On** - loads the PDF, and makes it visible • **Off** - unloads the PDF, making it invisible
Size	Reports the size of the PDF file.
References	Reports the number of times the PDF is attached to the drawing.
Date	Reports the date of the file. This can be useful in determining whether you ware working with the most recent revision.
Saved Path	Reports the path to the PDF file when first loaded. When the path cannot be found: 1. Click this field 2. Click the  **Browse** button. BricsCAD displays the Choose a File dialog box. 3. Locate the missing PDF file. 4. Click **Open**.
Found Path	Reports the path to the PDF file.

Related Commands

PdfAdjust (6.24.17) - Allows to adjust the fade, contrast and monochrome settings of a PDF-underlay in the command bar. PdfAttach (6.24.16) - inserts a PDF file as an underlay into the current drawing. Pdfclip (6.24.19) - allows clipping of PDF underlays. Pdflayers (6.24.22) - allows to control the display of layers in a PDF underlay. ExpXrefs (6.13.23) - attaches and controls externally referenced drawings through the Drawing Explorer. -XRef (6.34.8) - attaches and controls xrefs through the command bar. XClip (6.34.2) - clips externally-referenced drawings. Insert (6.17.13) - inserts drawings as blocks. Explorer (6.13.15) - opens the Drawing Explorer dialog box.

Figure 6.1118

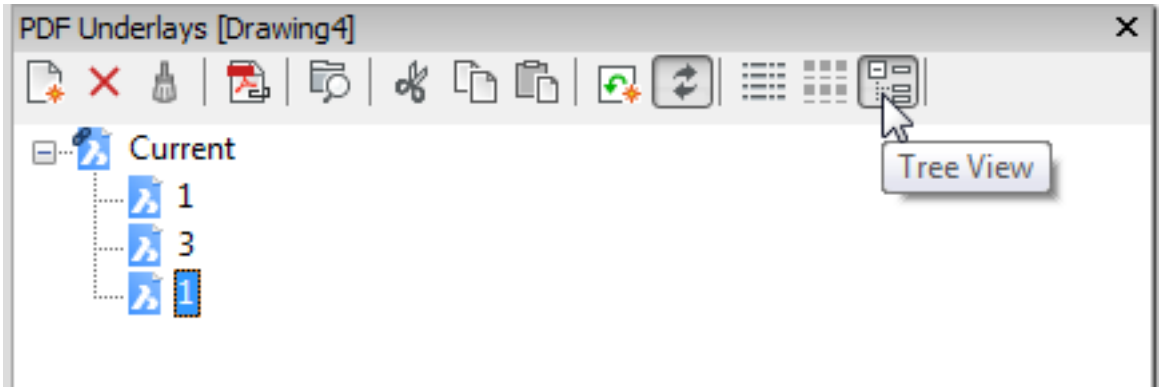

Figure 6.1119

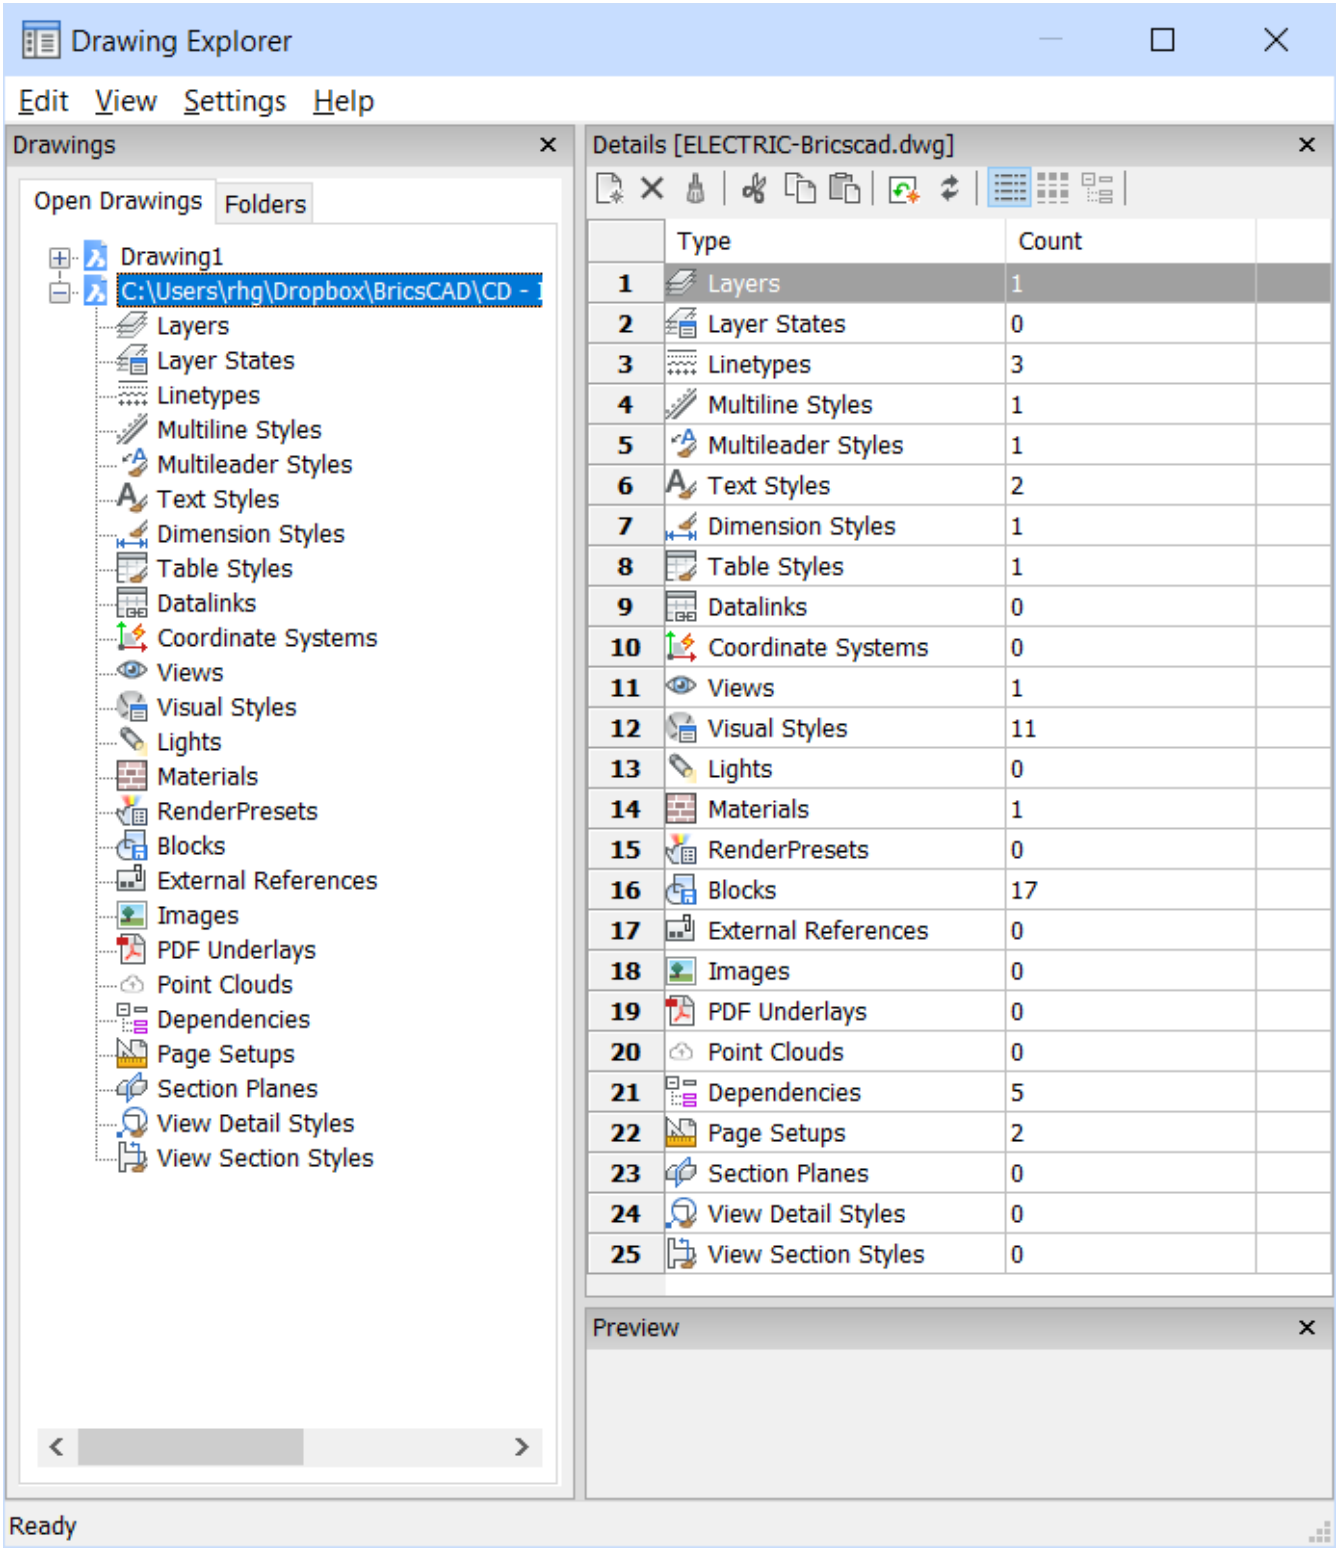
6.13.15 Explorer

(6.2981 on page 6079) Opens the Drawing Explorer dialog box; controls Layers (6.13.17), Layer States (6.20.9), Linetypes (6.20.32), Multiline Styles (6.21.26), Multileader Styles (6.21.24), Text Styles (6.27.55), Dimension Styles (6.11.19), Table Styles (6.29.6), Datalinks (6.10.1), Coordinate Systems (6.13.24), Views (6.31.2), Visual Styles (6.31.15), Lights (6.20.36), Materials (6.21.10), Render Presets (6.26.27), Blocks (6.13.11), External References (6.13.23), Images (6.13.13), PDF Underlays (6.13.14), Point Clouds (6.24.31), Dependencies (6.13.9), Page Setups (6.24.2), Section Planes (6.27.12), View Detail Styles (6.31.7), and View Section Styles (6.31.22).

Accessing the Command

command bar: **explorer** keyboard shortcut: **Ctrl+2** menu bar: **Tools | Drawing Explorer |** (select a category) ribbon: **Home | Settings | Drawing Explorer** toolbar: **Standard** : **Explorer** Displays a dialog box: (6.1120 on the next page) Press **F1** to access help. Click **X** to close.

Figure 6.1120



Command Options

Columns can be switched on and off and repositioned by drag-and-drop:

- **To move a column** - drag it by its header to a new location
- **To change the width of a column** - drag the separator line back and forth
- **To restore a column's width** - double-click the separator line
- **To turn columns on and off** - select a column, then right click:

(6.1121 on page 4383)

- **Check box** - displays or hides the column
- **Show all columns** - displays all columns, including ones that were previously hidden
- **Restore column positions** - returns all columns to their default locutions

Notes: The shortcut keystrokes shown below operate inside the Drawing Explorer dialog box. The options in menus and the buttons displayed by the toolbar vary depending on the current item. Shown below are the actions for layers.

Menu Bar: Edit	Keyboard Shortcut	Description
New 	Ctrl+N	Creates a new item with a generic name, such as NewLayer 1 or New-Style1. Use the Rename button to rename it.
Delete 	Ctrl+D	Erases the selected item from the drawing. When the item is in use, such as a layer with entities, you have to option to retain the entities from the layer to be erased: (6.1122 on page 4384) • **Delete** - removes the layer and the entities assigned to it • **Change** - move the entities to another layer, and then erases the layer; displays a list from which to choose one of all the other layers in the drawing • **Cancel** - cancels the operation so that no changes are made Some items cannot be erased, such as layer 0 and visual style 2D Wireframe.

Merge To		(Layers only.) Merges the content of one layer with another ones: 1. Choose a source layer 2. Click **Edit | Merge to** 3. Choose a target (destination) from the dialog box: (6.1123 on page 4385) • **Choose a target layer** - choose a layer name from the ones listed • **Merge** - move the entities from the source layer to the target layer • **Cancel** - cancels the merging process The source layer is removed from the drawing.
Purge 	Ctrl+P	Purges unused items from the drawing. Some items cannot be erased, such as layer 0 and text style Standard. See Purge (6.24.60) command.
Cut 	Ctrl+X	Copies the item to the Clipboard, and then deletes it from the drawing following the same procedure as the Delete button.
Copy 	Ctrl+C	Copies the item to the Clipboard for pasting elsewhere in the Drawing Explorer.
Paste 	Ctrl+V	Copies the item from the Clipboard, and pastes it into the Drawing Explorer. When the item on which the Clipboard content will be pasted is in use, such as a layer with entities, you have options: (6.1124 on page 4385) • **Copy and Replace** - replaces the existing item with the pasted one • **Don't Copy** - cancels the copy operation • **Copy, but keep both** - pastes the Clipboard content with an incremented name, usually suffixed by a 1 • **Cancel** - also cancels the operation
Rename	F2	Renames the selected item; alternatively, click on the item's name twice, slowly, to rename it.
Select All	Ctrl+A	Selects all items.

Invert Selection	Inverts the selected item(s). For instance, if you have one layer selected, then this option unselects it, and then selects all other layers,
Remove Viewport Overrides	(Layers only) Removes overrides from the viewport properties of selected layers.
Isolate Selected Layers	Hides from view all layers that are not selected. Use the Invert Selection option to reverse which layers are visible.
Current	Makes the item current, such as making the selected layer the current (working) layer.

Menu Bar: View	**Description**
Open Drawings	When checked, displays the Drawings pane in the left of the Drawing Explorer dialog box, in which you can select other drawings and items.
Details	When checked, displays the Details pane in the center of the Drawing Explorer dialog box, in which you view all related items and possibly edit them.
Preview	When checked, displays the Preview pane at bottom of the Drawing Explorer dialog box, in which the selected item can be viewed.
Editor	When checked, displays the Edit pane in the right of the Drawing Explorer dialog box, in which the properties of items can be changed.
Status Bar	Toggles the display of the status bar at the bottom of the Drawing Explorer dialog box.
Filters	(Layers only.) When checked, displays the Filters pane for layers.
Details	Displays the details of items.
Icons	Displays items as an array of icons; applies only to blocks and external references.
Tree	Displays items in tree form; applies only to layer states, data links, dimension styles, external references, images, PDF underlays and dependencies.
Regen	Updates the drawing display to reflect changes made in this dialog box.
Toggle Regen	Toggles automatic updating of the display.

Menu: Settings	**Description**
Restore Explorer Default Layout	Restores the layout of the Drawing Explorer to the default layout for the selected category. When you makes changes to the layout of the Drawing Explorer, the program remembers them. This option resets all your changes.
Options	(Applies to Blocks and External References only.) Specifies default settings for inserting blocks. See the ExpBlock (6.13.11) command.

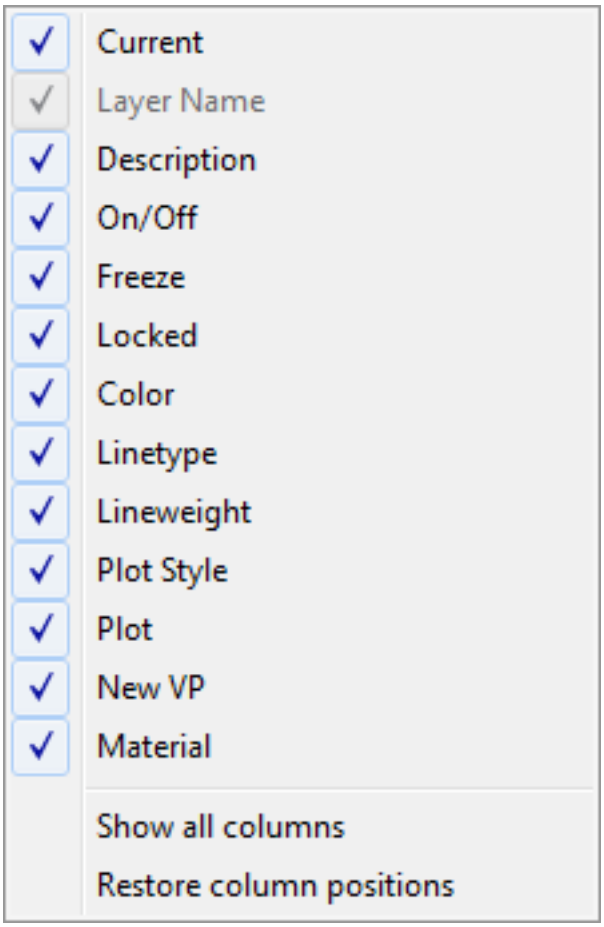
Drawings Pane	**Description**
Open Drawings	Displays a list of drawings that are currently open. Click a drawing to see a detailed list of its content in the Details pane.

Folders: Add Local Folders	Displays a list of drawing folders that you tend to access often: 1. Click the **Add Local Folder** button to add a folder, including all subfolders. 2. Double click a drawing to open it. 3. To copy items between drawings, drag definitions from one drawing to another; this lets you copy layers, text styles, linetypes, and so one to another drawing.
Folders: Login to Bricsys 24/7	Displays a list of drawings that you have stored online on the Bricsys 24/7 site: 1. Click the **Logon to Bricsys 24/7** button. 2. Enter the user name and password of a valid account: (6.1125 on page 4386) 3. Select a drawing in a project, and then right-click to download or view the drawing. See the CloudOpen (**??**) command.

Details	**Description**
 Layers	Reports on the layers defined in the selected drawing. Click to explore the layers; see the Layer (6.13.17) command.
 Layer States	Reports on the layer states defined in the selected drawing. Click to explore the layer states; see the LayerState (6.20.9) command.
 Linetypes	Reports on the linetypes loaded into the selected drawing. Click to explore the linetypes; see the Linetype (6.20.32) command.
 Multiline Styles	Reports on the multiline styles defined in the selected drawing. Click to explore multiline styles; see the MlStyle (6.21.26) command.
(6.1126 on page 4386)	Reports on the multileader styles defined in the selected drawing. Click to explore multileader styles; see the MLeaderStyle (6.21.24) command.
 Text Styles	Reports on the text styles defined in the selected drawing. Click to explore text styles; see the Style (6.27.55) command.
(6.1127 on page 4386)	Reports on the dimension styles defined in the selected drawing. Click to explore dimension styles; see the DimStyle (6.11.19) command.
 Table Styles	Reports on the table styles defined in the selected drawing. Click to explore table styles; see the TableStyle (6.29.6) command.
 Datalinks	Reports on the data in the drawing linked to external spreadsheet files. Click to explore data links; see the DataLink (6.10.1) command.
(6.1128 on page 4386)	Reports on the named user coordinate systems (UCS) defined in the selected drawing. Click to explore coordinate systems; see the ExpUcs (6.13.24) command.

 Views	Reports on the named views in the selected drawing. Click to explore saved views; see the View (6.31.2) command.
 Visual Styles	Reports on the visual styles defined in the selected drawing. Click to explore visual styles; see the VisualStyles (6.31.15) command.
 Lights	Reports on the lights placed in the selected drawing. Click to explore lights; see the LightList (6.20.36) command.
 Materials	Reports on the materials defined in the selected drawing. Click to explore materials; see the Materials (6.21.10) command.
 RenderPresets	Reports on the render presets defined in the drawing. Click to explore render presets; see the RenderPresets (6.26.27) command.
 Blocks	Reports on blocks defined in the selected drawing. Click to explore blocks; see the ExpBlocks (6.13.11) command.
(6.1129 on page 4386)	Reports on the external references (xrefs) attached to the selected drawing. Click to explore xrefs; see the Xref (6.13.23) command.
 Images	Reports on the images attached to the selected drawing. Click to explore the images; see the Image (6.13.13) command.
 PDF Underlays	Reports on the PDF underlays attached to the selected drawing. Click to explore PDF underlays; see the Pdf (6.13.14) command.
 Point Clouds	Reports on the point clouds attached to the selected drawing. Click to explore point cloud; see the PointCloud (6.24.31) command.
 Dependencies	Reports on the external files that the selected drawing depends on. Click to explore dependencies; see the eTransmit (6.13.9) command.
 Page Setups	Reports on the page setups attached to the selected drawing. Click to explore page setups; see the PageSetup (6.24.2) command.
 Section Planes	Reports on the section planes defined in the selected drawing. Click to explore the section planes; see the SectionPlaneSettings (6.27.12) command.
(6.1130 on page 4386)	Reports on the view detail styles defined in the selected drawing. Click to explore the view detail styles; see the ViewDetailStyle (6.31.7) command.
(6.1131 on page 4387)	Reports on the view section styles defined in the selected drawing. Click to explore the view section styles; see the ViewSectionStyle (6.31.22) command.

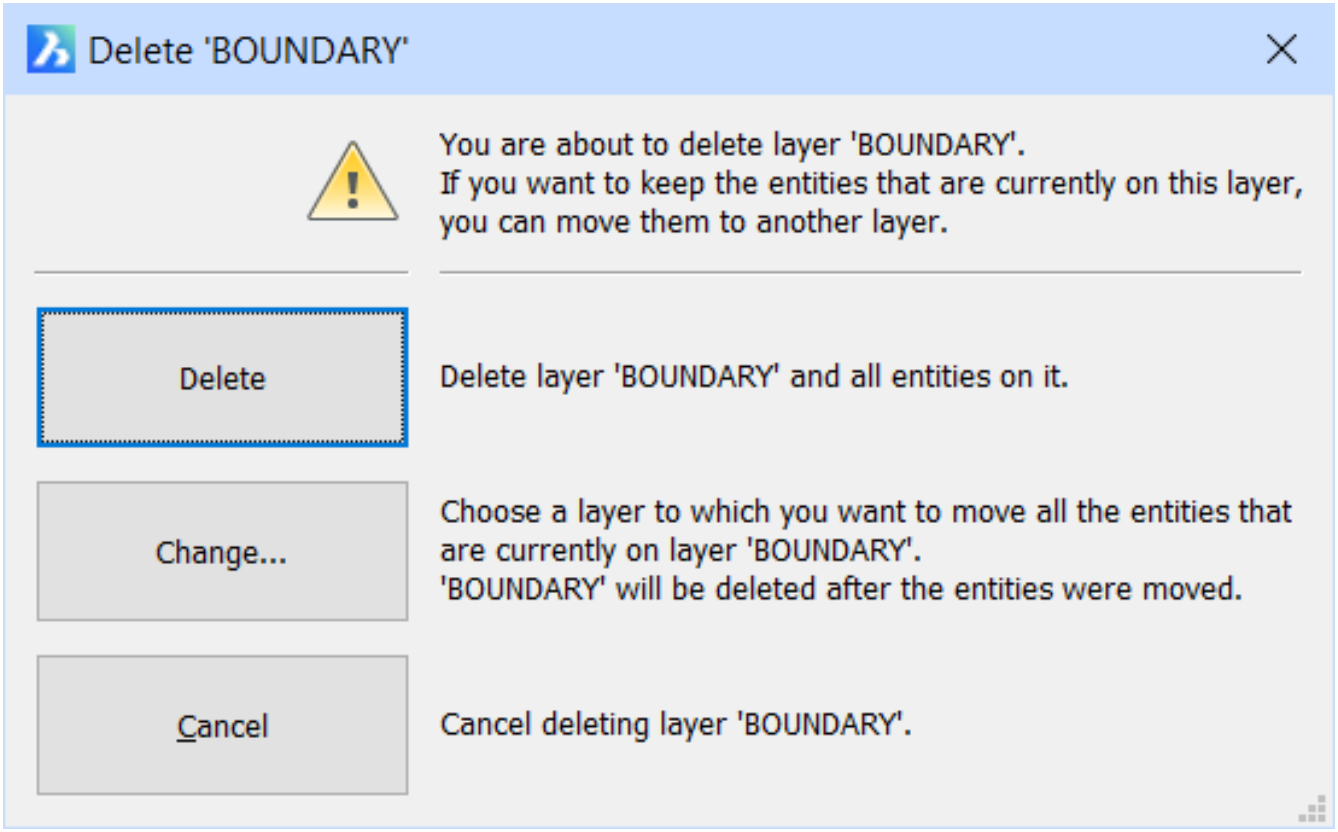
Figure 6.1121



Procedures

- To open the Drawing Explorer (1.19.2)
- To control the Drawing Explorer layout (1.19.2)
- Opening a drawing (1.19.2)
- Adding a drawing folder (1.19.2)
- To insert a block from an unopened drawing (1.19.2)
- To copy definitions between drawings (1.19.2)
- To merge the content of two layers (1.19.2)

Figure 6.1122



Related Commands

DimStyle (6.11.19) - creates and modifies dimension styles, through the Drawing Explorer. eTransmit (6.13.9) - creates a package of a drawing file and all its dependencies, such as: external references, images, font files, plot configuration files, plot style tables and font map files. ExpBlocks (6.13.11) - opens the Blocks section of the Drawing Explorer dialog box. ExpFolders (6.13.12) - opens the Drawing Explorer on the Folders tab. ExpLayers (6.13.17) - creates layers, changes their properties, and removes layers through the Drawing Explorer. ExpUcs (6.13.24) - creates, modifies, and deletes named UCSs through the Drawing Explorer. Image (6.13.13) - inserts images in drawings through the Drawing Explorer. Linetype (6.20.32) - Loads, sets, and creates linetypes through the Drawing Explorer. LayerState (6.20.9) - creates and controls layer states in the Drawing Explorer. LightList (6.20.36) - displays the Drawing Explorer - Lights dialog window. Materials (6.21.10) - creates materials and edits their properties through the Drawing Explorer. MLeaderStyle (6.21.24) - Creates and manages multileader styles through the Drawing Explorer. MlStyle (6.21.26) - creates and edits multiline styles. PageSetup (6.24.2) - creates and edits page setups for plotting drawings in the Drawing Explorer. Pdf (6.13.14) - attaches PDF files to the current drawing through the Drawing Explorer. RenderPresets (6.26.27) - allows to create and edit render presets, and to set the current render preset through a dialog box. SectionPlaneSettings (6.27.12) - Defines the properties of a section plane entity in the Drawing Explorer - Section Planes dialog. SheetSet (6.27.38) - Manages sheet sets. Style (6.27.55) - creates and modifies text style with the Drawing Explorer. TableStyle (6.29.6) - creates and edits table styles through the Drawing Explorer - Table Styles dialog box. View (6.31.2) - creates and sets named views through the Drawing Explorer. VisualStyles (6.31.15) - creates and controls visual style definitions in the Drawing Explorer. Xref (6.13.23) - attaches DWG files to the current drawing through the Drawing Explorer.

6.13.16 Explode

(7.3 on page 6132) Reduces complex entities to simpler ones, such as blocks into constituent parts, and polylines into lines and arcs.

Accessing the Command

 command bar: **explode** alias: **x** menu bar: **Modify | Explode** ribbon: **Change | Arrange | Explode** toolbar: **Modify |**  **: Explode Prompts you in the command bar:** Select entities to explode: **(Choose one or more entities)** Entities in set: 1 Select entities to explode: **(Choose more entities, or press else Enter to exit command)** The result depends on the entity(ies) you selected:

- Polylines become lines and arcs; width is lost.
- Dimensions becomes lines, text, and solids (arrowheads).
- Blocks become individual entities and nested blocks. (You may need to use Explode a second time.) Blocks that have the Explodable property set can be exploded only (see Drawing Explorer / Blocks (6.13.11)). Non-Uniformly scaled blocks can be exploded only if EXPLMODE=ON
- ByBlock colors and linetypes may change.
- Attributes revert to attribute definitions.
- Nonuniformly-scaled blocks are not exploded, unless the EXPLMODE system variable is turned on.
- 3D surface entities become 3D faces.
- Simple entities, such as line and circles, cannot be exploded.

Command Options

Option	Description
Select entities to explode	Choose one or more entities. Entities on frozen and locked layers are not exploded.

Related Commands

Join (6.18.1) - joins lines, LW polylines, 2D polylines, 3D polylines, circular arcs, elliptical arcs, splines and helixes at their common endpoints. Xplode (6.34.9) - explodes complex entities, with control over the results. TxtExp (6.29.36) - explodes text into polylines. U (6.30.3) - undoes the effect of the explosion.

Figure 6.1133

6.13.17 ExpLayers

(6.2981 on page 6079) Creates layers and layer states, changes their properties, and removes layers through the Drawing Explorer dialog box. **Note:** This dialog box must be closed to return to the drawing, unlike the Layers panel, which can remain open at all times; see the LayersPanelOpen (6.20.5) command.

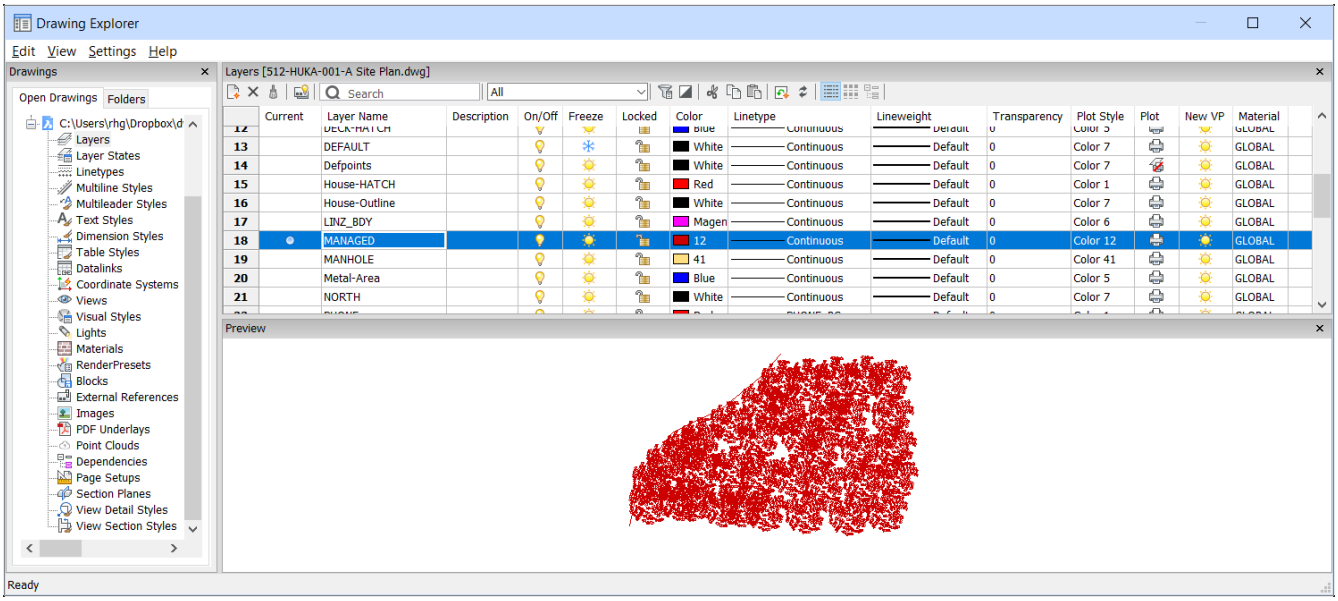
Accessing the Command

command bar: **explayers** menu bar: **Tools | Drawing Explorer | Layers** ribbon:

- **Home | Settings | Drawing Explorer | Layers**
- **Home | Layers | Layers**

: explayers Displays the Layers section of the Drawing Explorer dialog box: (6.1134 on the next page) Create layers or modify layer properties, and then click **X**. Press **F1** to access help.

Figure 6.1134



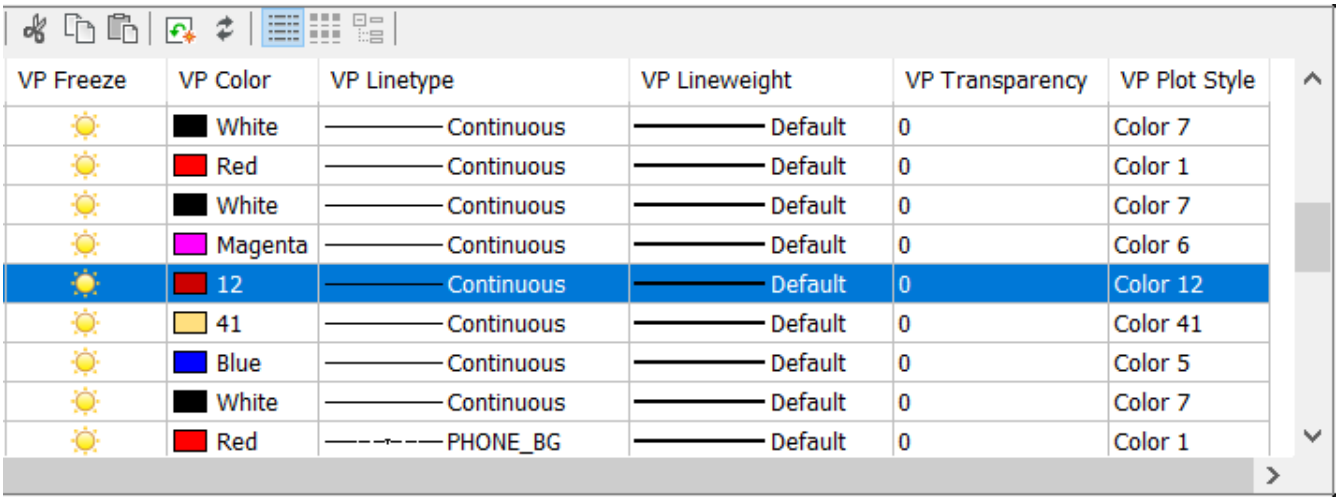
Properties of Layers in Viewports

When you open the Drawing Explorer - Layers dialog when in paper space, additional columns are displayed: **VP Freeze**, **VP Color**, **VP Linetype**, **VP Lineweight**, and **VP Plot Style**, where VP is short for viewport. (6.1135) By default, these columns match the corresponding model space settings, but viewport layer properties can be set differently for each layout and for each paper space viewport. If the SHOWLAYERUSAGE variable is on, then the **Layer Usage** icons indicate when viewport settings for the current layout and paper space viewport are different from model space settings:

- : Current layer with viewport overrides.
- : Layer with viewport overrides.
- : Empty layer with viewport overrides.

If no paper space viewport is active, then the settings apply to entities in the current layout. If a viewport is active, then viewport settings override the BYLAYER properties in the current viewport. The VP Freeze setting (or) allows you to control the visibility of model space entities in the current viewport. The New setting controls whether a layer is either Frozen ( ) are Thawed ( ) in new paper space viewports.

Figure 6.1135



Command Options

Option	Description
 New	Creates new layers with the generic name "NewLayer1". The new layer that is created copies the properties of the currently selected layer.
 Delete	Deletes layers, except for the following, which cannot be deleted: • 0 • Any layer with entities
 Purge	Purges layers from the current drawing, except for the following layers, which cannot be purged: • 0 • The current layer • Any layer with entities
 Xref symbols On/Off	Toggle the display of Xref layers ("symbols"): • **On** - layers from xref'ed drawings are displayed • **Off** - layers from xref'ed drawings are not displayed
(6.1388 on page 4674)	Filter the names of layers to shorten longer lists of layers. As you type characters, the program displays the layer names containing the text. Any layers containing the sequence of characters are listed, no matter where in the layer name the sequence is located. For example, entering "do" returns layers named DOOR and WINDOW.
Filter Used	Displays the current layer filter, if any are defined in the current drawing. Click the down-arrow button to choose a different layer filter The program creates the following layer filters automatically: • **All** - the only layer filter that appears in all drawings, and displays all layers • **Viewport Overrides** - you've overridden the properties of a viewport layer • **Xref** - the drawing has externally referenced drawings attached • 'xref name' - the name of each xref'ed drawing (note that layers from xref'ed drawings are prefixed automatically with the drawing's name)

Display Filter Panel

Toggles the display of the Filter Panel on and off. You can think of layer filters as "layer groups," groups of layers that you need to show or turn on-off all at once. The program creates layer filters in certain cases automatically, as described above. (6.1146 on page 4404)

- To apply a filter, select its name in the list
- To make a new layer filter, click the **New** button (); see the Layer Property Filter dialog box below
- To delete selected filter(s), click the **Delete** button (); filters created by the program, such as All and Xrefs, cannot be deleted.

Invert Filter

Inverts the content of current filter, so that the dialog box displays all layers not included in the filter. For example, to see all layers **not** in an xref'ed drawing, choose the **Xref** filter, and then click **Invert Filter**.

Current

Specifies the current working layer. Only one layer can be current at a time.
If the SHOWLAYERUSAGE variable is on, then following icons display in the **Layer Usage** column:

- - Layer is current
- - Layer is not empty
- - Layer is empty

In paper space layouts or viewports (model space with floating viewports), the following icons indicate when viewport overrides exist:

- - Viewport overrides exist and layer is current
- - Viewport overrides exist and layer is not empty
- - Viewport overrides exist and layer is empty

The **Indicate layers in use** item in the View menu toggles the SHOWLAYERUSAGE system variable ON/Off. (6.1143 on page 4403)

Header Options
Layer Name

Description
Specifies the name of the layer. In long lists of layers, you can type a character to jump to the first layer starting with that character, such as 'd' for DOORS. To sort the layer names from A to Z, click the **Layer Name** header; to reverse the order from Z to A, click the header a second time. To rename a layer:

1. Click the name twice, slowly (or right-click the layer name and then choose **Rename**)
2. Enter the new layer name

Description	(optional) Describes the content of the layer. Click the field, and then type.
On/Off	Toggles the selected layers between on and off. To change the status, select one or more layers, and then click a lightbulb icon: •  **On** - displays entities on the layer •  **Off** - hides entities from view; entities are included in the calculation of extents
Freeze	Toggles the selected layers between frozen and thawed. To change the status, select one or more layers, and then click a sun/snowflake icon: •  **Thaw** - displays entities on the layer •  **Freeze** - hides entities from view; entities are excluded in the calculation of extents, and are not exported with commands such as WBlock
Locked	Toggles the selected layers between locked and unlocked. To change the status, select one or more layers, and then click a padlock icon: •  **Unlocked** - allows entities to be edited •  **Locked** - prevents entities from being edited; entities are still visible
Color	Specifies the color of the layer. The default color is white (black). To change the color: 1. Choose one or more layers 2. Click a color square to display the Select Color dialog box; see Color (6.9.19) command 3. Choose a color, and then click **OK**
Linetype	Specifies the linetype of selected layers. The default linetype is "Continuous." To change the linetype: 1. Choose one or more layers 2. Click a linetype sample 3. Choose one from the droplist (6.1389 on page 4674) To load additional linetype definitions: 1. Click the **Load** option. 2. In the Load Linetypes dialog box, choose a linetype, and then click **OK**. See Linetype (6.20.32) command.

Lineweight	Specifies the lineweight of selected layers. Default is "Default." To change the lineweight: 1. Choose one or more layers 2. Click the lineweight sample 3. From the droplist, choose another lineweight (6.1390 on page 4674) See LWeight (6.20.42) command.
Transparency	Sets the transparency of entities on the selected layer(s) between 0 (fully opaque) and 90 (fully transparent); the default is 0. To change the transparency: 1. Choose one or more layers 2. Click the transparency number 3. From the droplist, choose another number The 2DWireframe visual style ignores this setting; instead, use the TRANSPARENCYDISPLAY variable to control the level of transparency.
Plot Style	Specifies the plot style of selected layers, if plot styles are enabled in the current drawing. The default is "Color_7." To change the plot style" 1. Choose one or more layers 2. Click a plot style name 3. From the droplist, choose another style name By default, plot styles are not enabled in drawings. To add plot styles to the drawing, see the PlotStyle (6.24.28) command.
Plot	Toggles selected layers between being printed and not printed. To change the status, select one or more layers, and then click the printer icon: • **Print**- prints the layer • **No Print** - does not print the layer Some layers created by the program also do not print by default, such as DefPoints.
New VP	Specifies whether the layer is visible (thawed) or invisible (frozen) when you make a new viewport (VP) in a layout tab. To change the status, select one or more layers, and then click a sun/snowflake icon: • **Thaw** - displays entities on the layer in the new viewport • **Freeze** - initially hides entities from view when the viewport is created See the MView (6.21.37) command.

Material	Specifies the material of selected layers. The default is material is name "Global." To change the material assigned to one or more layers: 1. Select one or more layers. 2. Click the **Material** field. 3. Click again to display the droplist, containing the materials available in the drawing. 4. Select a material in the list. When you need to add more materials to the drawing, see the Materials (6.21.10) command.
Preview	Displays the entities on the selected layer.

Viewport Headers

The following headers appear when you switch to from model tab to a layout tab, and then open the Drawing Explorer:

Header Option	Description
VP Freeze	Freezes the layer in the current layout; overrides the freeze/thaw setting in model space
VP Color	Specifies the color of entities on this layer in the current layout; overrides the color setting in model space
VP Linetype	Specifies the linetype for entities in the current layout; overrides the linetype setting in model space
VP Lineweight	Specifies the lightweight in the current layout; overrides the lightweight setting in model space
VP Transparency	Specifies the transparency of entities on this layer in the current layout; overrides the transparency setting in model space
VP Plotstyle	Specifies the plot style name in the current layout; overrides the plot style setting in model space

About Layer Filters

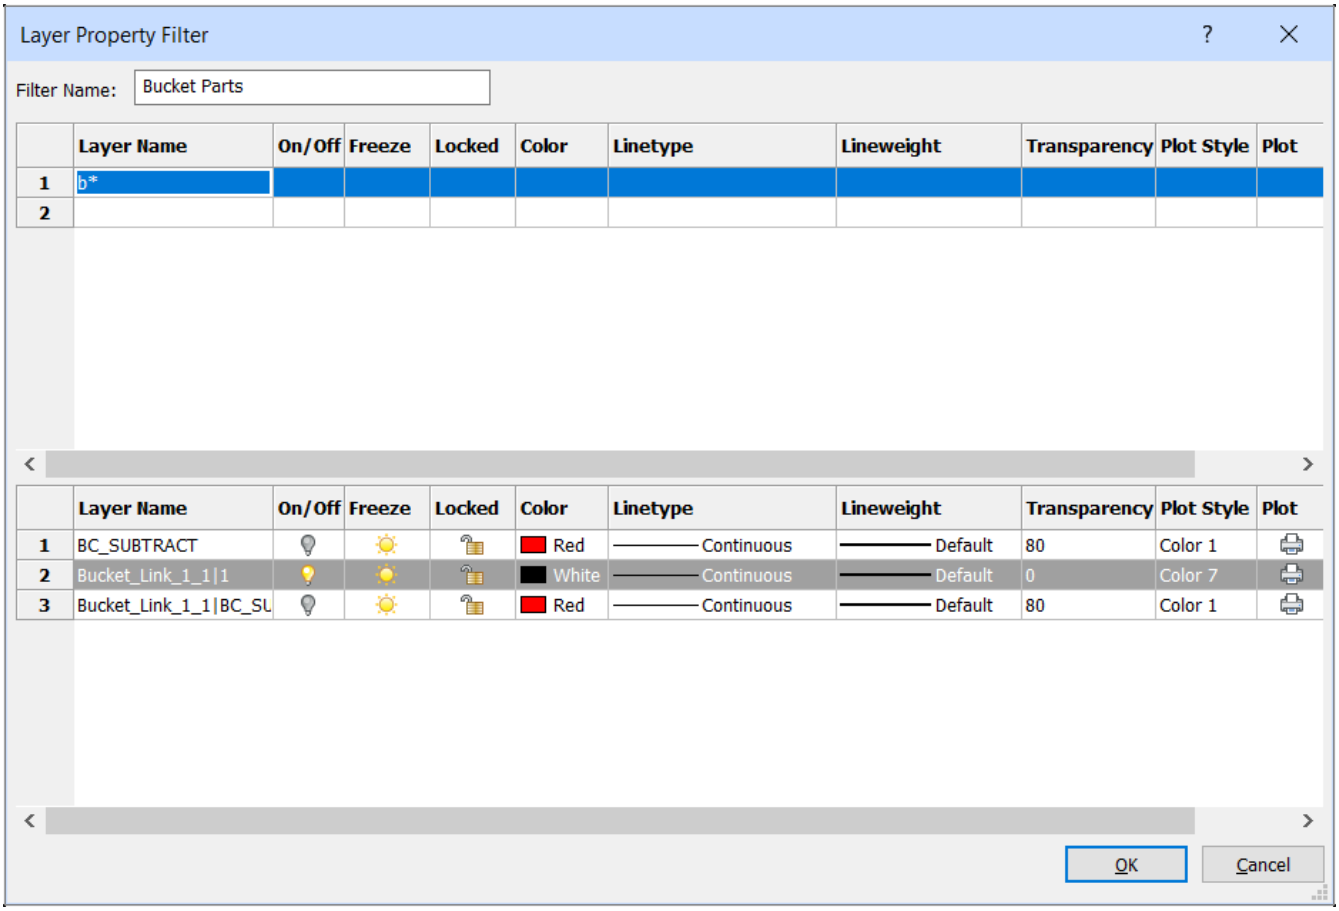
You can think of layer filters as "layer groups," groups of layers that you need to show or turn on-or-off all at once. The program creates layer filters in certain cases automatically, as described above. (6.1146 on page 4404)

- To apply a filter, select its name in the list
- To make a new layer filter, click the **New** button (); see the Layer Property Filter dialog box below
- To delete selected filter(s), click the **Delete** button (); filters created by the program, such as All and Xrefs, cannot be deleted

To create a new layer filter definition:

1. Click the **New** button () on the Filter Panel toolbar. The Layer Property Filter dialog box displays: (6.1136 on the next page)
2. **Filter Name** - enter a name for the filter in the Filter Name field. It can be descriptive of which layers the filter displays, such as 'Door and Windows.'
3. **Layer Name** - enter a layer name in the Layer Name field. You can use wildcards, such as ? and * to specify more than one layer with a similar name, such as Doors-* for Doors-Exterior and Doors-Interior.
4. **Properties** - to specify which layers to include according to their properties, select a property (such as Freeze), and the filter includes all layer(s) that currently are frozen.
5. Click **OK** to save the layer filter.
6. To use a layer filter, click on its name in either the Filters panel or from the Filters droplist. Notice that the layers shown in the Drawing Explorer changes.

Figure 6.1136



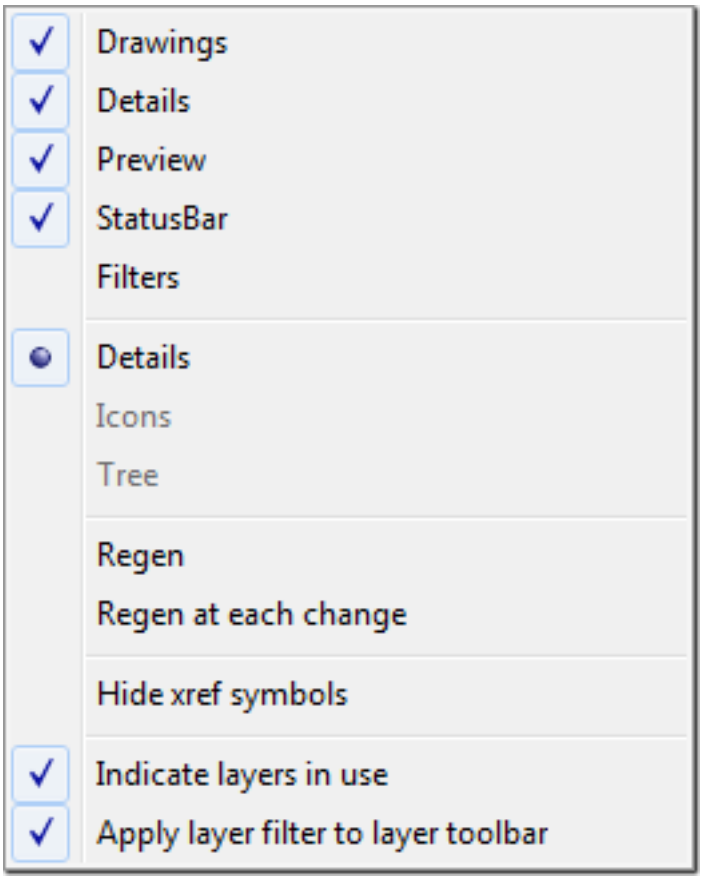
About the View Menu

The **View** menu on the Drawing Explorer's menu bar contains options specific to layers: (6.1137 on page 4398)

Option	Description
Drawings	Toggles the display of the Drawings panel (left side of the Drawing Explorer).
Details	Toggles the display of the Layers panel.
Preview	Toggles the display of the Preview panel at the bottom of the Drawing Explorer.
StatusBar	Toggles the display of the Status Bar at the very bottom of the Drawing Explorer.
Filters	Toggles the display of the Filters panel.
Details Icons Tree	Only the Details view is available for layers.
Regen	Forces the drawing display to be regenerated. See the Regen (6.26.23) command.
Regen at Each Change	Toggles the automatic regeneration of the drawing display each time you make a change in the Drawing Explorer.
Show/Hide XRef Symbols	Toggles the display of layers from externally-referenced drawings (the word Symbols should be 'Drawings').
Indicate Layers in Use	Toggles the SHOWLAYERUSAGE variable On/Off to show or not show the in-use and not-in-use icons in the Current column: • - Layer is not empty • - Layer is empty

Apply layer filter to layer toolbar	Applies the current layer filter to the **Layer** control on the **Entity Properties** toolbar.

Figure 6.1137



About Wild-Card Characters

Wild-card characters can be used in the Filter text field and in Filter definitions to filter layers by name.

Character	ASCII code*	Description
#	35	# matches any digit For example, ## matches 12 and 34 but not 5 or 123
@	64	Matches any alphabetic character, so not digits or symbols For example, @@@@@ matches all 5-letter layer names
.	46	Matches non-alphanumeric characters, so symbols but not letters or numbers For example, .* matches all layer names starting with an non-alphanumeric character such as _SITEPLAN and +1_LEVEL
	42	Matches any string, including letters, numbers, and characters. For example, A* matches all layer names starting with the letter A
?	63	Matches any single character. For example, ?AB* matches L**AB**ORATORY and C**AB**ARET but not ST**AB**LE, because STABLE begins with two letters and the ? specifies a single letter
~	126	Negative match, in which any string but the pattern is returned. For example, ~*A* matches all layer names not containing the letter A

[]	91 93	Matches any one of the characters enclosed inside the square brackets. For example, LA[YB] matches LA**Y** and LA**B**
[~]	91 126 93	Specifies any one of the characters not found in the square brackets. For example, LA[~YB] matches L**AD** but not L**AY** or L**AB**
[-]	91 45 93	Specifies a range for a single character in the layer name. For example, LAY-[A-E] matches any combination of LAY- and A through E, such as LAY-**A** ... LAY-**E** but not LAY-F
‘	96	Matches the next string exactly to find a layer name that contains a wild-card character when it is prefixed by the reverse quote character. Use ‘ to search for layer names that include characters like ? and ~. For example, ‘~LAY* matches ~LAY-1,~LAYER-1, and ~LAY-B.

* ASCII code: if a character is not available on the keyboard, press and hold the **Alt**-key and then type the ASCII code on the numeric keypad.

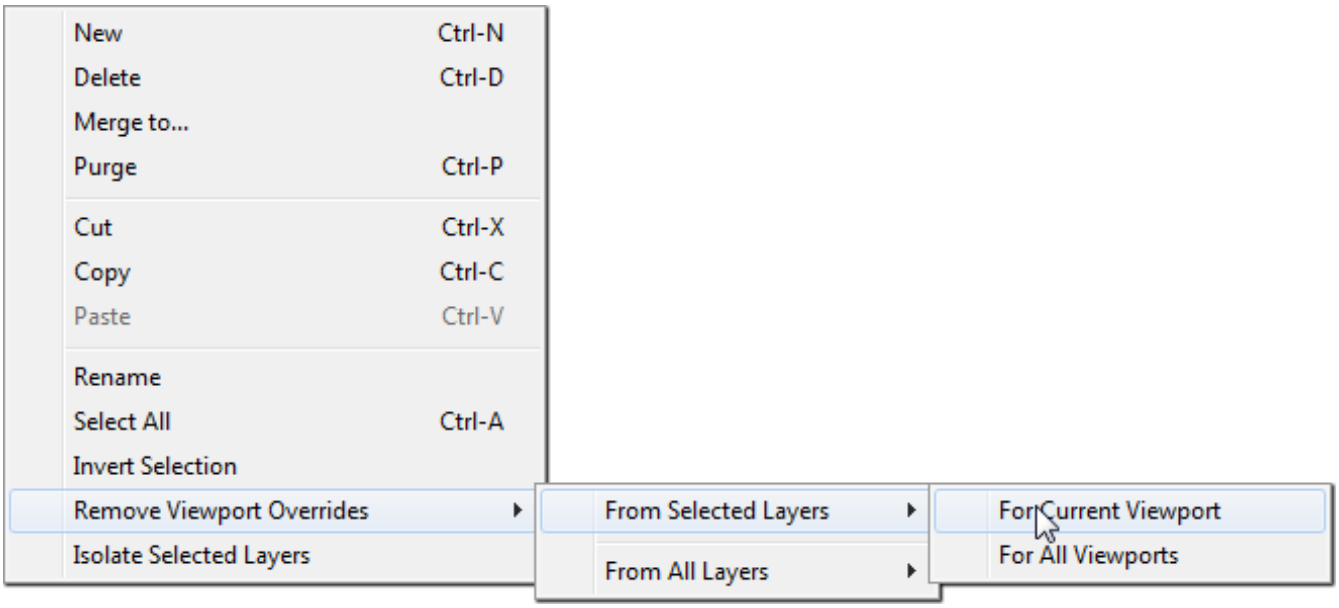
Shortcut Menu Options

Right-click a layer name to see the following shortcut menu: (6.1138 on page 4401) The keystrokes listed work only in the Drawing Explorer.

Option	Keystroke	Description
New	Ctrl+N	Creates a new layer.
Delete	Ctrl+D	Deletes layers from the drawing, except for the following ones: • 0 • Any layer with entities
Purge	Ctrl+P	Purges layers from the current drawing, except for the following ones: • 0 • Current layer • Any layer with entities
Cut	Ctrl+X	Cuts the layer and its properties to the Clipboard, which can then be pasted elsewhere in the Drawing Explorer, such as into the layer system of another drawing.
Copy	Ctrl+C	Copies the layer and its properties to the Clipboard.
Paste	Ctrl+V	Pastes the layer from the Clipboard into Drawing Explorer.
Rename		Renames the selected layer.
Select All		Selects all layers.
Set Current		Specifies the current working layer. Only one layer can be current at a time.

Remove Viewport Overrides	Removes overrides from properties that were set differently for viewports: **From Selected Layers** - **(select an option)**: • **For current viewport** - removes overrides from the current viewport • **For all viewports** - removes overrides from all viewports in the drawing **From All Layers** - removes the overrides form all layers in the drawing for either the current viewport or all viewports.
Isolate Selected Layers	Dims the entities on all other layers, except for the one(s) selected. Use the LayUnIso (6.20.20) command to unisolate layers. See the LayIso (6.20.7) command.

Figure 6.1138



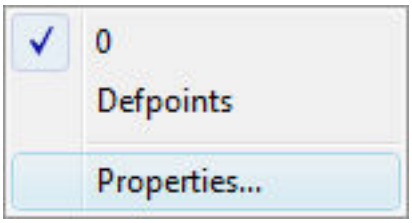
About the Status Bar Menu

Right-click **0** (or other layer name) on the status bar for the shortcut menu: (6.1268 on page 4534) (6.1140 on the next page)

Shortcut Option	Description
0 Defpoints	Chooses the current working layer. When the drawing contains additional layers, their names are listed here.
Properties	Opens the Layers section of the Drawing Explorer.

Figure 6.1139

Figure 6.1140



Procedures

- To merge the content of two layers (1.19.2)

Related Commands

-Layer (6.20.3) - creates layers and changes their properties in the command bar. LayersPanelOpen (6.20.5) - opens the Layers panel, which allows to edit the layers in the current drawing, apply layer states and layer filters. LayersPanelClose (6.20.4) - closes the Layers panel. LayerState (6.20.9) - saves and restores layer states. LayMCur (6.20.10) - changes the working layer to that of a selected entity LayFrz (6.20.12) - freezes layers associated with selected entities. LayThw (6.20.16) - thaws all frozen layers. LayIso (6.20.7) - isolates layers associated with selected entities. LayLck (6.20.8) - locks layers associated with selected entities. LayUlk (6.20.18) - unlocks layers associated with selected entities. LayOff (6.20.11) - turns off layers associated with selected entities. LayOn (6.20.13) - turns on all layers that have been turned off. Materials (6.21.10) - creates materials and edits their properties through the Drawing Explorer. VpLayer (6.31.20) - changes the properties of layers in the current paperspace viewport. Explorer (6.13.15) - Opens the Drawing Explorer dialog box.

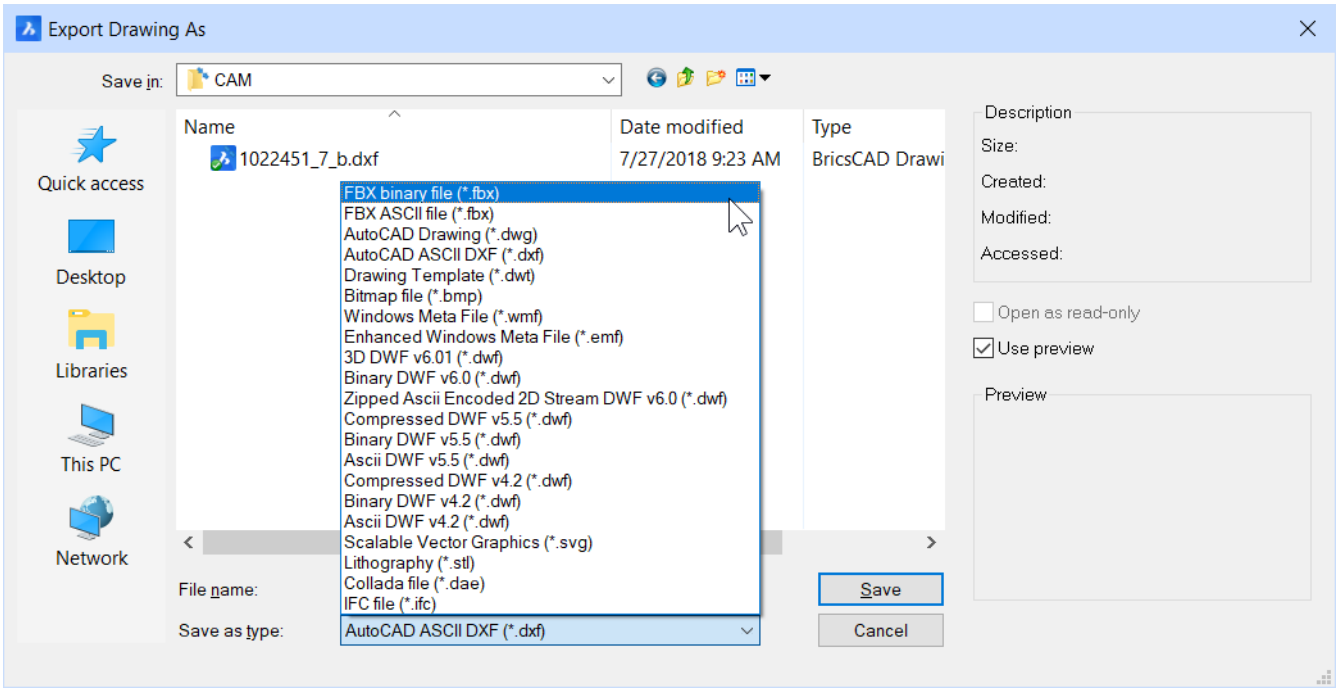
6.13.18 Export

(7.3 on page 6132) Exports drawings in a variety of vector and raster formats; exporting drawings to WMF and EMF formats is not supported on Linux.

Accessing the Command

 command bar: **export** alias: **exp, dwfout** menu bar: **File | Export** ribbon: **Home | File | Export** : **Export** Displays a dialog box: (6.1148 on the next page) Choose an export format from the Save As Type droplist, and then click **Save**. To export in PDF format, use the ExportPDF (6.13.20) command.

Figure 6.1148



Command Options

Formats are listed in the order in which they appear in the **Save as Type** drop list, segregated into CAD, vector, and raster formats.

CAD Formats	Extension	Description
FBX binary file	FBX	Mudbox format used to send 3D models to animation and rendering software; binary format creates compact files maintained by Autodesk; see FBXout (6.14.2) command.
FBX ASCII file	FBX	Mudbox format used to send 3D models to animation and rendering software; ASCII format creates human-readalbe files.
AutoCAD Drawing	DWG	CAD drawing format created by Autodesk; to export drawings in earlier version of DWG, use the SaveAs (6.27.3) command.
AutoCAD ASCII DXF	DXF	Drawing interchange format created by Autodesk; to create binary DXF files, use the DxfOut (6.10.49) command.
Drawing Template	DWT	Templates on which new drawings are based.
3D DWF	DWF or DWFx	CAD viewing format for 3D models created by Autodesk.
Binary DWF	DWF	Compressed version of DWF; creates more compact files.
Zipped Ascii Encoded 2D Stream DWF v6.0	DWF	ASCII version of DWF compressed into a ZIP file.
Compressed DWF v5.5	DWF	Compressed ASCII version of an older version of DWF; creates more compact files.
Binary DWF v5.5	DWF	Compressed version of an older version of DWF; creates more compact files.

ASCII DWF v5.5	DWF	ASCII version of an older version of DWF>
IFC file	IFC	Saves a BIM model as an IFC file for use with an IFC-certified applications. data. BIM properties (6.7.38) are included in IFC export. The Industry Foundation Classes (IFC) data model is intended to describe building and construction industry
Unreal Engine	UDATASMITH	Exports BIM data to the Unreal Engine file type, which can be imported in the Twinmotion 3D architectural visualization (1.34.1) program.
Vector Formats	**Extension**	**Description**
Windows Meta File*	WMF	Vector format created by Microsoft; used by the Clipboard; see the WmfOut command.
Enhanced Windows Meta File*	EMF	Updated version of WMF.
Scalable Vector Graphics	SVG	Used by Web pages to display vector graphics. Scalable Vector Graphics (SVG) is a family of specifications of an XML-based file format for describing two-dimensional vector graphics, both static and dynamic (i.e. interactive or animated). The SVG specification is an open standard that has been under development by the World Wide Web Consortium (W3C) since 1999.
Lithography	STL	3D format used by 3D printers. STL (STereoLithography) is a file format native to the stereolithography CAD software created by 3D Systems. STL is widely used for rapid prototyping and computer-aided manufacturing. STL files describe only the surface geometry of a three dimensional object without any representation of color, texture or other common CAD model attributes. The STL format specifies both ASCII and binary representations. Binary files are more common, since they are more compact. See also the StlOut (6.27.61) command.
Collada file	DAE	3D format used by rendering and animation software. COLLADA (from collaborative design activity) is an interchange file format for interactive 3D applications. It is managed by the nonprofit technology consortium, the Khronos Group, and has been adopted by ISO as a publicly available specification, ISO/PAS 17506.

Raster Format	Extension	Description
Bitmap*	BMP	Raster format created by Microsoft; used by the Clipboard.

(*) The **PictureExportScale** user preference sets the view size when exporting to picture formats (WMF, EMF, BMP). The following 3D formats are available through a separate module, BricsCAD Communicator; download it from the Bricsys website.

Format	Extension	Description
Standard for Exchange of Product data	STE, STP, STEP	STEP (Standard for the Exchange of Product Data) is an ISO standard exchange format used for representing three-dimensional data in a format that can be recognized by multiple programs.
Initial Graphics Exchange Specification	IGS, IGES	A file format which defines a vendor neutral data format that allows the digital exchange of information among Computer-aided design (CAD) systems.
CATIA V4	model	CATIA (Computer Aided Three-dimensional Interactive Application) is a multi-platform CAD/CAM/CAE commercial software suite developed by the French company Dassault Systèmes.
CATIA V5	CATPart, CATProduct	
Parasolid	XMT_TXT, XMT_BIN X_T, X_B	Parasolid is a geometric modeling kernel originally developed by ShapeData, now owned by Siemens PLM Software (formerly UGS Corp.), that can be licensed by other companies for use in their 3D computer graphics software products.
VDA-FS	VDA	VDA-FS is a CAD data exchange format for the transfer of surface models from one CAD system to another. Its name is an abbreviation of "Verband der Automobilindustrie - Flächenschnittstelle", which translates to the "automotive industry association - surface data interface". Standard was specified by the German organization VDA.
3D PDF	PDF	Portable Document Format (PDF) is a file format used to represent documents in a manner independent of application software, hardware, and operating system.

Settings

The import and export procedures using Communicator are controlled through a series of user preferences. See the Communicator section on the Settings (6.27.25) dialog.

Procedures

- Export to PDF settings (1.19.9)
- Exporting a drawing to PDF (1.19.9)

Related Commands

3dDwf (**??**) - Exports the current drawing in 3D dwf format. AcisOut (6.4.2) - exports 3D solids and surface entities in SAT format. BimExport (6.7.17) - saves a BIM model as an IFC file for use with an IFC-certified applications. BmpOut (6.6.20) - exports drawings in BMP format. CommunicatorInfo (6.9.24) - checks whether the Communicator product is correctly installed and prints a diagnostic report in the Prompt History window. DwfOut (6.10.48) - exports drawings in DWF format. DatasmithExport (6.10.3) - exports a 3D model in the Unreal Engine (*.udatasmith) file format. ExportLayout (6.13.19) - exports all visible objects from the current layout to the model space of a new drawing. ExportPdf (6.13.20) - exports layouts in a drawing to a pdf docucment. IfcExport (6.17.2) - exports a BIM model to IFC, partially or entirely. Import (6.17.10) - imports CAD files in a variety of formats. MSlide (6.21.31) - exports drawings in WMF, EMF, and SLD formats. StlOut (6.27.61) - exports 3D solids and watertight meshes in a format that can be used for stereolithography (3D printing). VmlOut (6.31.19) - exports drawings in VML format. VSlide (6.31.24) - displays files in WMF, EMF, and SLD formats. WmfOut (6.33.12) - exports drawings in WMF, EMF, and SLD formats.

Figure 6.1149

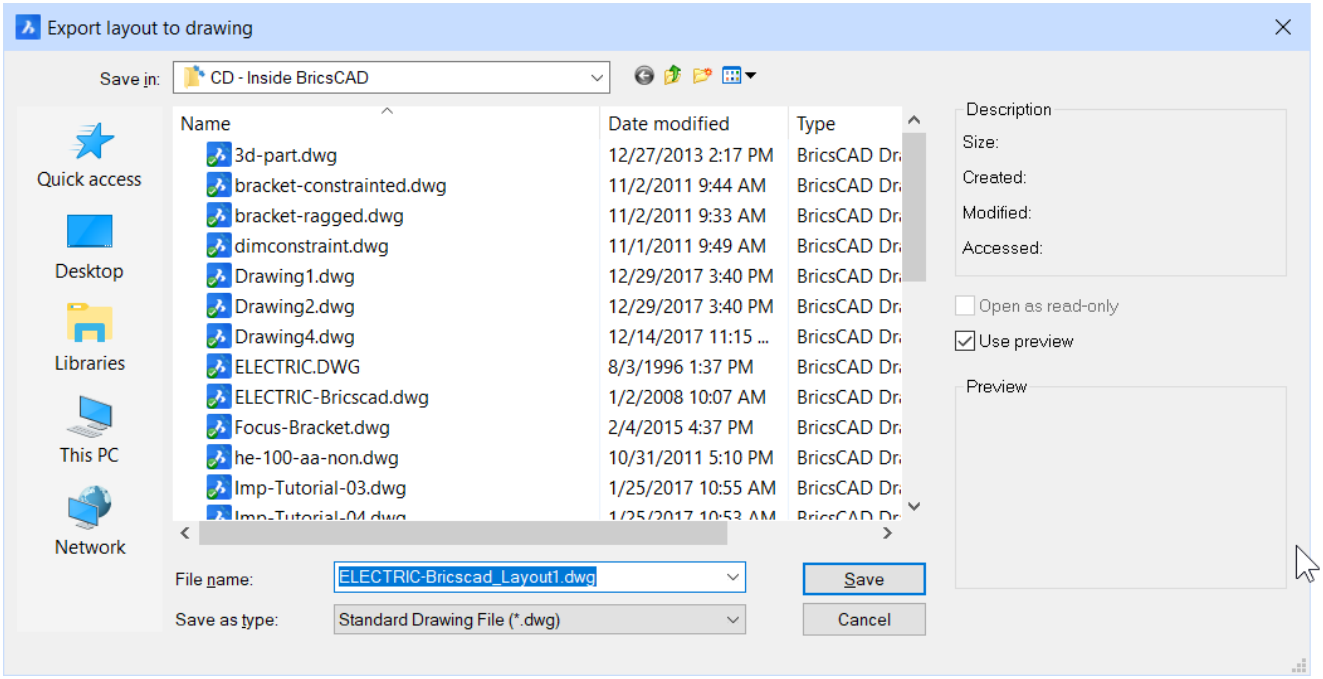
6.13.19 ExportLayout

(6.2981 on page 6079) Exports all visible objects from the current layout to the model space of a new drawing. The command can only be used in a layout.

Accessing the Command

command bar: **exportlayout** menu: **File | Export Layout to Model** : **ExportLayout** Displays a dialog box: (6.1150 on the next page) Type a name in the **File name** field, then press the **Save** button. Now that viewports are converted to polylines, and that entities are trimmed by the viewport boundary.

Figure 6.1150



Related Commands

Export (6.13.18) - exports the drawing in a variety of raster and vector formats. WBlock (6.33.1) - writes blocks and other drawing parts to files on disk through a dialog box. -WBlock (6.33.3) - writes blocks and other drawing parts to files on disk through the command bar.

Figure 6.1151

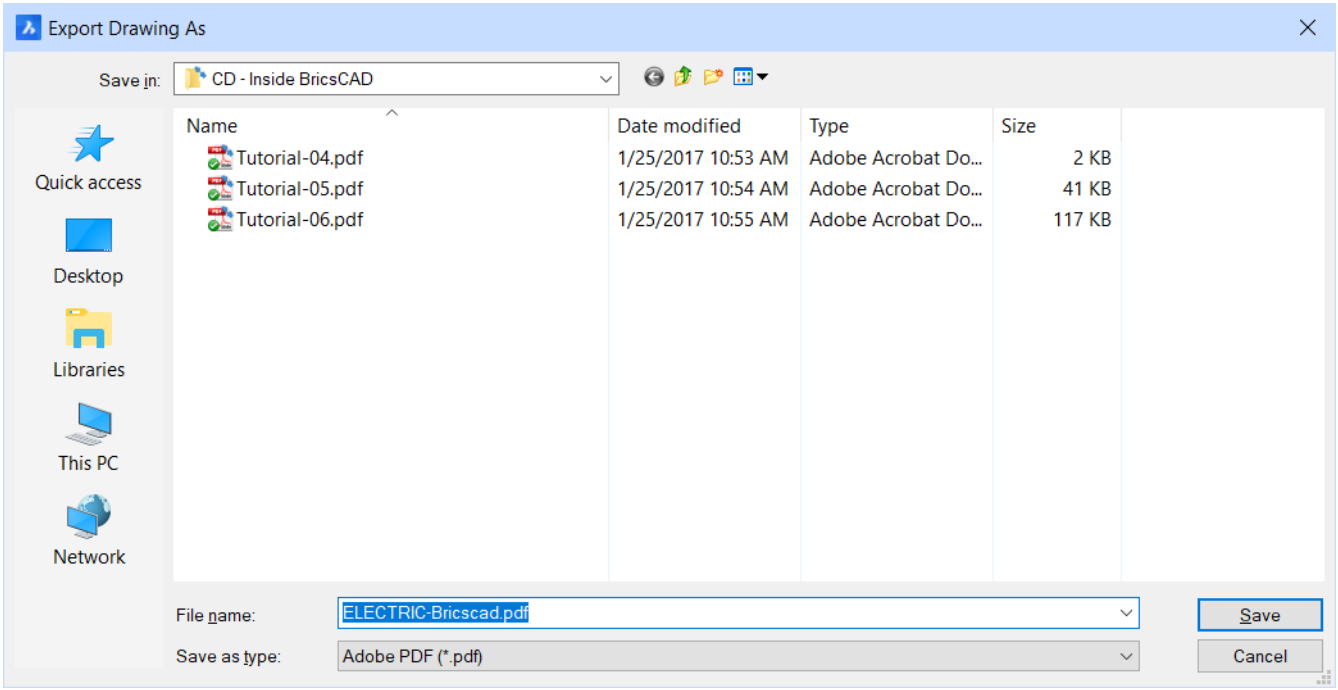
6.13.20 ExportPdf

(6.2981 on page 6079) Exports the current drawing to a single-page PDF document. (To publish multiple drawings and layouts to a single PDF file, use the Publish command.)

Accessing the Command

 command bar: **exportpdf** menu bar: **File| Export PDF** ribbon: **Home | File | Export PDF** : **ExportPdf** Displays a file dialog box: (6.1152 on the next page) Type a name in the **File name** field or accept the default name (**<DrawingName>.pdf**), then click the **Save** button.

Figure 6.1152



Command Options

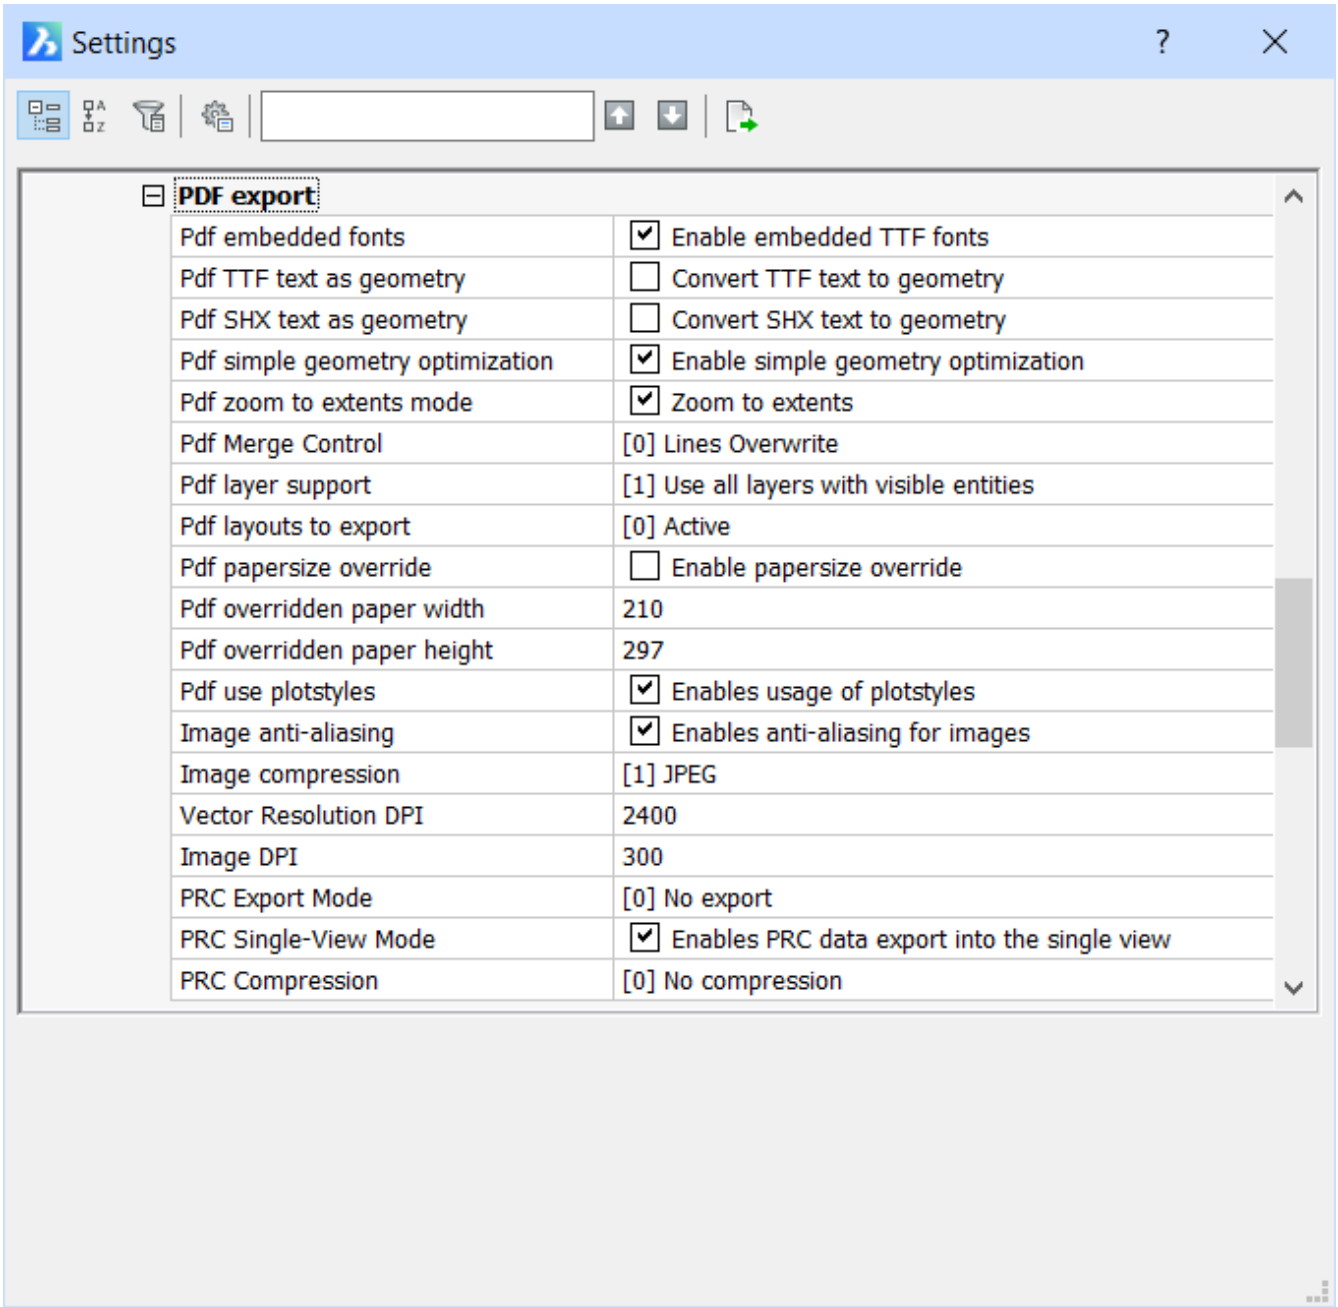
Use the PDFoptions command to access the options for exporting PDF files in the PDF Export group in the Settings (6.27.25) dialog box, or else or in the Pdf Options (6.24.68) on the Publish (6.24.68) dialog. (6.1153 on page 4416)

Option	Description
Pdf embedded fonts	Determines if True Type fonts are embedded in the PDF file: • **On** - TrueType fonts are included in the PDF file • **Off** - TrueType fonts are excluded, such as when they are covered by a license that prohibits sharing
Pdf TTF text as geometry	Determines if True Type fonts are exploded into geometry: • **On** - converts True Type text to geometry, useful for when the TTF files are covered by a license that prohibits sharing, or you want to make it harder to extract text • **Off** - keeps True Type text as fonts
Pdf SHX text as geometry	• **On** - converts SHX text to geometry, which is necessary if the receiving party does not have the same SHX fonts on their computer • **Off** - keeps SHX text as fonts
Pdf simple geometry optimization	• **On** - applies simple geometry optimization to unify separate segments to single polylines, and uses Bezier curve control points • **Off** - does not optimize the file

Pdf zoom to extents mode	• **OFF** - uses the scale and papersize of the page setup. • **ON** - zooms the geometry to the papersize.
Pdf Merge Control	Controls the appearance of crossing lines: • **0 - Lines Overwrite**: The top most line is visible at the intersection. • **1 - Lines Merge**: The colors of crossing lines are blended into a new color.
Pdf layer support	Controls the use of layers in the generated PDF file: • **0** - Do not export layers. • **1** - Only use visible layers • **2** - Use all layers, including layers that are OFF and FROZEN
Pdf layouts to export	Controls which layouts are exported. • **0** - Active layout only • **1** - All layouts in a single multi-sheet PDF file • **2** - Each layout in a separate single-sheet PDF file
Pdf papersize override	Enables papersize override to ignore the limits of the paper's size.
Pdf overridden paper width	PDF width to be used in the papersize override in millimeters.
Pdf overridden paper height	PdfPDF height to be used in the papersize override in millimeters.
Pdf use plotstyles	Enables the usage of plotstyles.
Image anti-aliasing	Enables anti-aliasing for images that require upscaling when exporting.
Image compression	Sets the compression for exported images. • **0** - no compression for cleaner imagers • **1** - JPEG compression for smaller files
Vector resolution DPI	Sets the resolution for vector graphics when exporting. Values between 72 and 40000 are accepted.
Image DPI	Sets the minimal resolution for raster images. The value cannot exceed the value of PdfVectorResolutionDPI.
PRC Export Mode	Determines how 3D models are exported to 3D PDF files: • **0** - 3D models are not exported from the drawing to the PDF file • **1** - 3D models are exported in BREP format • **2** - 3D models are exported as meshes
PRC Single-view Mode	Determines if the 3D model is exported into a single view.

PRC Compression	Determines the type of compression to use to reduce file size: • **0** - no compression • **1** - medium compression • **2** - high compression (smallest file size)

Figure 6.1153



Related Commands

Export (6.13.18) - exports drawings in a variety of vector and raster formats. PageSetup (6.24.2) - creates and edits page setups for plotting drawings in the Drawing Explorer. Plot (6.24.42) - plots drawings to printers and to files, through prompts at the command bar; this command is meant for scripts and routines. Print (6.24.51) - prints drawings to plotters and files through a dialog box. -Publish (6.24.62) - prints a saved sheet list (= a list of model space or paper space layouts). Publish (6.24.68) - allows to print a sheet list (= a list of model space or paper space layouts). Saves a sheet list to a file.

Figure 6.1154

Shape Classic Pro Platinum Mechanical BIM

6.13.21 Extend

(7.3 on page 6132) Extends or trims one or more open entities to a boundary entity. **Note**: Hold down the **Shift** key to switch this command to trim mode.

Accessing the Command

command bar: **extend** alias: **ex** menu bar: **Modify | Extend** ribbon: **Change | Modify | Extend** toolbar: **Modify |** : **Extend Prompts you in the command bar:** Select boundary entities for extend <ENTER to select all>: **(Choose one or more entities, or else press Enter to choose all)** Entities in set: 1 Select boundary entities for extend <ENTER to select all>: **(Choose more entities, or else press Enter to end entity selection)** Select entity to extend or shift-select to trim or [Fence/Crossing/Edge mode/ Projection/ eRase]: **(Choose the entity to extend, or enter an option, or else press Shift to pick an entity to trim)** Select entity to extend or shift-select to trim or [Fence/Crossing/Edge mode/Projection/eRase]: **(Choose another entity to extend, enter an option, or press Shift to pick an entity to trim, or else press Enter to exit the command)** (6.1155)

Figure 6.1155

Command Options

Option	Description
Select boundary entities for extend	Choose one or more entities to use as boundaries. These are the entities to which subsequently picked entities are extended.
ENTER to select all	Press **Enter** to choose all entities in the drawing as boundaries. There is no need to pick individual entities as boundaries, except in certain cases.
Select entity to extend	Chooses the entity to extend. When either end of an entity could be extended to a boundary, BricsCAD extends the end closest to your pick point.
Edge mode	Toggles edge mode; prompts you: **[Extend/No extend] <No extend>** - **(enter an option)**: • **Extend** - extends entities to real and implied boundaries in 3D space • **No Extend** - extends entities only to real boundaries
Fence	Allows fence selection, an irregular selection window; prompts you: 1. **First point of fence** - **(pick the first point of the fence.)** 2. **Next fence** - **(pick the next point of the fence; press Enter to exit selection mode.)**
Crossing	Allows crossing rectangle selection; prompts you: 1. **First corner of crossing window** - **(specify the first corner.)** 2. **Second corner of crossing window** - **(specify the second corner.)** The entities that cross the specified rectangle are extended.
Projection	Specifies the how the entity is projected to the boundary; prompts you: **Projection [No projection/xy plane of Ucs/current View] <UCS>** - **(enter an option)**: • **No projection** - extends only those entities that intersect real boundaries in 3D space • **xy plane of UCS** - projects entities and boundaries to the x,y-plane of the current UCS, and then extends the projected entities that would intersect projected boundaries • **Current View** - projects entities into the current view, and then extends them accordingly
Erase	Deletes selected entities; prompts you: **Select entities to delete** - **(select one or more entities)**
Undo	Undoes the previous extend operation.
Shift-select to trim	Switches to trim mode: press and hold the **Shift** key to select the part of an entity to be trimmed at the intersection with the nearest boundary entities. See the the Trim (6.29.35) command.

Procedures

- To extend entities (1.32.22)

Related Commands

Change (6.9.10) - changes the length of lines. Lengthen (6.20.24) - changes the length of open entities. Stretch (6.27.52) - stretches entities longer and shorter. Trim (6.29.35) - trims entities to a cutting line.

Figure 6.1156

Shape Classic Pro Platinum Mechanical BIM

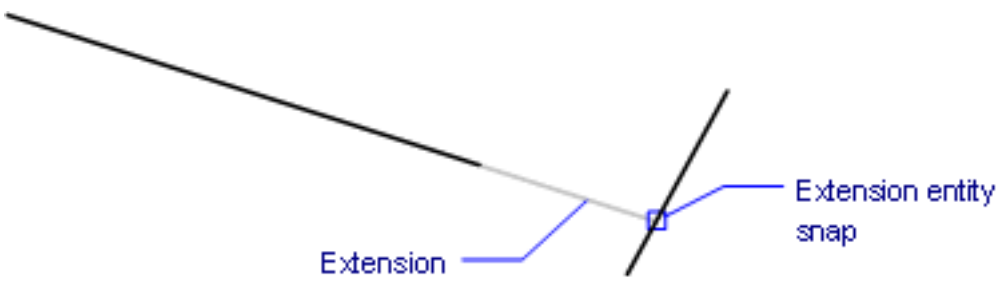
6.13.22 Extension

(6.2981 on page 6079) Toggles extension entity snap.

Accessing the Command

command bar: **extension** transparent: **extension** ribbon: **Home | Entity Snaps | Snap to Extension** toolbar: **Entity Snaps |**  : **Extension** Displays no prompts. If extension entity snap is off, entering the command turns it on. And vice versa. (6.1157) When extension entity snap is on, the cursor snaps to the intersection of one or two extended entities.

Figure 6.1157



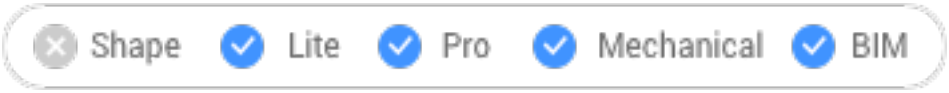
Command Options

Option	Description
Extension	Entering this command toggles extension entity snap. This command can be entered transparently during commands, but must be entered without the apostrophe prefix (').

Related Commands

OSnap (6.23.16) - toggles entity snap modes in the Settings dialog box. -OSnap (6.23.13) - toggles entity snap modes in the command bar. Aperture (6.4.14) - sizes the aperture cursor for entity snaps. 2dIntersection (6.2.1) - toggles apparent intersection snap mode. 3dIntersection (6.3.7) - toggles intersection snap mode. Apparent (6.4.16) - toggles apparent intersection snap mode. Center (6.9.3) - toggles center snap mode. Endpoint (6.13.7) - toggles endpoint snap mode. From (6.14.13) - allows to enter relative coordinates with respect to a reference point. GCenter (6.15.5) - toggles Geometric Center (GCenter) entity snap. Insertion (6.17.18) - toggles insertion snap mode. Intersection (6.17.19) - toggles intersection snap mode. Midpoint (6.21.16) - toggles midpoint snap mode. Mtp (6.21.35) - allows to specify a point as the midpoint between two points. Nearest (6.22.2) - toggles nearest snap mode. Node (6.22.7) - toggles node (point) snap mode. None (6.22.8) - turns off all entity snap modes. Parallel (6.24.5) - toggles parallel snap mode. Perpendicular (6.24.25) - toggles perpendicular snap mode. Quadrant (6.25.7) - toggles quadrant snap mode. Tangent (6.29.10) - toggles tangent snap mode.

Figure 6.1158



6.13.23 ExpXrefs

(6.2947 on page 6049) A command that combines several xref-related commands through the Drawing Explorer; attaches DWG files to the current drawing and controls the state of the attachments (short for "external reference").

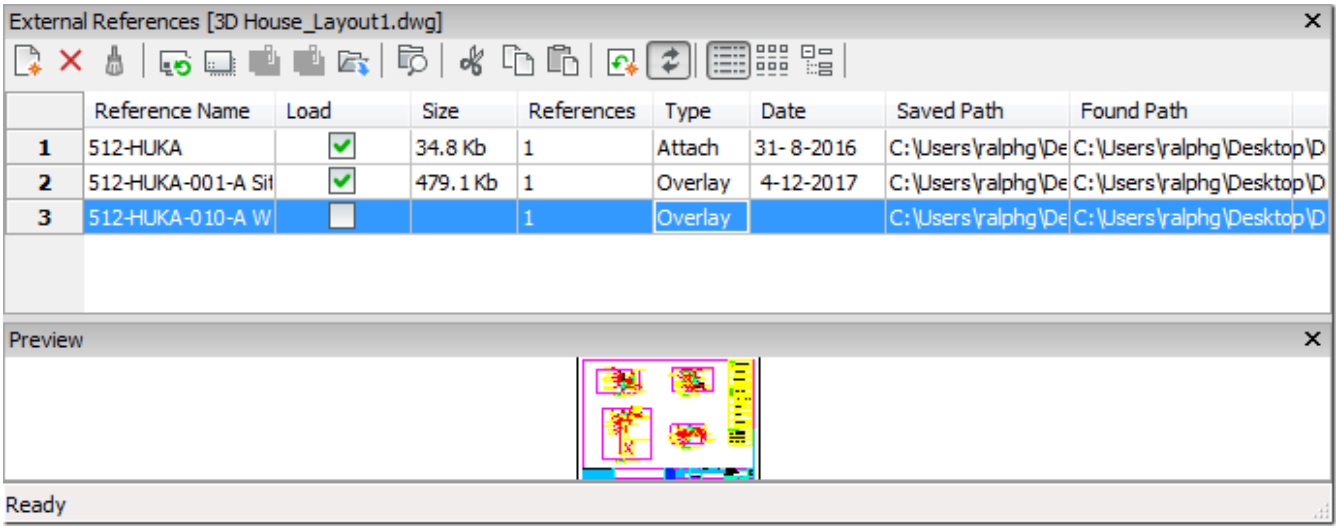
Accessing the Command

command bar: **expxrefs** menu bar: **Tools | Drawing Explorer | Xrefs...** : **expxrefs** Displays the External Reference section of the Drawing Explorer: (6.1159)

1. Click **New** to attach a DWG file, or change the properties of existing xrefs.
2. Click **X** to close the dialog box.

Press **F1** to access help. The XDWGFADECTL (1.17.10) system variable sets the fading of external references. Values between 0 (no fading) and 90 are accepted.

Figure 6.1159



Toolbar Options

Option	Description
 Attach Xref	Attaches DWG files as xrefs; prompts you in the command bar: **External References: ? to list/Bind/Insert/Detach/Path/Reload/Unload/Overlay/<Attach> - (enter an option.)** See the -XRef (6.34.8) command.
 Detach Xref	Erases the selected xref from the drawing without warning. This is equivalent to using the **Detach** option.
 Reload Xref	Reloads the selected xref. This is useful when the original DWG file has changed, and you want to see the updated version in your drawing.
 Unload Xref	Unloads the selected xref. This hides the xref from view. You can also click the checkboxes in the Loaded column.
 Bind Xref	Binds the xref to the current drawing to make the xref part of the drawing. References to the xref disappear from the Drawing Explorer. (This option is not available for xrefs that are unloaded.) This option sets the BINDTYPE settings variable OFF (Traditional binding behavior), thus influencing the behavior of the Bind (6.34.8) option of the -xref command.
 Insert Xref	Converts xrefs into blocks. This is like using the Insert (6.17.13) command to insert external DWG files in drawings. References to the xref disappear from the Drawing Explorer. (This option is not available for xrefs that are unloaded.)
 Open Xref	Opens the xref for editing. See the XOpen (6.34.5) command.
 Detail View	Displays the details of xrefs: (6.1161 on page 4426)
 Icon View	Displays the xrefs as icons: (6.1162 on page 4427)
 Tree View	Displays the relationship between xrefs in a tree-like view: (6.1163 on page 4427) • **Current** - the current drawing • **Column and Floor** - xrefs attached to the current drawing

External Reference Options

Option	Description
Reference Name	Specifies the name of the xref. This name is assigned by BricsCAD, but can be changed by the user. Click to rename.
Loaded	Toggles the loading of the xref; click to change the load status: • **On** - loads the xref, and makes it visible • **Off** - unloads the xref, making it invisible
Size	Reports the size of the xref DWG files. Very large files can slow down the system.

References	Reports the number of times the xref is attached to the drawing.
Type	Reports whether the xref is attached or overlaid: • **Attach** - all xrefs are displayed. • **Overlay** - only the first xref of nested xrefs is displayed. To change type: 1. Unload the xref 2. Reload it as attached or overlaid Overlay and Attach operate the same way. The difference, however, is in how they treat xrefs that have xrefs themselves: • **Overlay** - attaches only the first level of xref • **Attach** - attaches all xrefs
Date	Reports the date of the file. This can be useful in determining if you ware working with the most recent revision.
Saved Path	Reports the original path to the xrefs DWG file when first loaded: (6.1164 on page 4427) If the path cannot be found, click this field, and then click the  button. BricsCAD displays the Choose a File dialog box: 1. Locate the missing DWG file 2. Click **Open** To convert the xref path type, do the following: 1. Right click the xref name 2. Choose the path type in the context menu: (6.1165 on page 4427) or (6.1166 on page 4427)
Found Path	Reports the current path to the xrefs DWG file. This path should match the Saved Path in most cases.

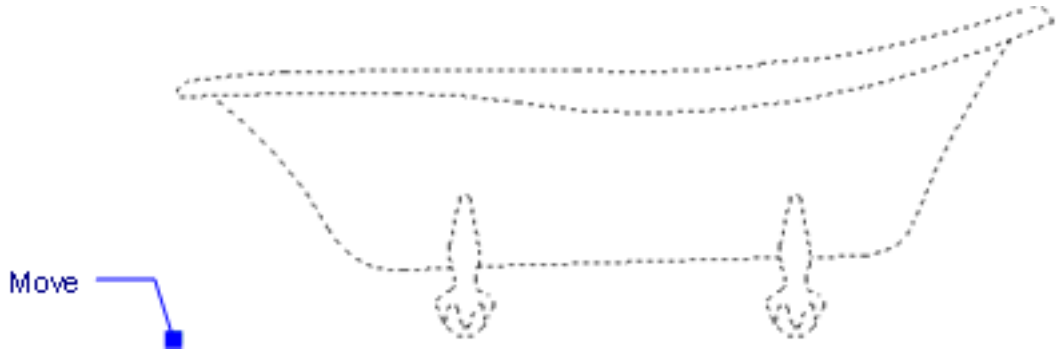
Grips Editing

External references can be edited directly through grips:

1. Select the xref. Notice that it has one grip at its insertion point.
2. Drag the grip to move the xref.

(6.2950 on page 6053)

Figure 6.1160



Procedures

- Managing Xrefs (1.30.17)
- To detach external references (1.30.17)
- To unload external references (1.30.17)
- To reload external references (1.30.17)

Related Commands

Insert (6.17.13) - inserts drawings as blocks. Explorer (6.13.15) - opens the Drawing Explorer dialog box PdfAttach (6.24.16) - inserts a PDF file as an underlay into the current drawing. -PdfAttach (6.24.18) - inserts a PDF file as an underlay into the current drawing; displays prompts in the command bar. Pdfclip (6.24.19) - allows clipping of PDF underlays. Pdflayers (6.24.22) - allows to control the display of layers in a PDF underlay. ExpPdfs (6.13.14) - attaches PDF files to the current drawing through the Drawing Explorer. PlaceView (6.24.34) - places a model view selected from a source drawing into a paper space layout of the current drawing. -XRef (6.34.8)- attaches and controls externally referenced drawings through the command bar. XAttach (6.34.1) - attaches xrefs through dialog boxes. XClip (6.34.2) - clips externally-referenced drawings. VpClip (6.31.18) - clips viewports.

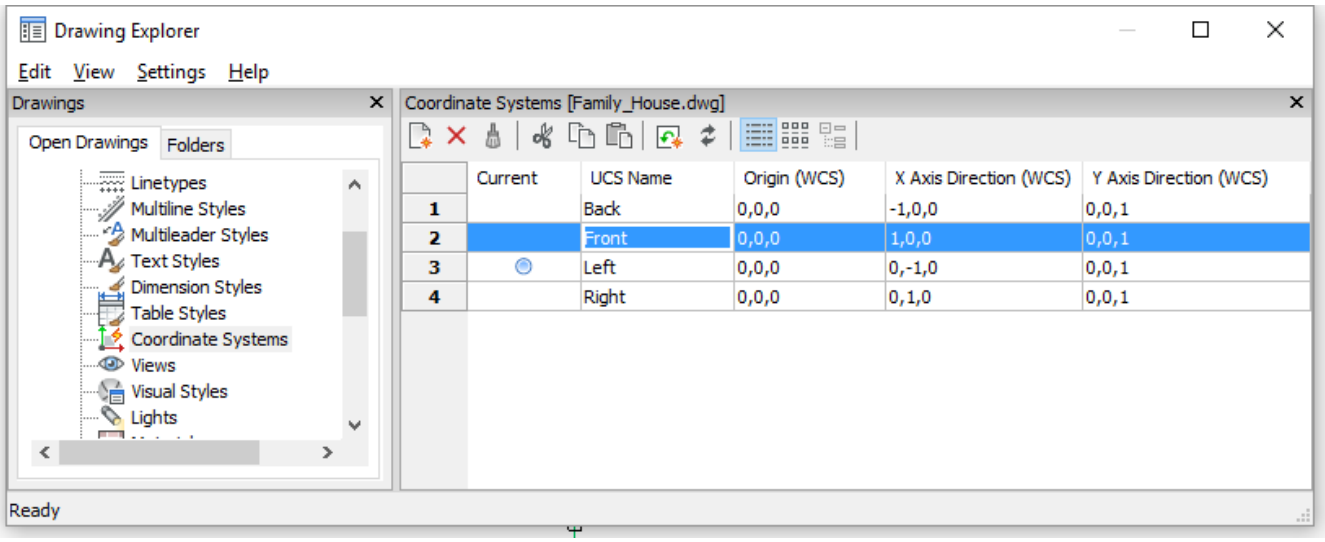
6.13.24 ExpUcs

(6.2981 on page 6079) Creates, renames, and deletes named UCSs through the Drawing Explorer (short for "explore user-defined coordinate systems").

Accessing the Command

command bar: **expucs** alias: **uc, dducs, explorer (6.13.15)** menu bar: **Tools | Drawing Explorer | Coordinate Systems** : **ExpUcs** Displays the UCS section of the Drawing Explorer dialog box: (6.1168) Create, rename, or delete named UCSs, and then click X. Press F1 to access help.

Figure 6.1168



Command Options

Option	Description
UCS Name	Lists the names of UCSs in the drawing; click to rename. UCS is short for "user-defined coordinate system."
Origin (WCS)	Reports the origin (0,0,0) of the UCS in x,y,z coordinates of the WCS; cannot be edited. WCS is short for "world coordinate system."
X Axis Direction (WCS)	Reports the direction of the x axis in WCS coordinates; cannot be edited.
Y Axis Direction (WCS)	Reports the direction of the y axis in WCS coordinates; cannot be edited.
Current	Indicates the current UCS.
Toolbar Icons	
New	Creates a new UCS; dismisses the Drawing Explorer, and then runs the Ucs command. See Ucs (6.30.1) command.
Erase	Deletes the selected UCS; the current UCS cannot be erased.

Related Commands

Ucs (6.30.1) - creates and modifies user-defined coordinate systems. UcsIcon (6.30.2) - controls the appearance of the UCS icon. SetUcs (6.27.26) - sets the UCS to a specified viewpoint. Plan (6.24.26) - changes the viewpoint to the plan view of the WCS or current UCS. DdVPoint (6.10.23) - changes the 3D viewpoint of the drawing through a dialog box. VPoint (6.31.21) - changes the 3D viewpoint of the drawing through the command bar. Settings (6.27.25) - sets parameters of UCSs. Explorer (6.13.15) - Opens the Drawing Explorer dialog box.

Figure 6.1169

6.13.25 Extrude

(6.2932 on page 6037) Extrudes closed and open 2D entities to 3D solids or 3D surfaces.

Accessing the Command

command bar: **extrude** alias: **ext** menu bar: **Model | 3D Solids | Extrude** ribbon: **Model | Solids | Extrude** toolbar: **3d Solids |**  : **Extrude Prompts you in the command bar.** Select entities/subentities to extrude or set [MOde]: **(Choose one or more closed 2D entities or faces of 3D solids)** Entities in set: 1 Select entities/subentities to extrude or set [MOde]: **(Choose more entities, or else press Enter to continue.)** Specify height of extrusion or [Direction/Path/Taper angle] <xx.xx>: **(Enter a number for the height, or pick two points, or press Enter to accept the default height, or else choose an option)** (6.1170) (6.1171 on the facing page) Depending on the value of the DELOBJ (1.26.1) (Delete Entity) system variable, the source 2D entities are either retained or deleted, or else you are prompted as to whether you want to keep or delete the source entities.

Figure 6.1170

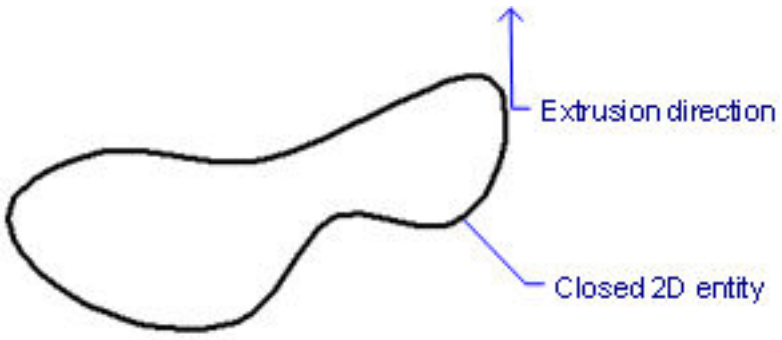


Figure 6.1171

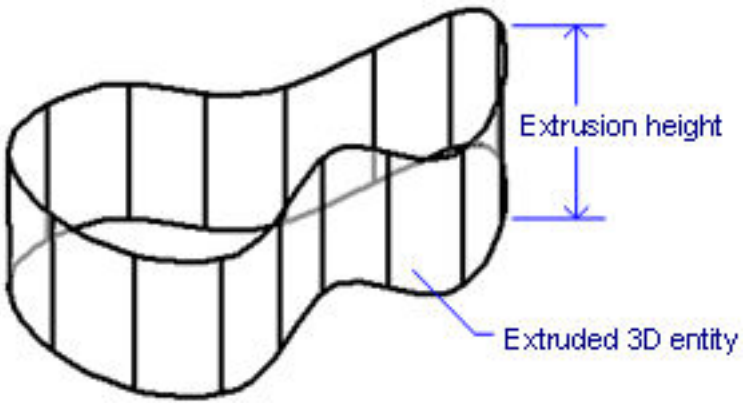


Command Options

Option	Description
Select entities	Specifies the entities to be extruded. Choose one or more 2D entities, regions, or faces of 3D solids. The resulting entity is either a 3D solid or a 3D surface: • 2D closed entities (like circles and closed polylines) and faces are extruded to 3D solids • 2D open entities (like lines and arcs) are exstruded to 3D surfaces • Use the **MOde** option extrude closed 2D entities as 3D surfaces When MOde is set to SOlid and you select an open 2D entity, the program does not extrude the entity, as open entities cannot be watertight. Depending on the value of the DELOBJ (1.17.10) variable, the source entities are either retained or deleted, or else you are prompted whether you want the entities deleted or not.
Mode	Determines how closed entities are extruded, as solids or surfaces. Prompts you: **Choose type of created entity [SOlid/SUrface] <SOlid>** - **(enter an option)**: • **SOlid** - returns to extruding closed entities as solids • **SUrface** - extrudes closed entities as surfaces
Specify height of extrusion	Specifies the height of the extrusion. The extrusion height is measured perpendicularly to the source entity. • **Enter a number** - specifies the height; enter a negative number to direct the extrusion downwards from the source entity • **Pick two points** - distance between two pick points specifies the height; for instance, you might pick two points on another entity

Direction	Sets the extrusion direction (up or down) and height at the same time. Prompts you: 1. **Specify start point of direction** - **(pick a point.)** 2. **Specify end point of direction** - **(pick another point.)**
Path	Specifies the extrusion height and taper angle by another entity. The program uses the path to determine how to extrude the source entity. Prompts you: **Select extrusion path or [Taper angle]** - **(pick an open entity to use as the path, such as a line, arc, open spline, or open polyline.)** (6.1173 on page 4434) The path entity cannot lie in the same plane as the extrusion entity. (6.1174 on page 4435)
Taper Angle	Specifies the taper angle for the extrusion; a positive angle tapers the extrusion inwardly, as shown by the illustration below. (6.1175 on page 4436) Prompts you: **Specify angle of taper for extrusion <0>** - **(enter a value)**: • **Enter a number** - specify the angle; enter a negative number to taper the extrusion outwards • **Pick two points** - defines the angle geometrically The angle must be shallow enough so that the sloping sides do not intersect after the top of the extrusion.

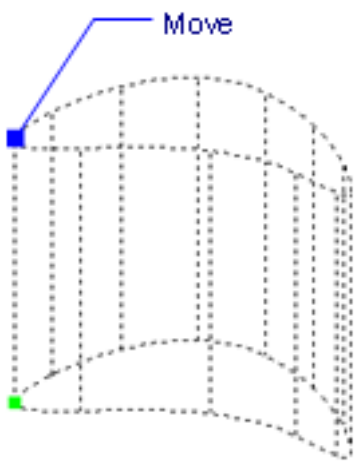
Grips Editing

Extrusion can be edited directly through grips:

1. Select the extruded solid. Notice that it has two grips.
2. Drag a grip to move the extrusion. (Both grips perform the same functions: move.)

(6.1172)

Figure 6.1172



Related Commands

DmExtrude (6.12.14) - creates 3D solids or surfaces by extruding open or closed 2D entities or regions. Loft (6.20.37) - creates 3D solids passing through two or more cross sections. Sweep (6.27.68) - creates 3D solids or 3D surfaces by sweeping profiles (open or closed 2D entities or 3D subentities) along an open or closed path. Interfere (6.17.17) - creates 3D volumes of intersecting 3D solid models. Intersect (6.17.20) - removes volumes not in common between two solid models. Revolve (6.26.45) - revolves 2D entities into 3D solids or surfaces. Section (6.27.11) - creates 2D regions from 3D models. Slice (6.27.40) - cuts 3D solids into two parts. SolidEdit (6.27.42) - edits the bodies, faces, and edges of 3D models. Subtract (6.27.58) - removes one solid model from a second. Union (6.30.6) - joins two or more solid models into a single entity.

6.14 F

6.14.1 -FbxExport

(7.3 on page 6132) Exports 3D entities in the current drawing to an FBX file, which is used with rendering and animation programs; operates at the command line.

Figure 6.1176

Accessing the Command

Keyboard: **-fbxexport :-FbxExport Prompts you:** What entities to export? [Selected/Visible] <Visible>: **(Enter s or v)** Export options. Entities: yes, lights: yes, cameras: yes, materials: yes What types to export? [Select/All] <Select>: **(Enter s or a)** Export entities? [Yes/No] <Yes>: **(Enter n or y)** Export lights? [Yes/No] <Yes>: **(Enter n or y)** Export cameras? [Yes/No] <Yes>: **(Enter n or y)** Export materials? [Yes/No] <Yes>: **(Enter n or y)** Export options. Entities: yes, lights: yes, cameras: yes, materials: yes How to export textures? [Embedded/Reference to file/Copy of file] <Embedded>: **(Enter an option)** Enter path to export fbx file: [C:\Bricsys\BricsCAD\Drawing1.fbx]: **(Press Enter to accept the path, or press ~ to access the FBX Export dialog box, or else type in a different path)**]:

Command Options

Option	Description
What entities to export?	Determines which entities to exports: • **Selected** - **selects the entities to be exported** • **Visible** - **export all visible entities (excludes those on frozen or off layers, and those not visible in the current viewport)** If you wish to export 2D entities, you must first give them a thickness with the Thickness variable.
What types to export?	Determines entity types to export: • **All** - exports all entity types • **Select** - prompts you to select among entities, lights, cameras, and materials
Export entities?	Determines if entities should be exported: • **Yes** - exports selected entities • **No** - does not export entities; use this option to export cameras, lighting, and materials only
Export lights?	Determines if lights should be exported: • **Yes** - lights are exported • **No** - lights are not exported
Export cameras?	Determines if cameras should be exported: • **Yes** - cameras are exported • **No** - cameras are not exported
Export materials?	Determines if materials should be exported: • **Yes** - materials are exported • **No** - materials are not exported
How to export textures?	Determines how texture files should be exported: • **Embedded** - includes the texture files into the FBX file • **Reference to file** - adds a reference link in the FBX file to the location of the texture files • **Copy of file** - copies the texture files to the destination folder, separately from the FBX file Texture files are not included in FBX files when they are very large, or when a common set of texture files are used by rendering and animation projects.

Enter path to export fbx file:	Specifies the path to the folder in which to place the FBX file: • **Enter** - accepts the path provided • **~** - displays the FBX Export dialog box Select a folder that is convenient for the rendering or animation software to access.

Related Commands

FbxExport (6.14.2) - Exports drawing contents to FBX files. Export (6.13.18) - exports drawing in a variety of file formats.

Figure 6.1177

6.14.2 FbxExport

(6.2981 on page 6079) Exports 3D entities in the current drawing to an FBX file, which is used with rendering and animation programs.

Accessing the Command

keyboard: **fbxexport** menu: **File | Export** and then choose FBX format **: FbxExport Prompts you:** What entities to export? [Selected/Visible] <Visible>: **(Enter s or v)** Export options. [Yes/No] <Yes>: **(Enter n or y)** Export cameras? [Yes/No] <Yes>: **(Enter n or y)** Export materials? [Yes/No] <Yes>: **(Enter n or y)** Export options. Entities: yes, lights: yes, cameras: yes, materials: yes How to export textures? [Embedded/Reference to file/Copy of file] <Embedded>: **(Enter an option)** Enter path to export fbx file: [C:\Bricsys\BricsCAD\Drawing1.fbx]: **(Press Enter to accept the path, or press ~ to access the FBX Export dialog box, or else type in a different path)**

Command Options

Option	Description
What entities to export?	Determines which entities to exports: • **Selected** - selects the entities to be exported • **Visible** - export all visible entities (excludes those on frozen or off layers, and those not visible in the current viewport) If you wish to export 2D entities, you must first give them a thickness.
What types to export?	Determines entity types to export: • **All** - exports all entity types • **Select** - prompts you to select among entities, lights, cameras, and materials
Export entities?	Determines if entities should be exported: • **Yes** - exports selected entities • **No** - does not export entities; use this option to export cameras, lighting, and materials only
Export lights?	Determines if lights should be exported: • **Yes** - lights are exported • **No** - lights are not exported
Export cameras?	Determines if cameras should be exported: • **Yes** - cameras are exported • **No** - cameras are not exported

Export materials?	Determines if materials should be exported: • **Yes** - materials are exported • **No** - materials are not exported
How to export textures?	Determines how texture files should be exported: • **Embedded** - includes the texture files into the FBX file • **Reference to file** - adds a reference link in the FBX file to the location of the texture files • **Copy of file** - copies the texture files to the destination folder, separately from the FBX file Texture files are not included in FBX files when they are very large, or when a common set of texture files are used by rendering and animation projects.
Enter path to export fbx file:	Specifies the path to the folder in which to place the FBX file. • **Enter** - accepts the path provided • **~** - displays the FBX Export dialog box Select a folder that is convenient for the rendering or animation software to access.

Related Commands

-FbxExport (6.14.1) - Exports drawing contents to FBX files at the command line. Export (6.13.18) - exports drawing in a variety of file formats.

Figure 6.1178

6.14.3 FileOpen

(7.3 on page 6132) Opens drawing (DWG), template (DWT), and interchange (DXF) files from the command line, replacing the current drawing.

Accessing the Command

command bar: **fileopen** : **FileOpen Prompts you in the command bar:** Save changes to drawing file? [Yes/No] <Yes>: **(Enter Y or N)** Drawing name: **(Type the name of a drawing, including the path)** If the file extension is not specified, BricsCAD searches for a drawing (DWG) file.

Command Options

Option	Description
Save changes to drawing file?	Specifies whether the current drawing should be saved: • **Yes** - drawing is saved • **No** - drawing is not saved
Drawing name	Type the name of a drawing, including the path; enter **~** to display the Open Drawing dialog box.

Related Commands

Open (6.23.8) - opens drawing (DWG), template (DWT), and interchange (DXF) files.

Figure 6.1179

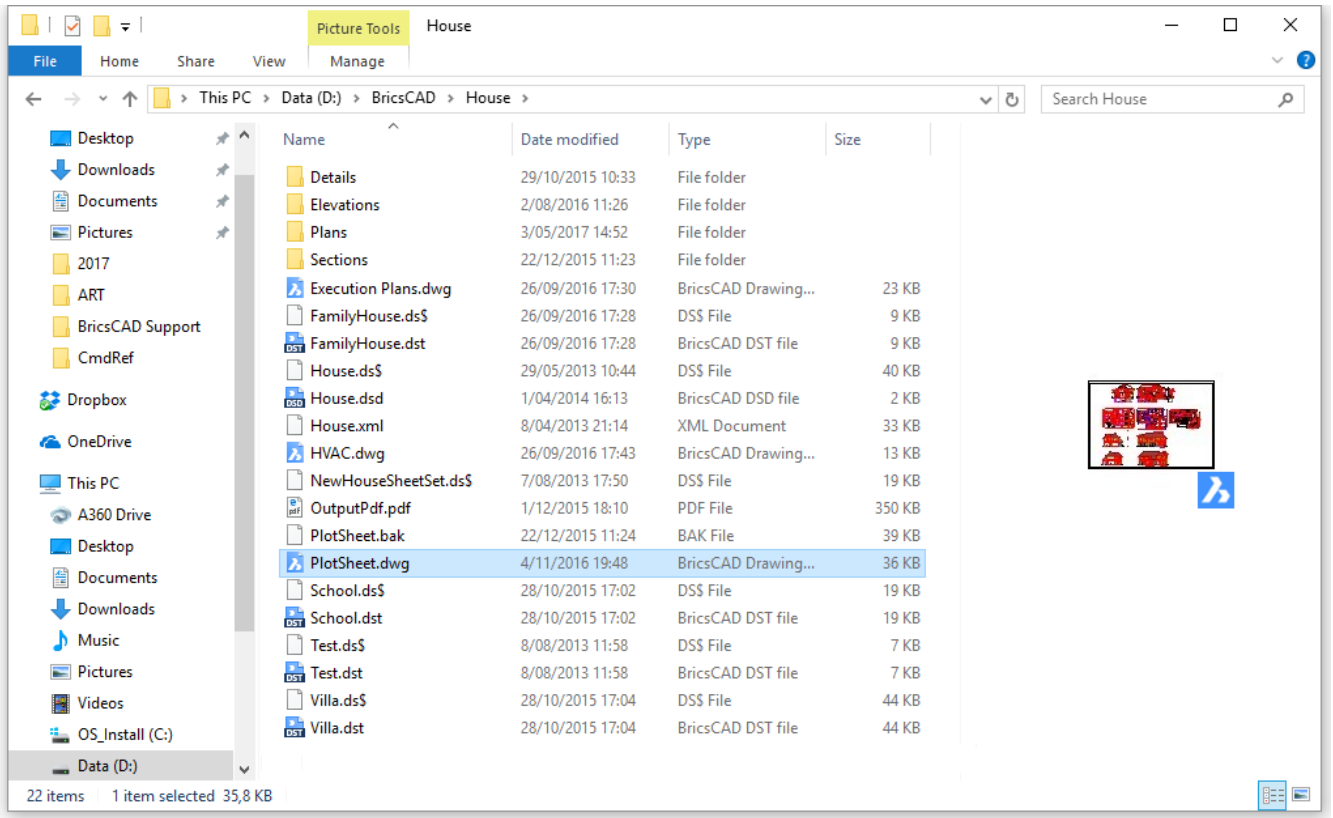
6.14.4 Files

(6.2981 on page 6079) Opens the operating system's file manager to access files.

Accessing the Command

command bar: **files** : **Files** Displays a dialog box: (6.1180 on the next page)

Figure 6.1180



Command Options

See Windows documentation.

Related Commands

Cal (6.9.2) - runs the Calculator application. Start (6.27.49) - starts other applications. Shell (6.27.33) - opens the operating system command prompt window; runs other applications.

Figure 6.1181

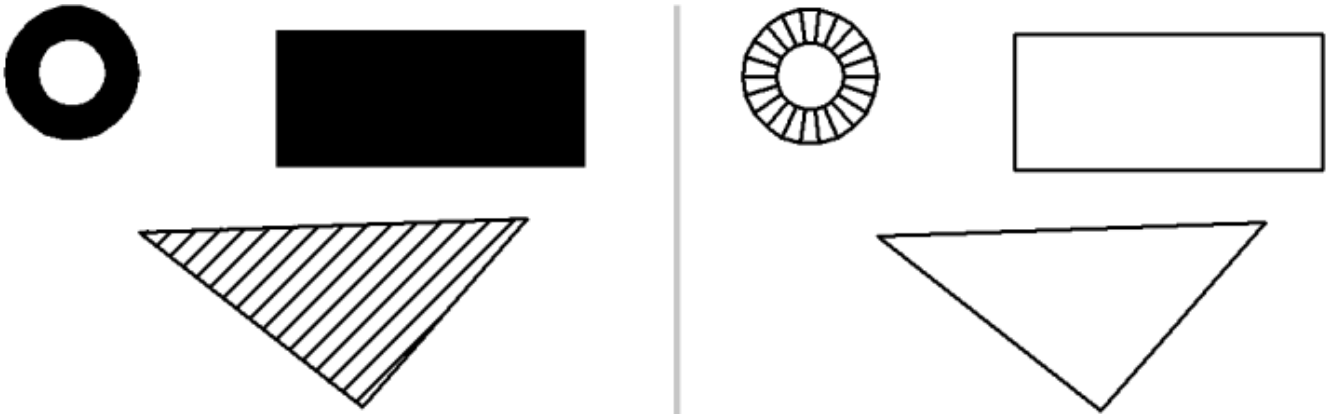
6.14.5 Fill

(6.2981 on page 6079) Toggles the display of filled and hatched areas, such as of wide polylines, hatches, and 2D solids.

Accessing the Command

command bar: **fill** : **Fill Prompts you in the command bar:** FILLMODE is currently on [ON/OFf/Toggle] <On>: **(Enter an option)** To come into effect, this command must be followed by the Regen (6.26.23) command: : **regen** Left: Fill on; right: Fill off. (6.1182)

Figure 6.1182



Command Options

Option	Description
OFF	Turns off the display of filled areas.
Toggle	Toggles fill mode; if on, turns it off, and vice versa.
On	Turns on the display of filled areas.

Note: This command was useful for early releases of the program, when computers were not fast enough to display filled areas quickly.

Related Commands

Settings (6.27.25) - changes the FillMode system variable through a dialog box. This setting affects the entities drawn by the following commands: PLine (6.24.27) - draws polylines with width. Donut (6.10.37) - draws fat circles out of polylines. Polygon (6.24.61) - draws regular polygons out of polylines. Rectang (6.26.6) - draws rectangles out of polylines. Solid (6.27.45) - draws solid-filled entities with 3 and 4 sides. Trace (6.29.32) - draws wide lines.

Figure 6.1183

6.14.6 Fillet

(7.3 on page 6132) Fillets intersections; joins intersecting lines with an arc of any suitable radius.

Accessing the Command

command bar: **fillet** alias: **f** menu bar: **Modify | Fillet** toolbar: **Modify |** : **Fillet Prompts you in the command bar:** Fillet (radius=10): Select first entity or [fillet Settings/ Polyline/ Radius/ Trim/ Undo/ Multiple]: **(Choose an entity or enter an option)** Select second entity (select with pressed SHIFT to make corner): **(Choose the other entity)**

Command Options

Option	Description
Select first entity	Choose one or two of the following entities: • Lines, including parallel lines • All vertices of a single 2D polyline; two polylines cannot be filleted • Rays, including parallel rays • Infinite lines, including parallel infinite lines • Arcs • Circles
Select second entity	Choose the second entity. Press and hold the **Shift** key to create a corner (radius = 0). The selected entities are extended or trimmed at the intersection point. The selected part of the entities is kept. (6.1184 on the next page) If the second entity is parallel to the first entity the entities are connected by a semicircle. If the parallel entities are not of equal length, then the second entity is extended or trimmed when Trim Mode = Trim.
fillet Settings	Displays the Chamfer/Fillet section of the Settings dialog box: • **Fillet radius** - sets the radius of the fillet arc • **Trim mode** - toggles whether the entities are trimmed back to meet the fillet radius (6.1185 on page 4449)
Polyline	Fillets the all vertices of a polyline. Prompts you: **Select 2D polyline to fillet** - **(choose a single polyline.)** (6.1186 on page 4449)
Radius	Prompts you to type the Fillet radius in the command bar.
Trim	Sets the trim mode for chamfers and fillets. Prompts you: **[Trim/No] <Trim>** - **(choose an option or press Enter to keep the current mode.)** • **Trim** - trims or extends the selected entities. • **No** - creates the chamfer or fillet, but leaves the selected entities unchanged.
Undo	Undoes the last fillet when in Multiple mode.

Multiple	Lets you create additional fillets using the same settings without having to restart the command.

Procedures

- Filleting two entities or polyline segments (1.32.28)
- Filleting all vertices of a polyline (1.32.28)
- Filleting two parallel lines (1.32.28)

Related Commands

Break (6.6.21) - cuts parts out of entities. Chamfer (6.9.9) - chamfers intersections. DmChamfer (6.12.4) - creates an equal distance chamfer between adjacent faces sharing a sharp edge. DmFillet (6.12.13) - creates a smooth fillet between adjacent faces sharing a sharp edge. Extend (6.13.21) - extends open entities to a boundary. Settings (6.27.25) - specifies parameters for fillets. Trim (6.29.35) - trims entities where they cross other entities.

Figure 6.1184

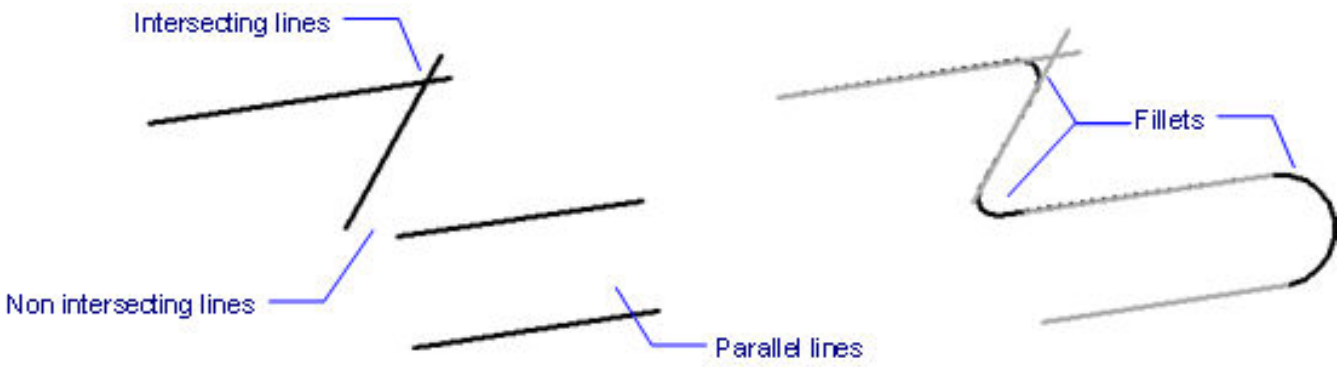


Figure 6.1185

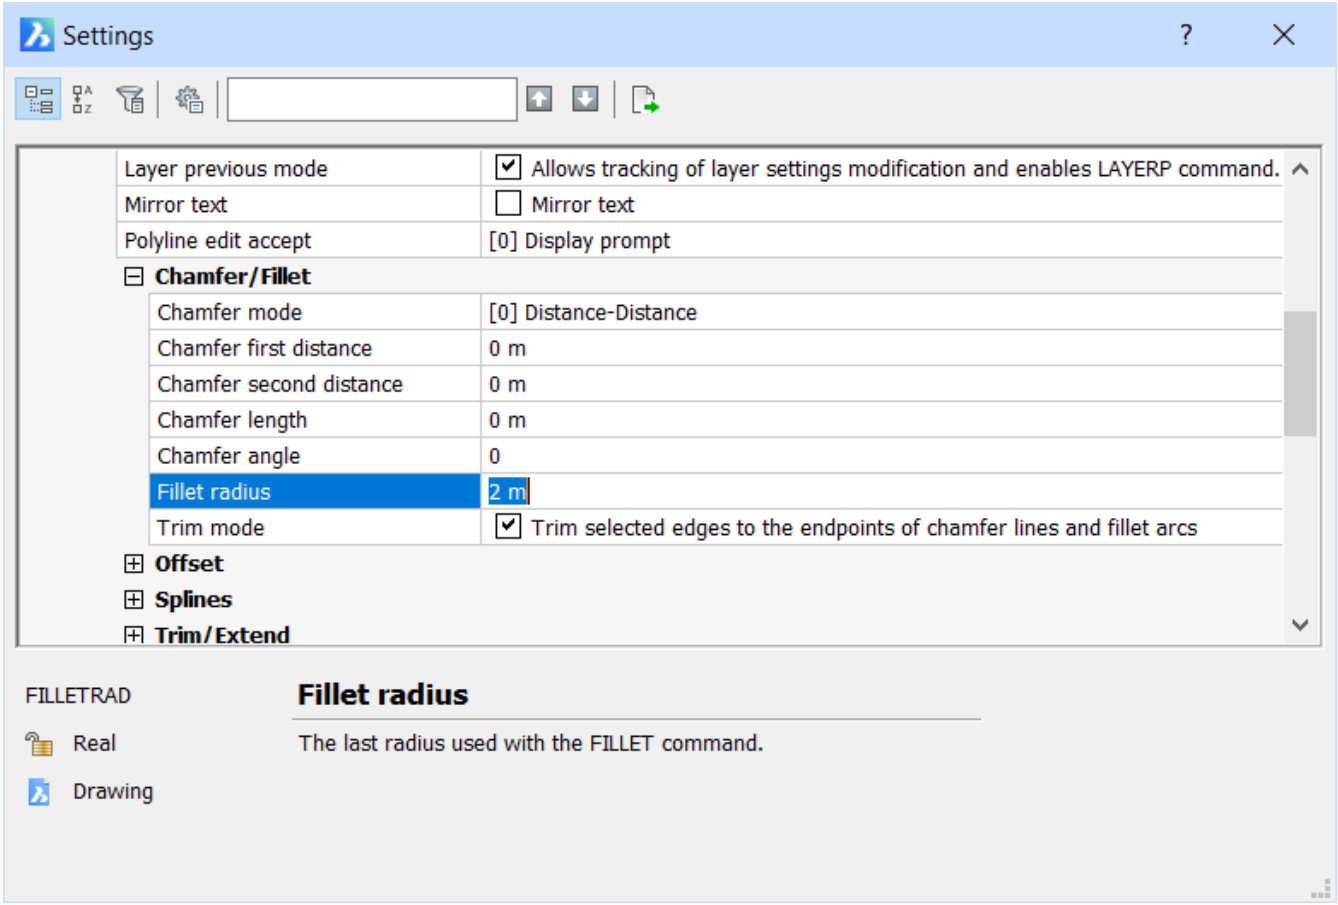

Figure 6.1186

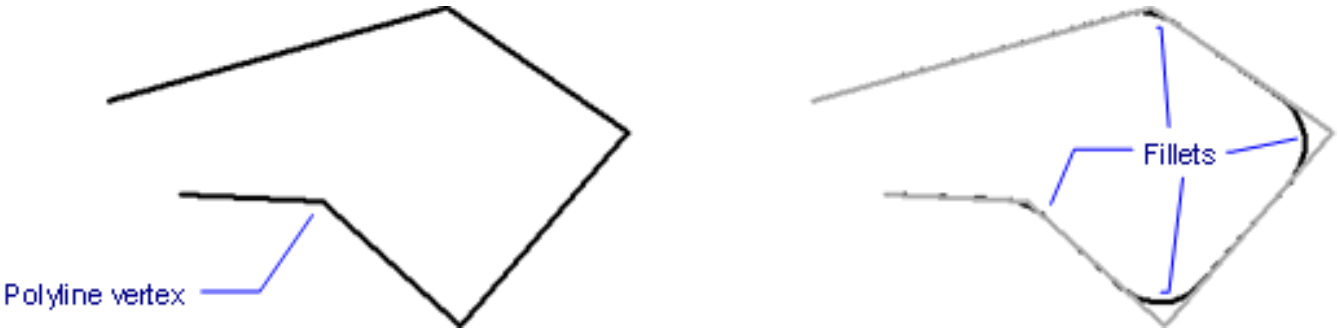

Figure 6.1187

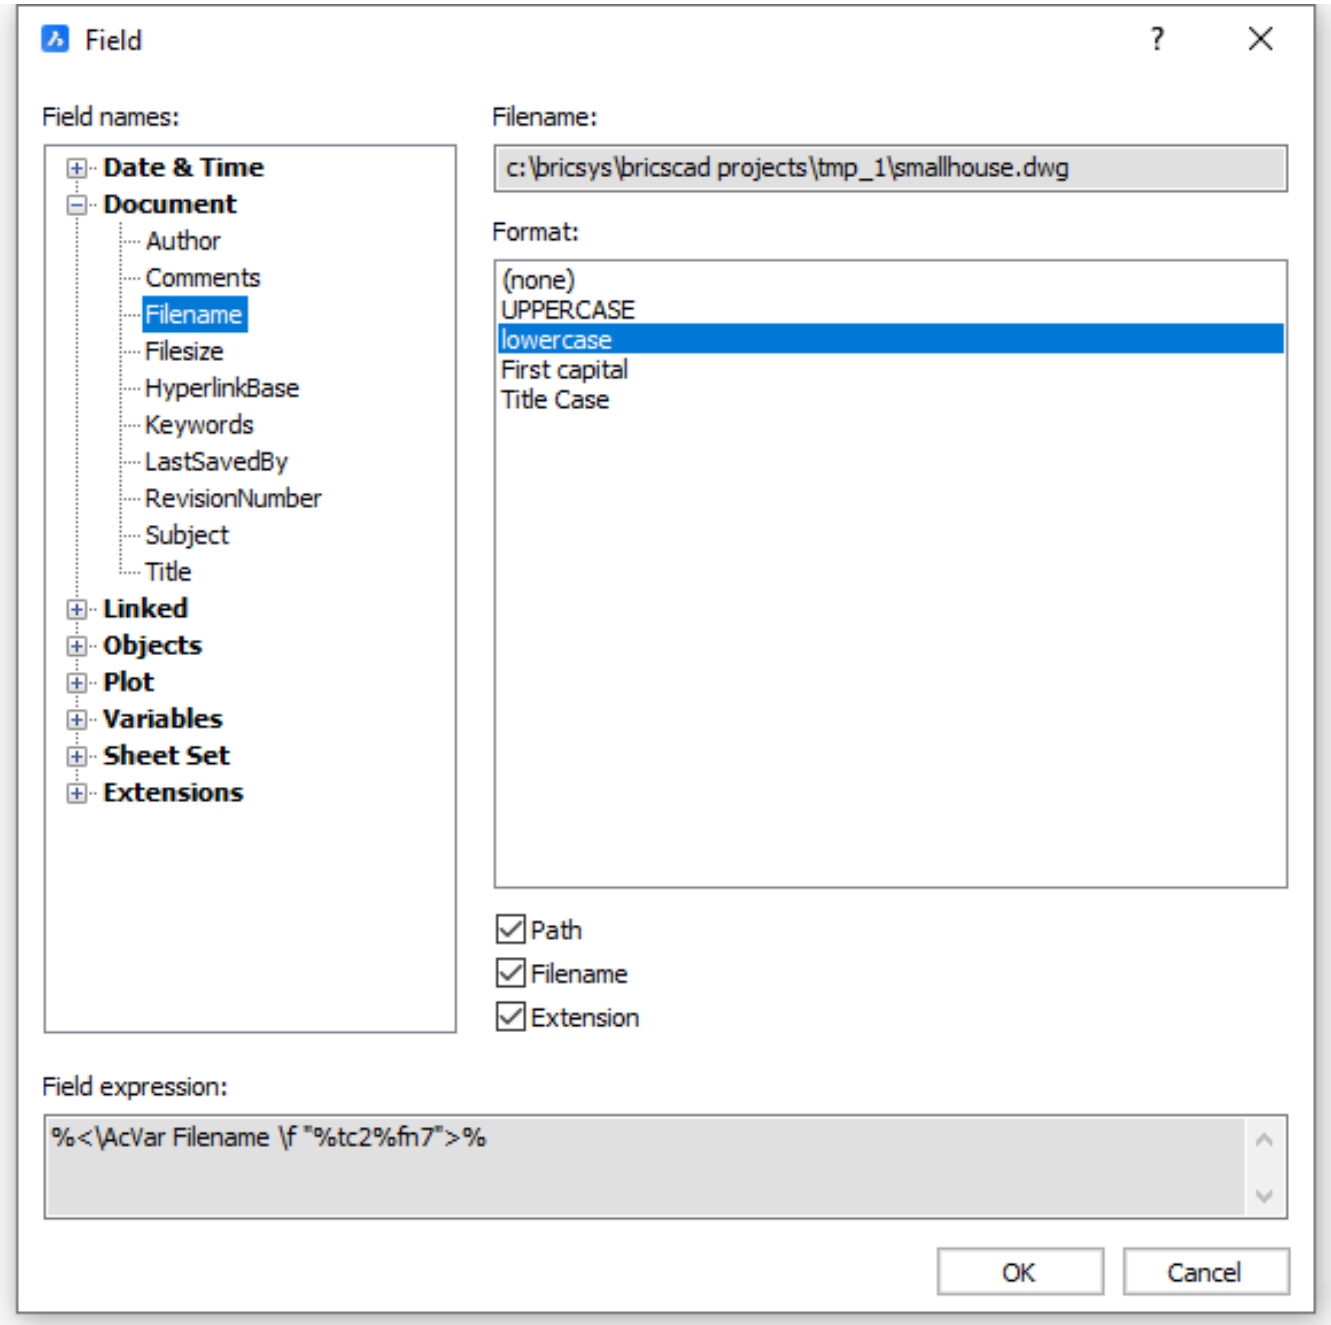
6.14.7 Field

(6.2981 on page 6079) Inserts field in multiline text, table cells, attributes, and so on. **Note:** A field is variable text that the program updates automatically, displaying such data as drawing properties (like a file name or the saved date), entity properties (like length, area, or layer), user-defined properties, plot settings, variables, and so on. If a field has no value, the the program displays hyphens (----).

Accessing the Command

command bar: **field** menu bar: **Insert| Insert Field** toolbar: **Insert** ribbon: **Draw | Text | Fields** dialog boxes: **MTEXT (6.21.38)** and **ATTDEF (6.4.31)** : **Field** Displays a dialog box: (6.1188 on the next page) Expand a catagory in the **Field Names** pane, then select a field name. The **Format** pane displays the format options for the selected field. Adjust the format, then click **OK**. **The program prompts you in the command bar:** Specify start point or [Height/Justify]: **(Enter an option)**

Figure 6.1188



Command Options

Field category	Dialog box
Date&Time	(6.1189 on page 4455) • Select a date type. – **Create date**: a random date – **Date**: current date – **PlotDate**: the date the drawing was last plotted – **SaveDate**: the date the drawing was last saved • Select a date format in the list or type a format in the **Date format** field.
Document	(6.1190 on page 4456) • Select a document property (6.10.46). • Select a format
Linked	(6.1191 on page 4457) • Click the **Hyperlink** button. The **Edit Hyperlink** dialog box displays. • Copy/Paste an URL in the **Link to file or URL** field. or Click the **Browse** () button and select a file. • Click the OK button on the **Edit Hyperlink** dialog box.

Objects	(6.1192 on page 4458) **BlockPlaceholder** See the ATTDEF (6.4.31) command to create block property fields in an attribute. When such attribute is included in a block definition, the field displays the current value of the block property. **Formula** Creates a formula field. You can use the values of table cells in a formula field. Click the **Average**, **Sum**, **Count** or **Cell** button. The Field dialog closes to let you select cells in a table (6.29.2) in the drawing. (6.1193 on page 4459) **Named object** Creates a field that shows the current name of a named entity. 1. Click the Named object type field, then select the object type in the list. All named objects of the selected type are listed in the Name list box. 2. Select a name in the list. 3. Choose a format. 4. Click the OK button to place the field. Object Creates a field that shows a property of a selected entity. 1. Click the select button, next to the Object type field. The Field dialog temporarily closes. 2. Select an entity in the drawing. The properties of the selected entity are listed in the Property list. 3. Select a property in the list. 4. Choose a format. 5. Click the OK button to place the field.
Plot	Plot fields apply to paper space layouts. Allows to create fields which show the current print settings of a layout.
Variables	Allows to create fields which show the current value of Diesel Expressions, Lisp Variables and System Variables.
Sheet Set	Allows to create fields which show default and custom sheet set properties.
Extensions	Allows to create fields showing properties of entities created by extensions, such as BIM or Mechanical. (6.1194 on page 4460)

Option	**Description**
Height	Specifies the text height. Prompts you: **Specify height <current height> - (enter a value for the height of the field text, or pick two points, or else press Enter to accept the current height.)**
Justify	Sets the text justification. Prompts you: **Enter justification [TL/TC/TR/ML/MC/MR/BL/BC/BR]<Top Left> - (enter a justification option.)**

Procedures

- General procedure to create fields (1.29.23)
- To display an entity property in a field (1.29.23)
- To edit a field (1.29.23)
- To update a field (1.29.23)
- To convert a field to text (1.29.23)

Related Commands

AttDef (6.4.31) - defines how block's attributes will be created through a dialog box. AttRedef (6.4.36) - redefines a block and updates associated attributes. AttSync (6.4.37) - synchronizes attribute definitions in all block references of a specified block definition. BattMan (6.6.1) - manages the attributes of a block definition. Dwgprops (6.10.46) - opens the Drawing Properties dialog box, showing the general information and user defined properties stored with a drawing. Mtext (6.21.38) and -MText (6.21.40) - places paragraph text. Updatefield (6.30.10) - updates fields in the selected Mtext entities. Table (6.29.2) - creates a table entity in the drawing.

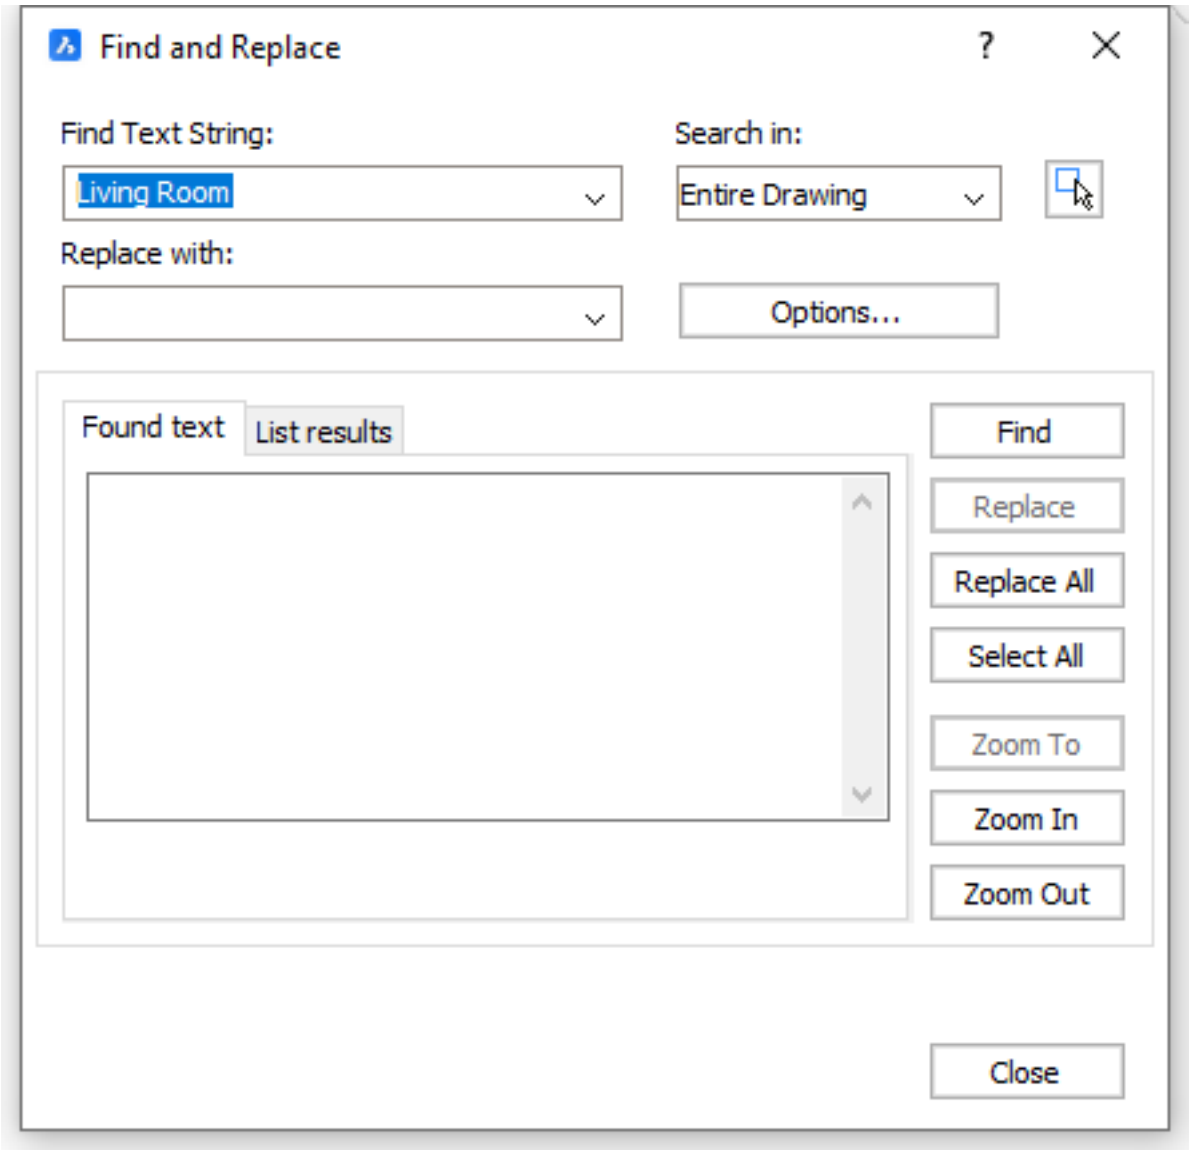
6.14.8 Find

(6.2981 on page 6079) Searches for text and optionally replaces it; searches for text in blocks, attributes, dimensions, and hyperlinks.

Accessing the Command

command bar: **find** keyboard shortcut: **Ctrl+F** menu bar: **Edit | Find** ribbon: **Draw | Text | Find** : **Find** Displays a dialog box: (6.1196 on the next page) Enter text to look for or replace, and then click Find Next.

Figure 6.1196



Command Options

The shortcut keystrokes listed below work only in this dialog box.

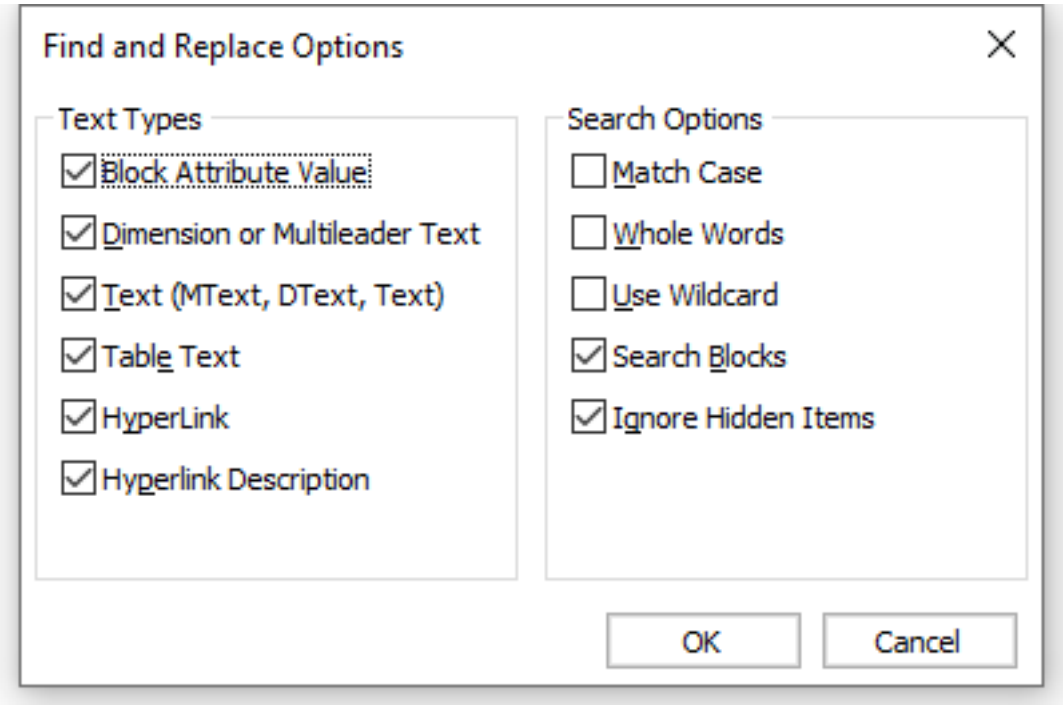
Option	Shortcut Keystroke	Description
Find Text String		Specifies the text to be located.
Replace With		Specifies the text with which to replace the located text. Leave this field empty when only searching for text.
Search In		Specifies the range of search: • **Entire Drawing** - searches all text in the drawing. • **Current Selection** - searches only among the selected entities.
 Select Entities		Dismisses the dialog box so that you can select the entities to search; prompts you: 1. **Select entities - (choose one or more entities.)** 2. **Select entities - (choose more entities, or else press Enter to return to the dialog box.)**
Options		Displays the Find and Replace Options dialog box; allows you to specify the kinds of text entities to search; see below.
Find Next	Alt+F	Finds the next occurrence of the text string.
Replace	Alt+R	Replaces the found text string with the replacement string.
Replace All	Alt+A	Replaces all occurrences of the text string with the replacement string.
Select All		Selects all occurrences of the text string.
Zoom To		Zooms to the part of the drawing containing the found text string.
Zoom In Zoom Out		Allows to take a closer look at the text within the context of the drawing without having to end the Find and Replace operation.

Click **Options...**, then select the required selection options and click **OK** . (6.1197 on page 4465)

Find and Replace Options	Description
Block Attribute Value	When checked, searches the values of block attributes as well.
Dimension or Multileader Text	When checked, searches dimension text as well.
Text (MText, DText, Text)	When checked, searches regular text as well.
Table Text	When checked, searches texts in tables.
Hyperlink	When checked, searches in hyperlinks (URLs) as well.
Hyperlink Description	When checked, searches in hyperlink descriptions as well.

Match Case	Searches the case of the text: • **Yes** - finds text that matches upper and lower case. For example, searching for "BricsCAD" matches BricsCAD but not bricscad • **No** - finds all text, regardless of upper or lowercase
Whole Words Only	Searches for full words: • **Yes** - finds only text that matches entire words. For example, searching for "CAD" matches CAD but not BricsCAD • **No** - finds all text, including text embedded in longer words
Use Wildcard	When checked, allows the use of wildcard characters such as * and ?
Search blocks	When checked, searches for matching text strings inside blocks.
Ignore Hidden Items	When checked, ignores content on hidden and frozen layers.

Figure 6.1197



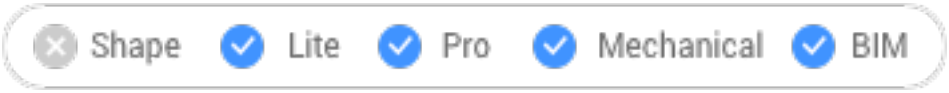
Procedures

- To set the Find and Replace options (1.29.22)
- To find text (1.29.22)
- To replace text (1.29.22)

Related Commands

Text (6.29.12) - places single-lines of text in drawings. -Text (6.29.12) - places text and evaluates LISP expressions. MText (6.21.38) and -MText (6.21.40) - places paragraph text. AttDef (6.4.31) - defines attribute text. DdEdit (6.10.13) - edits text. Hyperlink (6.16.11) - adds hyperlinks to entities. Spell (6.27.44) - checks the spelling of words. Properties (6.24.54) - modifies the properties of text.

Figure 6.1198



6.14.9 FitArc

(6.2947 on page 6049) Creates an arc or a circle for which the accumulated distance to the characteristic points of the input entities is minimal.

Accessing the Command

Keyboard: **fitarc : FITARC Prompts you:** Select fitting entities or [use Entire drawing/Delete initial entities/selection options (?)] <use Entire drawing>: **(Select points or linear entities or choose an option.)** Entities in set: xxx Select fitting entities or [use Entire drawing/Delete initial entities/selection options (?)] <use Entire drawing>: **(Select more entities or press Enter.)** A context menu displays: (6.1199) Optionally choose **Fit in 3D** and adjust the **Maximum Angle Gap**. Apply or Cancel [Apply/Cancel] <Apply>: **(Press Enter to create the arc or circle.)** (6.1200 on the next page) Resulting arc created from a series of points.

Figure 6.1199

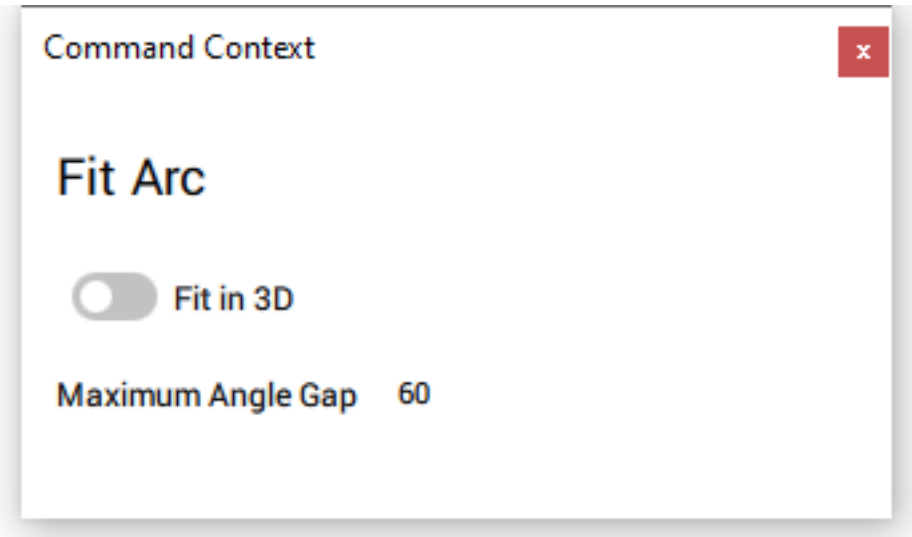


Figure 6.1200

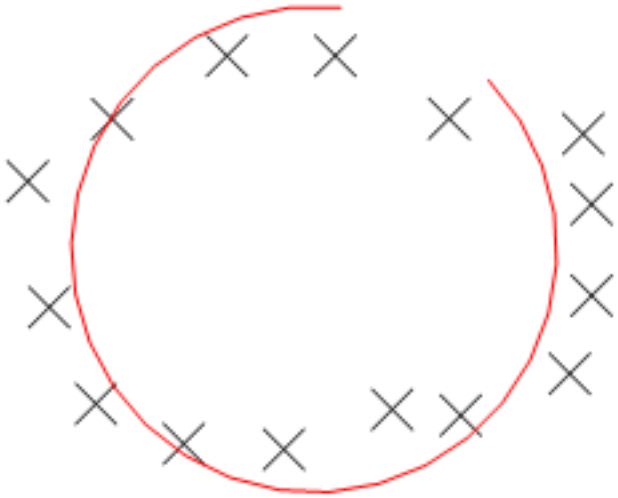


Command Options

Option	Description
Delete initial entities	Deletes the selected entities. Prompts you: **Delete initial entities [Yes/No] <No>:** Type **Y** then press Enter.
selection options (?)	Allows to choose a selection method. See the SELECT (6.27.16) command.
Use entire drawing	Use all entities in the drawing as input.
Fit in 3D	This option applies when one or more input entities do not lie in the XY-plane. If checked, the resulting arc or circle is created in 3D space, otherwise the input entities are projected onto the XY-plane first.
Maximum Angle Gap	Defines the threshold value for the maximal angle gap between the characteristic points of the input entities. If the maximal angle gap is larger than the threshold value, an arc is created; otherwise a circle is created.

Related Commands

FitLine (6.14.11) - creates a line for which the accumulated perpendicular distance to the characteristic points of the input entities is minimal. Overkill (6.23.14) - deletes duplicate entities and overlapping lines, arcs, and polylines, and unifies partly overlapping or contiguous ones; optionally moves duplicates to a dedicated layer.

Figure 6.1201

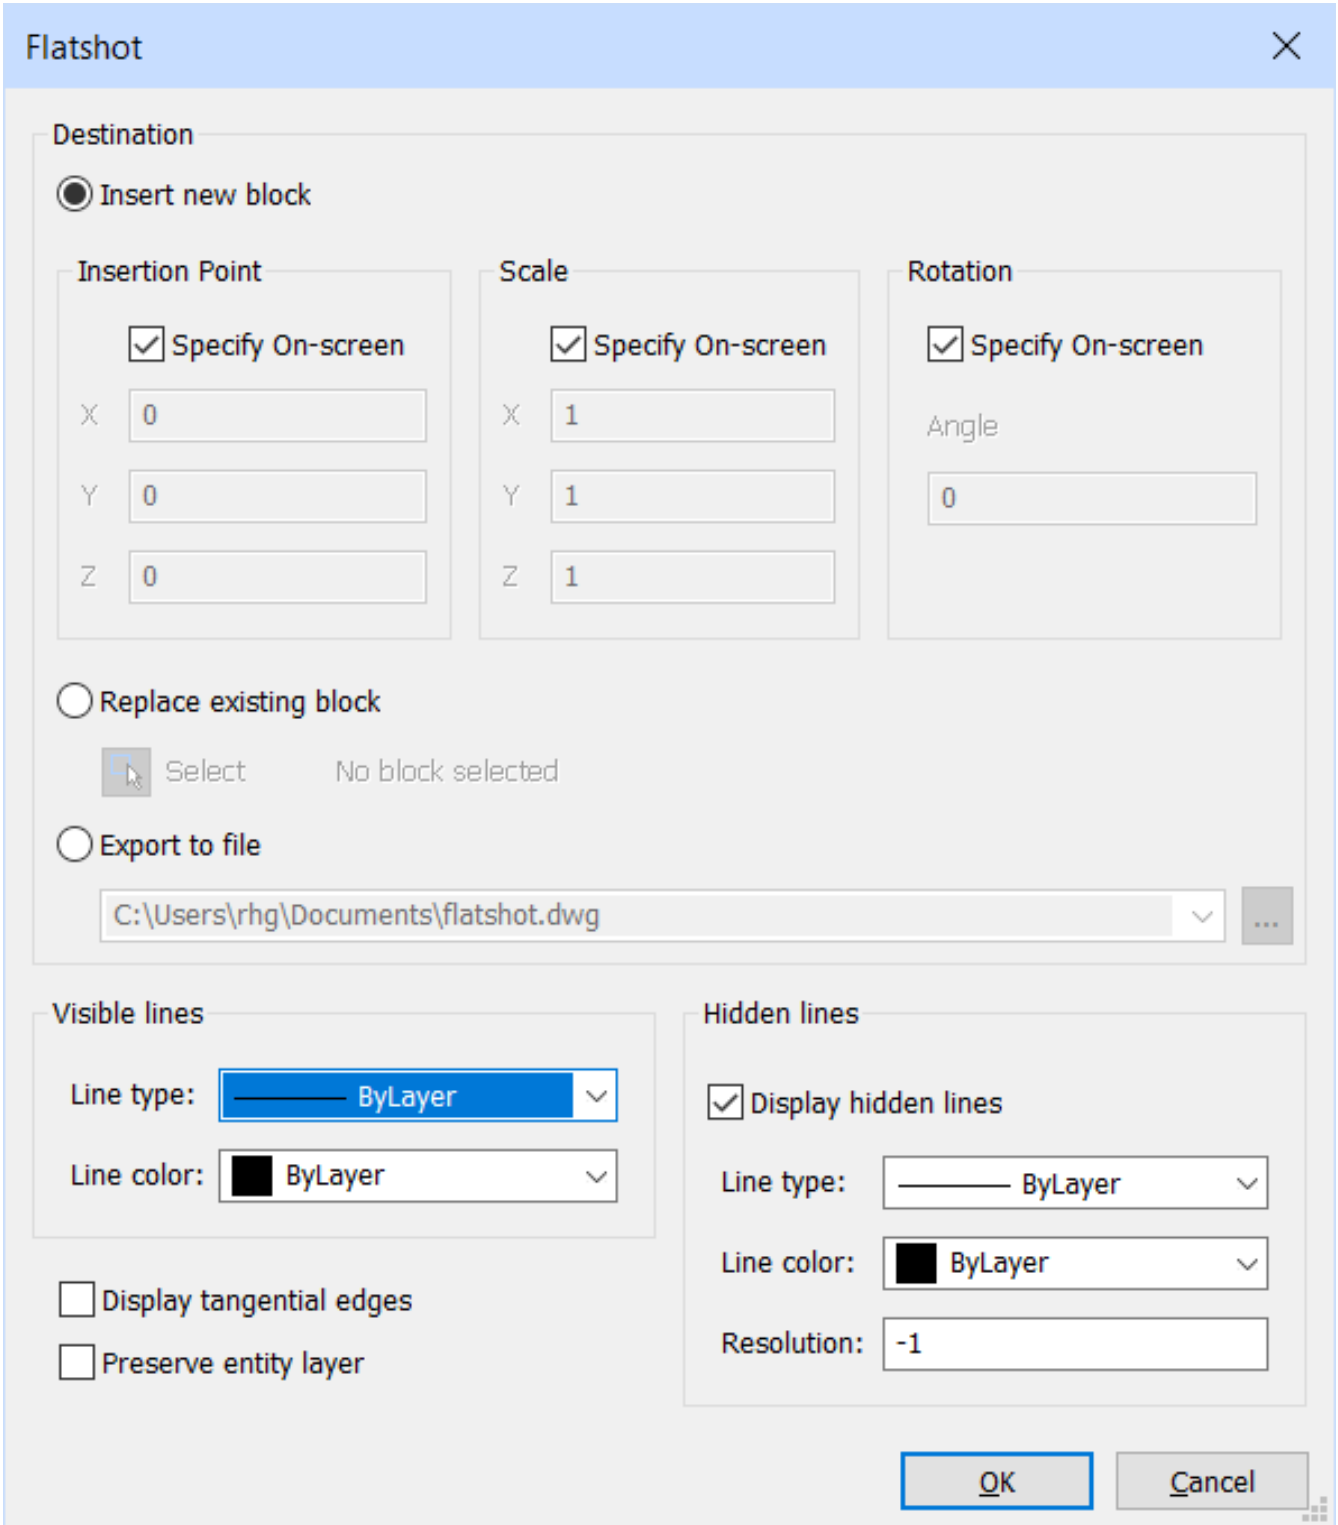
6.14.10 FlatShot

(6.2880 on page 5977) Creates a flattened, hidden line representation of 3D solids, 3D surfaces, and polyface meshes as a block or a new drawing. **Note:** This command works only in model space.

Accessing the Command

command bar: **flatshot** menu bar: **Model | Direct Modeling | Sections | Flatshot** ribbon: **Model | Sections | Section Plane | Flatshot** toolbar: **Sections | Flatshot** : **FlatShot** Displays a dialog box: (6.1202 on the next page)

Figure 6.1202



Command Options

Option	Description
Destination	Determines where the block should be placed; **(choose one)**: • **Insert New Block** - inserts the flatshot block as a new block in the current drawing; specify the insertion point, scale, and rotation angle like a regular block; see the Insert (6.17.13) command • **Replace Existing Block** - replaces a block already inserted in the drawing; click the **Select** button to choose the block graphically • **Export to File** - **(save the flatshot block as a DWG file; click Browse to specify the folder in which to save it.)**
Visible lines	Sets the linetype and color for the visible lines; choose the linetype and color from the droplists.
Hidden lines	Toggles the display of hidden lines, and sets their properties. Choose the linetype and color from the droplists, and enter a value for the resolution. Resolution specifies the short entity that will be represented by a hidden line. Enter a negative value so that the program will determine this automatically. The range is 0.01 to 0.000000000001.
Display tangential edges	Toggles the display of tangential edges. A tangential edge is the imaginary transition line between two tangent faces; see figure below. In most cases, leave this option off. Tangential edges removed (left); tangential edges displayed (right). (6.1203)
Preserve Entity Layer	When on, maintains the layers of entities in the block.

Related Commands

Hide (6.16.9) - removes hidden lines from 3D entities. Solprof (6.27.43) - creates a hidden line representation of 3D solids in a layout viewport. Shademode (6.27.31) - sets the shading style for 3D drawings. ViewBase (6.31.4) - generates associative orthographic and standard isometric views of a 3D solid model in a paper space layout. ViewExport (6.31.11) - exports the content of drafting views obtained by VIEWBASE and VIEWSECTION to the Model Space of the drawing. ViewSection (6.31.12) - creates a cross section view based on a standard drafting view generated by the VIEWBASE command in a paper space layout.

Figure 6.1203

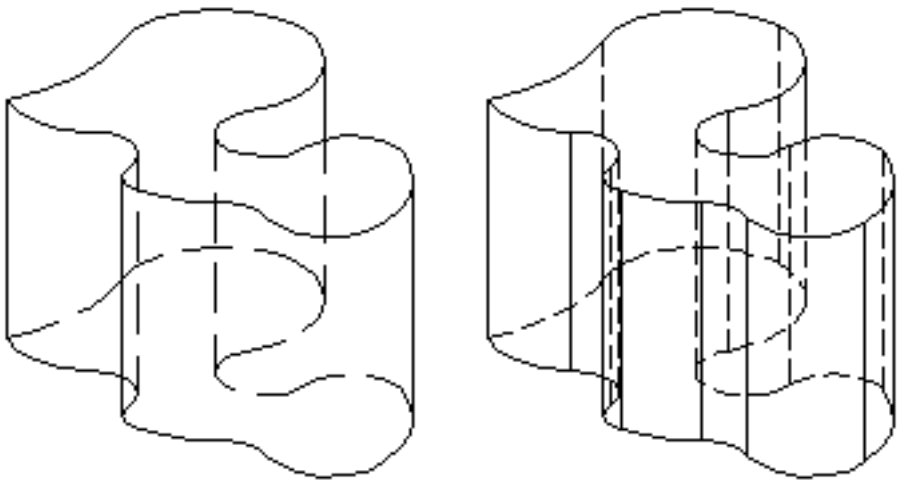


Figure 6.1204

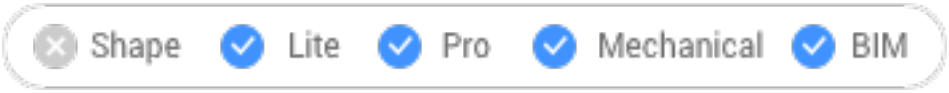

6.14.11 FitLine

(6.2947 on page 6049) Creates a line for which the accumulated perpendicular distance to the characteristic points of the input entities is minimal.

Accessing the Command

Keyboard: **fitline : FITLINE Prompts you:** Select fitting entities or [use Entire drawing/Delete initial entities/selection options (?)] <use Entire drawing>: **(Select points or linear entities or choose an option.)** Entities in set: xxx Select fitting entities or [use Entire drawing/Delete initial entities/selection options (?)] <use Entire drawing>: **(Select more entities or press Enter.)** A context menu displays: (6.1205) Optionally choose **Fit in 3D**. Apply or Cancel [Apply/Cancel] <Apply>: **(Press Enter to create the line.)** (6.1206 on the next page) Resulting line created from a series of points.

Figure 6.1205

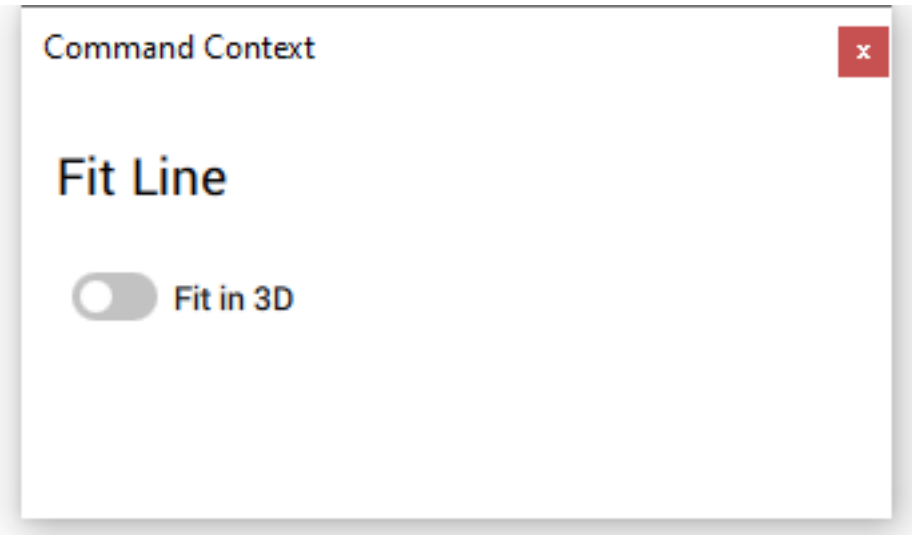

Figure 6.1206

Command Options

Option	Description
Delete initial entities	Deletes the selected entities. Prompts you: **Delete initial entities [Yes/No] <No>:** Type **Y** then press Enter.
selection options (?)	Allows to choose a selection method. See the SELECT (6.27.16) command.
Use entire drawing	Use all entities in the drawing as input.
Fit in 3D	This option applies when one or more input entities do not lie in the XY-plane. If checked, the resulting line is created in 3D space, otherwise the input entities are projected onto the XY-plane first.

Related Commands

FitArc (6.14.9) - creates an arc or a circle for which the accumulated distance to the characteristic points of the input entities is minimal. Overkill (6.23.14) - deletes duplicate entities and overlapping lines, arcs, and polylines, and unifies partly overlapping or contiguous ones; optionally moves duplicates to a dedicated layer.

Figure 6.1207

6.14.12 Flatten

(6.2981 on page 6079) Flattens 2D and 3D entities by projecting them onto the XY-plane of the current view.

Accessing the Command

 command bar: **flatten** menu bar: **Modify | Flatten** ribbon: **Change | Modify | Flatten** toolbar: **Modify |**  : **Flatten Prompts you in the command bar:** Select entities [new ucs ELevation/allow EXplode]: **(Choose one or more entities, or else choose an option)** Entities in set: 1 Select entities [new ucs ELevation/allow EXplode]: **(Choose more entities, or else press Enter to end entity selection)** The selected entities are flattened.

Command Options

Option	Description
Select entities to flatten	Choose the entities to be flattened. (6.1208) The entities will be projected onto the XY plane of the current view. In top view, the entities will be projected onto the XY-plane of the current coordinate system (WCX or UCS). (6.1209 on the following page) • Pyramid converted to a square with its diagonals • Cone becomes a circle with a point in the center • 3D polyline and spline are converted to 2D polylines
new ucs ELevation	Specifies the new elevation for the resulting 2D entities; prompts you: **New UCS elevation - (enter a value or press Enter to accept the default value.)** The elevation and thickness of the 2D entities can be changed with the Elev (6.13.4) command.
EXplode	Explodes compound entities, such as 3D solids; prompts you: **Allow explode of entities - (enter Y or N.)**

Related Commands

Elev (6.13.4) - sets the thickness and elevation of entities. FlatShot (6.14.10) - creates a hidden line representation of all 3D solids in model space as a block or a new drawing. Section (6.27.11) - creates 2D region slices of 3D solid models. SolidEdit (6.27.42) - creates 2D entities from 3D solid models. Solprof (6.27.43) - creates a hidden line representation of 3D solids in a layout viewport.

Figure 6.1208

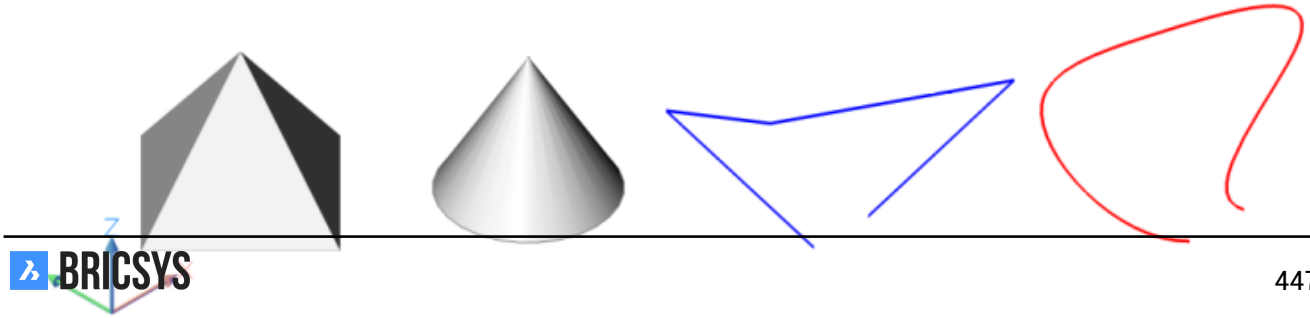

Figure 6.1209

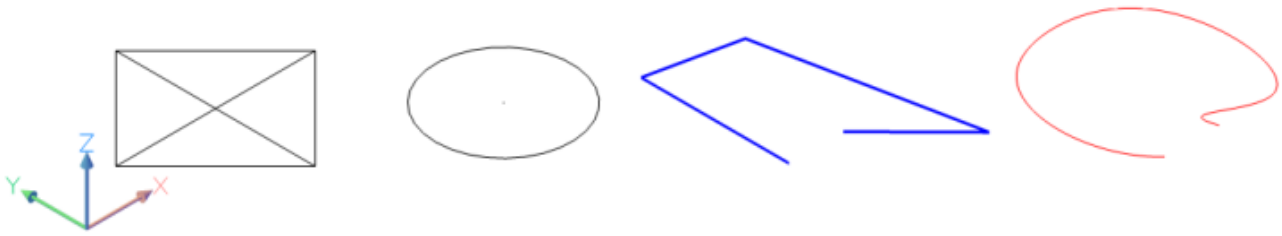

6.14.13 From

Allows you to enter relative coordinates with respect to a reference point whenever a command prompts you to enter a point. **Note:** This command is useful for starting entities offset from another entity, such as inserting a door relative to the end of a wall.

Accessing the Command

 transparent: **from** toolbar: **Entity Snaps |** 
: **From Prompts you in the command bar:** Base point: **(Identify the reference point)** Offset or regular point: **(Enter relative coordinates: @ x,y,z)**

Command Options

Option	Description
Base point	Pick a point or enter coordinates to specify the base point
Offset or regular point	Enter the offset by specifying relative coordinates, using the @x,y,z format

Note: From is a command modifier, not a command, and so it is entered only during a drawing or editing command.

Related Commands

OSnap (6.23.16) - toggles entity snap modes in the Settings dialog box. -OSnap (6.23.13) - toggles entity snap modes in the command bar. Aperture (6.4.14) - sizes the aperture cursor for entity snaps. 3dIntersection (6.3.7) - toggles intersection snap mode. Apparent (6.4.16) - toggles apparent intersection snap mode. Center (6.9.3) - toggles center snap mode. Endpoint (6.13.7) - toggles endpoint snap mode. Extension (6.13.22) - toggles extension snap mode. Insertion (6.17.18) - toggles insertion snap mode. Intersection (6.17.19) - toggles intersection snap mode. Midpoint (6.21.16) - toggles midpoint snap mode. Mtp (6.21.35) - allows to specify a point as the midpoint between two points. Nearest (6.22.2) - toggles nearest snap mode. Node (6.22.7) - toggles node (point) snap mode. None (6.22.8) - turns off all entity snap modes. Parallel (6.24.5) - toggles parallel snap mode. Perpendicular (6.24.25) - toggles perpendicular snap mode. Quadrant (6.25.7) - toggles quadrant snap mode. Tangent (6.29.10) - toggles tangent snap mode.

6.15 G

6.15.1 GradingBalance

(6.2880 on page 5977) Balances grading cut and fill volumes.

Figure 6.1210

Accessing the Command

 Commandline: **GRADINGBALANCE** Ribbon: **Civil | Utilities | Balance Grading Volumes : GradingBalance**
Prompts you: Select Grading entities [selection options (?)]: **(select grading entities)** Enter tolerance in percent (1 - 100) <1>: **(enter a tolerance percentage)**

Procedures

Adjusting the elevation of a grading to balance cut and fill volumes (1.26.7)

Related Commands

Grading (6.15.25) - Creates a graded surface on existing topo surfaces. Tin (6.29.14) - Creates a topographical surface from an imported points file or placing new points. TinEdit (6.29.19) - Allows to add/remove boundaries, breaklines, and points to a surface. TinMerge (6.29.22) - Combines two or more TIN surfaces (or gradings) into a new TIN surface. TinModify (6.29.23) - Easily deforms or smoothens a selected TIN surface. TinVolume (6.29.24) - Creates a TIN volume surface between a base and comparison TIN surfaces or an elevation.

Figure 6.1211

6.15.2 GcCollinear

(6.2981 on page 6079) Constrains one line or polyline segment to be collinear with another one, which means they lay in the same line. (This command is equivalent to using the Collinear (6.15.17) option of the GeomConstraint (6.15.17) command.) **Note:** The **second** entity you select is straightened out to be collinear to the first.

Accessing the Command

 command bar: **gccollinear** menu bar: **Assembly | 2D Constraints | Collinear** ribbon: **Parametric | 2D Constraints | Collinear** toolbar: **2D Constraints |**  : **GcCollinear Prompts you in the command bar:** Select first entity or [Multiple]: **(Select a line or polyline segment, or press M)** Select second entity: **(Select another line or polyline segment)**

Command Options

Option	Description
Select first entity	Select a line or polyline segment.
Select entity to make collinear to first	Select multiple lines or polyline segments; segments of the same polyline are accepted, which is straightens out the polyline.
Multiple	Makes more than two entities collinear; you can pick only one entity at a time. Prompts you: 1. **Select first entity - (pick a line or polyline segment.)** 2. **Select entity to make collinear to first - (pick another entity.)** 3. **Select entity to make collinear to first - (select more entities, or else press Enter to complete the command.)**

After you place the constraint, icons appear near the entities indicating the type of constraint. If you do not see them, then use the ConstraintBar (6.9.27) command to display them. To remove a constraint, click the tiny **x** on the constraint bar. (6.1212)

Related Commands

GeomConstraint (6.15.17) - applies geometric relationships between entities and/or points on entities. Dimconstraint (6.10.30) - applies a dimensional constraint to an entity or between constraint points on entities; converts associative dimensions to dynamic dimensions. GcCoincident (6.15.3) - applies a coincident geometrical constraint to two points or constrains a point to an entity. GcConcentric (6.15.4) - constrains the center points of circles, arcs, ellipses or elliptical arcs to coincide. GcEqual (6.15.6) - constrains arcs and circles to the same radius, or lines to the same length. GcFix (6.15.7) - constrains points and entities at a fixed position. GcHorizontal (6.15.8) - constrains lines or pairs of points to lie parallel to the X-axis of the current coordinate system. GcParallel (6.15.9) - forces two lines to be parallel to each other. GcPerpendicular (6.15.10) - constrains two lines to lie perpendicularly to each other. GcSmooth (6.15.11) - forces a spline to maintain fluid geometric continuity with another spline, line, arc or polyline. GcSymmetric (6.15.12) - constrains two entities or points to lie symmetrically with respect to a selected line. GcTangent (6.15.13) - constrains two entities to maintain a point of tangency to each other or their extensions. GcVertical (6.15.16) - constrains lines or pairs of points to lie parallel to the Y-axis of the current coordinate system. ConstraintBar (6.9.27) - controls the display of the constraint bar of entities. Delconstraint (6.10.26) - removes all dimensional and geometrical constraints from an entity.

Figure 6.1213

6.15.3 GcCoincident

(6.2981 on page 6079) Applies a coincident geometrical constraint to points on two entities. (This command is equivalent to using the Coincident option of the GeomConstraint (6.15.17) command.) **Note:** The second entity that you select is moved or stretched to coincide with the pick point on first entity.

Accessing the Command

command bar: **gccoincident** menu bar: **Assembly | 2D Constraints | Coincident** ribbon: **Parametric | 2D Constraints | Coincident** toolbar: **2D Constraints |**  : **GcCoincident Prompts you in the command bar:** Select first point or [Entity/Autoconstrain] <Entity>: **(Select a point on an entity, enter an option, or else press Enter to select an entity)** Select point or [Multiple]: **(Select a point, or type M to select multiple points)** Select second point or [Entity] <Entity>: **(Select a point on an entity, or else press Enter to select an entity)**

Command Options

Option	Description
Select first point	Select a valid constraint point on an entity; it is helpful to turn on ESnap to see these constraint points. • **Lines** - endpoints, midpoint • **Arcs and elliptical arcs** - endpoints, center point, midpoint • **Circles and ellipses** - center point • **Polylines** - endpoints, vertices, midpoints of line and arc segments, centers of arc segments • **Splines** - endpoints • **Blocks, xrefs, text, mtext, attributes, tables** - insertion point
Select second point	Select a valid constraint point on another entity. The second point is moved to coincide with the first point.
Entity	Places the constraint on a valid constraint entity: • Line or polyline segment • Circle or ellipse • Arc or elliptical arc • Spline Prompts you: 1. **Select an entity** - **(select an entity; the point you pick on an open entity applies the constraint the end closest to your pick point.)** 2. **Select point or [Multiple]** - **(select another entity.)** The second entity moves or stretches to connect to the first one.

Multiple	Snaps to valid constraint points on additional entities; prompts you: 1. **Select point - (pick a point on an entity.)** 2. **Select point - (pick a point on another entity, or else press Enter to complete the command.)**
Autoconstrain	Applies the coincident constraint to all entities in a selection set; the entities must be touching. Prompts you: 1. **Select entities - (select one or more entities; you can enter all to select all entities in the drawing; the program reports): Entities in set: 3** 2. **Select entities - (select more entities, or else press Enter to end entity selection; the program reports): 2 coincident constraint(s) applied**

After you place the constraint, icons appear near the entities indicating the type of constraint. If you do not see them, then use the ConstraintBar (6.9.27) command to display them. (6.1214) Pause the cursor over one of the icons to see the location of the constraint, shown as a large **X**: (6.1215 on the following page) To remove a constraint, click the tiny **x** on the constraint bar:

GcHorizontal (6.15.8) - constrains lines or pairs of points to lie parallel to the X-axis of the current coordinate system. GcParallel (6.15.9) - forces two lines to be parallel to each other. GcPerpendicular (6.15.10) - constrains two lines to lie perpendicularly to each other. GcSmooth (6.15.11) - forces a spline to maintain fluid geometric continuity with another spline, line, arc or polyline. GcSymmetric (6.15.12) - constrains two entities or points to lie symmetrically with respect to a selected line. GcTangent (6.15.13) - constrains two entities to maintain a point of tangency to each other or their extensions. GcVertical (6.15.16) - constrains lines or pairs of points to lie parallel to the Y-axis of the current coordinate system. ConstraintBar (6.9.27) - controls the display of the constraint bar of entities. Delconstraint (6.10.26) - removes all dimensional and geometrical constraints from an entity.

Figure 6.1216

6.15.4 GcConcentric

(6.2981 on page 6079) Constrains circles, arcs, polyline arcs, ellipses, and elliptical arcs to have the same center point, making them concentric. (This command is equivalent to using the Concentric option of the GeomConstraint (6.15.17) command.) **Note:** The second entity that you select is moved to be concentric to the first entity.

Accessing the Command

 command bar: **gcconcentric** menu bar: **Assembly | 2D Constraints | Concentric** ribbon: **Parametric | 2D Constraints |** toolbar: **2D Constraints |**  : **GcConcentric Prompts you in the command bar:** Select first entity: **(Select a valid curved entity)** Select second entity: (**Select a second valid curved entity**)

Command Options

Option	Description
Select first entity	Select a valid entity: • Circle • Ellipse • Arc • Polyline arc • Elliptical arc
Select second entity	Select a second valid curved entity; it is moved to be concentric to the first one -- both share the same center point, as shown below.

After you place the constraint, icons appear near the entities indicating the type of constraint. If you do not see them, then use the ConstraintBar (6.9.27) command to display them. (6.1217 on the following page) To remove a constraint, click the tiny **x** on the constraint bar.

Figure 6.1218

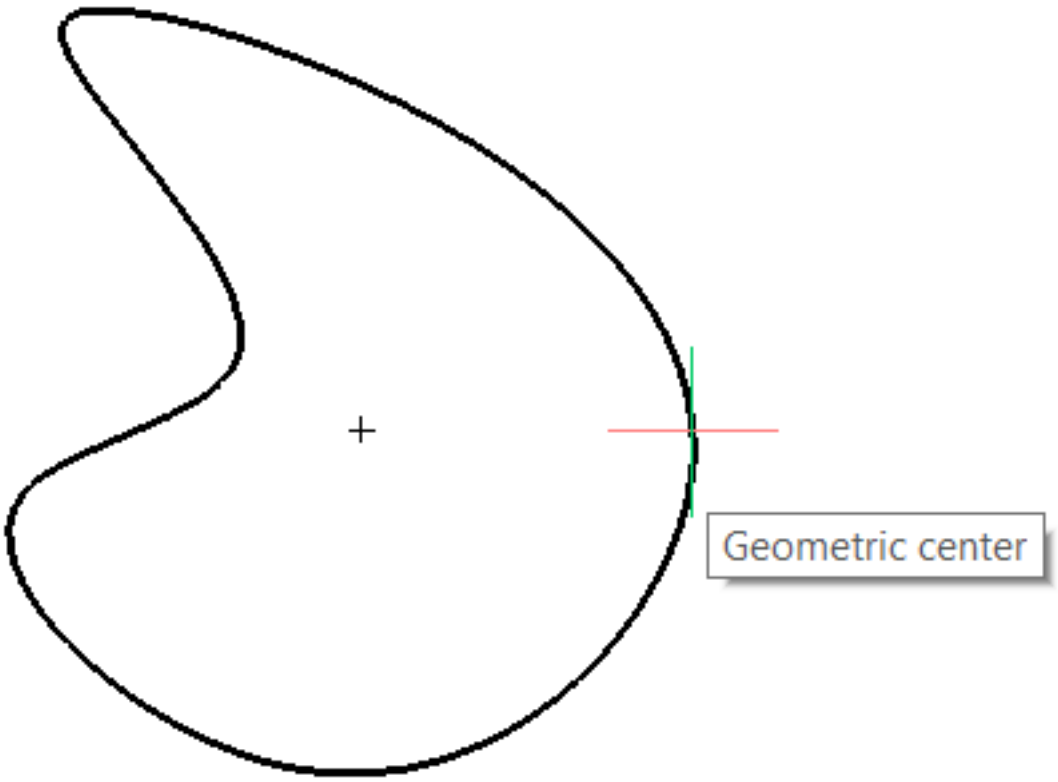
6.15.5 Gcenter

(6.2981 on page 6079) Toggles Geometric Center Entity snap; snaps to the centroid of a closed polyline, spline, planar 3D polyline, regions, or planar face of a 3D solid.

Accessing the Command

 command bar: **gcenter** transparent: **gce** ribbon: **Home | Entity Snaps | Snap to Geometric Center** toolbar: **Entity Snaps |**  : **Gcenter** Displays no prompts in the command bar; as you move the cursor over a closed entity, displays a blipmark (+) at the geometric center icon. (6.1219 on the following page)

Figure 6.1219



Command Options

Option	Description
Gcenter	Entering the command toggles Geometric Center entity snap. When on, it snaps to the centroid of a closed entity or and planar face of a 3D solid. This command can be entered transparently during commands, but must be entered without the apostrophe prefix (').

Related Commands

OSnap (6.23.16) - toggles entity snap modes in the Settings dialog box. -OSnap (6.23.13) - toggles entity snap modes in the command bar. Aperture (6.4.14) - sizes the aperture cursor for entity snaps. 2dIntersection (6.2.1) - toggles apparent intersection snap mode. 3dIntersection (6.3.7) - toggles intersection snap mode. Apparent (6.4.16) - toggles apparent intersection snap mode. Center (6.9.3) - toggles center snap mode. Endpoint (6.13.7) - toggles endpoint snap mode. Extension (6.13.22) - toggles extension snap mode. From (6.14.13) - allows to enter relative coordinates with respect to a reference point. Insertion (6.17.18) - toggles insertion snap mode. Intersection (6.17.19) - toggles intersection snap mode. Midpoint (6.21.16) - toggles midpoint snap mode. Mtp (6.21.35) - allows to specify a point as the midpoint between two points. Nearest (6.22.2) - toggles nearest snap mode. Node (6.22.7) - toggles node (point) snap mode. None (6.22.8) - turns off all entity snap modes. Parallel (6.24.5) - toggles parallel snap mode. Perpendicular (6.24.25) - toggles perpendicular snap mode. Quadrant (6.25.7) - toggles quadrant snap mode. Tangent (6.29.10) - toggles tangent snap mode.

Figure 6.1220

6.15.6 GcEqual

(6.2981 on page 6079) Constrains arcs and circles to the same radius, or lines and polyline segments to the same length. (This command is equivalent to using the Equal option of the GeomConstraint (6.15.17) command.) **Note:** The second entity that you select is stretched to be the same length (or radius) as the first entity.

Accessing the Command

command bar: **gcequal** menu bar: **Assembly | 2D Constraints | Equal** ribbon: **Parametric | 2D Constraints | Equal** toolbar: **2D Constraints |** : **GcEqual Prompts you in the command bar:** Select first entity or [Multiple]: **(Select an entity, or type M)** Select second entity: **(Select a second entity of the same kind -- linear or curved -- as the first entity)**

Command Options

Option	Description
Select first entity	Select a line, arc, circle, or polyline segment.
Select second entity	Selects a second entity, which is made the same length or radius as the first one.
Multiple	Selects more than two entities: 1. **Select first entity - (select the initial entity.)** 2. **Select entity to make equal to first - (select another entity.)** 3. **Select entity to make equal to first - (select another entity, or else press Enter to complete the command.)** All entities selected must be of the same kind -- straight or curved -- as the first one. You can select multiple segments of the same polyline.

After you place the constraint, icons appear near the entities indicating the type of constraint. If you do not see them, then use the ConstraintBar (6.9.27) command to display them. To remove a constraint, click the tiny **x** on the constraint bar: (6.1221)

GcTangent (6.15.13) - constrains two entities to maintain a point of tangency to each other or their extensions. GcVertical (6.15.16) - constrains lines or pairs of points to lie parallel to the Y-axis of the current coordinate system. ConstraintBar (6.9.27) - controls the display of the constraint bar of entities. Delconstraint (6.10.26) - removes all dimensional and geometrical constraints from an entity.

Figure 6.1222

6.15.7 GcFix

(6.2981 on page 6079) Constrains points or entities to a fixed position. (This command is equivalent to using the Fix option of the GeomConstraint (6.15.17) command.) **Note:** This command constrains

- **Point** - one end of the entity is fixed in place; for instance, one end of a line is fixed in place, but the other end can still be moved
- **Entity** - the entire entity is fixed in place and cannot be moved

Accessing the Command

 command bar: **gcfix** menu bar: **Assembly | 2D Constraints | Fix** ribbon: **Parametric | 2D Constraints | Fix** toolbar: **2D Constraints |** 
: **GcFix Prompts you in the command bar:** Select point or [Entity]: **(Select a valid constrain point, or else enter E)**

Command Options

Option	Description
Select point	Select a valid constraint point on an entity: • **Lines** - endpoints, midpoint • **Arcs and elliptical arcs** - endpoints, center point, midpoint • **Circles and ellipses** - center point • **Polylines** - endpoints, vertices, midpoints of line and arc segments, centers of arc segments • **Splines** - endpoints • **Blocks, xrefs, text, mtext, attributes, tables** - insertion point The selected point on the entity is fixed in place, and so can no longer be moved.
Entity	Places the constraint on a valid constraint entity: • Line or polyline segment • Circle or ellipse • Arc or elliptical arc • Spline Prompts you: 1. **Select an entity** - **(select an entity; the point you pick on an open entity applies the constraint the end closest to your pick point.)** The **position** of the entity cannot be moved any more, although you can modify the length of, say, a line or polyline segment in either direction.

After you place the constraint, icons appear near the entities indicating the type of constraint. If you do not see them, then use the ConstraintBar (6.9.27) command to display them. Pause the cursor over one of the icons to see the location of the constraint, shown as a large **X**: (6.1223 on the following page) To remove a constraint, click the tiny **x** on the constraint bar.

Figure 6.1224

6.15.8 GcHorizontal

(6.2981 on page 6079) Constrains a line, linear polyline segment, or a pair of points to lie parallel to the X-axis in the current coordinate system. (This command is equivalent to using the Horizontal option of the GeomConstraint (6.15.17) command.) **Note:** This command moves one end of the segment so that the segment is horizontal. The end that is moved is the end of the segment drawn second.

Accessing the Command

command bar: **gchorizontal** menu bar: **Assembly | 2D Constraints | Horizontal** ribbon: **Parametric | 2D Constraints | Horizontal** toolbar: **2D Constraints |** : **GcHorizontal Prompts you in the command bar.** Select an entity or [2Points] <2Points>: **(Select a line or linear polyline segment, or else press Enter to select two points)**

Command Options

Option	Description
Select an entity	Select a line or a linear polyline segment; the program moves one end to make the entity horizontal -- parallel to the X-axis of the current coordinate system.
2Points	Constrains two pick points to the horizontal; prompts you: 1. **Select first point - (pick a point on one entity.)** 2. **Select second point - (pick another point on the same entity, or on another entity.)** Pick two valid constraint points on the same entity or on two different entities. The two selected points are forced to lie on a line which is parallel to the X-axis of the current coordinate system. The program moves the second point vertically so that it lies horizontally to the first pick point; see figure below.

After you place the constraint, icons appear near the entities indicating the type of constraint. If you do not see them, then use the ConstraintBar (6.9.27) command to display the icons. Pause the cursor over one of the icons to see the location of the horizontal constraint, shown by the two large **X** markers: (6.1225) To remove a constraint, click the tiny **x** on the constraint bar.

GcConcentric (6.15.4) - constrains the center points of circles, arcs, ellipses or elliptical arcs to coincide. GcEqual (6.15.6) - constrains arcs and circles to the same radius, or lines to the same length. GcFix (6.15.7) - constrains points and entities at a fixed position. GcHorizontal (6.15.8) - constrains lines or pairs of points to lie parallel to the X-axis of the current coordinate system. GcParallel (6.15.9) - forces two lines to be parallel to each other. GcPerpendicular (6.15.10) - constrains two lines to lie perpendicularly to each other. GcSymmetric (6.15.12) - constrains two entities or points to lie symmetrically with respect to a selected line. GcTangent (6.15.13) - constrains two entities to maintain a point of tangency to each other or their extensions. GcVertical (6.15.16) - constrains lines or pairs of points to lie parallel to the Y-axis of the current coordinate system. ConstraintBar (6.9.27) - controls the display of the constraint bar of entities. Delconstraint (6.10.26) - removes all dimensional and geometrical constraints from an entity. Resizes 2D and 3D entities.

Figure 6.1232

6.15.12 GcSymmetric

(6.2981 on page 6079) Constrains two entities or points to lie symmetrically with respect to a selected line. (This command is equivalent to using the Symmetric option of the GeomConstraint (6.15.17) command.) **Note:** The second entity that you select is moved or stretched to be symmetric (mirror-like) to the first entity.

Accessing the Command

 command bar: **gcsymmetric** menu bar: **Assembly | 2D Constraints | Symmetric** ribbon: **Parametric | 2D Constraints | Symmetric** toolbar: **2D Constraints |** 
: **GcSymmetric Prompts you in the command bar:** Select first entity or [2Points] <2Points>: **(Select the first entity, or else press Enter to select two points)** Select second entity: **(Select the second entity)** Select symmetry line: **(Select a line)**

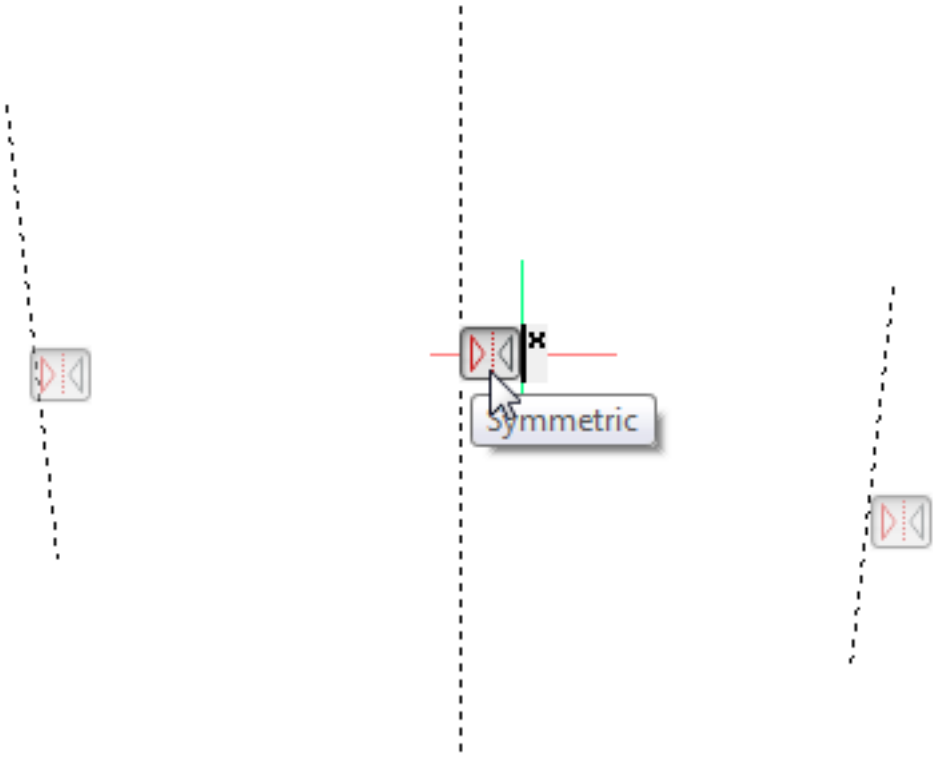
Command Options

Option	Description
Select first entity	Select a valid constraint entity: • Line • Circle • Arc • Ellipse • Elliptical arc
Select second entity	Select another entity of the same type.
Select symmetry line	Select a line, which acts as the line of symmetry to the two entities. The result depends on the entities selected earlier: • **Lines** - the angle of the two entities are made symmetric to the line of symmetry • **Circles** and **arcs** - the center point and radius are made symmetric about the line of symmetry • **Ellipses** and **Elliptical arcs** - the center, major, and minor axes are made symmetric about the line of symmetry

2Points	Makes two points symmetric about a line of symmetry; prompts you: 1. **Select first point** - **(select a valid point of constraint on an entity)**: Lines - endpoints, midpoint Arcs and elliptical arcs - endpoints, center point, midpoint Circles and ellipses - center point Polylines - endpoints, vertices, midpoints of line and arc segments, centers of arc segments Splines - endpoints Blocks, xrefs, text, mtext, attributes, tables - insertion point 2. **Select second point** - **(select another valid constraint point.)** 3. **Select symmetry line** - **(select a line about which the two points will be made symmetric.)** The second point is moved to lie symmetrically to the first point with respect to the selected line.

After you place the constraint, icons appear near the entities indicating the type of constraint. If you do not see them, then use the ConstraintBar (6.9.27) command to display them. Pause the cursor over one of the icons to see the location of the constraint, shown as a large **X**: (6.1233 on the facing page) To remove a constraint, click the tiny **x** on the constraint bar.

Figure 6.1233



Related Commands

GeomConstraint (6.15.17) - applies geometric relationships between entities and/or points on entities. Dimconstraint (6.10.30) - applies a dimensional constraint to an entity or between constraint points on entities; converts associative dimensions to dynamic dimensions. GcCoincident (6.15.3) - applies a coincident geometrical constraint to two points or constrains a point to an entity. GcCollinear (6.15.2) - forces lines to be collinear. GcConcentric (6.15.4) - constrains the center points of circles, arcs, ellipses or elliptical arcs to coincide. GcEqual (6.15.6) - constrains arcs and circles to the same radius, or lines to the same length. GcFix (6.15.7) - constrains points and entities at a fixed position. GcHorizontal (6.15.8) - constrains lines or pairs of points to lie parallel to the X-axis of the current coordinate system. GcParallel (6.15.9) - forces two lines to be parallel to each other. GcPerpendicular (6.15.10) - constrains two lines to lie perpendicularly to each other. GcSmooth (6.15.11) - forces a spline to maintain fluid geometric continuity with another spline, line, arc or polyline. GcTangent (6.15.13) - constrains two entities to maintain a point of tangency to each other or their extensions. GcVertical (6.15.16) - constrains lines or pairs of points to lie parallel to the Y-axis of the current coordinate system. ConstraintBar (6.9.27) - controls the display of the constraint bar of entities. Delconstraint (6.10.26) - removes all dimensional and geometrical constraints from an entity.

Figure 6.1234

6.15.13 GcTangent

(6.2981 on page 6079) Constrains two entities to maintain a point of tangency to each other, or to their extensions. (This command is equivalent to using the Tangent option of the GeomConstraint (6.15.17) command.) **Note:** The second entity that you select is moved to be tangent with the first entity.

Accessing the Command

command bar: **gctangent** menu bar: **Assembly | 2D Constraints | Tangent** ribbon: **Parametric | 2D Constraints | Tangent** toolbar: **2D Constraints |** : **GcTangent Prompts you in the command bar:** Select first entity: **(Select a line, polyline segment, circle, arc, polyarc, ellipse or elliptical arc)** Select second entity: **(Select another circle, arc, ellipse or elliptical arc; or a line or linear polyline segment, if the first object was not a line or polyline segment.)**

Command Options

Option	Command
Select first entity	Select a valid entity: • A linear entity - line or polyline segment • Or a curved entity - circle, arc, polyarc, ellipse, or elliptical arc
Select second entity	Select a second entity: • Linear entities can only be made tangent to curved entities; if you select two lines, the program remarks, "Invalid input" • Curved entities can be made tangent to curved and linear entities The second entity is moved to be tangent to the first, even when they do not touch each other physically; see figure below.

After you place the constraint, icons appear near the entities indicating the type of constraint. If you do not see them, then use the ConstraintBar (6.9.27) command to display them. To remove a constraint, click the tiny **x** on the constraint bar: (6.1235)

ConstraintBar (6.9.27) - controls the display of the constraint bar of entities. Delconstraint (6.10.26) - removes all dimensional and geometrical constraints from an entity.

Figure 6.1236

6.15.14 GenerateBoundary

(7.3 on page 6132) Generates a closed polyline or spline around the boundary of a flat, closed area, or the face of a 3D solid, or the area of a hatch pattern.

Accessing the Command

 command bar: **generateboundary** menu bar: **Draw | Boundaries | Generate Boundary** toolbar: **Draw | Boundaries |**  Quad: **2D Editing |**  : **GenerateBoundary Prompts you in the command bar:** Select a planar enclosed area, a planar face, or a hatch to generate a boundary: **(Pick a point inside a closed region, or select a face of a 3D solid, or select a hatches, and press Enter)** Generated boundaries for 1 object(s)

Command Options

Option	Description
Select a planar enclosed point, a planar face, or a hatch to generate a boundary	Pick a point inside one of the following entities: • Closed area • Face on a 3D solid; to select the face of a 3D solid, hold down the **Ctrl** key • Hatch pattern This command does not work with 3D solids that do not have edges, such as spheres and tori. The result of this command: • **Polyline** - when the boundary is polygonal (has corners, like a square) • **Spline** - when the boundary is curved, like a spline. To work with the resulting boundary polyline or spline entity, such as to move or copy it, use **L** (last) selection.

Related Commands

Boundary (6.6.15) - creates a polyline that forms a boundary inside a closed area through a dialog box. -Boundary (6.6.16) - creates a polyline boundary inside closed areas through the command bar. HatchGenerateBoundary (6.16.5) - generates a boundary around a hatch or gradient fill.

Figure 6.1237

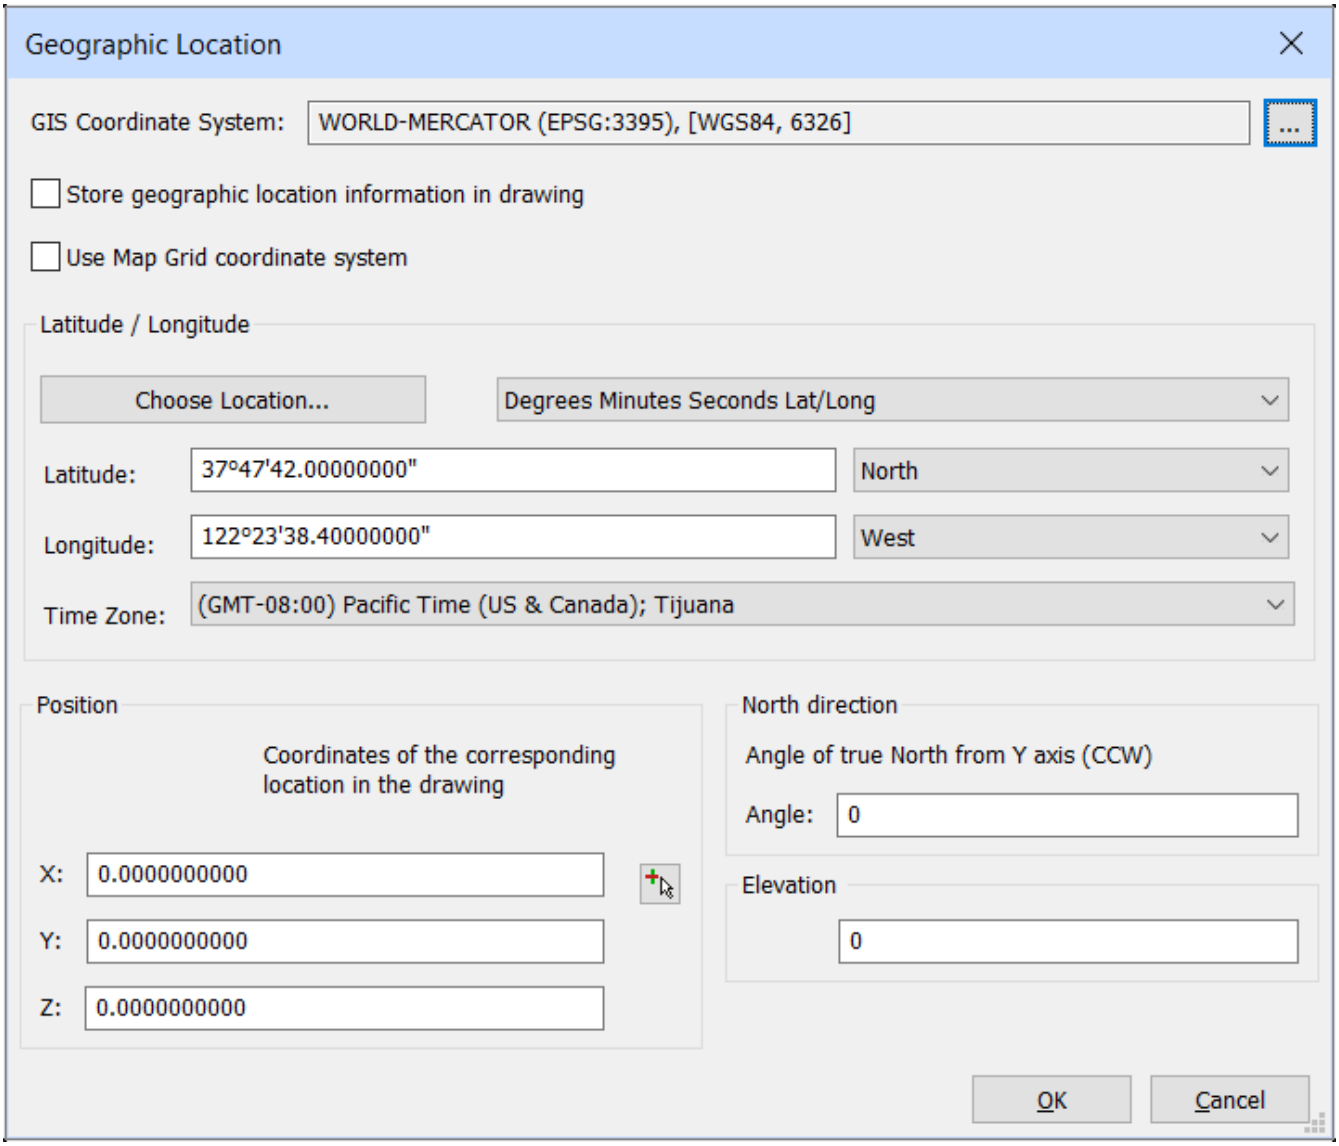
6.15.15 GeographicLocation

(7.3 on page 6132) Sets the geographic location of the drawing by applying the longitude and latitude to a point in the drawing. **Note**: This command cannot be used in a unitless drawing; first use the INSUNIT variable to set the units.

Accessing the Command

 command bar: **geographiclocation** alias: **geo** menu bar: **View | Rendering | Geographic Location Insert | Geographic Location** ribbon: **View | Sun | Geographic Location** toolbar:**Render |** 
: geographiclocation Displays a dialog box: (6.1238 on the next page) Enter options, pick a point in the drawing, and then click **OK**. To display geographic coordinates, in the status bar right-click the x,y,z coordinates and then choose Geographic. Click **Geographic Location System** in the status bar to change the way the coordinate system is represented in the drawing.

Figure 6.1238



Command Options

Option	Description
GIS Coordinate System	Reports the GIS system being used by the drawing. To change the system 1. Click the **Browse** button 2. Choose a system from the droplist (6.1239 on page 4509) 3. Click **OK**
Store geographic location information in the drawing	When checked, a red dot indicates the position in the drawing; see Position option. (6.1240 on page 4510)
Use Map Grid coordinate system	Uses the location data from the GIS Coordinate System, and so grays out all other options in this dialog box.
Choose Location	Displays the Choose Geographic Location dialog box: 1. Choose a city from the droplist 2. Optionally, also choose a time zone 3. Click **OK** (6.1241 on page 4510) 4. The program asks you if it is okay to change to the new time zone. Click **Yes** or **No**. You can also set the time zone independently in the Time Zone droplist; see below.
Location Format	Choose a format for the coordinates from the droplist: • Degrees Minutes Seconds • Decimal degrees
Latitude	Sets the latitude in either Degrees/Min./Sec. or decimal format. The valid range is 0 to 90. Choose **North** or **South** from the latitude option button. The value is saved to the LATITUDE (1.17.10) system variable.
Longitude	Sets the longitude of the drawing in either Degrees/Min./Sec. or decimal format. The valid range is 0 to 180. Choose **East** or **West** from the longitude option button. The value is saved to the LONGITUDE (1.17.10) system variable.
Timezone	Choose a time zone from the Time Zone droplist: (6.1242 on page 4511) The setting is saved to the TIMEZONE (1.17.10) system variable.
Position	Specifies the position of the location in the drawing: • **X, Y Z - (enter the coordinates; the z is optional and can remain 0.)** • **Pick Point**  **- (click the button, and then pick a point in the drawing.)**
North Direction: Angle	Specifies the angle of the sun from north, in the context of the world coordinate system. The setting is saved to the NORTHDIRECTION (1.17.10) system variable.

North Direction: Elevation	Enter an elevation for the long-lat point; the value can be positive or negative.

Procedures

- Managing geographic datasets (1.21.5)

Related Commands

GeoImport (6.15.19) - imports a drawing with respect to the geographic location in the source and the target drawing. Render (6.26.21) - calculates a photorealistic image of the 3D model. Sunproperties (6.27.70) - displays the Sun Properties of the Active Viewport editor in the Drawing Explorer - Lights dialog. MapConnect (6.21.5) - allows to set up a connection with a Web Map Service through a dialog box.

Figure 6.1241

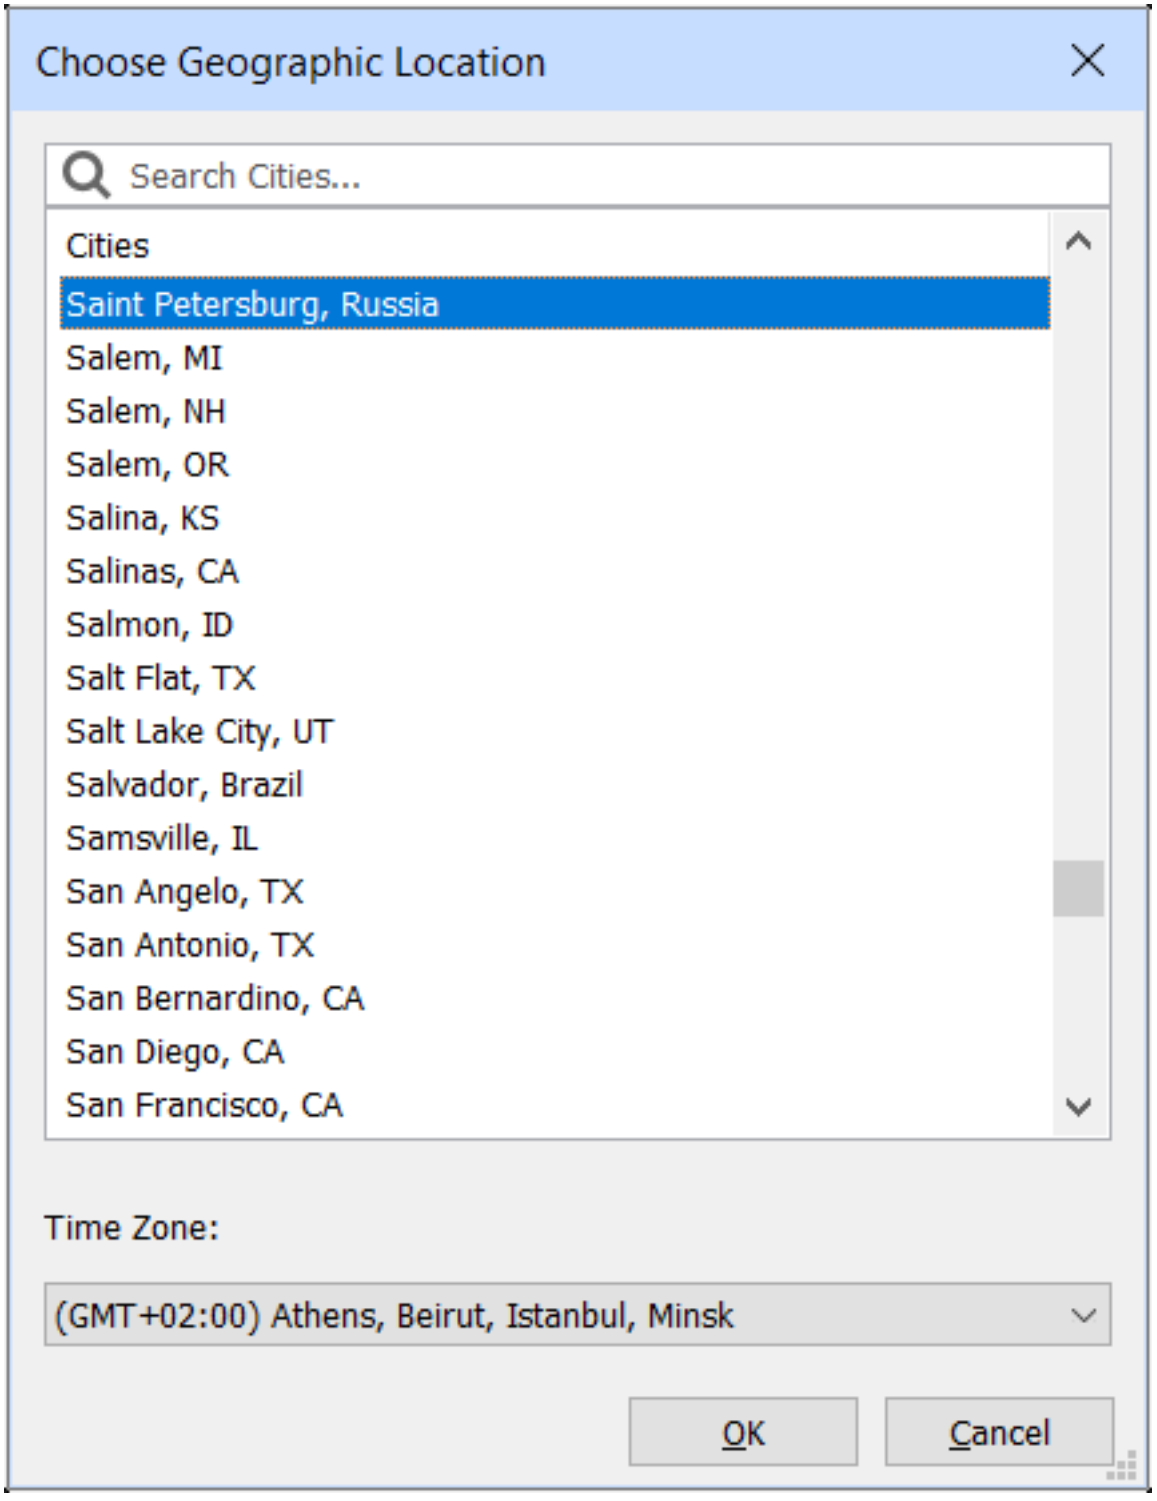

Figure 6.1242

Figure 6.1243

6.15.16 GcVertical

(6.2981 on page 6079) Constrains a line, linear polyline segment, or a pair of points to lie parallel to the Y-axis in the current coordinate system. (This command is equivalent to using the Vertical option of the GeomConstraint (6.15.17) command.) **Note:** This command moves one end of the segment so that the segment is vertical. The end that is moved is the end of the segment drawn second.

Accessing the Command

command bar: **gcvertical** menu bar: **Parametric | 2D Constraints | Vertical** ribbon: **Parametric | 2D Constraints | Vertical** toolbar: **2D Constraints |**
: **GcVertical Prompts you in the command bar:** Select an entity or [2Points] <2Points>: **(Select a line or linear polyline segment, or press Enter to select two points on one or two entities)**

Command Options

Option	Description
Select an entity	Select a line or a linear polyline segment; the program moves one end to make the entity vertical -- parallel to the Y-axis of the current coordinate system.
2Points	Constrains two pick points to the vertical; prompts you: 1. **Select first point** - **(pick a point on one entity.)** 2. **Select second point** - **(pick another point on the same entity, or on another entity.)** Pick two valid constraint points on the same entity or on two different entities. The two selected points are forced to lie on a line which is parallel to the Y-axis of the current coordinate system. The program moves the second point horizontally so that it lies vertical to the first pick point; see figure below.

After you place the constraint, icons appear near the entities indicating the type of constraint. If you do not see them, then use the ConstraintBar (6.9.27) command to display the icons. Pause the cursor over one of the icons to see the location of the vertical constraint, shown by the two large **X** markers: (6.1244 on the next page) To remove a constraint, click the tiny **x** on the constraint bar.

GcConcentric (6.15.4) - constrains the center points of circles, arcs, ellipses or elliptical arcs to coincide. GcEqual (6.15.6) - constrains arcs and circles to the same radius, or lines to the same length. GcFix (6.15.7) - constrains points and entities at a fixed position. GcHorizontal (6.15.8) - constrains lines or pairs of points to lie parallel to the X-axis of the current coordinate system. GcParallel (6.15.9) - forces two lines to be parallel to each other. GcPerpendicular (6.15.10) - constrains two lines to lie perpendicularly to each other. GcSmooth (6.15.11) - forces a spline to maintain fluid geometric continuity with another spline, line, arc or polyline. GcSymmetric (6.15.12) - constrains two entities or points to lie symmetrically with respect to a selected line. GcTangent (6.15.13) - constrains two entities to maintain a point of tangency to each other or their extensions. ConstraintBar (6.9.27) - controls the display of the constraint bar of entities. Delconstraint (6.10.26) - removes all dimensional and geometrical constraints from an entity.

Figure 6.1245

6.15.17 GeomConstraint

(6.2981 on page 6079) Applies geometric relationships between entities, on entities, and on valid constraint points. Constraints keep entities in a fixed position, such as perpendicularly or vertically. **Note:** Geometric constraints can be applied to the following entities and their constraint points:

Entity Type	Valid Constraint Points
Lines	Endpoints, midpoint
Arcs, elliptical arcs	Endpoints, center point, midpoint
Circles, ellipses	Center point
Polyline segments	Endpoints, vertices, midpoints
Polyline arcs	Endpoints, vertices, midpoints, center points
Splines	Endpoints
Inserted entities: blocks, xrefs, text, mtext, attributes, tables	Insertion points

Accessing the Command

command bar: **geomconstraint** : **GeomConstraint Prompts you in the command bar:** Enter constraint type [Horizontal / Vertical / Perpendicular / PArallel / Tangent / SMooth / Coincident / CONcentric / COLlinear / Symmetric / Equal / Fix] <Coincident>: **(Enter an option).**

Command Options

Option	Description
Horizontal	Constrains entities or pairs of points to lie parallel to the X-axis of the current coordinate system. See the GcHorizontal (6.15.8) command.
Vertical	Constrains entities or pairs of points to lie parallel to the Y-axis of the current coordinate system. See the GcVertical (6.15.16) command.
Perpendicular	Constrains two entities to lie perpendicularly to each other. See the GcPerpendicular (6.15.10) command.
PArallel	Forces two entities to be parallel to one other. See the GcParallel (6.15.9) command.
Tangent	Constrains two entities to maintain a point of tangency to each other or their extensions. See the GcTangent (6.15.13) command.
SMooth	Forces a spline to maintain fluid geometric continuity with another spline, line, arc or polyline. See the GcSmooth (6.15.11) command.
Coincident	Applies a coincident geometrical constraint to two points or constrains a point to an entity. See the GcCoincident (6.15.3) command.
CONcentric	Constrains the center points of circles, arcs, ellipses or elliptical arcs to coincide .See the GcConcentric (6.15.4) command.
COLinear	Forces entities to be collinear. See the GcCollinear (6.15.2) command.
Symmetric	Constrains two entities or points to lie symmetrically with respect to a selected line. See the GcSymmetric (6.15.12) command.

Equal 	Constrains circular entities to the same radius, or linear entities to the same length. See the GcEqual (6.15.6) command.
Fix 	Constrains points and entities at a fixed position. See the GcFix (6.15.7) command.

Related Commands

AutoConstraint (6.4.40) - automatically applies 2D geometric and dimensional constraints to selected 2D geometry. Dimconstraint (6.10.30) - applies a dimensional constraint to an entity or between constraint points on entities; converts associative dimensions to dynamic dimensions. GcCoincident (6.15.3) - applies a coincident geometrical constraint to two points or constrains a point to an entity. GcCollinear (6.15.2) - forces lines to be collinear. GcConcentric (6.15.4) - constrains the center points of circles, arcs, ellipses or elliptical arcs to coincide. GcEqual (6.15.6) - constrains arcs and circles to the same radius, or lines to the same length. GcFix (6.15.7) - constrains points and entities at a fixed position. GcHorizontal (6.15.8) - constrains lines or pairs of points to lie parallel to the X-axis of the current coordinate system. GcParallel (6.15.9) - forces two lines to be parallel to each other. GcPerpendicular (6.15.10) - constrains two lines to lie perpendicularly to each other. GcSmooth (6.15.11) - forces a spline to maintain fluid geometric continuity with another spline, line, arc or polyline. GcSymmetric (6.15.12) - constrains two entities or points to lie symmetrically with respect to a selected line. GcTangent (6.15.13) - constrains two entities to maintain a point of tangency to each other or their extensions. GcVertical (6.15.16) - constrains lines or pairs of points to lie parallel to the Y-axis of the current coordinate system.

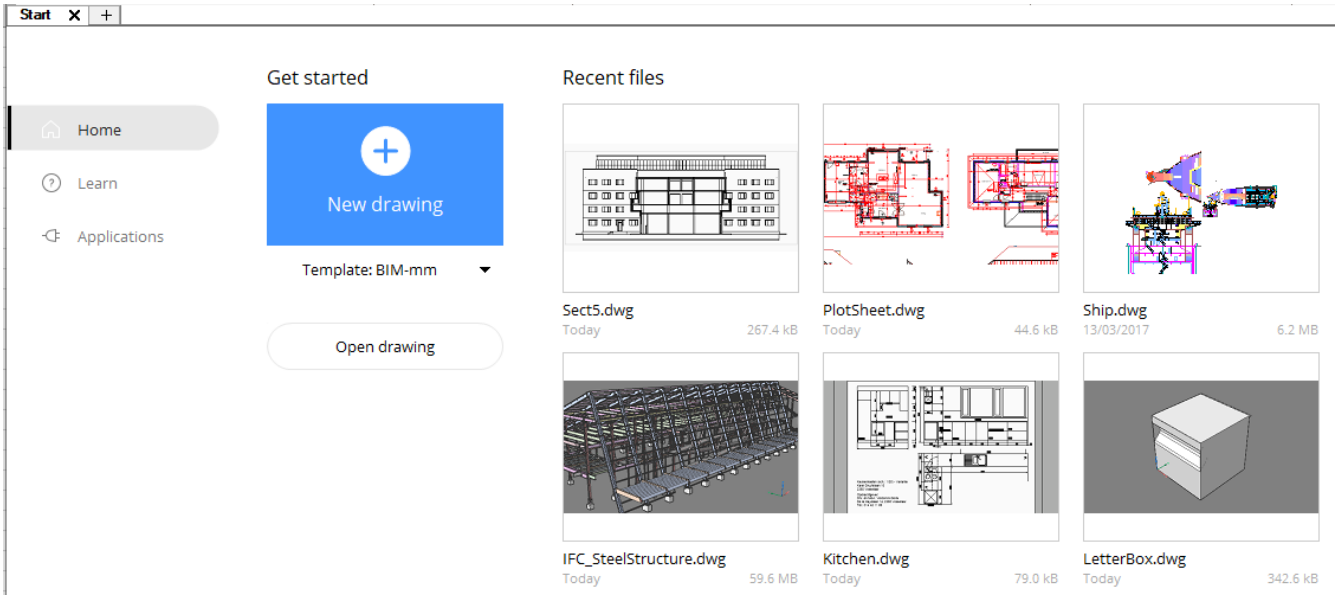
6.15.18 GoToStart

(7.3 on page 6132) Opens or activates the Start tab.

Accessing the Command

Keyboard: **gotostart** Keybaord shortcut: **Ctrl+Home : gotostart** Displays the **Start** tab. (6.1247 on the facing page)

Figure 6.1247



Command Options

Title	Description
Home	Allows to: • **Open a recent drawing** Click the thumbnail image of a recent file. The number of available recent files is controlled by the value of the RECENTFILES (1.17.10) system variable. • **Create a new drawing** – Optionally click the **Template** drawing. – Click the **New Drawing** tile. • **Open a drawing** Displays the **Open Drawing** dialog box.
Learn*	Allows to directly access BricsCAD tutorials and sample drawings. (6.1248 on the next page)
Applications*	Displays links to the Third Party Applications catalogue on the Bricsys website. (6.1249 on the following page)

* Internet access is required

Settings

Name	Title	Description
RECENTFILES	Recent files list max count	Specifies the maximum number of files shown in the "Recent Files" section in the File menu and the Home section of the Start tab. Values between 0 and 60 are accepted.

Related Commands

New (6.22.5) - prompting you to select a DWT template file, and then starts a new drawing based on it. Open (6.23.8) - opens drawing (DWG), template (DWT), and interchange (DXF) files in new document tabs. QNew (6.25.1) - starts a new drawing (short for "quick new") based on the default template file.

Figure 6.1248

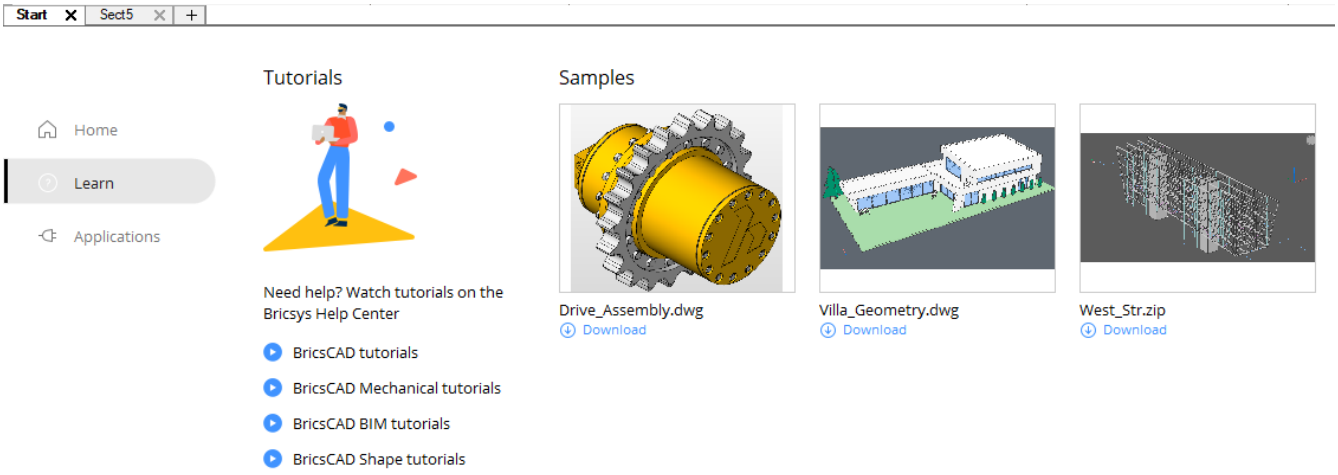


Figure 6.1249

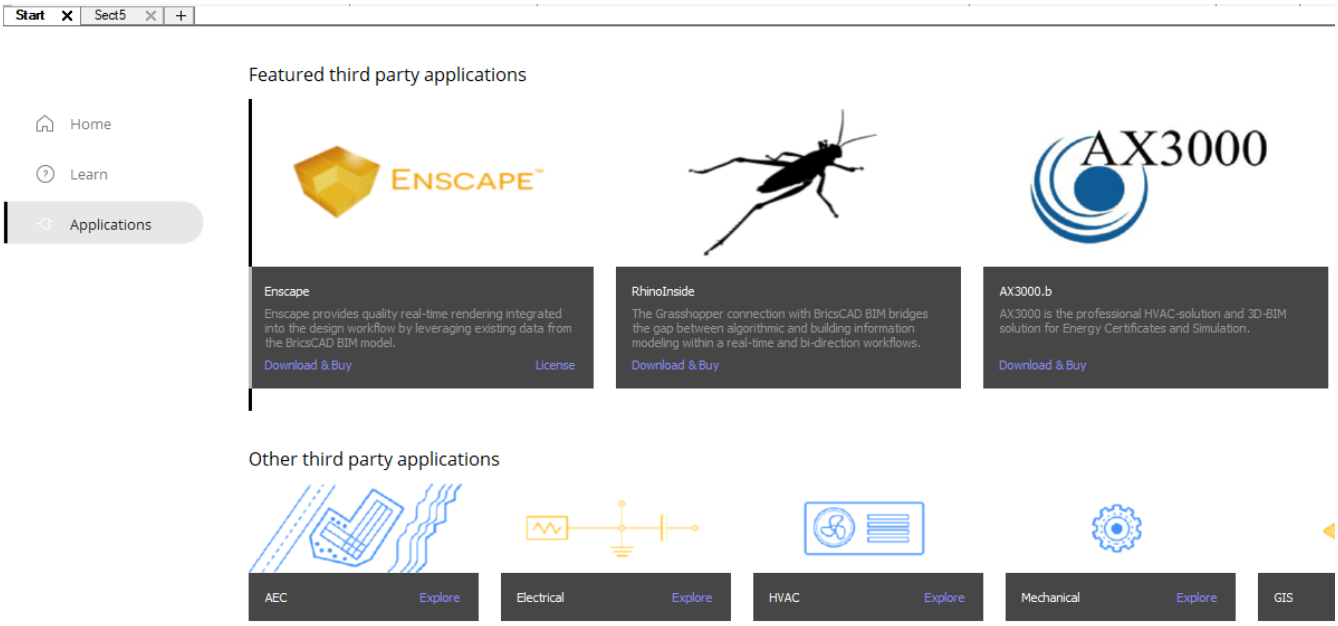

Figure 6.1250

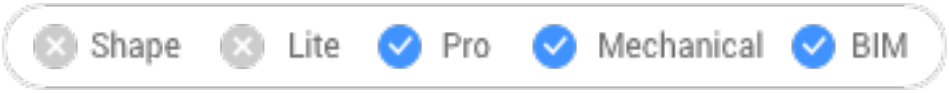


6.15.19 GeoImport

(6.1951 on page 5150) Imports a drawing with respect to the geographic location in the source and the target drawing. Note: The geographic location (6.15.15) must be defined in both the source and the target drawing.

Accessing the Command

Keyboard: **geoimport** : **geoimport** Displays the **Open Drawing File** dialog box. Select the *.dwg file to import, then click the **Open** button.

Command Options

Option	Description
Files of type	Click the list button, then select either Standard Drawing File (*.dwg) or Drawing Exchange Format (*.dxf).

Related Commands

Geographiclocation (6.15.15) - sets the geographic location of the drawing.

Figure 6.1251

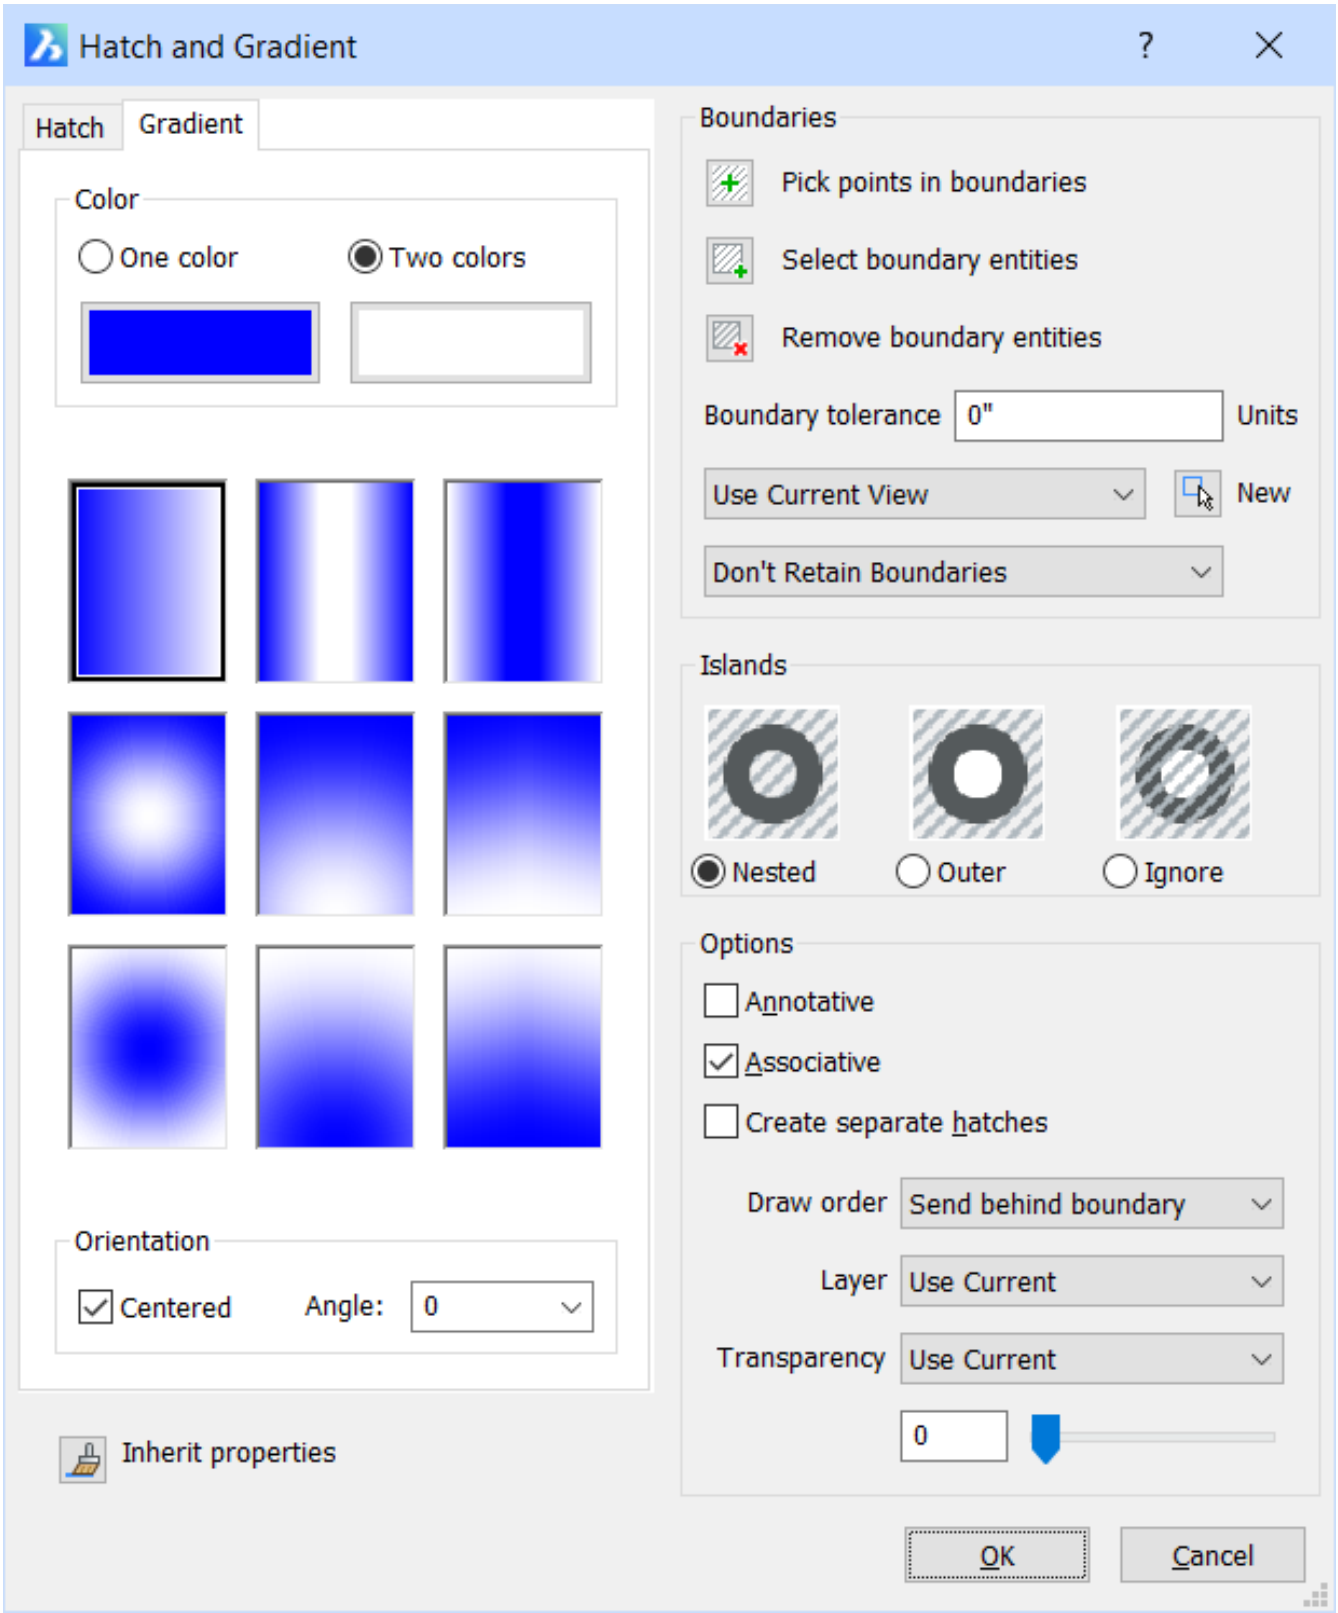
6.15.20 Gradient

(6.2981 on page 6079) Fills closed areas with solid fills in gradients of one or two colors in a variety of patterns; displays the Hatch and Gradient dialog box.

Accessing the Command

command bar: **Gradient** menu bar: **Draw | Gradient** toolbar: **Draw |** : **Gradient** Displays the Gradient tab of a dialog box: (6.1252 on the next page) Choose options, and then click **OK**. The program flood fills the selected area with the gradient effect.

Figure 6.1252



Command Options

Color Options	Description
(6.1253 on page 4525)	**One color** - click the colored tile to choose a different base color. Move the slider to change the underlying color between white, the selected color, and black.
(6.1254 on page 4526)	**Two colors** - click the colored tiles to choose different colors.
(6.1255 on page 4526)	Click a gradient fill pattern: name: 1. Linear 2. Cylindrical 3. Inverted Cylindrical 4. Spherical 5. Hemispherical 6. Curved 7. Inverted Spherical 8. Inverted Hemispherical 9. Inverted Curved
Orientation	**Orientation** - determines how the fill is placed in the boundary: (6.1256 on page 4526) • **Centered** - centers gradient fill in the area to be filled; when off, starts the fill from the upper left of the boundary. • **Angle** - select an angle of the gradient fill, relative to the current UCS; choose from increments on 15 degrees, or else enter any other value for the angle.

Boundaries

(6.1257 on page 4527) **Pick points in boundaries** - selects closed areas (boundaries) in which to place the gradient pattern; temporarily dismisses the dialog box, and then prompts you at the command bar: "Select a point to define a boundary or hatch area." Notice that the program immediately draws the gradient so that you can preview its colors, angle, and origin. When done selecting areas, press Enter. You cannot pick areas that already contains patterns or areas with gaps larger than the boundary tolerance. **Select boundary entities** - selects entities making up a pattern boundary; temporarily dismisses the dialog box, and then prompts you at the command bar "Select entities." You can fill areas already containing hatching. **Remove boundary entities** - prompts you to remove entities from the detected boundary set. **Boundary tolerance** - specifies how large a gap can be for this command to fill an open boundary.

- **0** - (Default) The tolerance is set by the application, based on the current view size. When zoomed in closely, boundary detection will fail; when zooming out further so the contour 'looks' closed, the boundary will become detected
- **Any Value** - Defines the maximum gap in drawing units.

The value is saved in the HPGAPTOL (1.17.10) system variable. Specifies where BricsCAD should search for entities that make up the hatch boundary:

- **Current Viewport** - searches all entities in the current viewport.
- **Existing Set** - searches only the current selection set for possible boundaries.

New - creates a new selection set of entities making up the boundary; prompts you at the command bar, "Select entities". **Boundary retention** - determines how boundaries are handled:

- **Don't retain boundaries** - erases the temporary boundary after the command is finished
- **Retain boundaries as polylines** - converts the boundary into a polyline entity, which can be used afterwards for other purposes
- **Retain boundaries as regions** - converts the boundary into a region entity

Islands

(6.1258 on page 4527) **Nested** - alternating areas are filled. **Outer** - only the outermost area is filled. **Ignore** - all outer and interior areas of filled.

Options	(6.1259 on page 4527) **Annotative** - toggles the annotative property of fills: • **On** - annotative, so that the fill changes its scale automatically when the annotative scale factor changes • **Off** - not annotative, so that the fill retains its scale factor, no matter how the annotative scale factor changes **Associative** - toggles the associativity property of fills: • **On** - associative, so that the fill updates itself automatically when the boundary changes • **Off** - not associative, so that the fill retains is area when the boundary is changed The associative and annotative options are mutually exclusive: when one is on, the other is turned off. **Create separate hatches** - creates separate gradient entities for each region in the selection set. **Draw Order** - specifies where the fill should appear relative to visually overlapping entities: • **None** - draw order is ignored. • **Send to Back** - fill is behind (underneath) overlapping entities. • **Send to Front** - fill is in front (on top) of overlapping entities. • **Send Behind Boundary** - fill is placed underneath the boundary. • **Bring in Front of Boundary** - fill is placed in on top of the boundary. **Layer** - specifies the layer onto which to place the fill: • **Use Current** - places the fill on the current layer • **Other layer names** - selects one of the drawing's layers **Transparency** - specifies how transparent the fill should be (saved in the HPTRANSPARENCY (1.17.10) system variable): • **Use Current** - uses the level of transparency specified by the CETRANSPARENCY (1.17.10) system variable. • **By Layer** - use the transparency specified by the layer onto which the fill will be placed • **By Block** - use the transparency specified by the block of which the fill belongs • **Specify Value** - use the slider to specify a value between 0 (fully opaque) to 90 (nearly fully transparent)
Inherit properties	(6.1260 on page 4528) **Inherit properties** - copies properties of another gradient in the current drawing; prompts you at the command bar, "Select hatch entity to copy properties from." This button is useful for quickly setting options of a new fills based on existing fills.

Procedures

- General procedure to create hatches and gradient fills (1.25.27)
- To define gradient fill properties (1.25.27)
- To define the boundary for a hatch or gradient fill (1.25.27)
- To edit a hatch or gradient fill (1.25.29)
- Defining the MAXHATCH setting (1.25.26)

Grips Editing

Gradient fills can be edited directly through grips:

1. Select the hatch. Notice that it has one grip.
2. Drag the grip to move the hatch.

Related Commands

Hatch (6.16.3) - places hatch patterns through a dialog box. -BHatch (6.6.5) and -Hatch (6.16.1) - places hatch patterns through the command bar. Boundary (6.6.15) and -Boundary (6.6.16) place a polyline boundary inside closed areas. HatchEdit (6.16.2) - edits hatches and gradient fills in a dialog box. -HatchEdit (6.16.4) - edits the boundaries of hatch and gradient entities; displays prompts in the command bar. Properties (6.24.54) - changes the properties of hatch patterns. Settings (6.27.25) - specifies the default parameters for hatch patterns. Solid (6.27.45) - draws 3- and 4-side solid-filled areas.

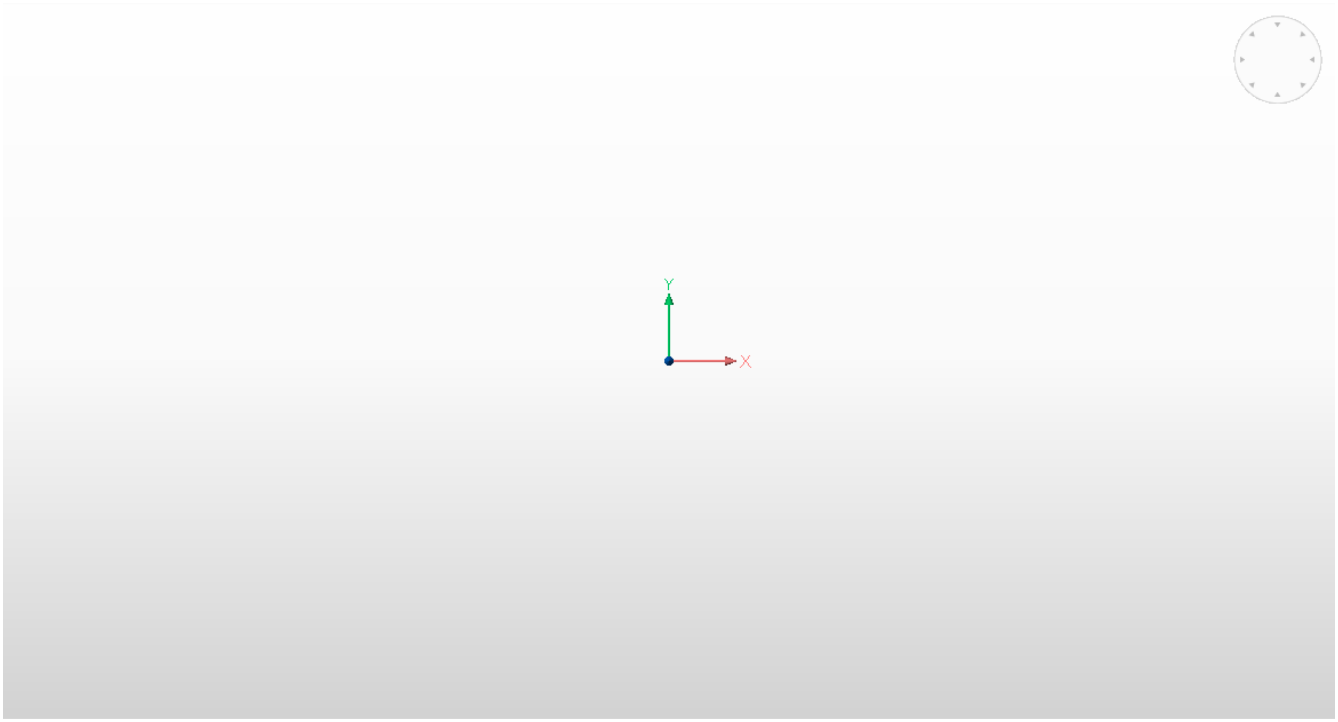
6.15.21 GradientBkgOn

(6.2981 on page 6079) Restores the default gradient background of the current viewport. **Note:** This command works only when the visual style is not "2D Wireframe."

Accessing the Command

command bar: **gradientbkgon** : **GradientBkgOn** Displays no prompts in the command bar, but turns on the background gradient colors. (6.1262 on the next page)

Figure 6.1262



Command Options

No options. To establish the colors of the background gradient, use the following variables:

- **GradientColorTop** - sets the color for the top 1/3 of the gradient background
- **GradientColorMiddle** - sets the color for the middle 1/3 of the gradient background
- **GradientColorBottom** - sets the color for the lower 1/3 of the gradient background

After changing the colors, re-run the GradientBkgOn command.

Related Commands

Background (6.6.3) - sets the model space background for the current viewport and saved views. GradientBkgOff (6.15.24) - switches the gradient background color of the current viewport off. Restores the default view background. View (6.31.2) - creates and sets named views through the Drawing Explorer. -View (6.31.3) - creates and sets named views through the command bar.

Figure 6.1263

6.15.22 GraphScr

(7.3 on page 6132) Switches from the programs Text Prompt window to the drawing window (short for "graphics screen").

Accessing the Command

command bar: **graphscr** transparent: **'graphscr** keyboard shortcut: **F2** : **GraphScr** Displays no prompt in the command bar; brings the drawing window (graphics screen) to the foreground.

Command Options

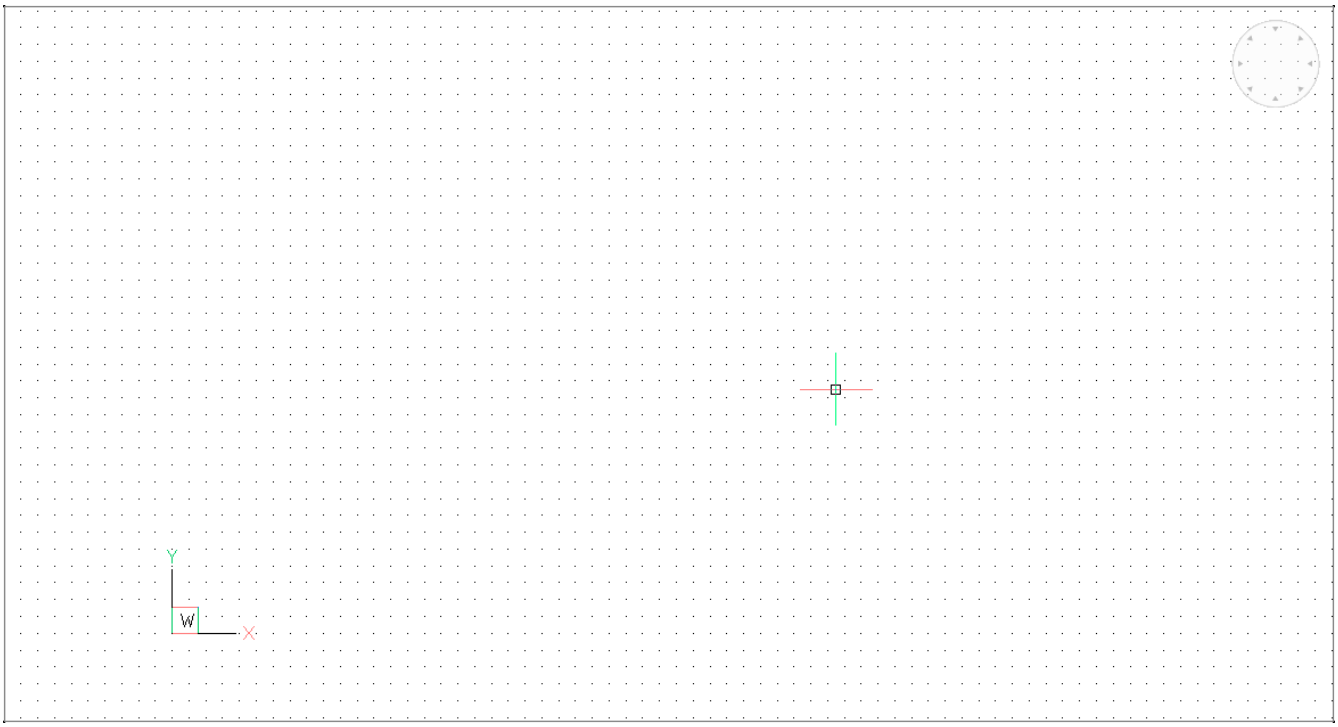
No options.

Related Commands

TextScr (6.29.16) - brings the text window to the foreground.

Figure 6.1264

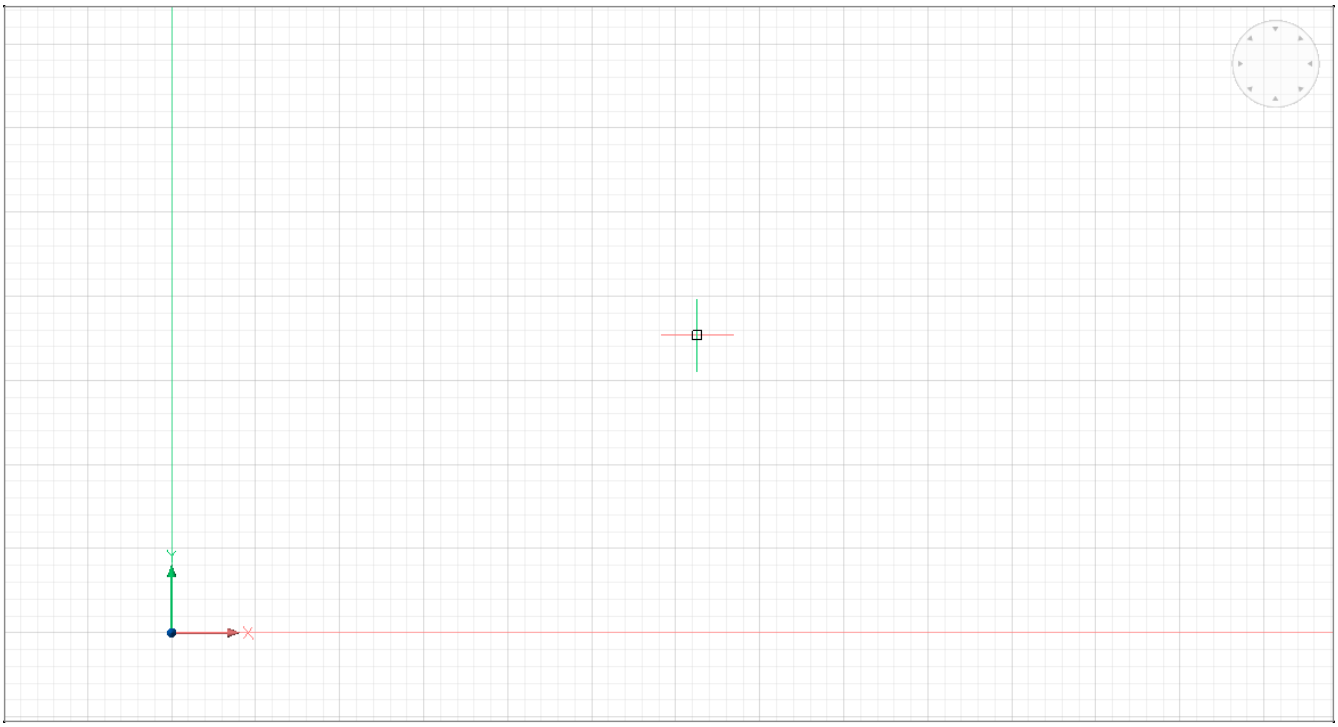
Figure 6.1265



6.15.23 Grid

(6.2981 on page 6079) Toggles the display of the grid, and sets some of its properties. (6.1265) **Note:** When the grid is on, it is made of dots or lines in model, paper, and block editor spaces, but is always displayed as lines when the visual style is other than "2D Wireframe" and always displayed as dots when the grid is rotated. In additions, the grid lines emanating from the origin are usually colored red in the x direction and green in the y direction. (6.1266 on the next page)

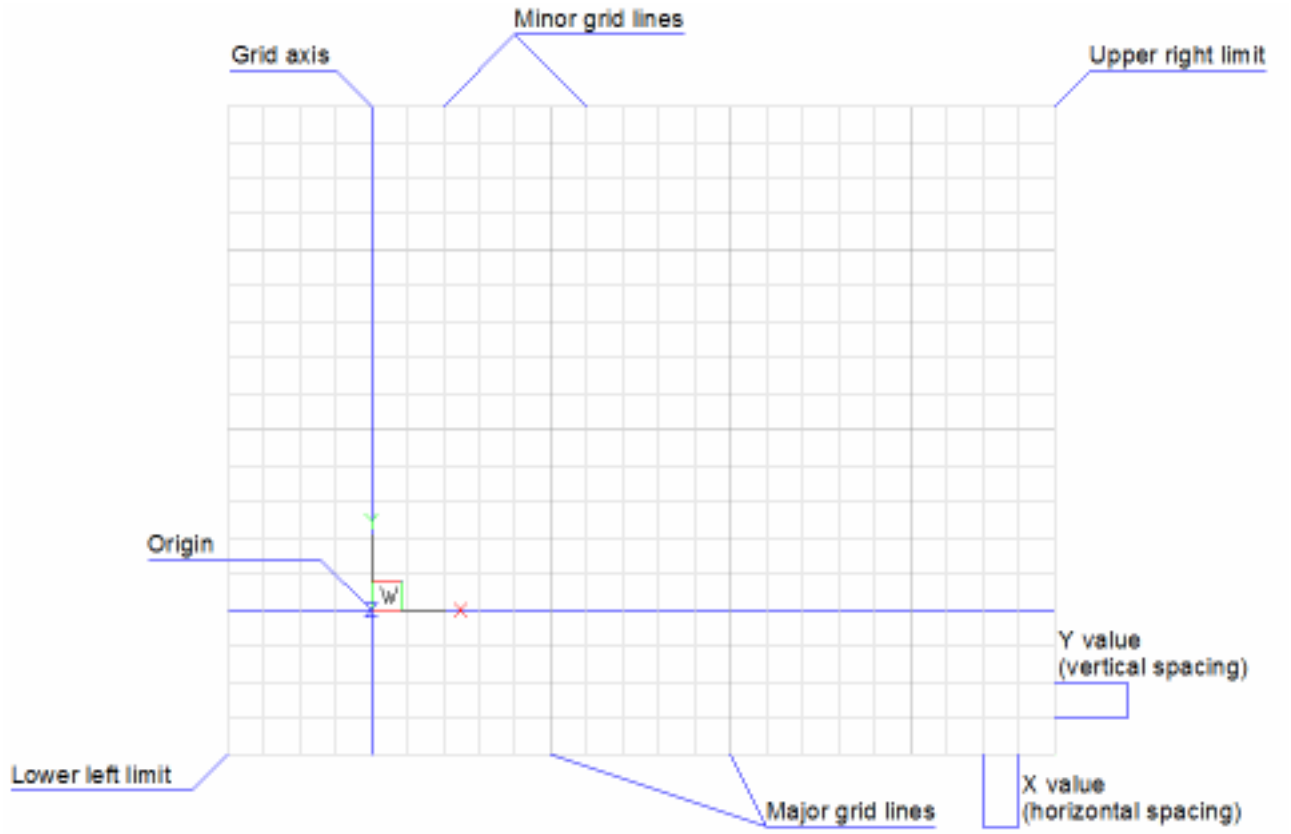
Figure 6.1266



Accessing the Command

 command bar: **grid** transparent: **'grid** alias: **g** keyboard shortcuts: **F7 Ctrl+G** menu bar: **Settings | Reference Grid** ribbon: **Settings | Reference Grid** status bar: **GRID** toolbar: **Settings |**  : **Grid Prompts you in the command bar:** Grid is off. Enter grid spacing or [grid ON/sync to Snap/Aspect] <10>: **(Enter an option)** (6.1267 on the following page) The extents of the grid are controlled by the Limits (6.20.38) command when the **Display beyond limits area** setting of the GRIDDISPLAY (1.17.10) variable is turned off.

Figure 6.1267



Command Options

Option	Description
Enter grid spacing	Specifies the spacing between grid lines or dots; makes the x and y grid spacing the same; enter a positive number larger than 0.
grid OFF **or** grid ON	Turns the display of the grid off and on, respectively.
Sync to snap	Synchronizes the grid spacing with the current snap spacing, so that the two are the same. The grid spacing stays remains synced to the current snap spacing until you use the Grid Spacing or Aspect options to make the grid spacing different from the snap spacing. When SNAPTYPE = 2, adaptive grid snap (1.21.13) is used and SNAPMODE is denied.
Aspect	Sets the aspect ratio of the grid; prompts you: 1. **Horizontal Spacing - (specify the x distance between grid lines or dots.)** 2. **Vertical Spacing - (specify the y distance between grid lines or dots.)** To change the grid's look to isometric, use the Snap (6.27.41) command's Style option.

Procedures

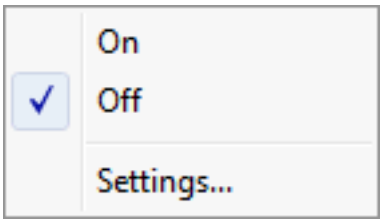
Using snap and grid (1.21.12)

Status Bar Menu

~~Right-click **GRID** on the status bar for the shortcut menu: (6.1268) (6.1269 on the facing page)~~

Shortcut Menu	Description
On	Turns on grid display

Figure 6.1269



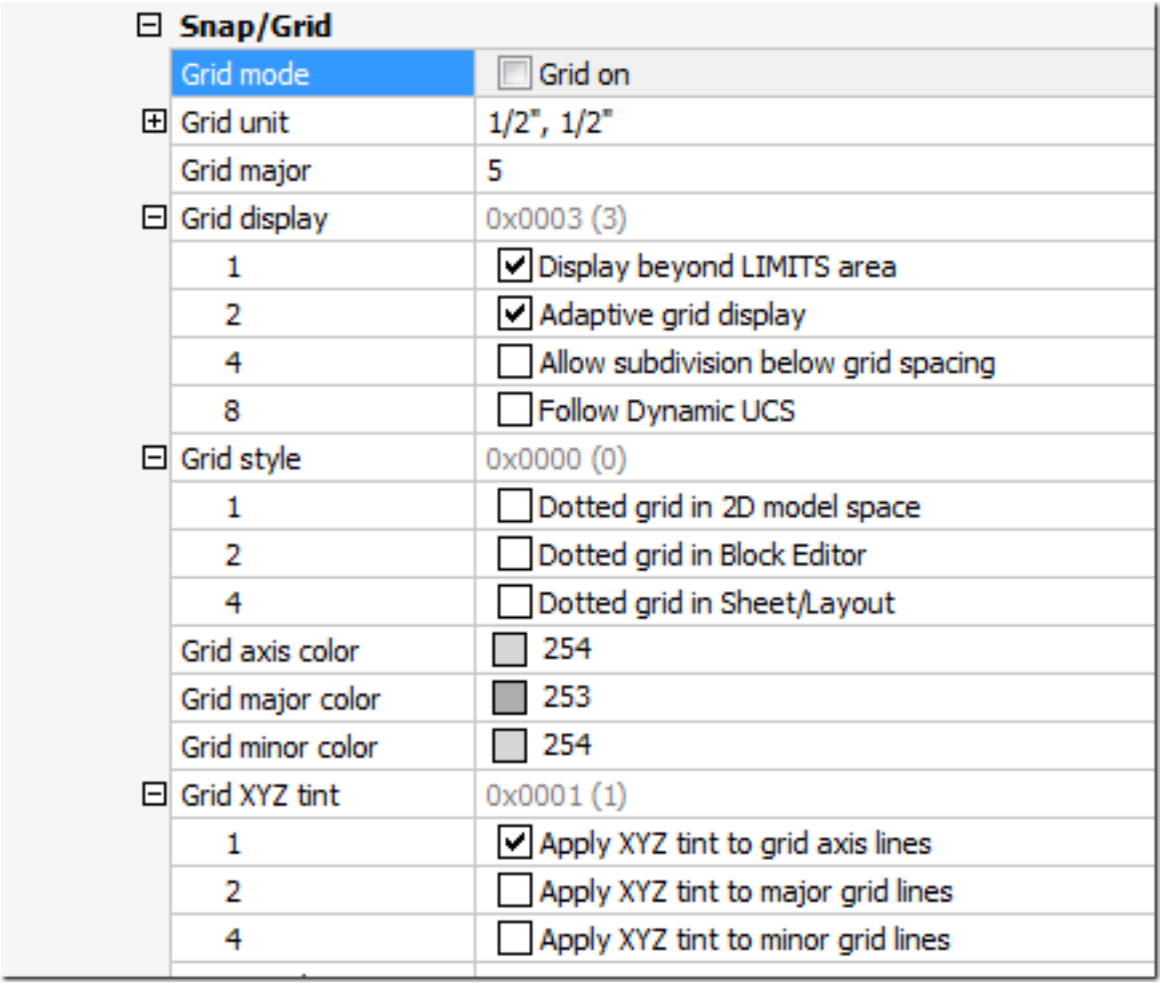
Settings Command: Snap/Grid Section

(6.1270 on page 4537)

Setting	Description
Grid mode	Toggles grid display: • **On** - turns on grid display • **Off** - turns off grid display
Grid unit	Specifies the distance between grid lines or dots in the drawings's units: • **X** - spacing between dots or lines in the x direction • **Y** - spacing between dots lines in the y direction There is no grid in the z direction.
Grid Major	Specifies the frequency of major versus minor grid lines; enter a number.
Grid Display	Specifies how the grid is displayed: • **Display beyond limits area** - displays the grid all over the graphic screen. When this option is off, the grid's display is limited to the area defined by the LIMMIN (1.17.10) and LIMMAX (1.17.10) system variables, set by the Limits (6.20.38) command. • **Adaptive grid display** - displays fewer grid lines when the grid spacing is too small to display. When this option is off, the program displays a message in the command window when it is not possible to display the grid properly. • **Allow subdivision below grid spacing** - displays more grid lines as you zoom in. When this option is off, the distance between the minor grid lines equals the current grid spacing. • **Follow dynamic UCS** - the grid displays in the XY-plane of the dynamic UCS. When this option is off, the program displays the grid only in the XY-plane of the current UCS.

Grid Style	Specifies how the program displays the grid; when on, the grid is displayed as dots; when off, the grid is displayed as lines. • **Dotted grid in 2D model space** - dots are display in model space when the visual style is set to 2D Wireframe. In all other view modes the grid always displays with lines (see the Shademode (6.27.31) command). • **Dotted grid in Block Editor** - dots are displayed in the block editor environment • **Dotted grid in Sheet/Layout** - dots are displayed in paper space layouts.
Grid color	Specifies the color of the grid axis lines and the major and minor grid lines: • **Grid axis color** - specifies the color of axis lines, the x and y grid lines that emanate from the origin; override by the **Grid XYZ Tint** settings, when it is on • **Grid major color** - specifies the color of the primary grid lines • **Grid minor color** - specifies the color of the sub-grid lines
Grid XYZ tint	Specifies whether the XYZ tints are applied over the grid line colors. • **Apply XYZ tint to axis lines** - turns on the color for the axis lines • **Apply XYZ tint to major grid lines** - turns on the color for the primary grid lines • **Apply XYZ tint to minor lines** - turns on the color for the minor grid lines XYZ tints are defined by the COLORX (usually red), COLORY (usually green), and COLORZ (usually blue) variables.
Snap angle	Defines the rotation of the grid (as well as the snap and the cursor crosshairs) for the current viewport, relative to the current UCS. If the snap angle is different from zero, then only dotted grids display (grid lines do not display).

Figure 6.1270



Related Commands

Snap (6.27.41) - sets the snap spacing. Limits (6.20.38) - limits the extent of the grid dots. Settings (6.27.25) - sets grid parameters through a dialog box.

Figure 6.1271

6.15.24 GradientBkgOff

(6.2981 on page 6079) Switches off the gradient background color in the current viewport off, restoring the default view background. **Note:** To turn on the background gradient color, use the GradientBkgOn (6.15.21) command.

Accessing the Command

command bar: **gradientbkgoff**
: **GradientBkgOff** Displays no prompts in the command bar. Removes the background gradient colors.

Command Options

No Options

Related Commands

Background (6.6.3) - sets the model space background for the current viewport and saved views. GradientBkgOn (6.15.21) - restores the default gradient background of the current viewport. View (6.31.2) - creates and sets named views through the Drawing Explorer. -View (6.31.3) - creates and sets named views through the command bar.

Figure 6.1272

6.15.25 Grading

(6.1726 on page 4955) Creates a graded surface on existing topo surfaces.

Accessing the Command

Commandline: **GRADING** Quad: **Model | Grading** Ribbon: **Civil | Create | Grading : Grading Prompts you:** Select input entity: **(Select the entity to define a graded surface.)** (6.1273) Select the target surface or [slope/Offset]: **(Select the target surface to create a graded surface or choose an option.)** (6.1274 on the next page) Move the mouse to change the slope of the grading: **(Move the mouse to adjust the slope of the grading.)**

Figure 6.1273

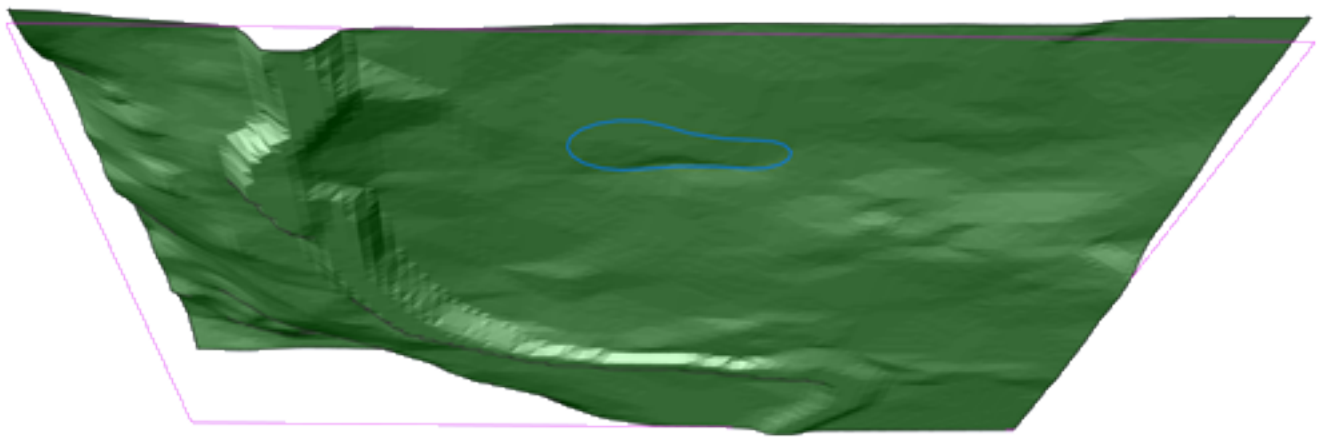


Figure 6.1274

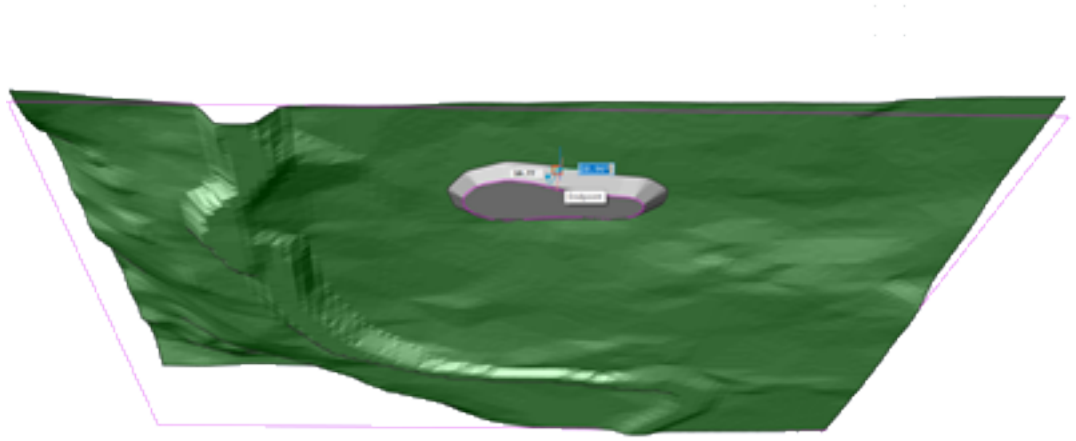


Command Options

Option Description After selecting an entity slope/Offset Sets either the slope or offset option of the grading. Type "O" in the command line Prompts you: **Move the mouse to change the offset of the grading or press tab key to change the slope: Note:** that for the offset-slope projection method requires input entity, offset, and slope.

Procedures

Grading a surface to create a pond (1.26.7) Displaying the properties of a graded surface (1.26.7) Grading a surface to create a platform (1.26.7) Adjusting the elevation of a grading to balance cut and fill volumes (1.26.7)

Related Commands

GradingBalance (6.15.1) - Balances grading cut and fill volumes. Tin (6.29.14) - Creates a topographical surface from an imported points file or placing new points. TinEdit (6.29.19) - Allows to add/remove boundaries, break-lines, and points to a surface. TinMerge (6.29.22) - Combines two or more TIN surfaces (or gradings) into a new TIN surface. TinModify (6.29.23) - Easily deforms or smoothens a selected TIN surface. TinVolume (6.29.24) - Creates a TIN volume surface between a base and comparison TIN surfaces or an elevation.

Figure 6.1275

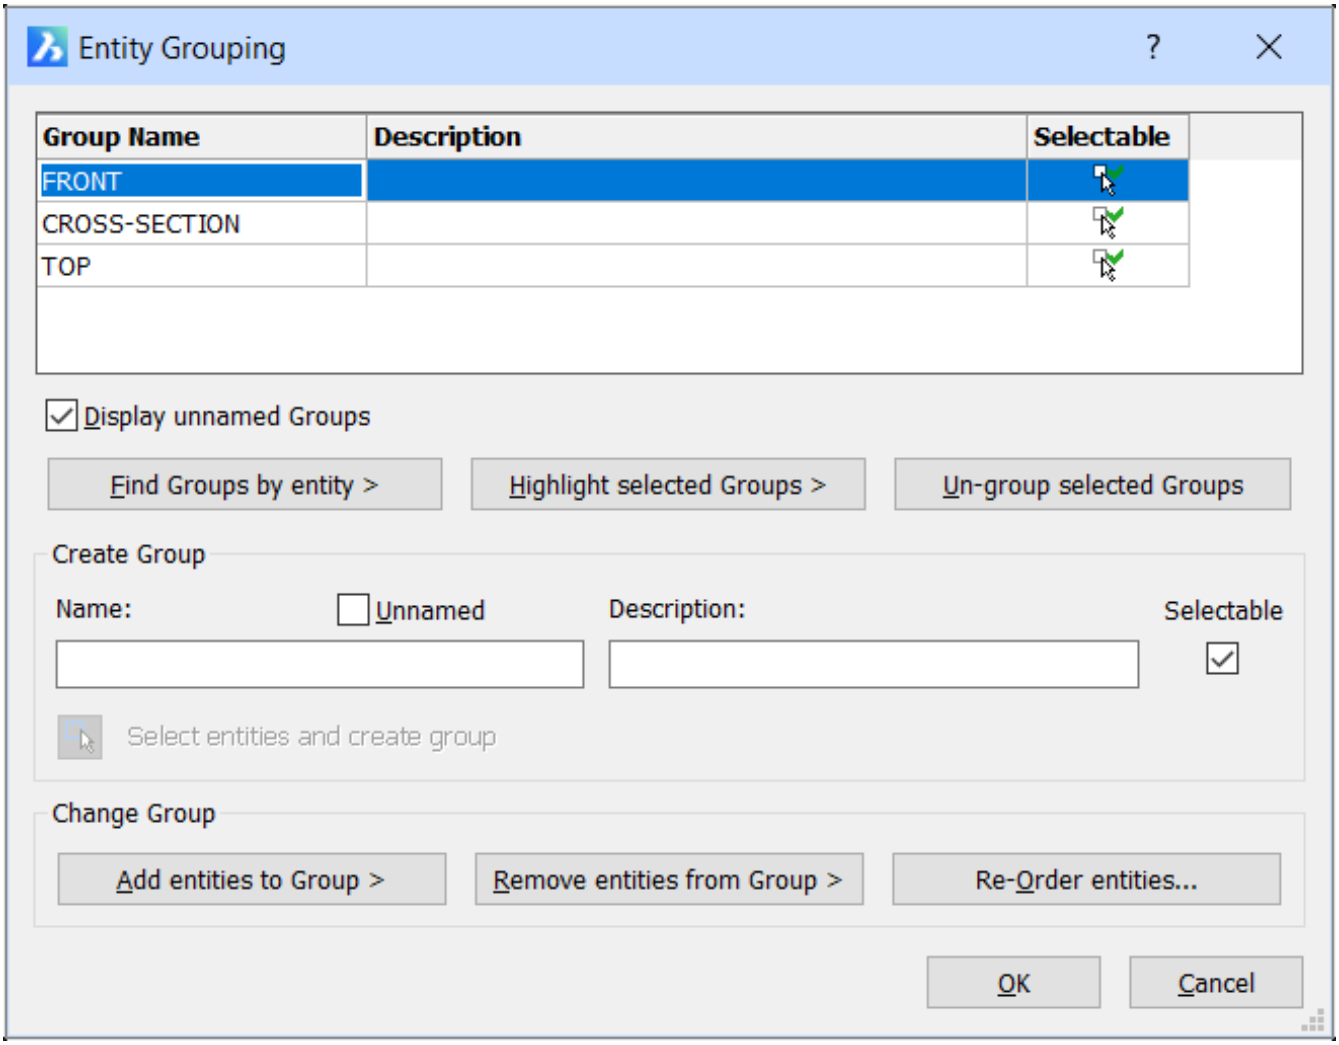
6.15.26 Group

(6.2981 on page 6079) Creates, modifies, and deletes named groupings of entities.

Accessing the Command

command bar: **group** menu bar: **Tools | Group** ribbon: **Change | Arrange | Group** toolbar: **Tools |** : **Group**
Displays a dialog box: (6.1276 on the next page) Create, edit, pr erase a named group, and then click **OK**.

Figure 6.1276



Command Options

Option	Description
Display Unnamed Groups	Toggles the display of unnamed groups: • **Off** - displays only named groups created by users • **On** - also displays unnamed groups created by the program
Find Groups by Entity	Reports the name(s) of groups when you select entities in the drawing. Temporarily removes the dialog box, and then prompts: 1. **Select entities** - **(choose one or more entities.)** 2. **Select entities** - (**choose more entities, or press Enter to continue.)** 3. Displays the Group Member List dialog box with one or more group names: (6.1280 on page 4548) Click **OK** to close this dialog box and to return to the original dialog box.
Highlight Selected Groups	Highlights entities that belong to the selected group. 1. Choose one or more groups in the Group Name list 2. Click the **Highlight Selected Groups** button 3. Notice that the dialog box disappears and that entities are highlighted: (6.1281 on page 4549) 4. Click **OK** to return to the Entity Grouping dialog box.
Un-group Selected Groups	Removes group status from selected entities: 1. Select groups in the Group Names list 2. Click the **Un-group Selected Groups** button The names disappear from the list.

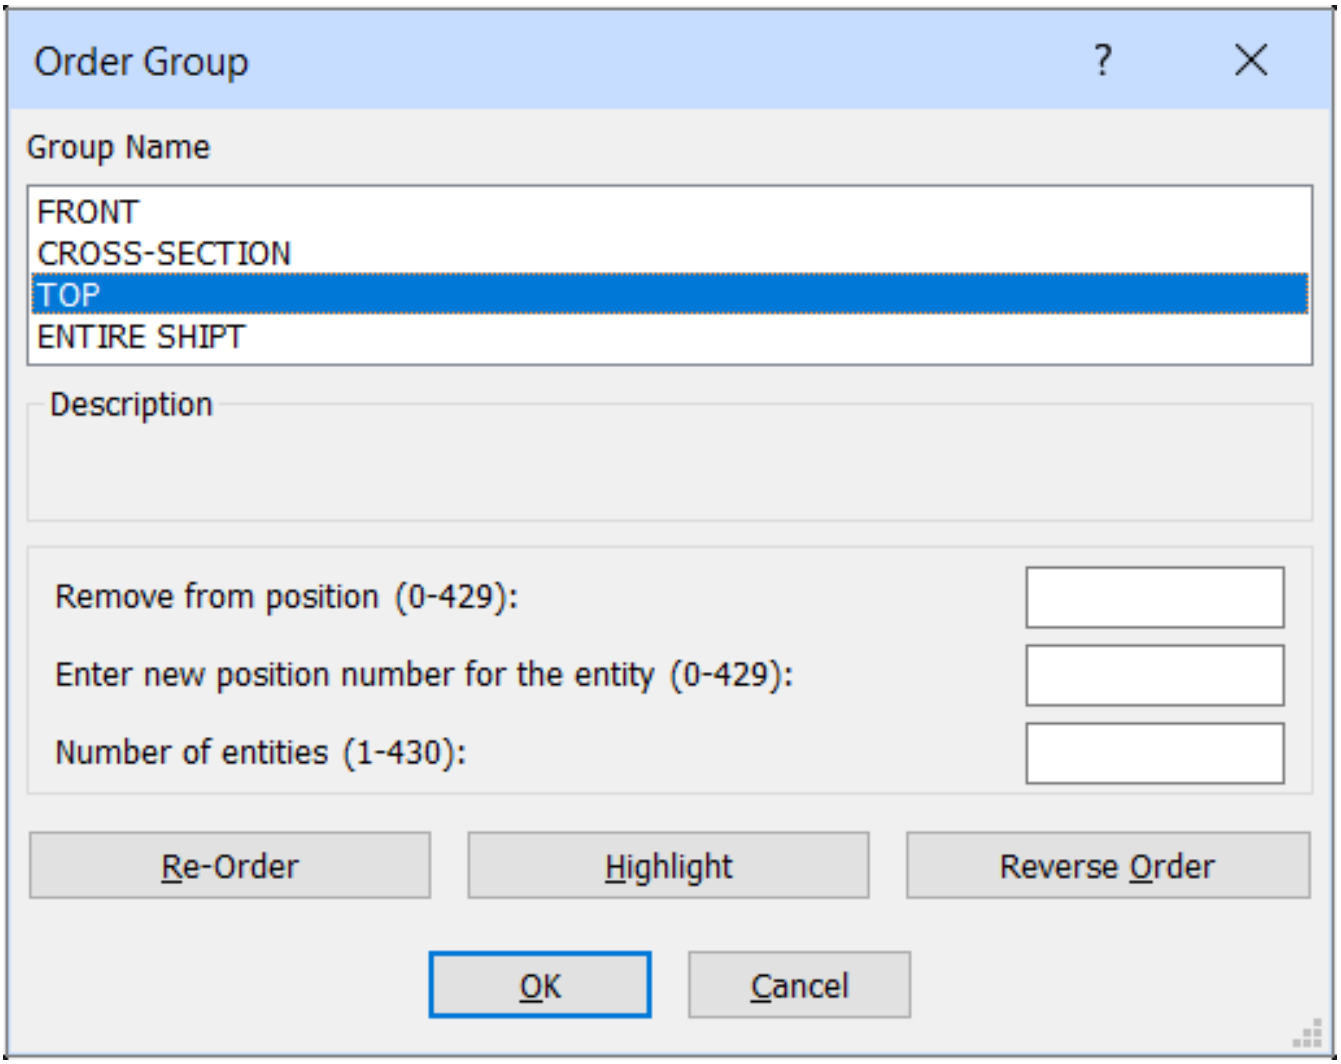
Create Group Section	Description
Name	Specifies the names of groups.
Unnamed	Toggles whether the group has a name: • **On** - allows unnamed groups to be created; the Name field is grayed out. • **Off** - requires that groups be named Unnamed groups are assigned the prefix *A following by an incremented number, such as *A2.
Description	Specifies an optional description of the group.
Selectable	Determines how groups are selected when the PICKSTYLE system variable is set to 1 or 3. • **On** - you can select the group but not the entities that make it up • **Off** - you can select individual members of the group

Select Entities	Dismisses the dialog box temporarily, and then prompts you at the command bar: 1. **Select entities - (choose one or more entities.)** 2. **Select entities - (choose more entities, or press Enter to return to the dialog box.)** Back in the dialog box, the selected entities become part of the group.
Change Group Section	**Description**
Add Entities to Group	Adds entities to the selected group; prompts you at the command bar: 1. **Select entities - (choose one or more entities to add to the group.)** 2. **Select entities - (choose more entities, or press Enter to return to the dialog box.)**
Remove Entities from Group	Removes entities from the selected group; prompts you at the command bar: 1. **Select entities - (choose one or more entities to remove from the group.)** 2. **Select entities - (choose more entities, or press Enter to return to the dialog box.)**
Re-Order Entities	Changes the order of entities in groups; displays the Order Group dialog box; see below.

(6.1277 on the following page)

Order Group Options	**Description**
Group Name	Lists the names of named and unnamed groups.
Remove From Position	Specifies the position number of the entity to be re-ordered.
Enter New Position Number for the Entity	Specifies the new position number for the group.
Number of Entities	Specifies the range of entities to reorder.
Re-Order	Applies the re-ordering dictated by the previous three fields.
Highlight	Highlights entities in the group; dismisses the Order Group dialog box, and then displays the following one: (6.1282 on page 4549) • **Next** - highlights the next entity of the group. • **Previous** - highlights the previous entity. • **OK** - returns to the Order Group dialog box.
Reverse Order	Reverses the order of entities in the group.

Figure 6.1277



Grips Editing

Groups can be edited directly through grips in two ways: Selectable - select one entity in the group, and all entities are selected (show highlights and grips). (6.1278) Not Selectable - select one entity and only that entity is selected, such as the ellipse shown below. (6.1279 on the next page)

Figure 6.1278

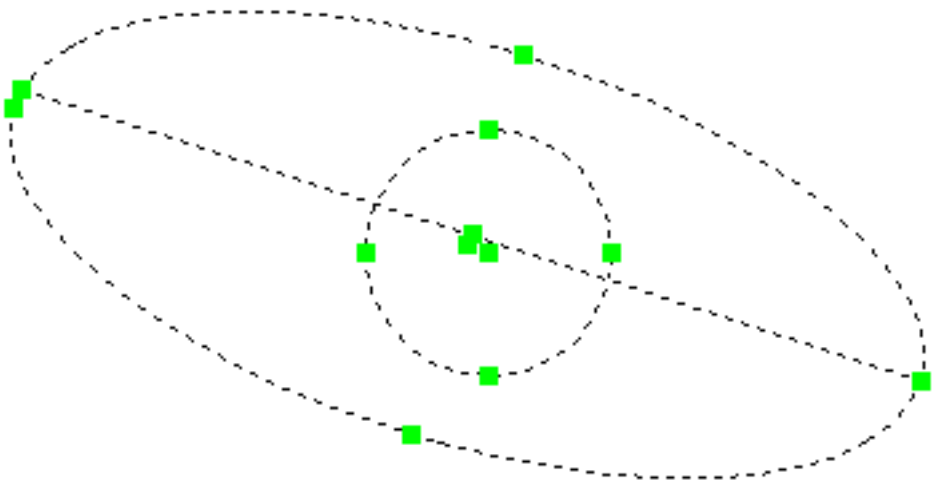


Figure 6.1279

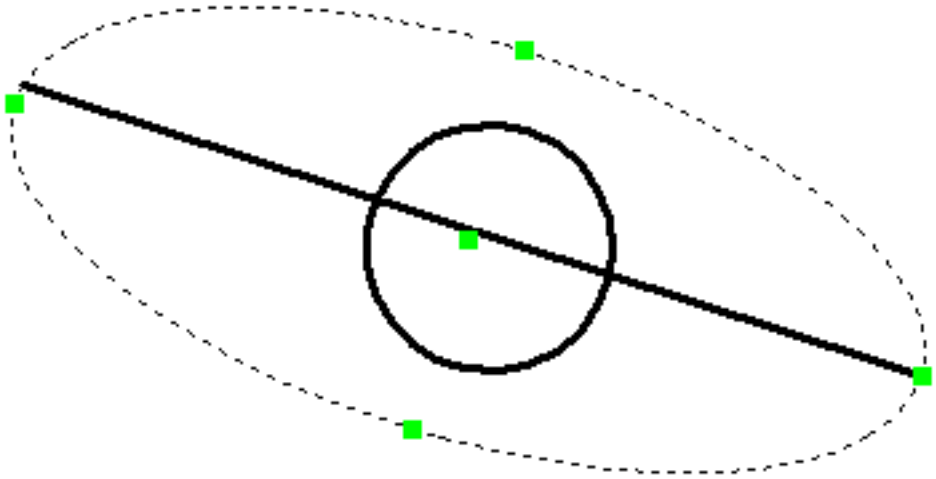

Procedures

- To create a group (1.30.22)
- To modify a group (1.30.22)
- To ungroup entities (1.30.22)
- To change the order of entities (1.30.22)

Related Commands

-Group (6.15.27) - creates and modifies named groups of entities, at the command line. Block (6.6.11) - groups entities into a block (symbol), through a dialog box -Block (6.6.12) - groups entities into a block (symbol), at the command line.

Figure 6.1280

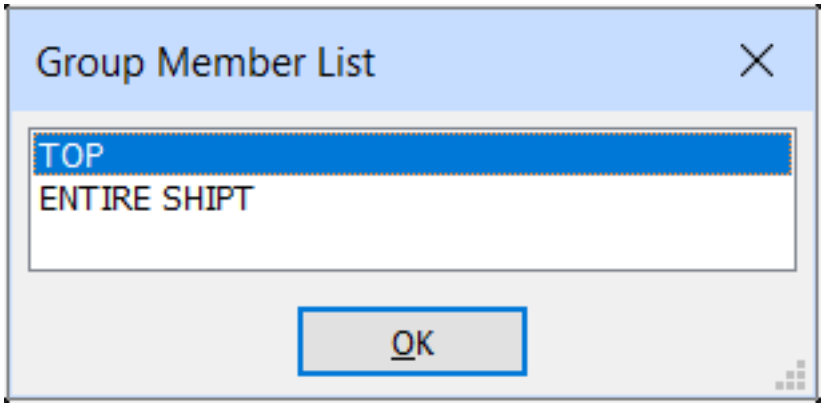

Figure 6.1281

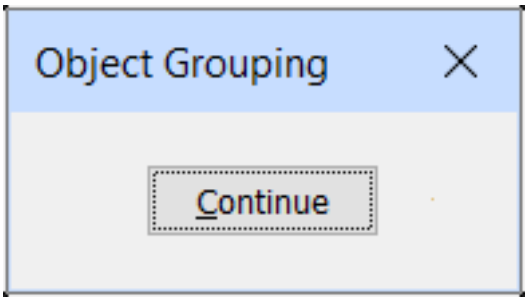

Figure 6.1282

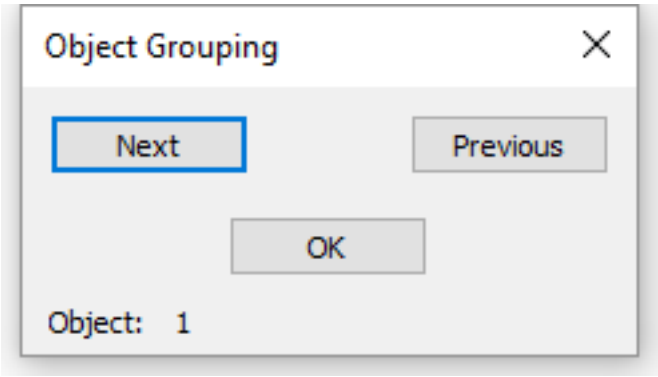

Figure 6.1283

6.15.27 -Group

(6.2981 on page 6079) Creates and modifies named groups of entities at the command line.

Accessing the Command

command bar: **-group** : **-Group Prompts you in the command bar:** Enter group option [? to list/Order/Add/Remove/Explode/ REName/ Selectable/ Create] <Create>: **(Enter an option)**

Command Options

Option	Description
? to list	Lists named and unnamed groups in the drawing, and then exits the command. Sample listing: Group name: SIDEVIEW Group description: Side View of Boiler Selectable: Yes Unnamed groups are prefixed with *A, followed by an incremented number, such as *A3.
Order	Reverses the order of entities in a group; prompts you: 1. **Enter a group name or ? to list** - **(specify the name of a group.)** 2. **Reverse order** - **(enter Y or N.)**
Add	Adds entities to a group; prompts you: 1. **Enter a group name or ? to list** - **(specify the name of a group.)** 2. **Select entities** - **(choose one or more entities, and then press Enter.)**
Remove	Removes entities from a group; prompts you: 1. **Enter a group name or ? to list** - **(specify the name of a group.)** 2. **Select entities** - **(choose one or more entities, and then press Enter.)**
Explode	Ungroups the selected group; prompts you: • **Enter a group name or ? to list** - **(specify the name of a group.)**
REName	Renames groups; prompts you: 1. **Enter a group name or ? to list** - **(specify the name of a group.)** 2. **Enter new name** - **(specify a different name for the group.)**

Selectable	Toggles the selectability of groups; prompts you: 1. **Enter a group name or ? to list** - **(specify the name of a group.)** 2. **This group is selectable, do you want to change it** - **(enter Y or N.)**
Create	Creates new groups; prompts you: 1. **Enter a group name or ? to list [* to create unnamed]** - **(enter a name, or press * for an unnamed group.)** 2. **Enter description** - **(enter a description, or press Enter for no description.)** 3. **Select entities** - **(choose one or more entities.)** 4. **Select entities** - **(choose more entities, or press Enter to create the group.)**

Related Commands

Group (6.15.26) - creates and modifies named groups of entities, through a dialog box Block (6.6.11) - groups entities into a block (symbol), through a dialog box -Block (6.6.12) - groups entities into a block (symbol), at the command line.

6.16 H

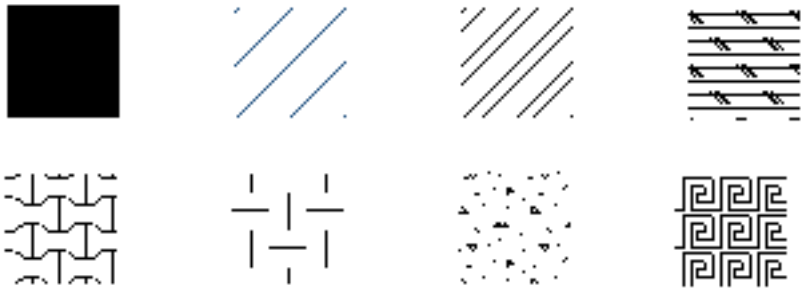
6.16.1 -Hatch

(6.2981 on page 6079) Fills closed 2D areas with repeating patterns; displays prompts at the command bar. Examples of hatch patterns: (6.1290 on page 4561) **Note:** 3D entities cannot be hatched. 

Figure 6.1284

Shape Classic Pro Platinum Mechanical BIM

Figure 6.1285



Accessing the Command

command bar: **-hatch** aliases: **-h, -bh** Quad: **2D Editing |** ribbon: **Draw | Hatch | Hatch | Quick Hatch** : **-Hatch Prompts you in the command bar:** Current hatch pattern: ANSI31 Specify internal point or [hatch Properties/Select entities/Remove boundaries/ Advanced options/Draw order/Origin/ANnotative/Layer/Transparency/Undo]: **(Pick a point, or enter an option)** Selecting everything visible... (*) Specify internal point or [hatch Properties/Select entities/Remove boundaries/ Advanced options/Draw order/Origin/ANnotative/Layer/Transparency/Undo]: **(Pick another point, or enter an option, or press Enter to create the hatch)** * Entities which are not visible in the current viewport when the command is launched cannot be selected. Partly visible entities can, however, be selected.

Command Options

Option	**Description**
Current hatch pattern: ANSI31	Reports the name of the current hatch pattern; you change the pattern with the Properties option.
Specify internal point	Pick a point inside a closed area; BricsCAD creates an invisible boundary, and then hatches the area. You can pick more than one area to hatch at a time.

Properties Options	**Description**
Enter a pattern name	Specifies the name of the hatch pattern.
? to list patterns	Lists the names of all patterns; reminds you of their names. Press **F2** to see the list in the prompt history window.
Solid	Specifies a solid-color filled hatch.
User defined	Allows you to define simple hatch patterns based on angle, scale, and crosshatching.
Proceed	Skips the next two prompts, and returns to the original prompt.
Scale for pattern	Specifies the scale factor of the hatch pattern. The scale factor is usually the same as that of text and linetypes.
Angle for pattern	Specifies the angle at which the pattern is drawn.

User Defined Options	**Description**
Proceed	Skips the following prompts, and returns to the original prompt.
Space between standard pattern lines	Specifies the distance between hatch lines.
Angle for lines	Specifies the angle at which the pattern is drawn.
Cross-hatch area?	Applies the pattern a second time at 90 degrees to the first.
Select	Prompts you to select the entities making up the boundary: **Select entities - (select one or more entities; press Enter to return to original prompt.)**
Remove	Removes boundary entities; prompts you to select island (interior) entities, which will be hatched through.

Advanced	Accesses advanced hatching properties; prompts you: **Enter an option [Boundary set/Retain boundary/Island detection/Specify style/Set associativity(A)/Boundary tolerance(T)/Separate hatches(H)]** - **(enter an option; see below.)**
Boundary set	Specifies the entities to consider for creating boundaries; prompts you: **Specify candidate set for boundary [New selection/All objects(E)]<Everything>** - **(enter an option)**: • **Everything** - selects all entities in the current viewport • **New** - prompts you to select entities
Retain boundary	Determines whether the temporary boundary is retained after the command ends; prompts you: **Retain derived boundaries? [Yes-Retain boundariess(Y)/No-Discard boundary(N)]<No>** - **(enter an option)**: **Yes** - boundary is kept in the drawing. **No** - boundary is erased.
Island detection	Toggles whether islands are hatched over or not; prompts you: **Do you want island detection? [Yes-Detect islands(Y)/No-Set ray casting(N)]<Yes>** - **(enter an option)**: • **Yes** - islands (interior boundaries) are not hatched. • **No** - islands are hatched over.
Specify style	Specifies how islands are treated; prompts you: **Enter hatching style: [Nested/Outer/Ignore]<Nested>** - **(enter an option)**: • **Nested** - alternating islands are hatched, beginning with the outermost one. • **Outer** - only the outermost region is hatched; interior islands are not hatched. • **Ignore** - islands are ignored and hatched over.
set Associativity	Toggles whether hatches are associative; prompts you: **Associativity hatch? [Yes-Associative hatch(Y)/No-Nonassociative hatch(N)]<Yes>** - **(enter an option)**: • **Yes** - hatches are associative; when their boundary changes, they automatically update. • **No** - hatches are not associative; when the boundary changes, the hatch keeps its original shape.
boundary Tolerance	Specifies the largest gap that BricsCAD will close when hatching open areas: **Specify a boundary gap tolerance value <0>** - **(enter a value)**. A value of 0 means that no gaps in the boundary are tolerated by the program.

separate Hatches	**Create separate hatches? [Yes/No-Do not separate(No)]** - **(enter an option)**: • **Yes** - creates separate hatches if the hatch is composed of multiple closed boundaries • **No** - creates a single hatch entity.
Draw order	Specifies whether the hatch pattern appears visually above or below overlapping entities; prompts you: **Enter an option [None/Send to back(B)/Send to front(F)/Send behind boundary(H)/Bring in front of boundary(D)]** - **(enter an option)**: • **None** - ignores draw order • **send to Back** - places the hatch pattern behind (below) other entities; this prevents the hatch from obscuring other entities • **bring to Front** - places the pattern in front (on top) of other entities • **send beHind boundary** - places the pattern behind its boundary; this makes it easier to select the boundary • **bring in front of bounDary** - places the pattern in front of its boundary
Origin	Prompts for a new hatch origin point: **New value for the hatch origin <0.0000,0.0000>** - **(enter an option)**: • **x,y** - enter x,y coordinates • Pick a point in the drawing • **Enter** - **use the default value** Use entity snaps to pick the origin accurately.
Annotative	Sets the annotative property for the hatch and applies the current annotative scale (see the CANNOSCALE variable); prompts you: **Create annotative hatch [Yes/No] <No>** - **(enter an option)**: • **Yes** - add annotative scale factor to hatch • **No** - uses the value specified by **Scale for Pattern** to create a non-annotative hatch
Layer	Creates the hatch on a specified layer, rather than on the current layer. Prompts you: **Specify layer or . for use current <.>** - **(enter an option)**: • Enter the name of the layer on which you want to create the hatch • Enter . or press **Enter** to create the hatch on the current layer.

Transparency	Sets the transparency property of the hatch. Prompts you: **Specify transparency [0/90/ByLayer(L)/ByBlock(B)/. for use current(.)] <Use current>** - **(enter an option)**: • **Use current** - applies the current transparency value as defined by the CETRANSPARENCY system variable. • **Specify transparency [0/90]** - specifies a value between 0 (fully opaque) and 90. The transparency level is limited to 90% to avoid confusion with layers that are frozen or turned off. • **By Layer** - applies the value of the transparency property of the layer on which the hatch resides • **By Block** - transparency value is controlled by block The transparency value for new hatches is saved by the HPTRANSPARENCY variable.
Undo	Remove selected boundaries from the selection

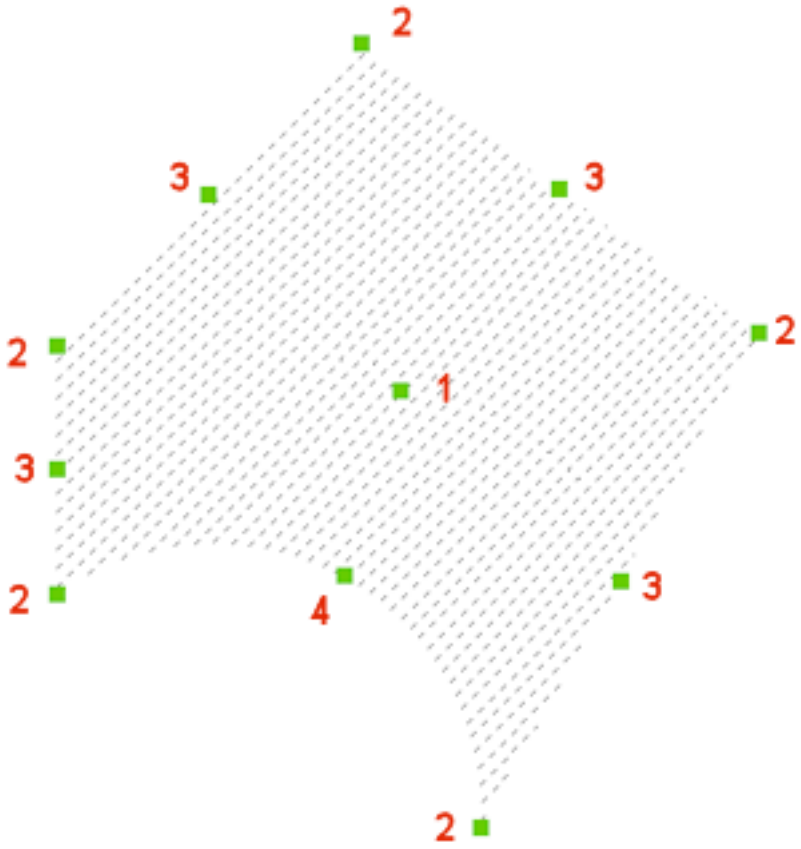
Grips Editing

Hatches can be edited directly through grips:

1. Select the hatch. Notice that it has one central grip (1), grips on each boundary vertex (2) and grips in the midpoint of each boundary segment (3 and 4).
2. Drag the central grip (1) to move the hatch.
3. Drag a vertex grip (2) or a midpoint grip (3 and 4) to change the hatch boundary.

(6.1292 on page 4569) 1. Center grip: moves the hatch 2. Vertex grip: moves the vertex 3. Midpoint grip: moves the boundary segment 4. Arc midpoint grip: modifies the arc radius

Figure 6.1286



Procedures

- General procedure to create hatches and gradient fills (1.25.27)
- To define hatch properties (1.25.27)
- To define the boundary for a hatch or gradient fill (1.25.27)
- To edit a hatch or gradient fill (1.25.29)
- Defining the MAXHATCH setting (1.25.26)

Related Commands

Hatch (6.16.3) - place hatch patterns through a dialog box. Boundary (6.6.15) and -Boundary (6.6.16) place a polyline boundary inside closed areas. HatchEdit (6.16.2) - edits hatches and gradient fills in a dialog box. -HatchEdit (6.16.4) - edits the boundaries of hatch and gradient entities; displays prompts in the command bar. HatchGenerateBoundary (6.16.5) - generates a boundary around a hatch or gradient fill. Properties (6.24.54) - changes the properties of hatch patterns. Settings (6.27.25) - specifies the default parameters for hatch patterns. Solid (6.27.45) - draws 3- and 4-side solid-filled areas.

Figure 6.1287

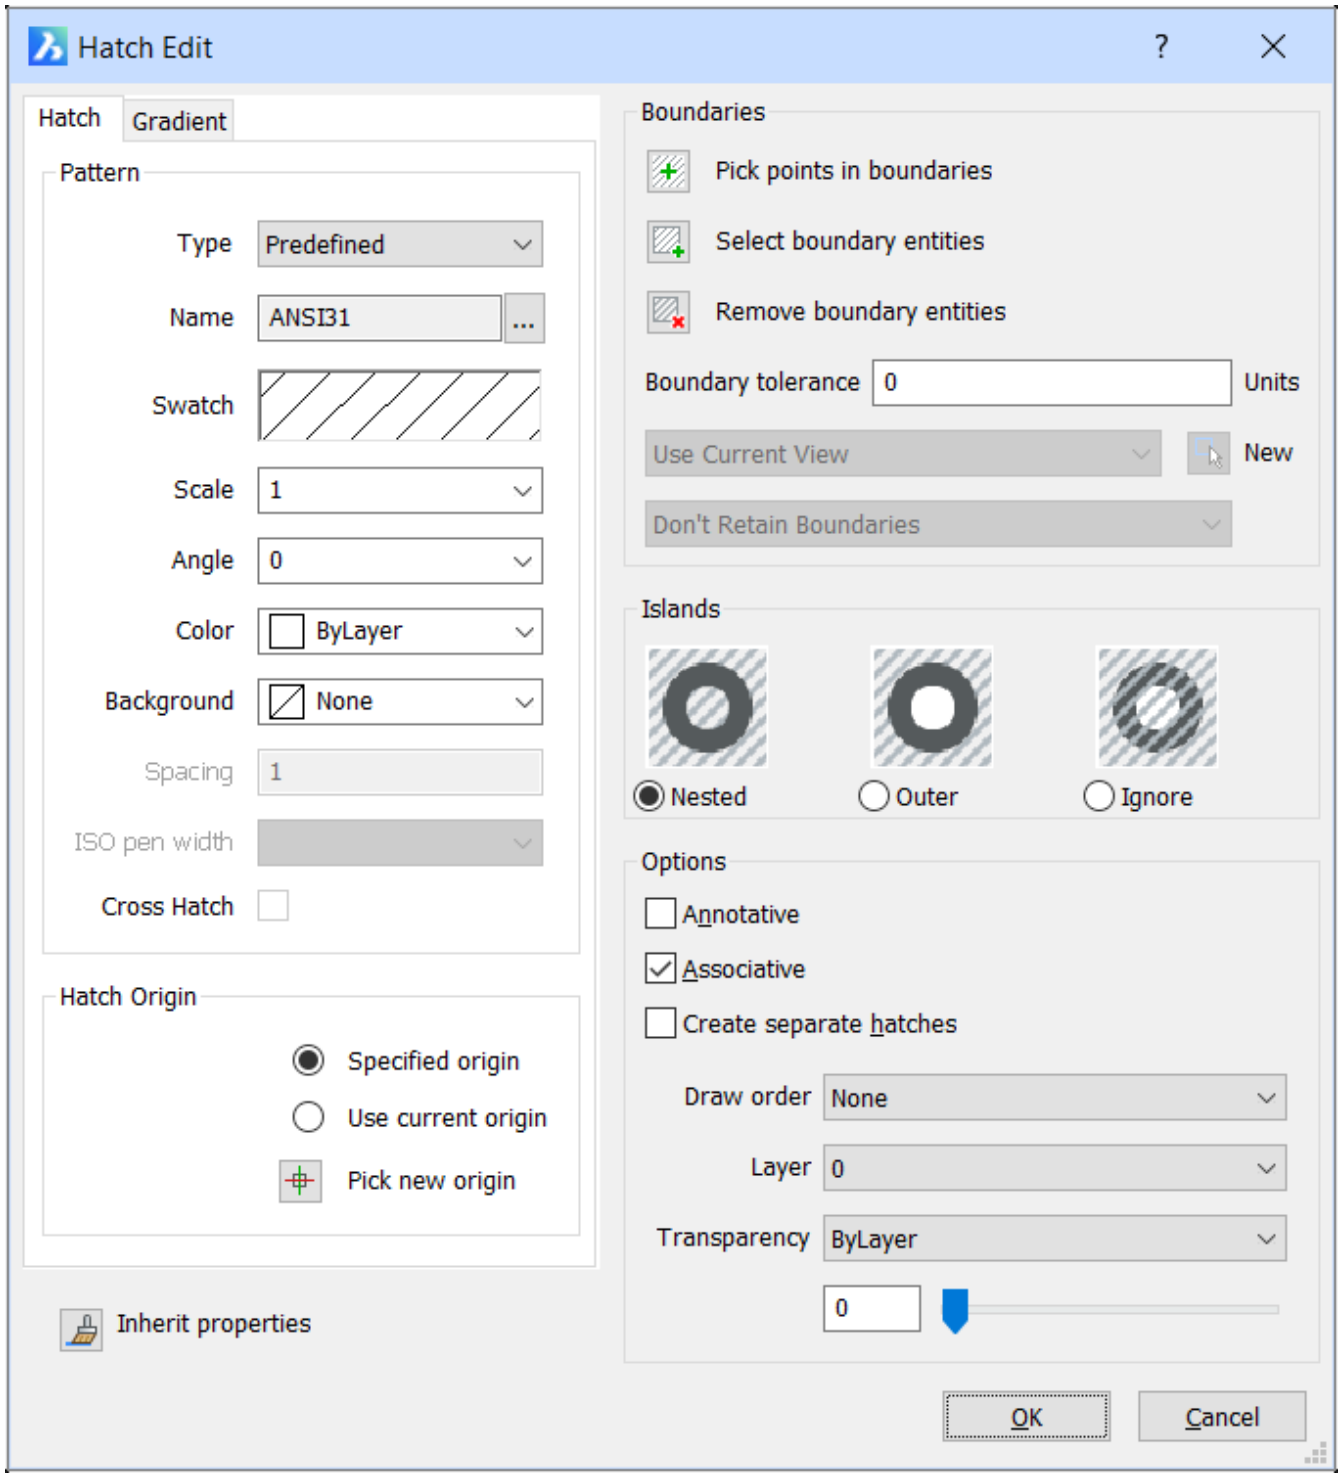
6.16.2 HatchEdit

(6.2981 on page 6079) Edits hatches and gradient fills through a dialog box.

Accessing the Command

 command bar: **hatchedit** transparent: **'hatchedit** alias: **he** mouse shortcut: **Double-click a pattern** menu bar: **Modify | Hatch edit** toolbar: **Modify |**  : **Hatchedit Prompts you in the command bar:** Select hatch entity: **(Select a hatch or gradient fill in the drawing)** Displays a dialog box: (6.1288 on the next page) Make changes, and then click the **OK** button to apply the changes. As an alternative, you can use the Properties (6.24.54) panel to edit hatch and gradient parameters.

Figure 6.1288



Command Options

Option	Description
Select hatch entity	Select an entity for editing: • Hatch pattern - see the Hatch (6.16.3) command for the meaning of the options in the dialog box • Gradient fill - see the Gradient (6.15.20) command • Any other entity - the program repeats the Select hatch entity prompt

Procedures

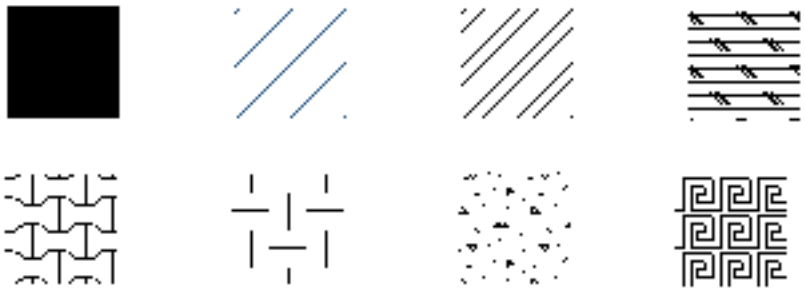
- To edit a hatch or gradient fill in the properties bar (1.25.27)
- To edit a hatch in a dialog box (1.25.29)
- To edit a gradient fill in a dialog box (1.25.29)

Related Commands

Gradient (6.15.20) - Fills closed areas with solid fills in nine different patterns and one or two colors; displays the Hatch and Gradient dialog box. Hatch (6.16.3) - fills closed areas with repeating patterns; displays the Hatch and Gradient dialog box. -Hatch (6.16.1) - fills closed areas with repeating patterns; displays prompts at the command bar. -HatchEdit (6.16.4) - Edits the boundaries of hatch and gradient entities; displays prompts in the command bar. HatchGenerateBoundary (6.16.5) - generates a boundary around a hatch or gradient fill.

Figure 6.1289

Figure 6.1290



6.16.3 Hatch

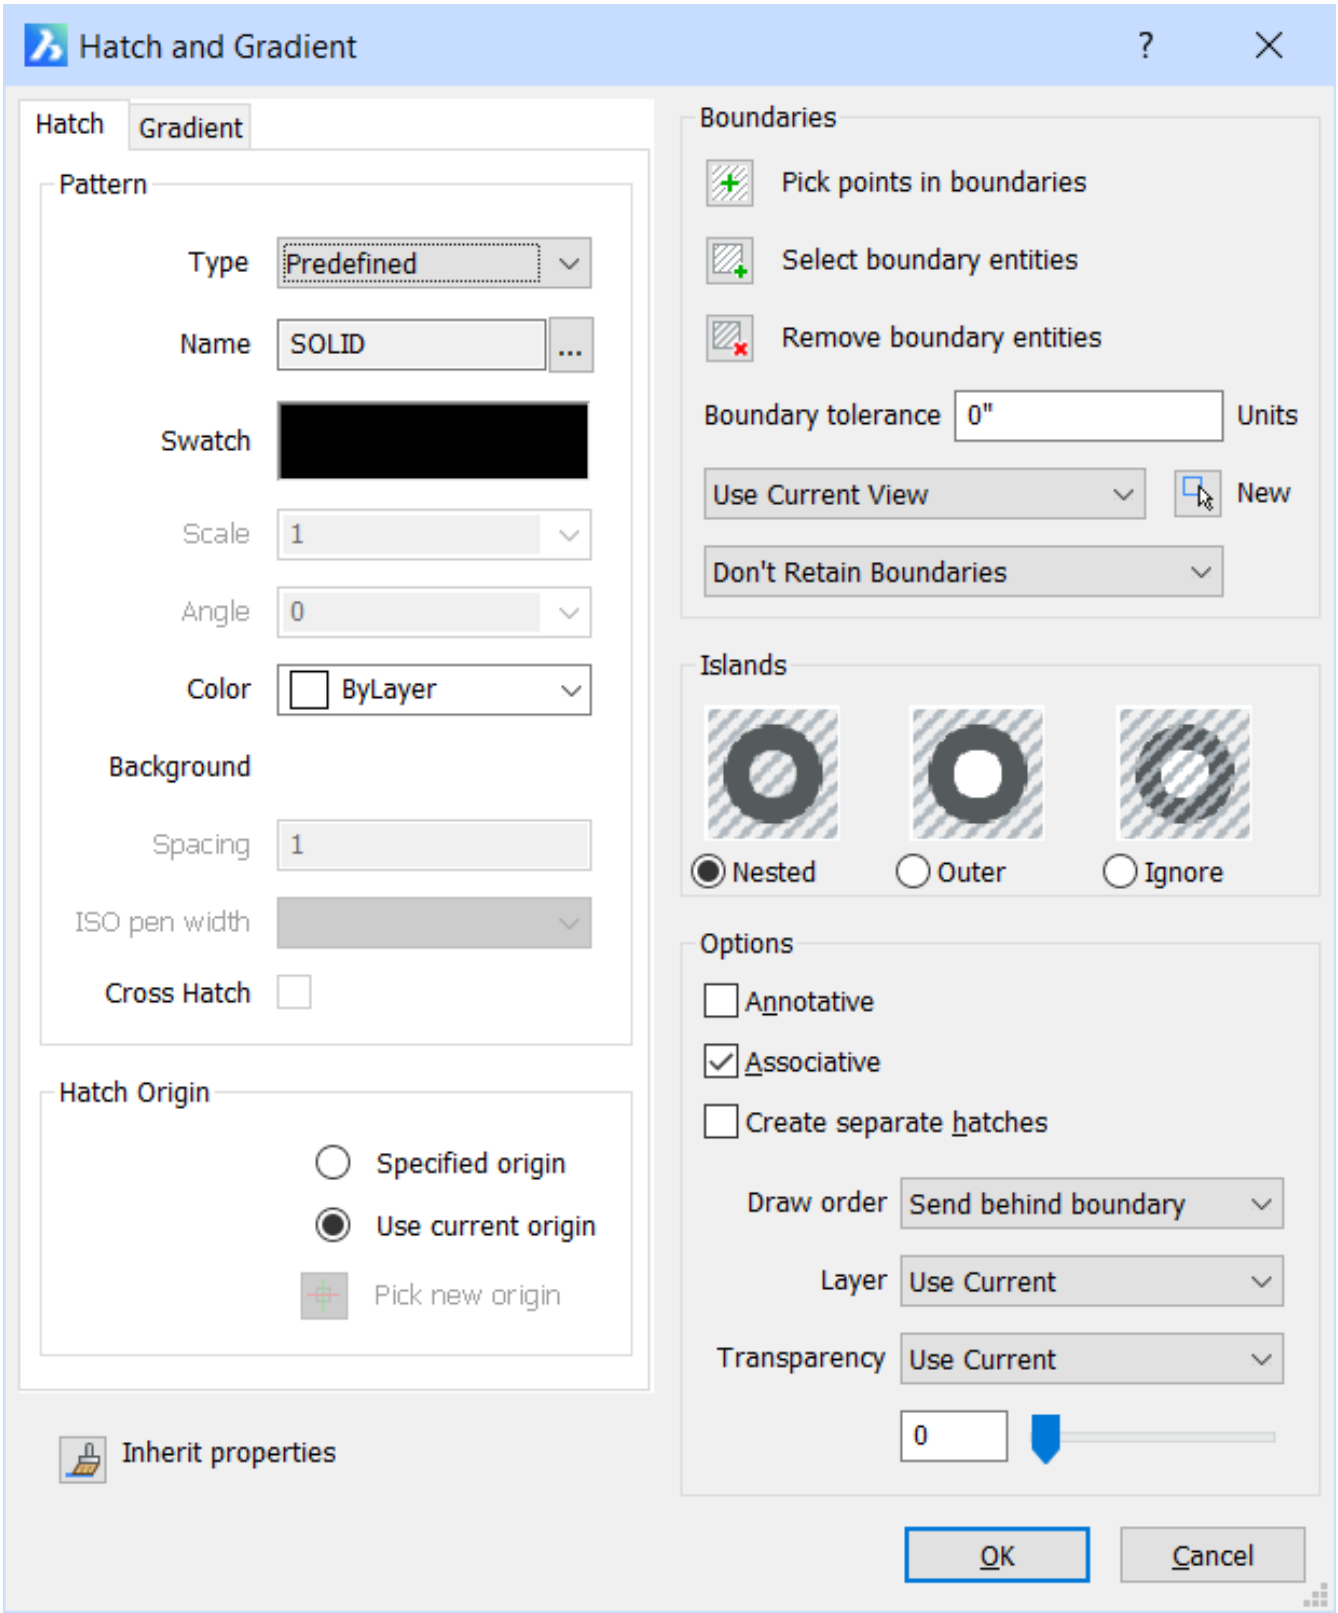
(6.2981 on page 6079) Fills closed 2D areas with repeating patterns or solid colors; displays the Hatch and Gradient dialog box. **Note:** 3D entities cannot be hatched. Examples of hatch patterns: (6.1290)

Accessing the Command

command bar: **hatch** aliases: **h, bh**

(**6.6.5**)menu bar: **Draw | Hatch** ribbon: **Draw | Hatch | Hatch** toolbar: **Draw |**  : **Hatch** Displays a dialog box: (6.1291 on the following page) Choose options, and then click OK.

Figure 6.1291



Command Options

Pattern Options	Description
Type	Select a source of the hatch pattern from the droplist: • **User Defined** - constructs patter from the the user-define parameters of Angle, Spacing, Cross Hatch, Color, and Background Color • **Predefined** - uses the patterns defined in the iso.pat (metric units) or default.pat (imperial units) pattern definition files provided with the program • **Custom** - uses a pattern defined by *.pat files (limited to one pattern definition per file) created by users; the program searches for *.pat files in the folders that are defined in the SRCHPATH (1.17.10) (Support File Search Path) variable
Name	Specify the name of the predefined hatch pattern by one of these methods: • Type a name • Click the **Browse** button to display the Hatch Pattern Palette dialog box, choose a pattern, and then click **OK** This option is unavailable for the User-defined pattern.
Swatch	Click to display the Hatch Pattern Palette dialog box: 1. Choose a pattern 2. Click **OK** to return to the previous dialog box This option is unavailable for the User-defined pattern.
Scale	Specifies the scale factor of the pattern: • Click the droplist and then choose a preset scale factor • Enter a number for the scale factor The scale factor of hatch patterns is generally the same as that for text and linetypes.
Angle	Specifies the angle of the pattern: • Choose a preset angle from the droplist • Else enter a custom angle This angle is measured relative to the positive x-axis of the current UCS.
Color	Specifies the color of the hatch lines: • **Use Current** - uses the current color specified by the CeColor variable. • Choose a color available in the droplist • **Select Color** - **(choose a color from the complete palette; see Color command.)**

Background Color	Specifies the background color under the hatching: • **None** - uses no color. • **Select Color** - **(choose a color from the complete palette; see Color command.)**
Spacing	Specify the distance between hatch lines; this option is available for only user defined patterns
ISO pen width	Specifies the lineweight; this option is available only for ISO hatch patterns
Cross Hatch	Determines whether the pattern is crossed: • **On** - the pattern is repeated at 90 degrees to the original • **Off** - the pattern is not crossed This option is available for only user defined patterns

Hatch Origin Section	**Description**
Specified origin	Uses a point other than the drawings's origin (0,) for the lower-left corner where the pattern begins: 1. Click the **Pick New Origin** button 2. **Select origin point** - **(pick a point in the drawing.)** Use this option to begin the hatch pattern at the corner of a wall or other location where the placement of the pattern is critical.
Use current origin	Uses the drawing's origin (0,0) as the origin of the hatch pattern.
Pick new origin	Dismisses the dialog box temporarily, and then prompts you at the command bar: 1. Click the **Pick New Origin** button 2. **Select origin point** - **(pick a point in the drawing)** This option is available for only the specified (user defined) origin.

Boundaries Section	**Description**

Pick points in boundaries	Specifies the closed areas (boundaries) in which to place the pattern: 1. Click the **Pick Points in Boundaries** button; the program temporarily dismisses the dialog box 2. **Select a point to define a boundary or hatch area [or Select entities/Undo]** - **(pick a point inside a closed area, or enter an option): Select Entities** - prompts you to select entities that form the boundary **Undo** - removes the previously selected area from the selection set Notice that the program draws the hatch immediately , allowing you to preview its scale factor, angle, origin, and other parameters 3. **Select a point to define a boundary or hatch area [or Select entities/Undo]** - **(pick another point, or else press Enter to return to the dialog box.)** You cannot pick an area that already contains a hatch pattern, or areas that are not closed (whose gap is larger than the value specified by Boundary Tolerance).
Select boundary entities	Selects the entities that make up the hatching boundary to constrain the extent of the pattern: 1. Click **Select Boundary Entities** button; the program temporarily dismisses the dialog box 2. **Select entities** - **(use any selection method to choose one or more entities.)** 3. **Select entities** - **(select more entities, or else press Enter to return to the dialog box.)** This option allows you to hatch closed areas, including ones that already contain a hatch. It hatches open areas whose gap is less than the value specified by Boundary Tolerance.
Remove boundary entities	Remove entities from the detected boundary set: 1. Click **Remove Boundary Entities** button; the program temporarily dismisses the dialog box 2. **Select entities** - **(use any selection method to choose one or more entities.)** 3. **Select entities** - **(select more entities to remove, or else press Enter to return to the dialog box.)**

Boundary Tolerance	Specifies the largest gap the program ignores when hatching a boundary that is not fully closed: • **0** - (Default) The tolerance is set by the application, based on the current view size. When zoomed in closely, boundary detection will fail; when zooming out further so the contour 'looks' closed, the boundary will become detected • Any Value - Defines the maximum gap in drawing units. The value is saved in the HPGAPTOL (1.17.10) system variable.
Current View/ Boundary Set	Specifies where the program should search for entities that make up the boundary: • **Use Current View** - searches all entities in the current viewport • **Use Boundary Set** - searches only the current selection set for possible boundaries
New	Creates a new selection set of entities that make up the pattern boundary: 1. Click the **New** button; the program temporarily dismisses the dialog box 2. **Select entities** - **(use any selection method to choose one or more entities.)** 3. **Select entities** - **(select more entities, or else press Enter to return to the dialog box.)** The next step is to click the **Pick Points in Boundaries** button to choose the hatch area.
Retain boundaries	Determines what happens to boundaries: • **Don't Retain Boundaries** - removes the boundary after the hatch is created • **Retain Boundaries as Polylines** - retains boundaries and turns them into polylines • **Retain Boundaries as Regions** - retains boundaries and turns them into regions (Pro or Platinum versions only)

Islands Section	**Description**
Nested	When a closed hatch boundary contains other boundaries, BricsCAD hatches alternating areas.
Outer	When a closed hatch boundary contains other boundaries, BricsCAD hatches only the outermost area.
Ignore	When a closed hatch boundary contains other boundaries, BricsCAD hatches all interior areas, as if they were not present.

Options Section	**Description**

Annotative	Toggles the the Annotative property of the hatch: • **On** - applies the current annotative scale; see the CANNOSCALE (1.17.10) variable • **Off** - hatches use scale factor specified above When this option is turned on, the Associative option is unavailable
Associative	Toggles the associativity of hatch patterns: when the boundary is changed, the pattern automatically updates itself. • **On** - patterns is associative • **Off** - patterns i not associative: when the boundary is changed, the pattern remains as originally placed This option is not available for annotative hatches.
Create separate hatches	Toggles how multiple hatches are treated: • **On** - creates a separate hatch entity for each boundary in the selection set • **Off** - creates a single hatch entity of all areas
Draw order	Specifies where the pattern should be placed relative to overlapping entities: • **None** - draw order is ignored • **Send to Back** - pattern is behind (underneath) all other entities • **Send to Front** - pattern is in front (on top) of all other entities • **Send Behind Boundary** - pattern is placed behind the boundary • **Bring in Front of Boundary** - pattern is placed in front of the boundary
Layer	Specifies the layer on which the hatch should be placed: • **Use Current** - places the pattern on the current layer • **Other layer name** - **(choose a layer from the droplist onto which to place the pattern)**
Transparency	Set the transparency property of the hatch: • **Use current** - apply the current transparency value as defined by the CETRANSPARENCY (1.17.10) system variable • **By Layer** - apply the value of the transparency property of the layer on which the hatch is placed • **By Block** - the transparency value is controlled by block • **Specify value** - type a value or use the slider to set a value between 0 (fully opaque) and 90. The transparency level is limited to 90% to avoid confusion with layers that are frozen or turned off. The transparency value for new hatches is saved by the HPTRANSPARENCY (1.17.10) system variable.

Inherit properties	Copies the properties of another existing hatch pattern to use with this pattern: 1. Click the **Inherit Properties** button; the program temporarily dismisses the dialog box 2. **Select hatch entity to copy properties from - (use any selection method to choose a single hatch pattern already in the drawing.)** 3. **Select hatch entity to copy properties from - (select more hatches, or else press Enter to return tot he dialog box.)** This button is useful for quickly setting options of a new hatch based on existing hatches.

Tutorial: Use the Quad to simplify working with Hatch

Click here (1.16.1) to watch

Grips Editing

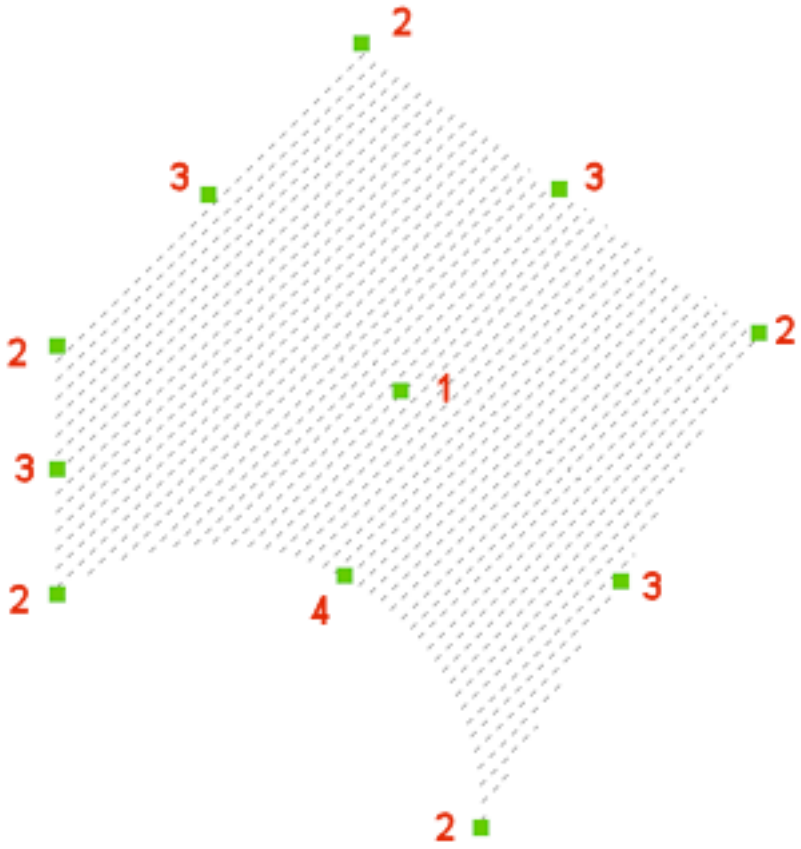
Non-associative hatches can be edited directly through grips:

1. Select the hatch. Notice that it has one central grip (1), grips on each boundary vertex (2) and grips in the midpoint of each boundary segment (3 and 4).
2. Drag the central grip (1) to move the hatch.
3. Drag a vertex grip (2) or a midpoint grip (3 and 4) to change the hatch boundary.

(6.1292 on the next page)

1. Center grip: moves the hatch
2. Vertex grip: moves the vertex
3. Midpoint grip: moves the boundary segment
4. Arc midpoint grip: modifies the arc radius

Figure 6.1292



Procedures

- General procedure to create hatches and gradient fills (1.25.27)
- To define hatch properties (1.25.27)
- To define the boundary for a hatch or gradient fill (1.25.27)
- To edit a hatch or gradient fill (1.25.29)
- Defining the MAXHATCH setting (1.25.26)

Related Commands

Gradient (6.15.20) - places a gradient fill through a dialog box. -Hatch (6.16.1) - places hatch patterns through the command bar. HatchEdit (6.16.2) - edits hatches and gradient fills in a dialog box. -HatchEdit (6.16.4) - edits the boundaries of hatch and gradient entities; displays prompts in the command bar. HatchGenerateBoundary (6.16.5) - generates a boundary around a hatch or gradient fill. Properties (6.24.54) - changes the properties of hatch patterns. Settings (6.27.25) - specifies the default parameters for hatch patterns. Solid (6.27.45) - draws 3- and 4-side solid-filled areas.

Figure 6.1293

6.16.4 -HatchEdit

(6.2981 on page 6079) Edits the boundaries of hatch and gradient entities; displays prompts in the command bar.

Accessing the Command

command bar: **-hatchedit** transparent: **'-hatchedit** Quad menu: **2D Editing |** | | ribbon: **Draw | Hatch | Hatch Add Loop**
: **-HatchEdit Prompts you in the command bar:** Select hatch entity: **(Select a hatch or a gradient entity in the drawing)** Enter hatch option [Disassociate/ADd/Remove/ASsociate]: **(Enter an option, and then press Enter)**

Command Options

Option	Quad Icon	Description
Disassociate		Removes the associative property of the selected hatch or gradient entity; the program reports in the command bar: **Hatch boundary associativity removed**
Add		Adds boundary entities to the selected hatch or gradient entity; prompts you: **Specify internal point or [Select entities] - (do one of the following):** • Click inside a closed area; prompts you: **Selecting everything visible... Specify internal point or [Select entities] - (click inside another closed area, or press Enter to end.)** • Choose **Select entities**; prompts you: **Select entities - (select a closed entity.) Entities in set: 1 Select entities - (select another closed entity or else press Enter to end.)**

Remove		Removes boundary entities from the selected hatch or gradient entity. Boundaries of the selected hatch or gradient entity highlight; prompts you: 1. **Select entities - (select a boundary.)** 2. **Select entities - (select another entity, or press Enter to end.)**
Associate		Associates the selected hatch or gradient entity to a different boundary set; prompts you: **Specify internal point or [Select entities] - (do one of the following)**: • Click inside a closed area; prompts you: **Selecting everything visible... Specify internal point or [Select entities] - (click inside another closed area or press Enter to stop.)** • Choose **Select entities**; prompts you: **Select entities - (select a closed entity.) Entities in set: 1 Select entities - (select another closed entity or press Enter to stop.)**

Related Commands

HatchEdit (6.16.2) - edits hatches and gradient fills in a dialog box. -Hatch (6.16.1) - fills closed areas with repeating patterns; displays prompts at the command bar. Hatch (6.16.3) - fills closed areas with repeating patterns; displays the Hatch and Gradient dialog box. HatchGenerateBoundary (6.16.5) - generates a boundary around a hatch or gradient fill. Gradient (6.15.20) - fills closed areas with solid fills in nine different patterns and one or two colors; displays the Hatch and Gradient dialog box.

Figure 6.1294

6.16.5 HatchGenerateBoundary

(6.2981 on page 6079) Generates a boundary around a hatch or gradient fill at the command line. (Use the Boundary command for the dialog box version of this command.)

Accessing the Command

 command bar: **hatchgenerateboundary** menu: **Draw | Boundaries | Hatch Generate Boundary** Quad: **2D Editing |**  ribbon: **Draw | Hatch | Hatch Add Loop** : **HatchGenerateBoundary Prompts you in the command bar:** Select hatches to generate boundary: **(Select a hatch or gradient fill)** Entities in set: 1 Select hatches to generate boundary: **(Select another hatch or gradient fill, or else press Enter to stop adding entities)** Generated boundaries for # hatch(es) The program creates a boundary made of a polyline around the selected hatches or gradient fill.

Command Options

Option	Description
Select hatches to generate boundary	Choose one or more patterns or filled areas, or press **Enter** to end the command

Related Commands

BHatch (6.6.5) - places hatch patterns through a dialog box. Boundary (6.6.15) and -Boundary (6.6.16) place a polyline boundary inside closed areas. GenerateBoundary (6.15.14) - Creates closed polylines from faces of 3D solids as well as the boundaries detected when the Enable Boundary Detection open of SELECTIONMODES is activated. Gradient (6.15.20) - Fills closed areas with solid fills in nine different patterns and one or two colors; displays the Hatch and Gradient dialog box. Hatch (6.16.3) - fills closed areas with repeating patterns; displays the Hatch and Gradient dialog box. -Hatch (6.16.1) - fills closed areas with repeating patterns; displays prompts at the command bar. HatchEdit (6.16.2) - edits hatches and gradient fills in a dialog box. -HatchEdit (6.16.4) - Edits the boundaries of hatch and gradient entities; displays prompts in the command bar.

Figure 6.1295

6.16.6 HatchToBack

(6.2981 on page 6079) Sets the draw order of all hatch entities in the drawing to display behind all other entities.

Accessing the Command

command bar: **hatchtoback** menu bar: **Tools | Draw Order | Send Hatches to Back** ribbon: **Draw | Hatch | Send Hatches to Back** toolbar: **Draw Order |**
: **HatchToBack** 3 hatch entity(ies) sent to back

Command Options

No options. This command selects all hatch patterns in the current drawing automatically.

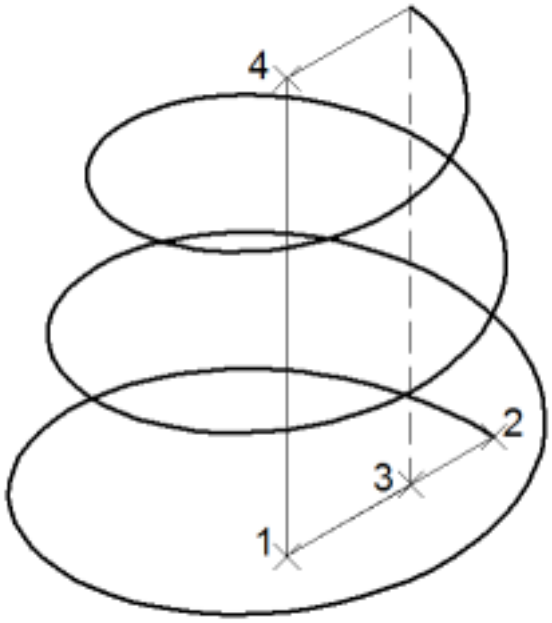
Related Commands

DrawOrder (6.10.40) - changes the display order of overlapping entities. DrawOrderByLayer (6.10.41) - sets draw order of overlapping objects through layer names. TextToFront (6.29.13) - sets the draw order of all texts and dimensions in the drawing to display in front of all other entities.

Figure 6.1296

Shape Classic Pro Platinum Mechanical BIM

Figure 6.1297



6.16.7 Helix

(7.3 on page 6132) Creates a 2D spiral or a 3D helix. (6.1297) The initial values for drawing a helix are

- Base Radius - 1
- Top Radius - equal to the base radius
- Base Diameter - 2
- Top Diameter - equal to the base diameter
- Height - 1
- Turns - 3
- Twist - CCW (counter clockwise)

In a drawing session, the previously used value becomes the new default value.

Accessing the Command

 command bar: **helix** transparent: **'helix** menu bar: **Draw| Helix** ribbon: **Draw | Draw | Polylines | Helix** toolbar: **Polylines |**  : **Helix Prompts you in the command bar:** Number of turns = 3.0 Twist = CCW Specify center point of base: **(Specify a point in the drawing; see #1 above)** Specify base radius or [Diameter] <default>: **(Specify the radius of the base, or else press Enter to accept the default; see #2)** Specify top radius or [Diameter] <default>: **(Specify the radius of the top, or else press Enter to the top radius equal to the base radius; see #3)** Specify helix height or [Axis endpoint/Turns/turn Height/tWist] <default>: **(Specify the height of the helix, enter an option, or else enter 0 to create a 2D spiral; see #4)**

Command Options

Option	Description
Specify center point of base	Pick a point in the drawing for the center of the helix's base; see point #1 in the figure above

Specify base radius	Specifies the radius of the helix's base; see point #2: • Enter a value • Press **Enter** to accept the default value • Enter **D** to specify a diameter instead
Diameter	Specifies the diameter of the base of the helix; prompts you: **Specify diameter <default> - (enter a value or else press Enter to accept the default value.)**
Specify top radius	Specifies the radius of the helix's top; see point #3: • Enter a value • Press **Enter** to accept the default value • Enter **D** to specify a diameter instead
Specify helix height	Specifies the height of the helix: • Enter a value; enter **0** for a 2D spiral (a helix of no height) • Press **Enter** to accept the default value • Enter an option, as described below
Axis endpoint	Defines the height and orientation (angle) of the helix; prompts you: **Specify axis end point - (specify a point in the drawing.)** The first point of the axis was specified earlier with the **Specify center point of base** option.
Turns	Specifies the number of revolutions for the helix, between 1 and 500; prompts you: **Enter number of turns <default> - (enter a number, or else press Enter to accept the default.)**
turn Height	Specifies the height of one revolution of the spiral; prompts you: **Specify distance between turns <default> - (enter a value, pick two points, or else press Enter to accept the default.)** The Turn Height and the number of Turns define the height of the helix.
tWist	Determine which way the spiral/helix rotates; prompts you: **Enter twist direction of helix [CW/CCW] <default> - (enter an option)**: • **CW** - clockwise • **CCW** - counterclockwise

Grips Editing

Helixes can be edited through grips:

1. Select the helix. Notice that it has four grips.
2. Drag the grips to perform the following actions:

- 1 - Moves the helix
- 2 - Modifies the base radius
- 3 - Modifies the top radius
- 4 - Modifies the height

6.16.9 Hide

(7.3 on page 6132) Removes hidden lines from 3D entities, as shown below. (This is an old command superseded by the Hidden visual style, which produces better results visually; see VisualStyles (6.31.15) command.) (6.1302)

Accessing the Command

command bar: **hide** alias: **hi** menu bar: **View | Rendering | Hide** ribbon: **View | Render Modes | Hide** toolbar: **Rendering |** : **Hide** Displays no prompt in the command bar; the program immediately removes hidden lines. To return to wireframe display, change the visual style to 2D Wireframe.

Command Options

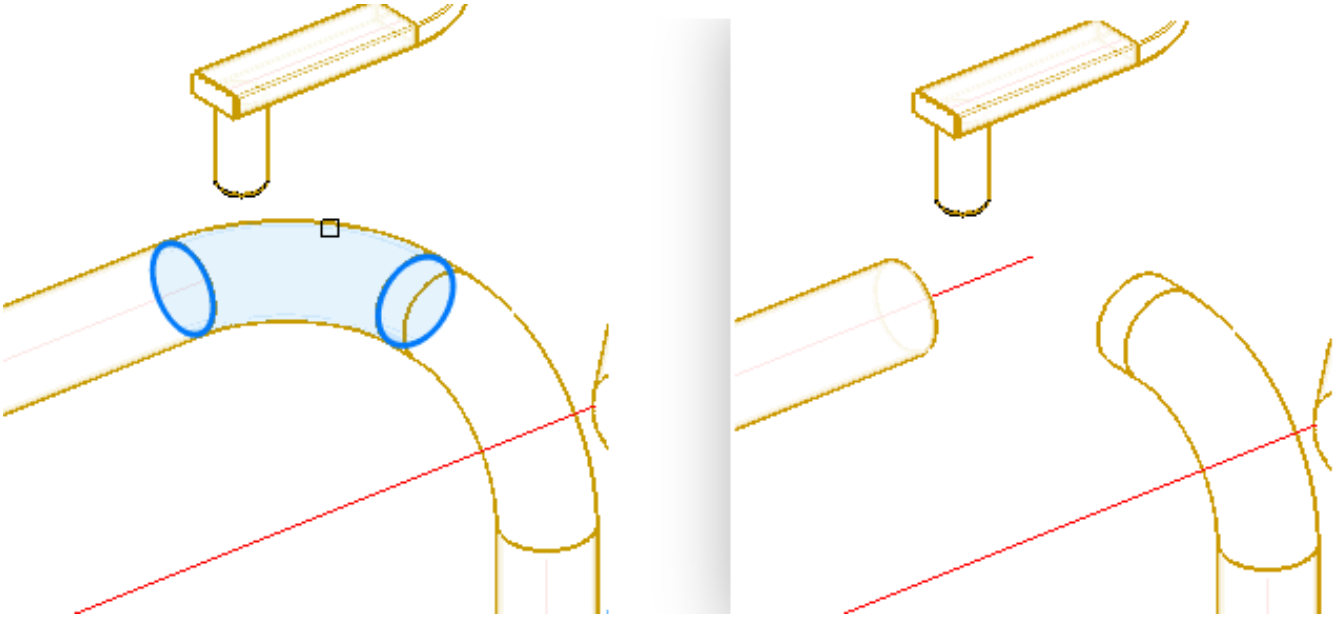
No options.

Related Commands

Render (6.26.21) - generates a photorealistic rendering using materials and lights Shade (6.27.30) - generates shaded images of 3D drawings. ShadeMode (6.27.31) - sets the shading style for 3D entities. Solprof (6.27.43) - creates a hidden line representation of 3D solids in a layout viewport. Flatshot (6.14.10) - creates a hidden line representation of all 3D solids in model space as a block or a new drawing. VisualStyles (6.31.15) - creates and controls visual style definitions in the Drawing Explorer. VsCurrent (6.31.23) - sets the visual style at the command line.

Figure 6.1303

Figure 6.1304



6.16.10 HideObjects

(7.3 on page 6132) Hides selected entities, like using the Freeze option of the Layer command but for individual entities. Hidden entities optionally stay hidden between drawing sessions. At left, an entity is selected; at right, it is hidden from view by this command. (6.1304)

Accessing the Command

command bar: **hideobjects** Quad: **Select** ribbon: **Model | View** toolbar: **Hide/Show Entities** : **HideObjects** **Prompts you in the command bar.** Select Entities to Hide: **(Select one or more entities)** Entities in set: 1 Select Entities to Hide: **(Select more entities, or else press Enter to end the command.)** The program hides from view the entities you selected; to return them to view, use the UnisolateObjects (6.30.7) command.

Command Options

Option	Description
Select Entities to Hide	Select one or more entities, or else press **Enter** to end the command

The OBJECTISOLATIONMODE system variable controls whether the hidden state is saved or not: (6.1377 on page 4653)

Figure 6.1305

[0] Objects are temporarily hidden for the current session. Interfered solids are selected together with the interference solids.
[1] Objects remain hidden between sessions. Interfered solids are selected together with the interference solids.
[2] Objects are temporarily hidden for the current session. Interfered solids are not selected together with the interference solids.
[3] Objects remain hidden between sessions. Interfered solids are not selected together with the interference solids.

Related Commands

LayFrz (6.20.12) - freezes the layers associated with entities selected in the drawing. LayOff (6.20.11) - turns off layers associated with entities selected in the drawing. IsolateObjects (6.17.22) - hides all but the selected entities. UnisolateObjects (6.30.7) - unhides entities that were hidden.

Figure 6.1306

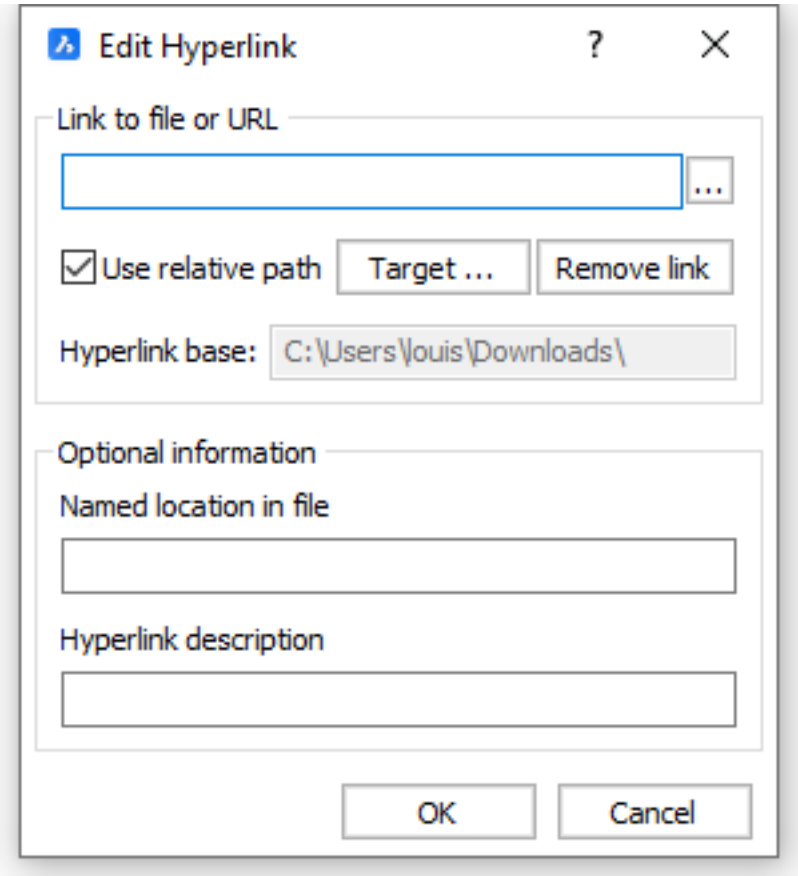
6.16.11 Hyperlink

(7.3 on page 6132) Links entities with files and Web pages through a dialog box.

Accessing the Command

command bar: **hyperlink** shortcut: **Ctrl+K** menu bar: **Insert | Hyperlink** : **Hyperlink Prompts you in the command bar:** Select entities: **(Choose one or more entities)** Entities in set: 1 Select entities: **(Choose more entities, or else press Enter to continue command)** Displays a dialog box: (6.1307 on the facing page) Change hyperlink options, and then click **OK**. Each entity can contain just one hyperlink.

Figure 6.1307



Command Options

Option	Description
Link to file or URL	Specifies the hyperlink; can be the path and name of a file, networked file, or location on the Internet. Examples of hyperlink syntax • File - C:\foldername\filename.ext • Networked file - \\networkname\c\foldername\filename.ext • URL - https://www.bricsys.com or www.bricsys.com Locations on the Internet can include Web pages (http://), FTP sites (ftp://), and so on.
...	Displays the Select File dialog box: 1. Choose a file name 2. Click **Open** The program establishes a hyperlink between the entity and the file. Any type of file can be linked to.
Use relative path	Determines how the path is stored in the URL: • **Yes** - uses the path specified by **Hyperlink base**: hyperlink base + relative path = full path or URL • **No** - uses the actual path to the file on your computer

Target...	For hyperlinks to drawings, you can specify a saved view or a layout to be displayed when the drawing opens. Displays a dialog box: (6.1308 on the next page) Select a saved view or a layout, then click the **OK** button.
Remove link	Removes the link from the entity
Hyperlink base	Specifies the path to relative hyperlinks; available only when **Use Relative Path** is turned on
Named location in file	Specifies a bookmark name. The # character specifies locations (bookmarks) within files or Web pages, such as www.bricscad.sys#bookmark.
Hyperlink description	Describes the purpose of the URL or file; this description is displayed in a optional tooltip when the cursor is paused over the entity, as specified by the HyperlinkOptions (6.16.13) command.

Related Commands

-Hyperlink (6.16.12) - attaches hyperlinks through the command bar. HyperlinkOptions (6.16.13) - sets options for hyperlinks. Settings (6.27.25) - sets options for hyperlinks in the Files section of the Settings dialog box. Browser (6.6.19) and Url (6.30.11) - open the default Web browser. OnWeb (6.23.6) - opens the Bricsys home page in your computer's default Web browser. Mail (6.21.1) - attaches the current drawing to a message in the default email client.

Figure 6.1308

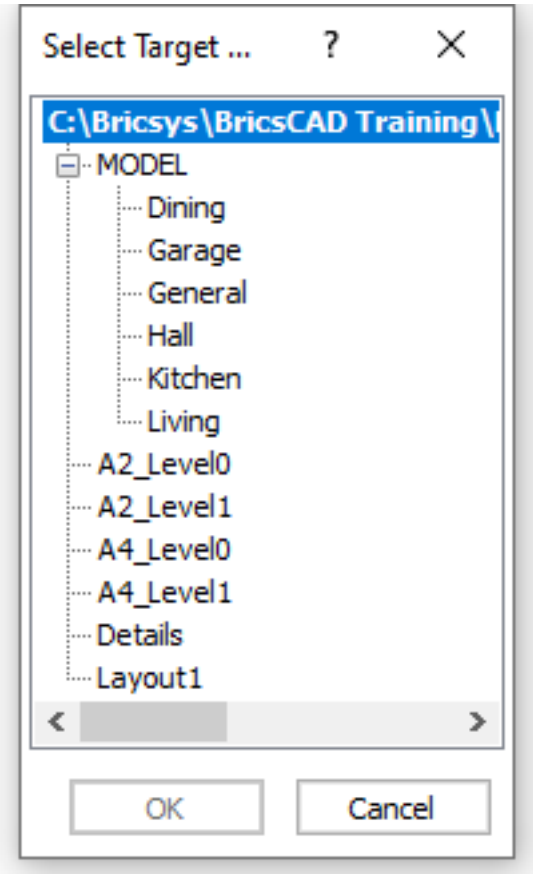


Figure 6.1309

6.16.12 -Hyperlink

(7.3 on page 6132) Links entities with files and Web pages at the command prompt. This command is meant for use by macros and LISP routines.

Accessing the Command

command bar: **-hyperlink** transparent: **'-hyperlink**
: **-Hyperlink Prompts you in the command bar:** Enter an option [Remove/Insert] <Insert>: **(Type R or I)** Entities can contain just one hyperlink; when you want to insert another hyperlink, BricsCAD asks: Overwrite existing hyperlinks? [Yes/No] <Yes>: **(Type Y or N)**

Command Options

Option	Description
Remove	Removes hyperlinks from entities; prompts you: 1. **Select entities** - **(choose one or more entities.)** 2. **Select entities - (choose more entities, or else press Enter to end the command.)**
Insert	Adds a hyperlink to one or more entities; prompts you: 1. **Select entities** - **(choose one or ore entities to which hyperlinks are to be added.)** 2. **Select entities - (choose more entities, or else press Enter to continue the command.)** 3. **Enter URL** - **(specify the path and name of the file, networked file, or location on the Internet.)** 4. **Enter named location** - **(specifies a bookmark name; press Enter to ignore this option.)** 5. **Enter description** - **(describes the hyperlink; press Enter to leave empty.)**

Overwrite Option	Description
Yes	Replaces the existing hyperlink with the new one
No	Leaves the existing hyperlink as it is; does not replace it

See the Hyperlink (6.16.11) command for example URLs.

Related Commands

Hyperlink (6.16.11) - attaches hyperlinks through a dialog box. HyperlinkOptions (6.16.13) - sets options for hyperlinks. Settings (6.27.25) - sets options for hyperlinks in the Files section of the Settings dialog box. Browser (6.6.19) and Url (6.30.11) - open the default Web browser. OnWeb (6.23.6) - opens the Bricsys home page in your computer's default Web browser. Mail (6.21.1) - attaches the current drawing to a message in the default email client.

(6.1726 on page 4955) Exports a BIM model to IFC, partially or entirely.

Accessing the Command

Keyboard: **ifcexport : IfcExport Prompts you:** Select entities to export [Entire model] <Entire model>: **(Select the entities to be exported or press Enter to export the entire model.)** The IFC File dialog box displays. Type a name in the File Name field, then click the Save button.

Command Options

No command options.

Procedures

IFC import and export settings (2.11.3) Export an IFC file (2.11.3) Export an IFC file only for selected entities (2.11.3) Export a BricsCAD BIM project with Xrefs exploded (2.11.3) Exporting a structural analysis model (2.11.3) Import/Export mapping of IFC files (2.11.3)

Related Commands

Export (6.13.18) - exports drawings in a variety of vector and raster formats. Import (6.17.10) - imports the geometry from external files into the current drawing.

Figure 6.1317

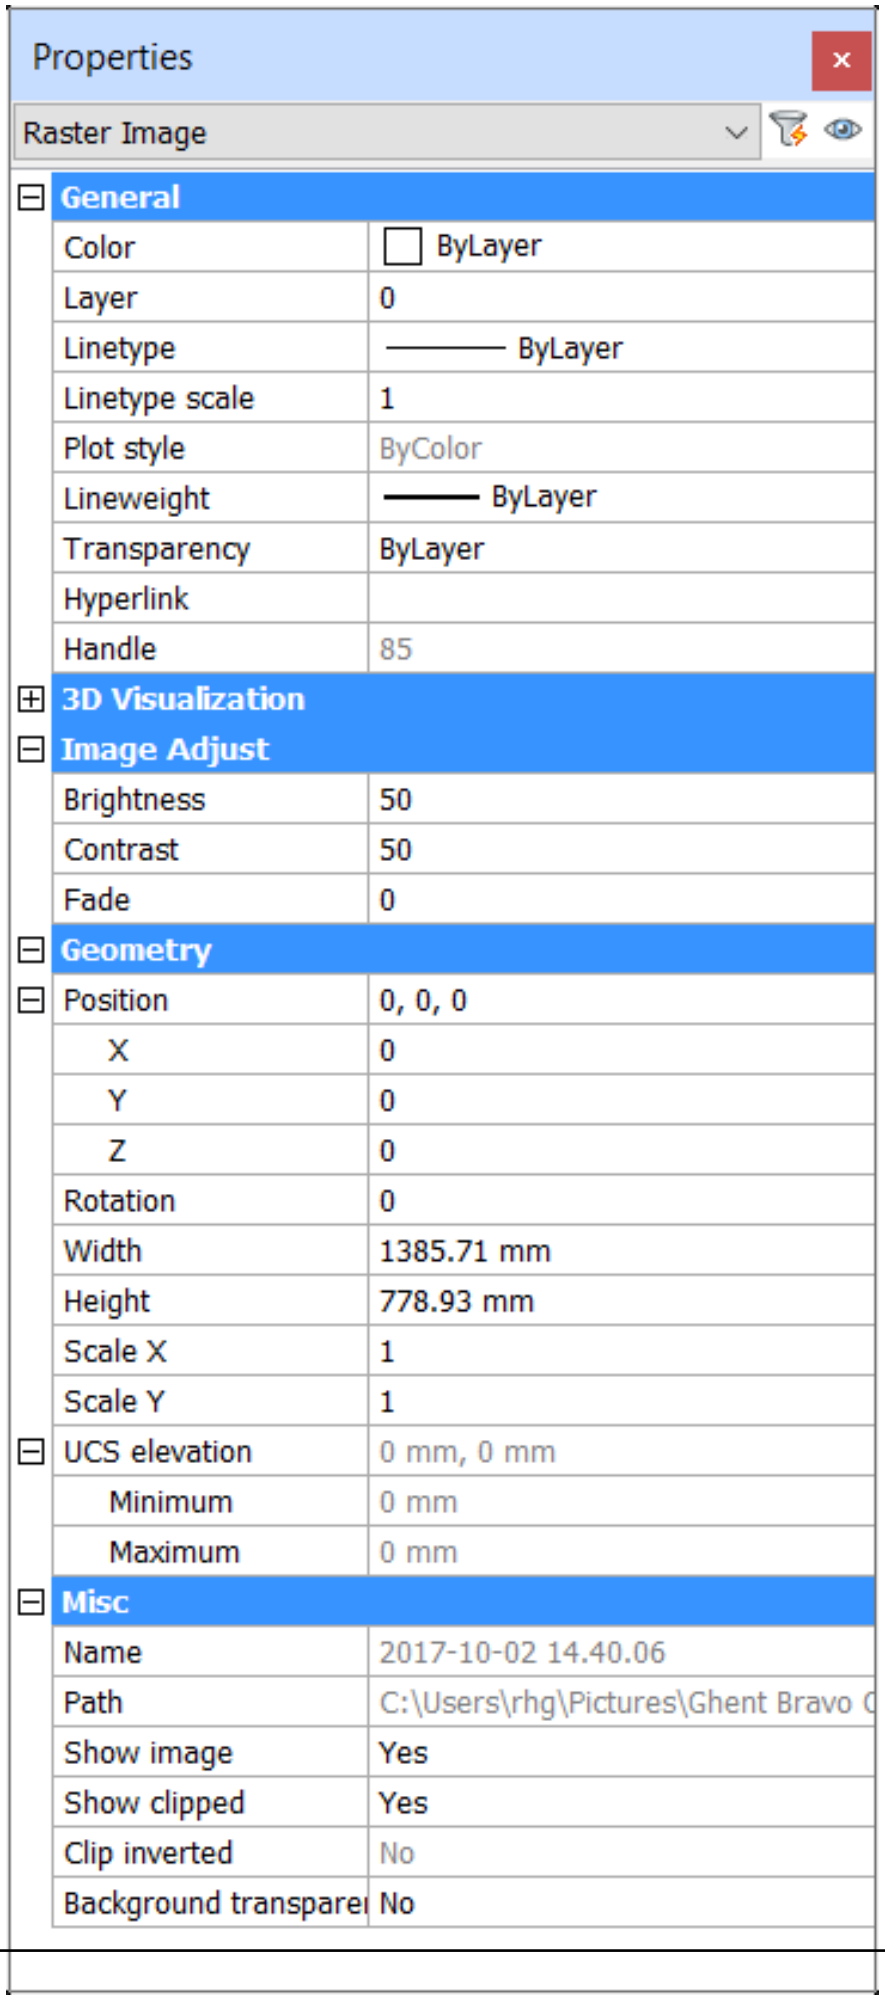
6.17.3 ImageAdjust

(6.2981 on page 6079) Adjusts the properties of images through the Properties palette.

Accessing the Command

 command bar: **imageadjust** transparent: **'imageadjust** shortcut: **double-click the image frame** alias: **iad** ribbon: **Insert | Images | Image Adjust** toolbar: **Images |**  : **ImageAdjust Prompts you in the command bar:** Select entities: **(Choose one or more image entities by their frames)** Select entities: **(Choose more entities, or else press Enter to continue)** Displays the Properties panel: (6.1318 on the next page) As you change properties in this panel, the program applies them immediately to the selected image(s).

Figure 6.1318



Command Options

Option	Description
Select entities	Selects the images to be adjusted.

Properties Panel Options	Description
General Properties	**The following properties affect the frame that surrounds the image:**
Color	Specifies the color of the frame. See Color (6.9.19) command.
Layer	Specifies the layer of the frame. When the image is placed on its own layer, you can use layer visibility to toggle the display of the image and its frame. See Layer (6.13.17) command. Alternatively, use the ImageFrame (6.17.9) command to toggle the display of the frame independently of the image.
Linetype	Specifies the linetype of the frame. See Linetype (6.20.32) command.
Linetype Scale	Specifies the linetype scale of the frame. See LTSCALE (1.25.6) system variable.
Plot Style	Specifies the plot style of the frame. This option is available only when plot styles are enabled in the drawing, See PlotStyle (6.24.28) command.
Lineweight	Specifies the lineweight of the frame. See LWeight (6.20.42) command.
Hyperlink	Specifies a URL or path to a file. See Hyperlink (6.16.11) command.
Image Adjust	**The following properties affect the image:**
Brightness	Lightens and darkens the image: • **0** - very dark or black • **50** - normal • **100** - very light or white
Contrast	Increases and decreases the contrast: • **0** - very low contrast • **50** - normal • **100** - very high contrast
Fade	Fades the image: • **0** - no fade • **100** - fully faded
Geometry Options	**The following properties affect the image:**
Position	Specifies the x, y, and z coordinates of the image's lower left corner. When you change the coordinates, the lower left corner is marked with a large X. (6.1319 on page 4597)
Rotation	Specifies the rotation angle about the position point: • **Positive angles** - rotate the image counter-clockwise • **Negative angles** - rotate in the image clockwise
Width	Specifies the width of the image, in current unit
Height	Specifies the height of the image, in current units

Scale	Specifies the scale factor of the image: • **Less than 1** - makes the image smaller. • **More than 1** - makes the image larger.
Misc Options	**Description**
Name	Reports the name of the image; cannot be edited by the user
Path	Reports the path to the image file; cannot be edited by the user
Show Image	Toggles display of the image: • **Yes** - shows the image; this can be overridden by setting the layer to Frozen • **No** - hides the image
Show Clipped	Toggles clipping: • **Yes** - displays clipped image, if clipping has been previously applied by ImageClip (6.17.7) command; part of the image is hidden. • **No** - hides clipped portion(s); the full image is displayed
Clip Inverted	Inverts the clip to flip which part of the image is shown • **Yes** - inverts the clipping of the image • **No** - retains the original cklipping This option is available only when the image was previously clipped by ImageClip (6.17.7) command
Background Transparency	Toggles the background transparency: • **Yes** - makes the background color of the image • **No** - keeps the image nontransparent Transparency makes one color of the image see-through. See the Transparency (6.29.34) command.

Related Commands

Image (6.13.13) - controls the parameters of the image file. ImageAttach (6.17.6) - places raster images in drawings. -ImageAttach (6.17.5) - attaches raster images to the drawing; displays prompts in the command bar. ImageClip (6.17.7) - clips images. ImageFrame (6.17.9) - toggles the display of the frame around images. ImageQuality (6.17.8) - toggles the quality of the image. Transparency (1.25.9) - toggles the transparency of monotone images.

Figure 6.1319

Figure 6.1320

6.17.4 Id

(7.3 on page 6132) Reports the x,y,z coordinates of points you pick using the current coordinate system.

Accessing the Command

 command bar: **id** transparent: **'id** alias: **idpoint** menu bar: **Tools | Inquiry | ID Coordinates** ribbon: **Tools | Inquiry | ID Coordinates** toolbar: **Inquiry |**  : **Id Prompts you in the command bar:** Select point to identify coordinates: **(Pick a point in the drawing)** X=x.xxxx Y=y.yyyy Z=z.zzzz Use entity snaps (6.23.16) to pick points accurately on geometric features.

Command Options

Option	Description
Select point to identify coordinates	Specifies the point to be reported

Related Commands

Area (6.4.18) - reports the area, circumference, and perimeter of entities. Dist (6.10.36) - reports the 2D and 3D distances between two points. List (6.20.34) - lists the area and other parameters of entities in the command bar. MassProp (6.21.2) - reports the properties of solid models and regions. Properties (6.24.54) - lists the area and other parameters of entities in a palette.

Figure 6.1321

6.17.5 -ImageAttach

(7.3 on page 6132) Attaches raster images to the drawing; displays prompts in the command bar.

Accessing the Command

command bar: **-imageattach** : **-ImageAttach Prompts you in the command bar:** Image path will be stored as Full Path. Set image path mode [Full path/Relative path/No path] <Image path>: **(Enter the path and file name of the image file, or else choose a path option)** Use geocoding information [use Geocoding info] <Insertion point>: **(Pick an insertion point for the image, or else type G)** Scale [Size/XY scales] <1.0000>: **(Pick a point to specify the size of the image, enter a value for the scale factor, press Enter to accept the default scale, or else choose an option)** Rotation angle <0>: **(Pick a point to specify the rotation of the image, enter a value for the rotation angle, or else press Enter to accept the default value)**

Command Options

Option	Description
Set image path mode	Specifies how the program should remember the path to the image, which is saved in the drawing: • **Full path** - the full path of the image file is saved, such as D:\BricsCAD Training\EN\Exercises\Gearbox.png • **Relative path** - the path relative to the drawing folder is saved, such as ..\Exercises\Gearbox.png • **No path** - the path is not saved, and so the program searches for the image in the drawing folder
Use geocoding information	Uses geocoding data to determine the image's insertion point, scale, and rotation angle; Prompts you: **Embedded geocoding information/Geocoding file path [Embedded]<Path\ImageName.pgw>** - **(enter an option)**: • **Embedded geocoding information** - use the geocoding information embedded in the image file • **Geocoding file path** - specify the name of a PGW file that contanis the geocoding data
Scale	Specifies the scale factor of the image; enter a number: • **Larger than 1.0** - increases the size of the image • **1.0** - image is inserted at its actual size • **Smaller than 1.0** - decreases the size of the image • Press **Enter** to accept the default Scale factor cannot be 0 or a negative value. This option maintains the image's aspect ratio.

XY scales	Specifies the scale factors for the X and Y directions independently; prompts you: **Specify X scale factor <1.0000>** - **(enter an option)**: • Press **Enter** to accept the default value • Pick a point in the drawing; the base point is the point you picked earlier for the insertion point • Type a positive value for the X scale factor **Specify Y scale factor <Equal to X scale factor <221.8098»** - • Press **Enter** to make the Y scale factor the same as the X • Pick a point in the drawing; the base point is the point you picked earlier for the insertion point • Type a positive value for the Y scale factor
Size	Sizes the image interactively; the first point was the point you picked earlier for the insertion point. Prompts you: **Specify opposite corner** - **(pick a point in the drawing.)** This option maintains the image's aspect ratio.
Rotation Angle	Specifies the rotation angle; prompts you: **Rotation angle <0>** - **(press Enter to accept the default 0° rotation, or else pick a point to show the rotation, or type a value.)**

Related Commands

ImageAttach (6.17.6) - attaches raster images to the drawing; displays a dialog box. Image (6.13.13) - controls the parameters of the image file. ImageAdjust (6.17.3) - changes the properties of images through the Properties palette. ImageClip (6.17.7) - clips images. ImageFrame (6.17.9) - toggles the display of the frame around images. ImageQuality (6.17.8) - toggles the quality of the image. Transparency (1.25.9) - toggles the transparency of monotone images.

Figure 6.1322

6.17.6 ImageAttach

(7.3 on page 6132) Attaches raster images of the following formats to the drawing through dialog boxes: **BMP** - Windows bitmap **ECW** - Enhanced Compressed Wavelet format **GIF** - CompuServe graphic image format **JPG**, **JPEG**, and **JPEG2000** (JP2, j2k) - Joint Photographic Experts Group (common among digital cameras) **MTI** - Multi-resolution Tiled Image (Bricsys raster format for large images) **PCX** - PC Paintbrush **PNG** - Portable network graphics **SID** - MrSID is an acronym for Multi-resolution Seamless Image Database **TGA** - Targa **TIF** and **TIFF** - Tagged Image File Format (commonly used by desktop publishing) **BIGTIFF**: TIFF variant file format which uses 64-bit offsets and supports much larger files. To allow fast display operations, BigTiff images are cached in the BricsCAD proprietary MTI format. Until this cache generation is completed, the image frame is displayed.

Accessing the Command

 command bar: **imageattach** transparent: **'imageattach** alias: **iat** menu: **Insert | Attach Raster Image** ribbon: **Insert | Images | Attach Raster Image** toolbar: **Images |**  : **ImageAttach** Displays a dialog box: (6.1323 on the following page) Choose an image, and then click **Open**. Displays a second dialog box: (6.1324 on page 4603) Specify options, and then click **OK**.

Figure 6.1323

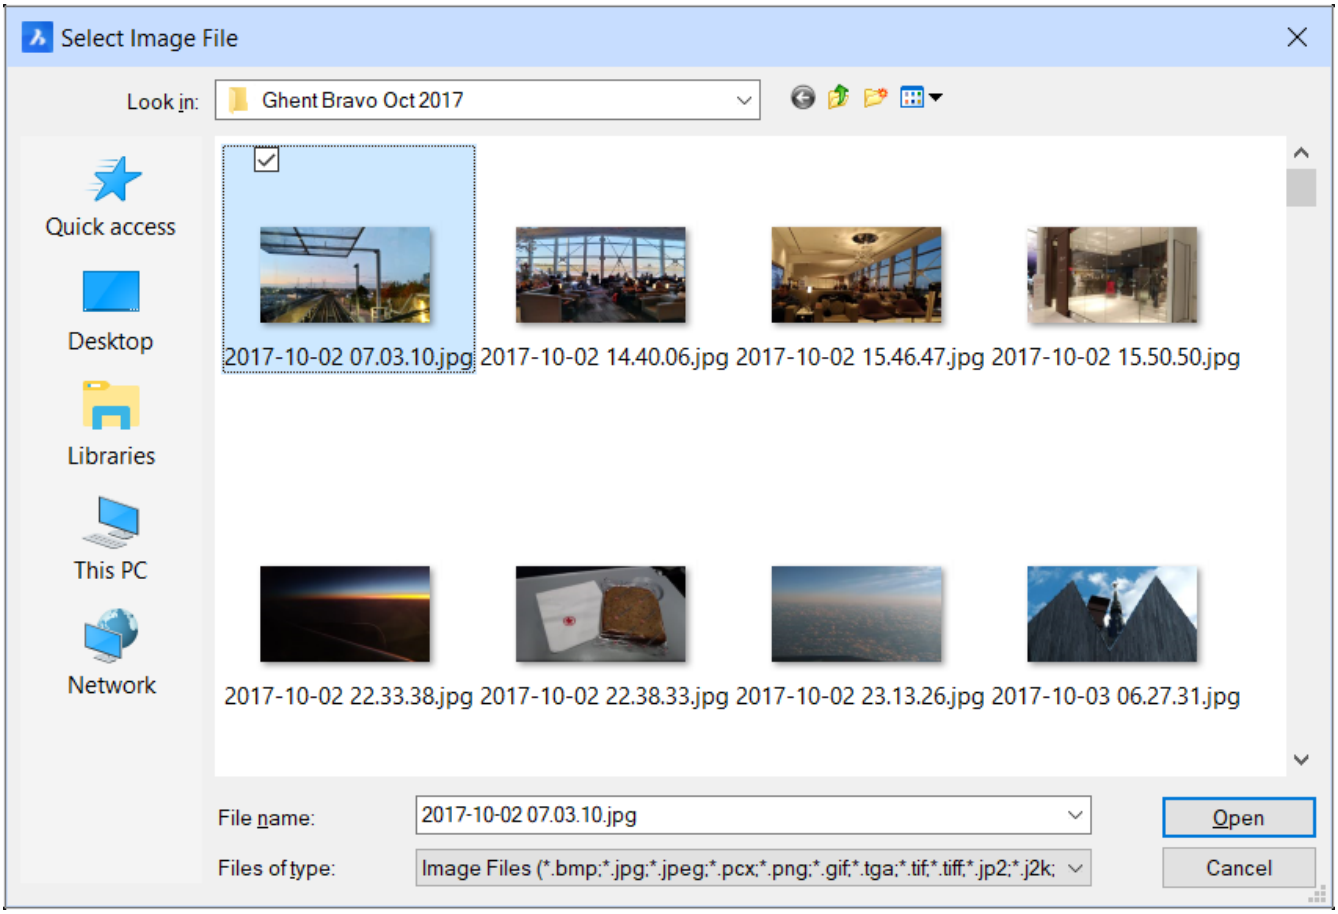


Figure 6.1324

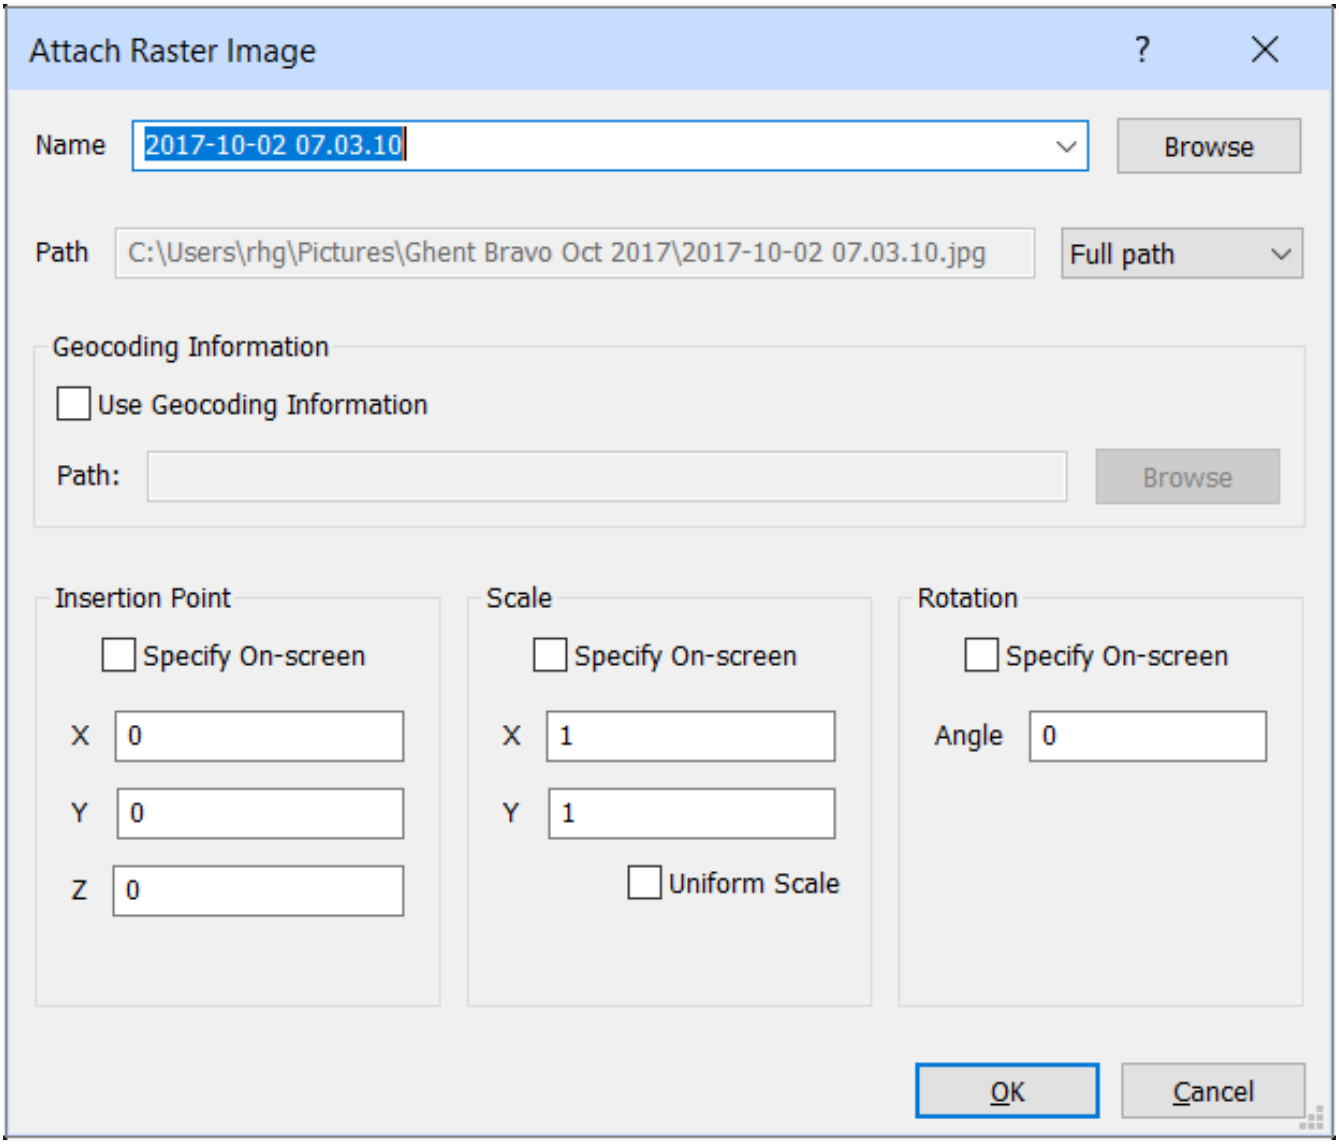


Command Options

Options	Description
Name	Specifies the file name of the image.
Browse	Displays the Open dialog box; click this button to choose a different raster file. Choose a raster file, and then click Open .
Path	Reports the path to the image file; cannot be edited by the user.
Full Path	Determines how much of the path is stored: • Full Path - stores the full path to the file, including drive and folder names. For example: c:\foldername\imagename.ext • Relative Path - stores the path from the drawing's location to the image's location; the drawing must be saved before this option can be selected. For example: ..\foldername\imagename.ext where .. refers to the folder above the current one. • No path - the path is discarded.
Geocoding Information	Position files or world files have an extension that depends on what kind of image file they are associated with. See explanatory notes below: "About Geocoding Information".
Use Geocoding Information	Toggles use of a position file, which specifies the size, location, and rotation of the image file: • Yes - uses a position file. • No - does not use a position file.
Path	Reports the path to the position file.
Browse	Displays the Select Image Position File dialog box; choose a TWF file, and then click Open .
Insertion Point	Positions the lower left corner of the image in the drawing. This option is unavailable when a position file is used.
Specify On-screen	Toggles where you specify the insertion coordinates: • Off - Specifies the x,y,z coordinates in the dialog box. • On - Specifies the coordinates after you click OK, in the command bar: **Insertion point - (specify the x,y or x,y,z coordinates of the image's lower left corner.)**
XYZ	Specifies the x-, y- and z-coordinate of the image's lower left corner.
Scale	Sizes the image. This option is unavailable when a position file is used.
Specify On-screen	Toggles where you specify the scale factors: • Off - Specifies the x,y,z scales in the dialog box. • On - Specifies the scales in the command bar after you click OK : **Scale factor - (specify the scale factor.)**

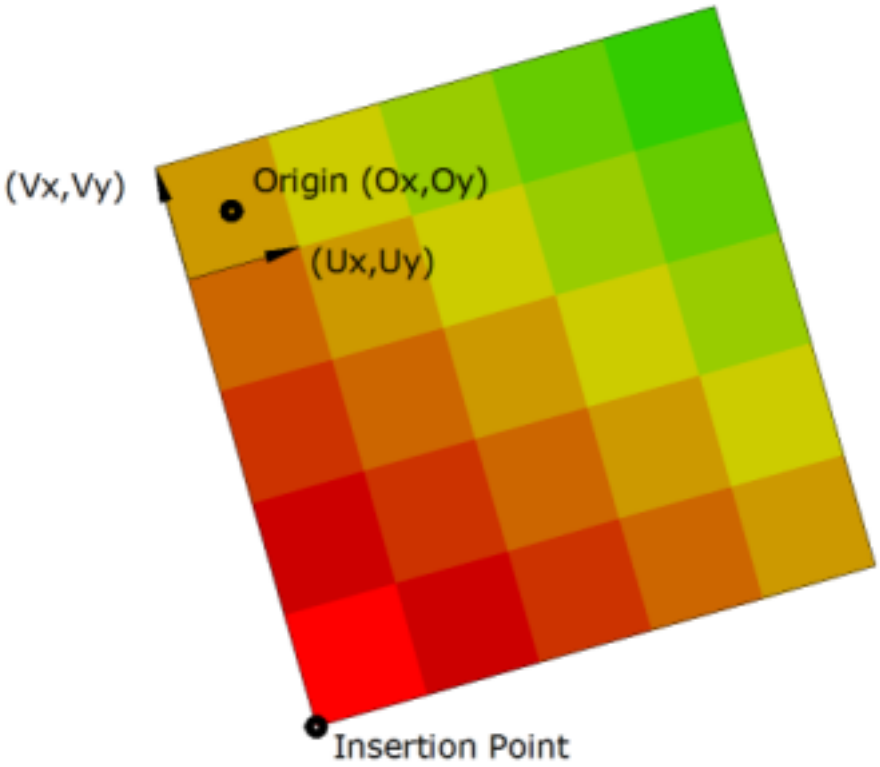
XY	Specifies the scale factor in the x and y direction: • Values larger than 1 make the image larger. • 1 inserts the image at actual size. • Values smaller than 1 make the image smaller.
Uniform Scale	Makes the Y scale factor equal to X.
Rotation Specify On-screen	Rotates the image about the insertion point. Toggles where you specify the rotation angle: • Off - Specifies the angle in the dialog box. • On - Specifies the angle in the command bar after you click OK :. Prompts you: **Rotation angle - (specify the angle.)**
Angle	Specifies the rotation angle about the insertion point. • Positive angles rotate the image counterclockwise. • Negative angles rotate the image clockwise.

About Geocoding Information

Position files (or world files) are plain ASCII text files that position raster files in the drawing. They are useful for positioning images according to geographic coordinates, such as latitude and longitude. They can be created using text editors such as **Notepad** . The format is a list of 6 numbers that fully describe location, scale and orientation of the top left pixel of the raster file to be attached. If **U** is the vector along the width, **V** is the vector along the height, and **O** is the center of the pixel (see image below): (6.1325 on the following page) then the list consists of: Ux Uy Vx Vy Ox Oy Typically, the first and last letters of the image extension are used with a "w" added at the end. Sometimes the full image extension with a "w" at the end is used also. The following position file formats are supported:

- *.bpw (for BMP images)
- *.jgw (for JPG images)
- *.gfw (for GIF images)
- *.tfw (for TIFF images)
- *.j2w (for JPEG2000 images)
- *.sdw (for SID images)
- *.pgw (for PNG images)

Figure 6.1325



Procedures

- Placing images in a drawing (1.31.1)

Related Commands

Image (6.13.13) - controls the parameters of the image file. -ImageAttach (6.17.5) - attaches raster images to the drawing; displays prompts in the command bar. ImageAdjust (6.17.3) - changes the properties of images through the Properties palette. ImageClip (6.17.7) - clips images. ImageFrame (6.17.9) - toggles the display of the frame around images. ImageQuality (6.17.8) - toggles the quality of the image. Transparency (1.25.9) - toggles the transparency of monotone images.

Figure 6.1326

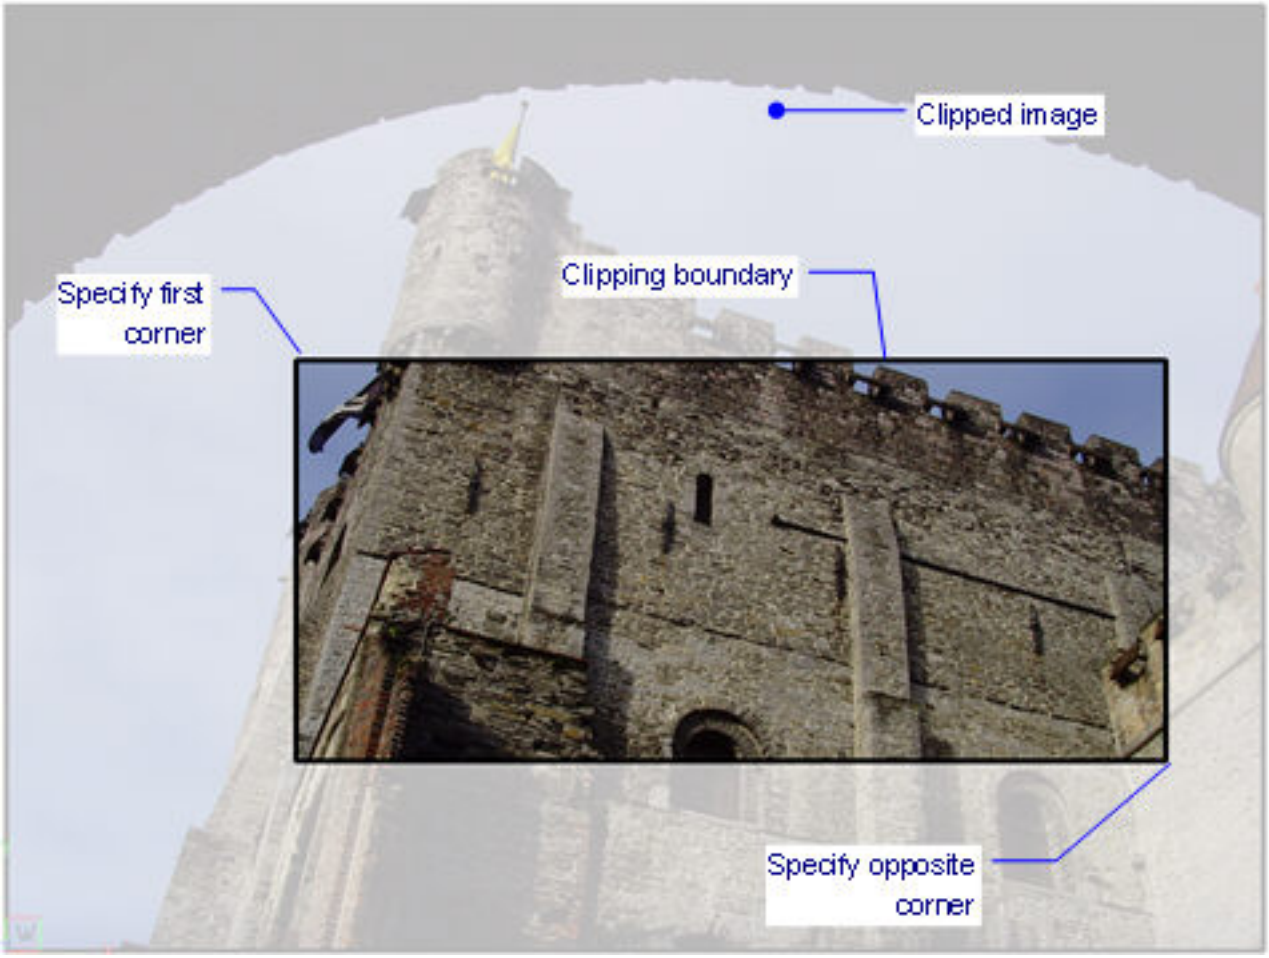
6.17.7 ImageClip

(7.3 on page 6132) Clips images with rectangular or polygonal shapes. **Note:** An image can have just one clipping boundary; creating a new one erases the old one.

Accessing the Command

 command bar: **imageclip** transparent: **'imageclip** alias: **icl** menu bar: **Modify | Raster Image | Clip Image** toolbar: **Images |**  : **ImageClip Prompts you in the command bar:** Select image: **(Select an image by clicking on its frame)** Enter image clipping option [ON/OFf/Invert/Delete boundary/New boundary] <New boundary>: **(Enter an option, or else press Enter to create a new clipping boundary)** Enter image clipping type [Polygonal/Rectangular] <Rectangular>: **(Press Enter to create a rectangular clipping boundary, or else choose Polygonal)** Specify first corner: **(Pick one corner of the clipping rectangle)** Specify opposite corner: **(Pick other corner of the clipping rectangle)** (6.1327 on the following page) The clipped portion becomes invisible; the figure shows the clipped portion faded for illustrative purposes; in BricsCAD,

Figure 6.1327



Command Options

Option	Description
Enter clipping option	Determines the clipping action: • **ON** - turns on the clipping and displays the clipping boundary • **OFF** - turns off the clipping and hides the clipping boundary • **Invert** - inverts the clipping mode so that the image is clipped on the outside or the inside the clipping boundary • **Delete boundary** - removes the clipping boundary • **New boundary** - creates a new clipping boundary, and turns on clipping
Rectangular	Creates a rectangular clipping boundary; prompts you: 1. **Specify first corner** - specifies the first corner of the clipping rectangle 2. **Specify opposite corner** - specifies the other corner of the clipping rectangle
Polygonal	Creates a multi-sided, polygonal boundary; prompts you: 1. **Specify first point** - specifies the starting point of the clipping boundary 2. **Specify next point or [Undo]** - specifies the next point; as you pick points, the program previews the boundary 3. **Specify next point or [Undo]** - specifies the next point, or undoes the last one; this prompt repeats until you press **Enter** **Undo** - undraws the last polygonal segment (6.1329 on page 4612)

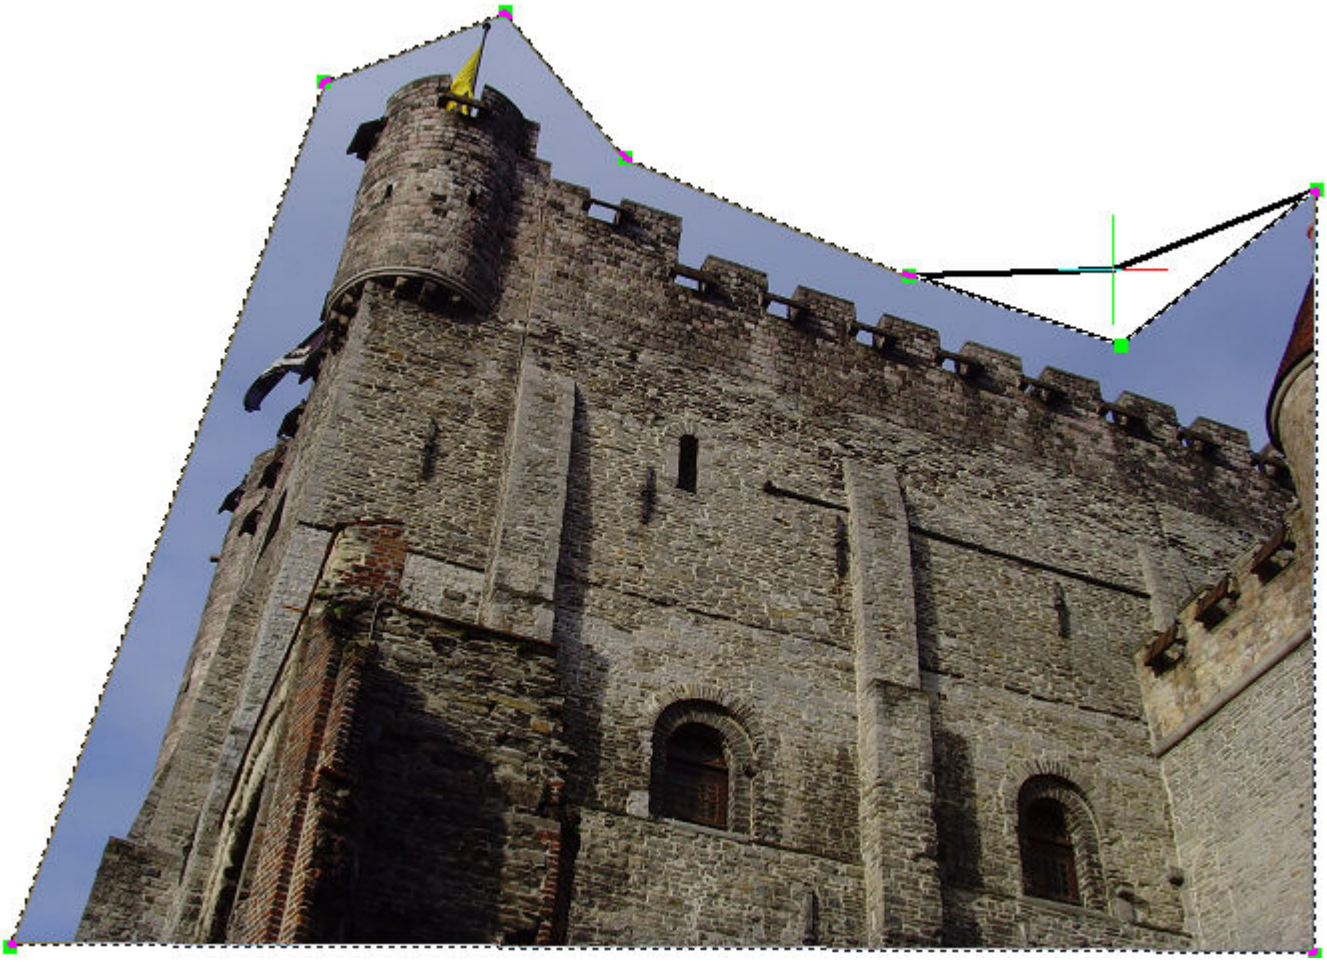
Grips Editing

Clipped images can be edited directly through grips:

1. Select the image frame. Notice that it has several grips.
2. Drag a grip to stretch the frame, which changes the path of the clipping boundary.

(6.1328 on the following page)

Figure 6.1328



Procedures

- To clip an image (1.31.2)
- To toggle the clipping boundary of an image (1.31.2)

Related Commands

Image (6.13.13) - controls the parameters of the image file. ImageAttach (6.17.6) - places raster images in drawings. -ImageAttach (6.17.5) - attaches raster images to the drawing; displays prompts in the command bar. ImageAdjust (6.17.3) - changes the properties of images through the Properties palette. ImageFrame (6.17.9) - toggles the display of the frame around images. ImageQuality (6.17.8) - toggles the quality of the image. Transparency (1.25.9) - toggles the transparency of monotone images.

Figure 6.1329

Figure 6.1330

6.17.8 ImageQuality

(7.3 on page 6132) Toggles the quality of images between draft and high.

Accessing the Command

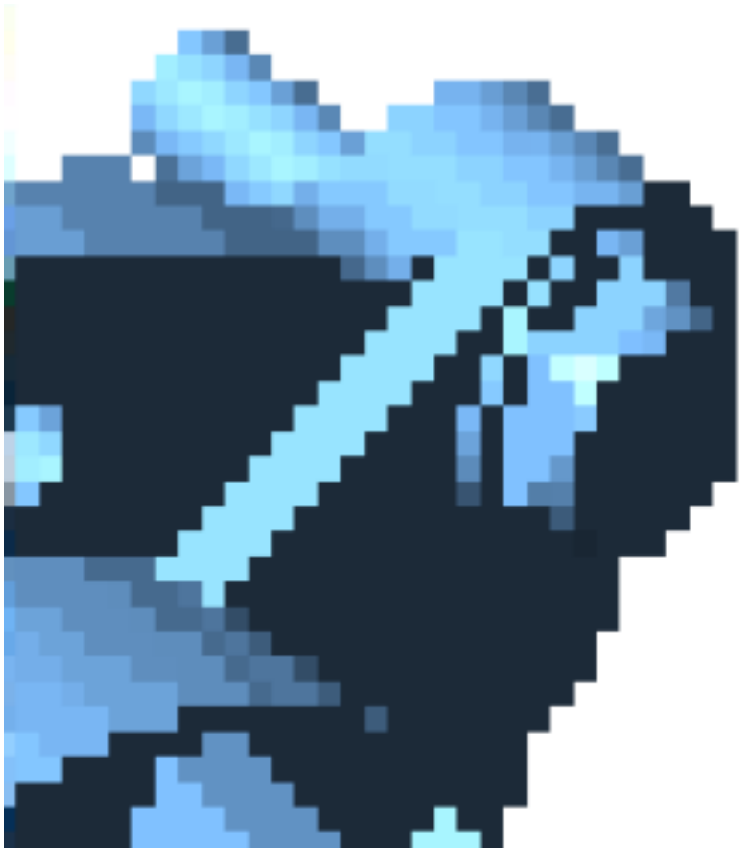
 command bar: **imagequality** transparent: **'imagequality** menu bar: **Modify | Raster Image | Image Quality** toolbar: **Images |** 

: **ImageQuality Prompts you in the command bar:** Enter image quality setting [Draft/High] <High>: **(Type D or H)** Image quality high (left) and draft (right): (6.1331 on the following page) (6.1332 on the next page) Use this command to reduce the memory used by very large images. When set to Draft, this command:

- Reduces color resolution
- Scales images with large numbers of pixels to reduce resolution and memory footprint

Figure 6.1331

Figure 6.1332



Command Options

Option	Description
Enter image quality setting	Toggles the image display quality: • **Draft** - lowers quality, displays faster • **High** - raises quality, displays slower

Related Commands

Image (6.13.13) - controls the parameters of the image file. ImageAttach (6.17.6) - places raster images in drawings. -ImageAttach (6.17.5) - attaches raster images to the drawing; displays prompts in the command bar. ImageAdjust (6.17.3) - changes the properties of images through the Properties palette. ImageClip (6.17.7) - clips images. ImageFrame (6.17.9) - toggles the display of the frame around images. Transparency (1.25.9) - toggles the transparency of monotone images.

Figure 6.1333

Shape Classic Pro Platinum Mechanical BIM

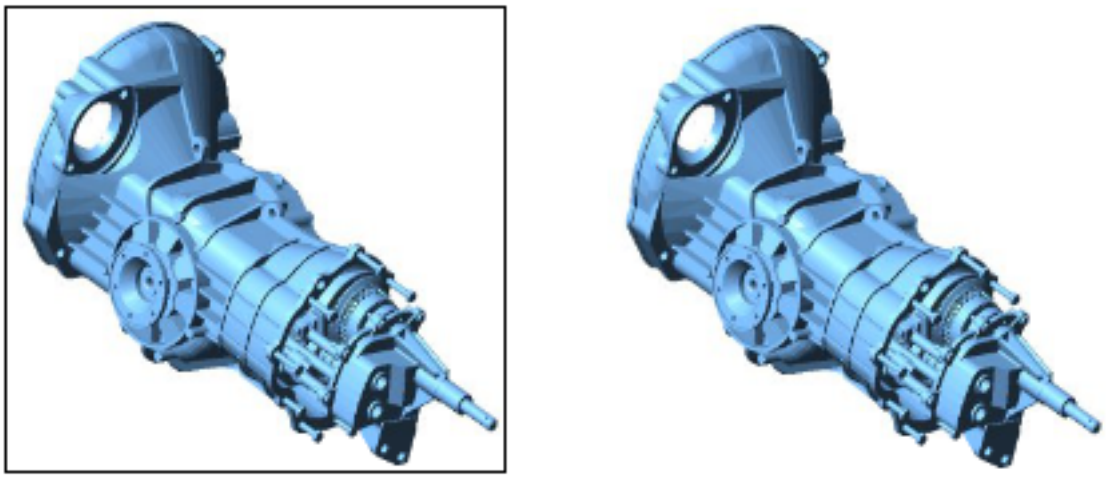
6.17.9 ImageFrame

(7.3 on page 6132) Toggles the display of the frame around all images in the drawing.

Accessing the Command

 command bar: **imageframe** transparent: **'imageframe** menu bar: **Modify | Raster Image | Display Image Frame** toolbar: **Images |** : **ImageFrame Prompts you in the command bar:** Enter image frame setting <0>: **(Type 0 or 1)** Fame on (left) and off (right): (6.1334) This command applies to all images in the drawing; frames cannot be toggled on individual images. It also applies to the frames made of rectangular and polygonal clippings. When frames are turned off, images can only be selected using window selection (1.32.7).

Figure 6.1334



Command Options

Option	Description
Enter image frame setting	Toggles the display of image frames: • **1** - turns on image frames. • **0** - turns off image frames.

Related Commands

Image (6.13.13) - controls the parameters of the image file. ImageAttach (6.17.6) - places raster images in drawings. -ImageAttach (6.17.5) - attaches raster images to the drawing; displays prompts in the command bar. ImageAdjust (6.17.3) - changes the properties of images through the Properties palette. ImageClip (6.17.7) - clips images. ImageQuality (6.17.8) - toggles the quality of the image. Transparency (1.25.9) - toggles the transparency of monotone images.

Figure 6.1335

6.17.10 Import

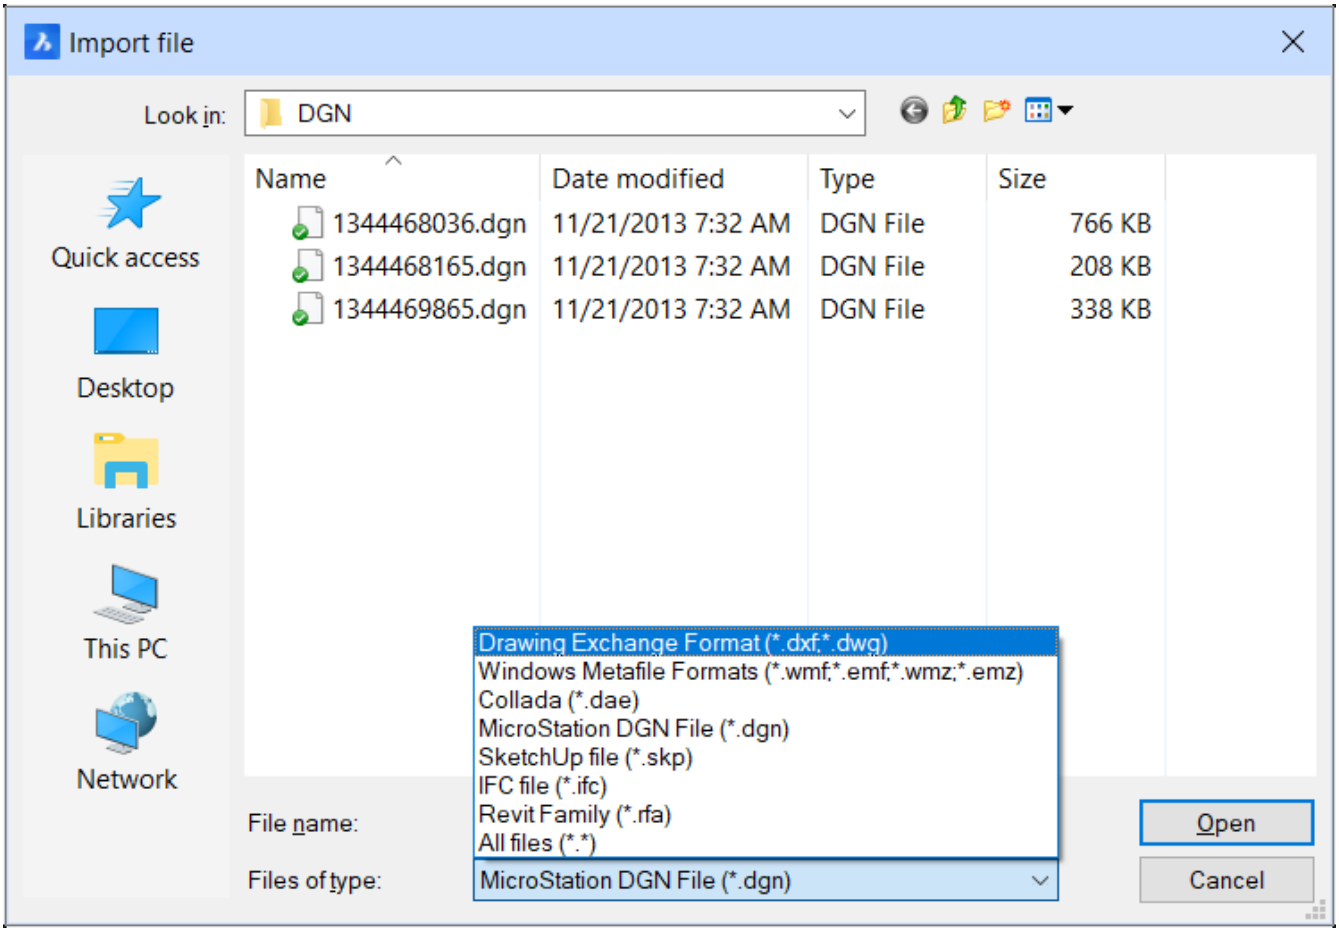
(7.3 on page 6132) Imports the geometry from external files into the current drawing.

NOTE	Some import formats have settings that can be changed through Import section of the Settings (6.27.25) command.

Accessing the Command

command bar: **import** alias: **imp** menu bar: **File | Import : Import** Displays a dialog box: (6.1336 on the next page) Choose a file, and then click **Open**. The file is opened in the current drawing.

Figure 6.1336



Command Options

Option	Description
File name	Specifies the name of the file.
Files of type	Specifies the file type to show in the Import File dialog box: • **DAE** - Collada files • **DGN** - Microstation design files • **DWG** - drawing files • **DXF** - drawing interchange files • **EMF**, **WMF**, **EMZ**, **WMZ** - Windows metafiles Formats available with the BIM add-on: • **IFC** - Industry Foundation Classes (IFC) data model that describes building and construction industry data. • **RFA** - Revit family files of symbols. • **SKP** - Sketchup model files. *.skp model files are imported as meshes. If desired, the ConvToSolid and ConvToMesh commands provide easy conversion between meshes and solids.
Open	Inserts the geometry in the current drawing.

The following 3D formats are available through a separate extra-cost module, BricsCAD Communicator; download it from the Bricsys website. The import and export procedures using **Communicator** are controlled through a series of user preferences. See the **Communicator** section on the Settings (6.27.25) dialog.

JT	JT	JT is a 3D data format developed by Siemens PLM Software (formerly UGS Corp.) and is used for product visualization, collaboration, and CAD data exchange. It can contain any combination of approximate (faceted) data, boundary representation surfaces (NURBS), Product and Manufacturing Information (PMI), and Metadata (textual attributes) either exported from the native CAD system or inserted by a product data management (PDM) system.
CATIA V4	model	CATIA (Computer Aided Three-dimensional Interactive Application) is a multi-platform CAD/CAM/CAE commercial software suite developed by the French company Dassault Systèmes.
CATIA V5	CATPart, CATProduct	V5 of the Catia CAD program from Dassault.
PARASOLID	XMT_TXT, XMT_BIN X_T, X_B	Parasolid is a geometric modeling kernel originally developed by ShapeData, now owned by Siemens PLM Software (formerly UGS Corp.), that can be licensed by other companies for use in their 3D computer graphics software products.
Solid Edge	PAR, PSM	Solid Edge is a 3D CAD parametric feature solid modeling software. which provides solid modeling, assembly modelling and drafting functionality.
NX	PRT	PRT is a part or model file format used by PTC Pro/Engineer, which is a CAD program that creates design parts and assembly processes.
Creo Elements Pro Engineer	ASM, PRT	Parametric, integrated 3D CAD/CAM/CAE solution created by Parametric Technology Corporation (PTC).
Solidworks	SLDASM, SLDPRT	SolidWorks is a 3D mechanical CAD program that runs on Microsoft Windows and is being developed by Dassault Systèmes. SLDPRT: part file, SLDASM: assembly file The ImportSwRotateYZ (1.17.10) user preference controls if geometry imported from SolidWorks files should be automatically rotated to map Y axis to Z axis.

VDA-FS	VDA	VDA-FS is a CAD data exchange format for the transfer of surface models from one CAD system to another. Its name is an abbreviation of "Verband der Automobilindustrie - Flächenschnittstelle", which translates to the "automotive industry association - surface data interface". Standard was specified by the German organization VDA.

Physical materials (2.7.17) If the imported assembly has physical materials assigned to its parts, the materials can be imported together with the assembly structure. For each material in the imported file, a corresponding material will be created in the target document material library, and its name, density, specific heat and thermal conductivity will be copied from the source material. If the imported file contains several materials with the same name, the first one will be used. If the document already has a material with the same name in its material library, this material will be used instead. Materials copied to the document material library will not be erased in Undo operations.

Procedures

IFC import and export settings (2.11.3) Import an IFC file (2.11.3) Import an IFC project as Xrefs (2.11.3) Import/Export mapping of IFC files (2.11.3)

Related Commands

CommunicatorInfo (6.9.24) - checks whether the Communicator product is correctly installed and prints a diagnostic report in the Prompt History window. dmSimplify (6.12.27) - simplifies the geometry and topology of 3d solid entities. DmStitch (6.12.29) - converts a set of region and surface entities that bound a watertight area to a 3d solid. DmAudit (6.12.2) - fixes inconsistencies in 3d geometry supported by ACIS kernel (3D solids, surfaces). Export (6.13.18) - exports the current drawing in a variety of raster and vector formats. IfcExport (6.17.2) - exports a BIM model to IFC, partially or entirely. Insert (6.17.13) - inserts DWG, DXF, and DWT files. InsertObj (6.17.16) - inserts objects from other applications. Load (6.20.35) - loads SHX shape files. VSlide (6.31.24) - displays SLD, WMF, and EMF files.

Figure 6.1337

6.17.11 -Import

(7.3 on page 6132) Imports geometry from external files at the command prompts.

NOTE	This command opens all file formats supported by the Import (6.17.10) command.

Accessing the Command

command bar: **-import** : **-Import Prompts you at the command line:** Enter import file name: **(Enter the path and file name of an importable file, such as C:\dwg\DXF\bc.dxf)** The geometry in the file is added to the current drawing.

Command Option

Option	Description
Enter import file name	Specifies the full path path and file name of an importable file: • Enter a path and name, such as **C:\dwg\DXF\bc.dxf** • Press **~** (tilde) to display the Import File dialog box; see the Insert (6.17.10) command • Press **Enter** to exit the command; the program reports, "No file name entered"

Related Command

Import (6.17.10) - imports geometry from external files into the current drawing via a dialog box.

Figure 6.1338

6.17.12 Imprint

(6.2932 on page 6037) Imprints 2D entities onto planar faces of 3D solids and surfaces to create additional edges.

NOTE	Use dynamic UCS (DUCS) to draw on the faces of 3D objects.

Accessing the Command

 command bar: **imprint** menu bar: **Model | 3D Solid Editing | Imprint** toolbar: **3D Solid Editing| Imprint** ribbon:

- **Home | Solid editing | Imprint**
- **Solid | Edit | Imprint**

Quad cursor menu: **Model | Imprint** : **Imprint Prompts you in the command bar:** Select 3d solid, surface or region: **(Select a 3D solid, a surface, or a region entity)** Select an entity to imprint: **(Select a 2D entity lying on or intersecting a planar face of the selected entity; the figure shows a circle, line, and rectangle polyline on the faces of a 3D solid)** (6.1339) Delete the source object Yes/<No>: **(Type Y or N)** Select an entity to imprint: **(Select another 2D entity to imprint on the same sold/surface/region, or else press Enter to end the command; the figure shows the imprints on the 3D solid, with source entities deleted)** (6.1340 on the next page) With the entities imprinted on the solid, you can use commands like Extrude (6.13.25) or dmPushPull (6.12.25) to manipulate the newly created faces, as shown below. (6.1341 on the following page)

Figure 6.1339

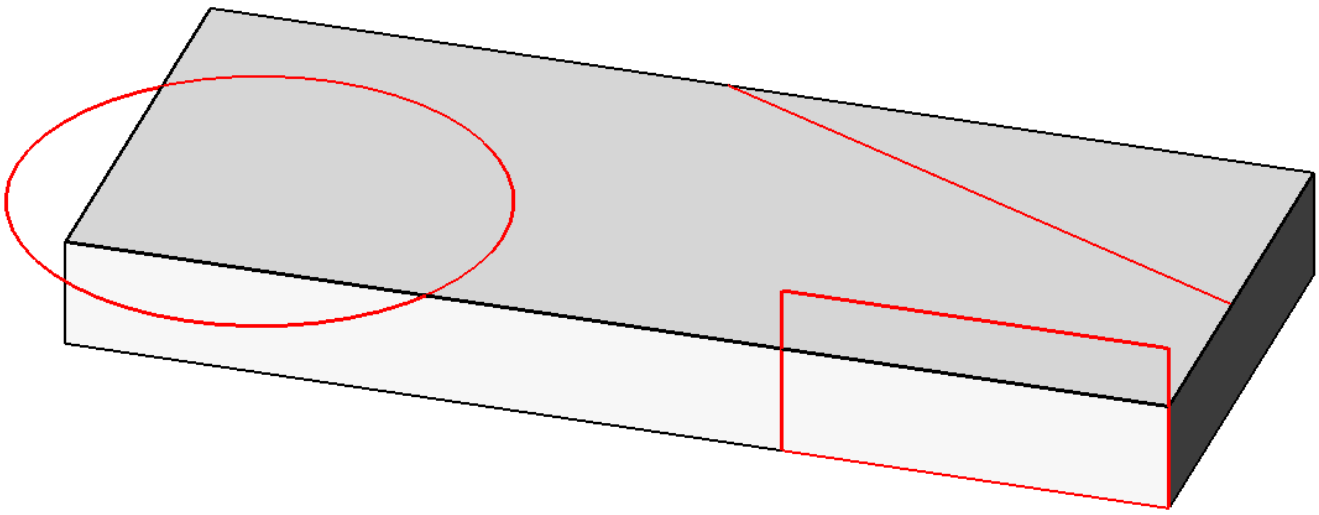


Figure 6.1340

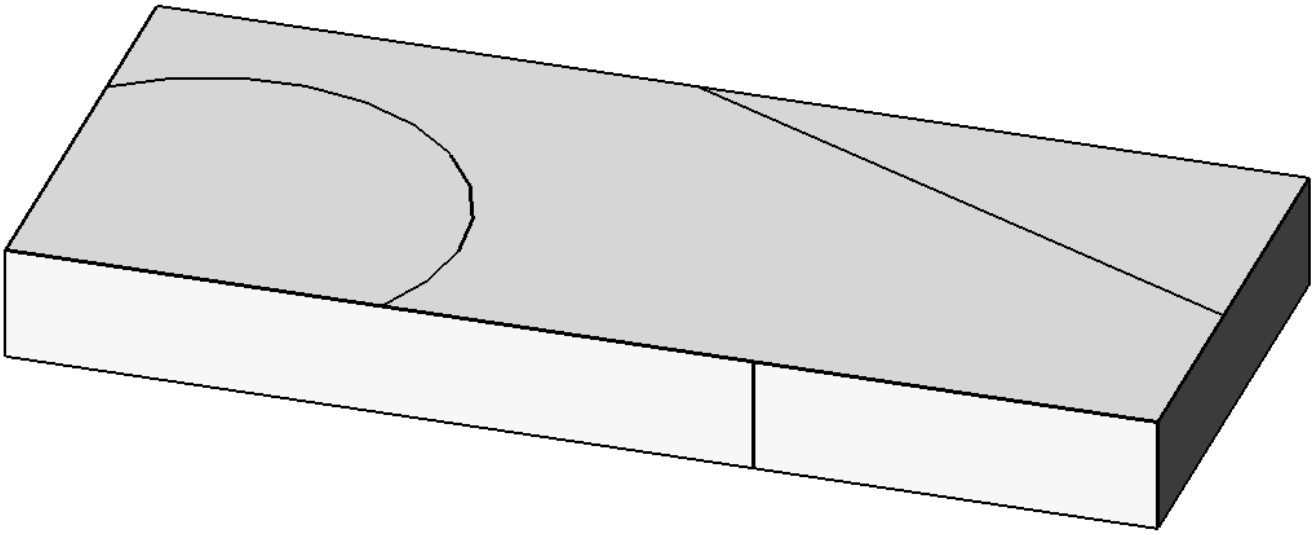

Figure 6.1341

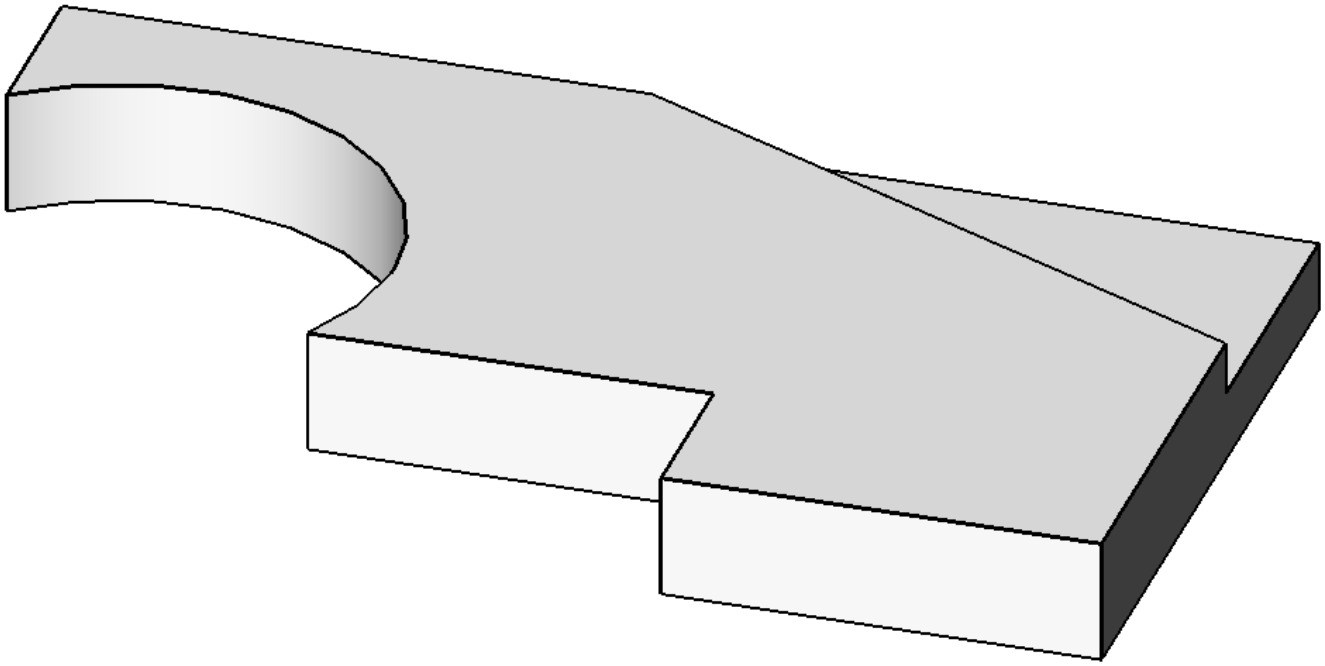


Command Options

Option	Description
Select 3d solid, surface or region	Select one of the following entities: • 3D planar solid, which is a solid that has at least one flat face, so no spheres or tori • Surface entity • Region entity; see the Region command
Select an entity to imprint	Select any 2D entity laying on or intersecting the planar face; this is the "source object"
Delete the source object	Determines the fate of the source entities used to make the imprints: • **Yes** - deletes the source entity after the imprint is completed • **No** - keeps the source entity around The **Select an entity to imprint** prompt repeats so that you can imprint more source entities on the solid/surface/region.

Related Commands

ProjectGeometry (6.24.53) - projects 2D geometry onto a region, a surface or a 3D solid; allows to create additional linework on the faces of solids and surfaces. SolidEdit (6.27.42) - edits 3D solids and 2D regions. XEdges (6.34.4) - creates 2D linear entities (lines, arcs, circles, ellipses, elliptical arcs and splines) from the edges of 3D solids, 3D solid faces, surfaces, etc. and regions.

Figure 6.1342

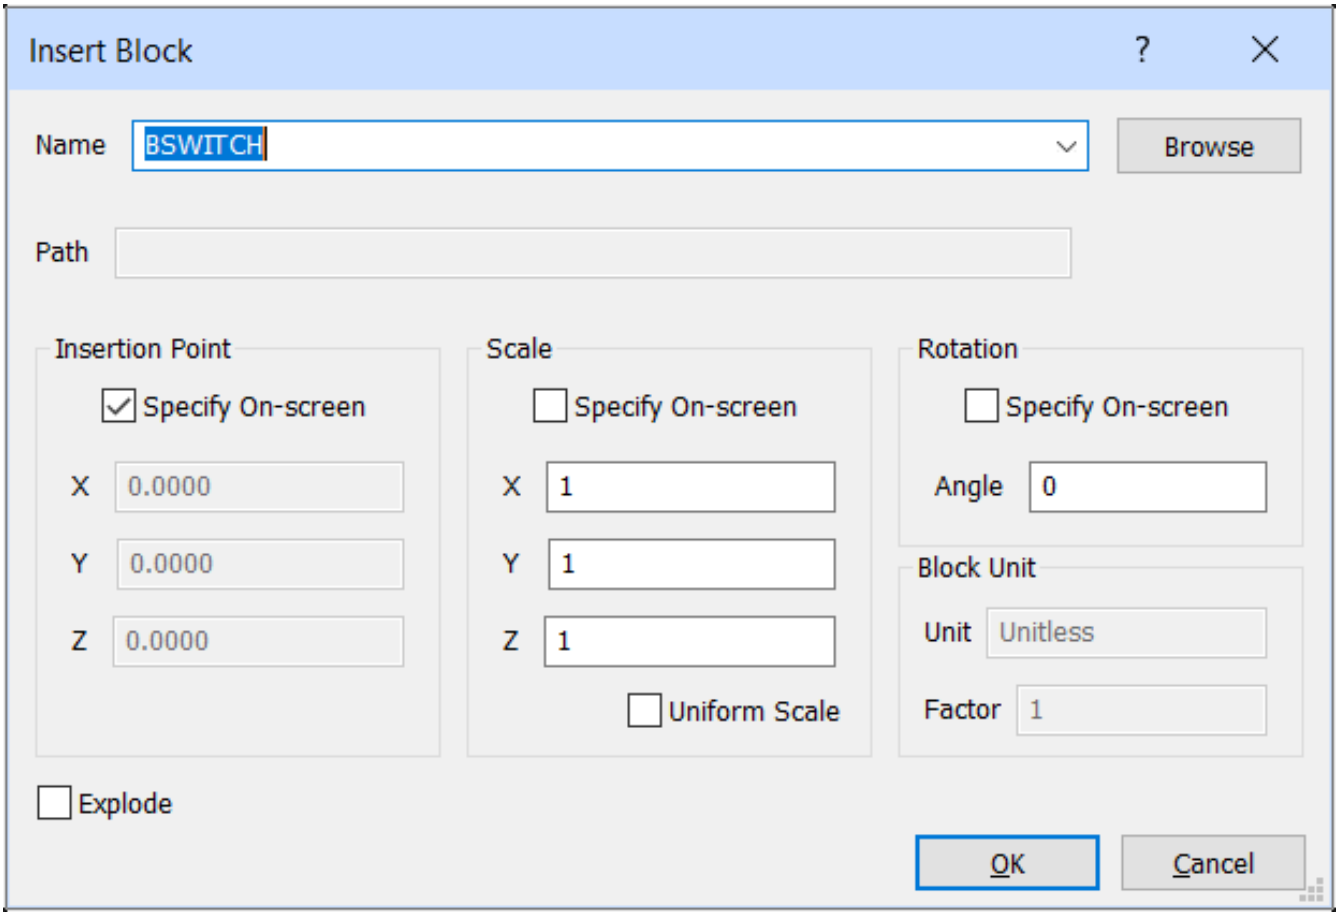
6.17.13 Insert

(7.3 on page 6132) Inserts blocks into the current drawing through a dialog box, and then prompts for attribute values, if any; also inserts entire DWG and DXF files as blocks into the drawing.

Accessing the Command

command bar: **insert** aliases: **i, ddinsert** menu bar: **Insert | Insert Block** ribbon: **Insert | Blocks** toolbar: **Insert |** Quad: **Insert** : **Insert** Displays a dialog box: (6.1343 on the facing page) Enter options, and then click **OK**. If the block contains attributes, then you are prompted to enter values for the attributes in the command bar or through a dialog box -- depending on the value of the the value of the ATTDIA (attribute dialog) variable.

Figure 6.1343



Command Options

Option	Description
Name	Specifies the name of the block, whose definition exists in the drawing, or is a DWG or DFX file on the computer or network: To choose a block in the drawing: • Enter the name • Click the **Name** droplist to choose from the names of blocks defined in the drawing Blocks are created with the Block (6.6.11) command.
Browse	Selects a DWG or DXF file from your computer or network: 1. Click the **Browse** button 2. Select a DWG or DXF file from the Select Drawing File dialog box 3. Click **Open**
Path	Reports the path to the block, if the block was opened from a DWG or DXF file.
Insertion Point	Specifies the insertion point of the block in the drawing. (6.1352 on page 4636) Insertion points are typically chosen at the lower-left corner of the block, in the center of the block, or at entity in the block that represents a connection point.

Specify On-screen

Toggles where you specify the insertion coordinates:

- **Off** - you specify the x,y,z coordinates in the dialog box
- **On** - you specify the coordinates in the command bar after you click **OK** when the program prompts you:

Insertion point - (specify the x,y or x,y,z coordinates of the block's lower left corner)

X Y Z

Specify the X-, Y- and Z- coordinates of the block's insertion point. The Z coordinate is typically left at 0 for 2D blocks.

Scale

Scales the block:

- Values larger than 1 - make the block larger
- 1 - inserts the block at actual size
- Values smaller than 1 - make the block smaller
- Values less than zero - flip the block, like mirroring it

(6.1351 on page 4635)

Specify On-screen

Toggles where you specify the scale factors:

- **Off** - specifies the x,y,z scales in the dialog box.
- **On** - Specifies the scale factor in the command bar after you click **OK** when the program prompts you:

Scale factor - (specify the scale factor.)

X Y Z

Defines the scaling of the block:

- **X** - specifies the scale factor along the x axis; enter a negative value to mirror the block about the y axis
- **Y** - specifies the scale factor along the y axis; enter a negative value to mirror the block about the x axis
- **Z** - specifies the scale factor along the z axis

Uniform Scale

Toggles whether or not the same scale factor is used for all axes:

- **On** - use the x scale factor also for the y and z scale factors
- **Off** - allows the x, y, and z scale factors to be different from one other

Rotation Angle

Specifies the rotation angle of the block about its insertion point, starting with the x-axis as 0 degrees:

- **Positive angles** - rotate the block counter-clockwise
- **Negative angles** - rotate the block clockwise

(6.1354 on page 4636)

Specify On-screen	Toggles where you specify the rotation angle: • **Off** - specifies the angle in the dialog box • **On** - specifies the angle in the command bar after you click **OK** when the program prompts you: **Rotation angle** - **(specify the angle.)**
Explode	Toggles whether the block is inserted exploded: • **Yes** - insert the block and then explode it to its constituent parts; see the Explode command • **No** - does not explode block; it is inserted as a block
Block Unit	Controls the automatic scaling of the block with respect to the INSUNITS system variable of the current drawing.
Unit	Shows the INSUNITS setting of the inserted block or drawing.
Factor	Shows the calculated scaling factor with respect to the INSUNITS setting of the inserted block (or drawing) and the current drawing.

Attribute Options	**Description**
ATTDIA = on	When the block contains attributes, the program prompts you to enter values for each attribute. Whether it displays a dialog box or prompts you at the command line depends on the AttDia variable. When AttDia=on, displays a dialog box: (6.1355 on page 4636) 1. Select an attribute in the list 2. Specify the value in the **Value** field; when the value is mtext,click the **...** button to access the mtext editor 3. Repeat for each attribute 4. Click **OK** To accept the default value for all attributes, simply click **OK**.
ATTDIA = OFF	When AttDia=off (default), the program prompts you in the command bar: **Attribute Prompt <default value>** - **(Type a new value at the command prompt, or else press Enter to accept the default value.)**

Grips Editing

Blocks can be edited directly through grips:

1. Select the block. Notice that it has one grip located at the insertion point.
2. Drag the grip to move the block.

(6.1350 on page 4634)

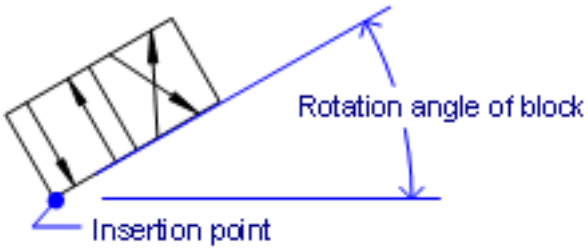

Figure 6.1348

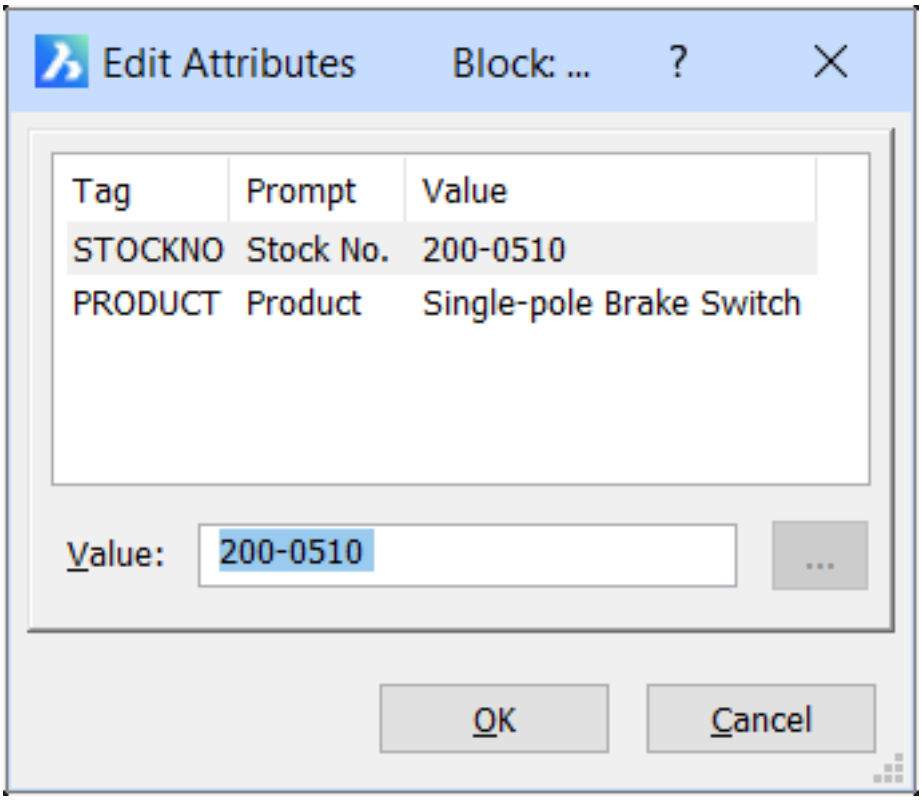

Figure 6.1349

6.17.14 -Insert

(7.3 on page 6132) Inserts blocks through prompts in the command bar; also prompts for attribute values, if any are part of the block definition.

Accessing the Command

command bar: **-insert** alias: **-i** : **-Insert Prompts you in the command bar:** ? to list blocks in drawing/~ to open the file dialog/<Block to insert> <BlockName>: **(Type the name of the block to insert, press Enter to accept the name of the previously inserted block, or else choose an option)** Insertion point for block or [Multiple blocks/Scale]: **(Specify the insertion point, or else choose an option)** [Corner] <1.000000>: **(Specify a point to show the size of the block, type a value to specify the X scale factor, press Enter to accept the default, or else enter C)** Y scale factor: < Equal to X scale (1.000000)>: **(Press Enter to set the Y scale factor equal to the X scale factor, or else type a value to specify the Y scale factor)** Rotation angle for block <0>: **(Press Enter to accept the default rotation angle, pick a point to show the rotation, or else or type a value)**

Command Options

Option	Description
? to list blocks in drawing	Lists the names of all blocks in the current drawing. Prompts you: **Block(s) to list <* for all>** - **(enter an option)**: • Press **Enter** to list all blocks • Enter part of a name to view the names of certain blocks. You can use wildcards like ? (for an individual character) and * for all characters. Generates a report similar to the following one: **Defined blocks. "_DYN_DIM_3D" "_None" User Unnamed Blocks Blocks 2 0** If necessary, press **F2** to view the full list; see TextScr (6.29.16) command. You must restart the -Insert command to insert the block.
~ to open the file dialog	Displays the Insert Block dialog box. Choose a DWG or DXF file, and then click **Open** .

BlockName=DrawingName

Redefines an existing block, replacing the block by a specified drawing. At the prompt: **? to list blocks in drawing/~ to open the file dialog/<Block to insert> <BlockName>: (Specify the block to be replaced and the replacement drawing.)**
BlockName=DrawingName * **The block BlockName already exists. Do you want to redefine it? [Yes-redefine block/No-do not redefine] <No-do not redefine>: (Type Y to redefine the block.)**

- Unless a path is specified, BricsCAD searches for the drawing in the folder of the current drawing and the paths defined by the SRCHPATH (1.17.10) system variable. When the replacement drawing is not found BricsCAD responds: Could not find file DrawingName
- Else, BricsCAD responds: The block "BlockName" redefined: Units: Millimeters Conversion: 1 Insertion point for block or [Multiple blocks/Scale]: X scale factor or [Corner/scale X Y Z] <1.000000>: Y scale factor: <Equal to X scale (1.000000)>: Rotation angle for block <0>:

* If the EXPERT (1.17.10) system variable is 2 or higher, the final prompt is suppressed and the block is redefined without confirmation.

Block to insert

Specifies the name of the block to be inserted; prompts you: **Block(s) to list [* for all] -**

- The program first looks the block in the block definitions of the current drawing
- If the block is not found in the current drawing, then the program searches the paths defined by the SRCHPATH (1.17.10) system variable
- When the block is not found there either, the command responds 'Could not find file <blockname>'

Multiple blocks

Inserts the same block multiple times by repeating the following prompts until you press **Enter** or **Esc**.

Scale

Sets the overall scale factor for the block. Prompts you: **Scale factor for block:** - **(enter a value)**:

- Values larger than 1 - make the block larger
- 1 - inserts the block at actual size
- Values smaller than 1 - make the block smaller
- Values less than zero - flip the block, like mirroring it

(6.1351 on page 4635)

Insertion point for block

Specifies the insertion point of the block in the drawing. (6.1352 on page 4636) Insertion points are typically chosen at the lower-left corner of the block, in the center of the block, or at entity in the block that represents a connection point.

Corner	Indicates the size of the block by specifying a second corner of a rectangle. The insertion point is the first corner. Prompts you: **Select other corner for scale or enter X scale factor - (pick a second corner, or enter a number for the x scale factor. You can pick points or enter x,y coordinates.)** (6.1353 on page 4636)
Y scale factor	Specifies the scale factor of the block in the y direction. Enter a negative number to mirror the block. Press Enter to make the y scale = x scale.
Rotation angle for block	Specifies the rotation angle of the block about its insertion point. Enter an angle or pick a point to show the rotation .(6.1354 on page 4636)
ATTDIA = ON	If the block contains attributes, the value of the ATTDIA (Attribute Dialog) system variable determines whether you are prompted in the command bar to set the attributes or through a dialog box. A dialog box displays: (6.1355 on page 4636) Select an attribute in the list, then define the attribute in the **Value** field.
ATTDIA = OFF	You are prompted in the command bar: **Attribute Prompt <Default Text>. (Type a new value at the command prompt or press Enter to accept the default value.)**

Grips Editing

Blocks can be edited directly through grips:

1. Select the block. Notice that it has one grip located at the insertion point.
2. Drag the grip to move the block.

6.17.15 InsertAligned

(7.3 on page 6132) Inserts blocks aligned with entities, and optionally mirrors them. (6.1357) **Note:** This command must be used with an entity snap turned on.

Accessing the Command

command bar: **insertaligned** alias: **insal** menu: **Insert | Insert Aligned Block**
: **InsertAligned Prompts you in the command bar:** ? to list blocks in drawing/~ to open the file dialog/<Block to insert> <defaultname >: **(Type ? for a list of block names, enter ~ for a file dialog box, or else enter the name of a block)** Insertion point for block or [Multiple blocks/Scale]: **(With an entity snap turned on move the cursor over an entity in the drawing, , or else type M or S)** Enter block mirroring control point: **(Move the cursor to flip the block, and then pick a point to place the block)**

Command Options

Option	Description
? to list blocks in drawing	Lists the names of all blocks in the current drawing. Prompts you: **Block(s) to list <* for all> - (press Enter to list all blocks, or enter part of a name to view some blocks. If necessary, press F2 to view the full list. See TextScr command.)**
~ to open the file dialog	Displays the Insert Block (6.17.13) dialog box. Choose a DWG or DXF file, and then click **Open**.
Block to insert	Specifies the name of the block to be inserted: • Press **Enter** to accept the name of the previously inserted block • Type the name of the block to insert
Multiple blocks	Repeats the Insertion point for next block: prompt until you press **Enter** or **Esc**. This allows you to insert the same block many times quickly.
Scale	Scale the block; prompts you: **Scale factor for block - (type a value.)**

Insertion point for block	Specifies the insertion point of the block in the drawing; follow these steps: 1. Turn on an entity snap mode, such as **end** or **nea** 2. Move the cursor over an entity, such as a line or circle 3. Click to insert the block 4. At the 'Enter block mirroring control point' prompt, move the cursor to flip the direction of the block 5. Click to locate the block
Enter block mirroring control point	Flips the block by 180 degrees: 1. Move the cursor to flip the block back and forth; the block is mirrored about its insertion point 2. Click to place the block (6.1358)

6.17.16 InsertObj

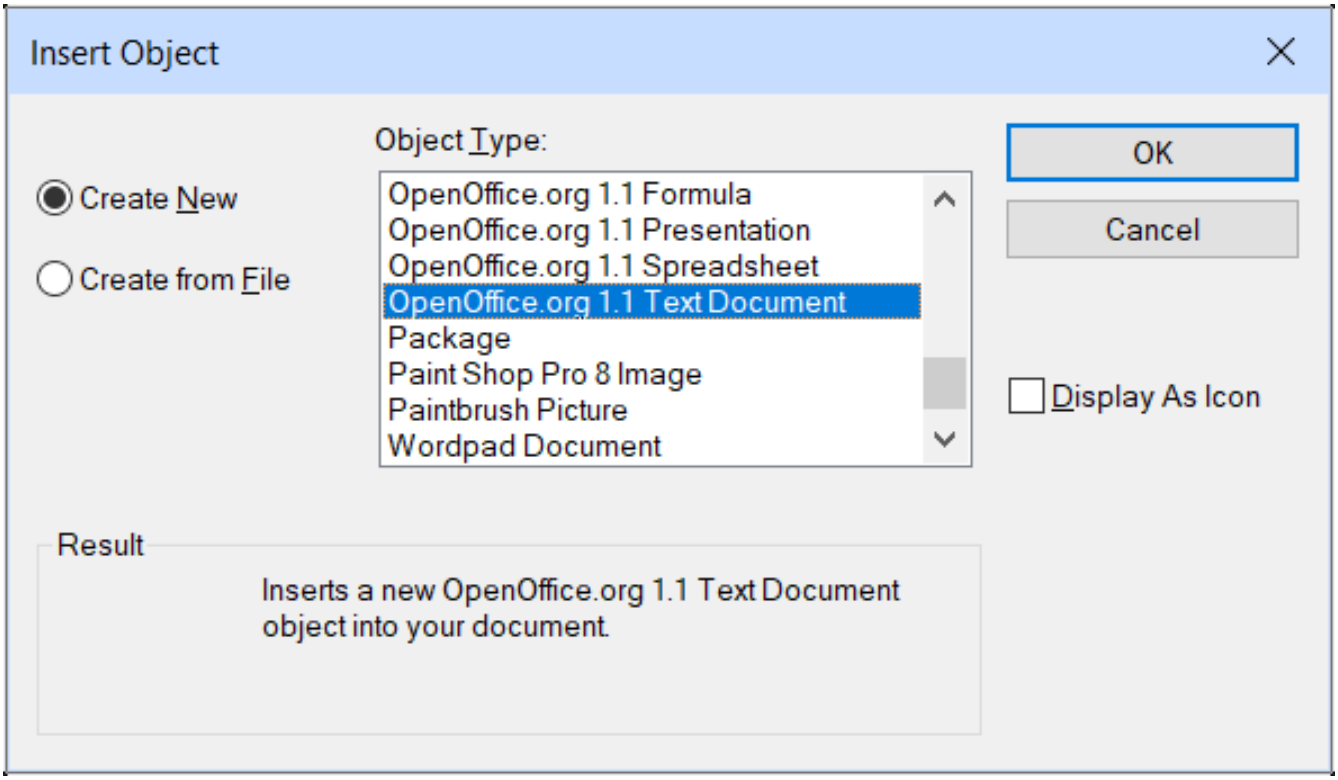
(6.2981 on page 6079) * Command only available on the Windows platform Inserts a linked or embedded document in the current drawing.

Accessing the Command

command bar: **insertobj** alias: **io** menu bar: **Insert | Insert Object** : **InsertObj** Displays a dialog box; the objects types listed varies according the software installed on your computer. (6.1360 on the next page)

1. Choose an object type, and then click **OK**.
2. BricsCAD opens the related application, in which you create an object (such as a spreadsheet or diagram) or use the application's **File | Open** command to open a file.
3. When done, choose **File | Close and Return to Drawing** in the application. The object appears in the upper left corner of the drawing, sometimes only as a blank rectangle.

Figure 6.1360



Command Options

Option	Description
Create New	Creates a new object by opening an application. These objects are also known as "OLE objects", short for Object Linking and Embedding.
Create From File	Displays a dialog box: (6.1362 on page 4642)
File	Specifies the file name of the file to be inserted.
Browse	Displays the Browse dialog box; choose a file, and then click **Open**.
Link	Toggles linkage to the source document: • **On** - links the object in the drawing to the source file, so that when the source file is changed, the linked object also changes • **Off** - does link not the object
Display As Icon	Displays the object as an icon. The icon is related to the document type and is defined by the source applications.
Change Icon	Displays the Change Icon dialog box: (6.1363 on page 4642) 1. Choose another icon 2. Optionally edit the label text 3. Click **OK** to return to the previous dialog box.

Grips Editing

Select an OLE object by clicking on its frame. Eight grips appear: (6.1361)

Grips Editing	Description
Resize	Resizes the object by dragging any of the four corner grips. The aspect ratio is maintained.

Related Commands

OleLinks (6.23.4) - adjusts links of OLE entities embedded in or linked to drawings. OleOpen (6.23.5) - opens linked and embedded objects in the appropriate application. PasteSpec (6.24.14) - pastes entities in several formats. Insert (6.17.13) - inserts DWG files in drawings. ImageAttach (6.17.6) - attaches raster images to drawings. XAttach (6.34.1) - attaches DWG files to drawings.

6.17.17 Interfere

(6.2880 on page 5977) Shows volumes and areas of interference between two sets of ACIS entities. The Platinum edition additionally shows volumes of interference between two sets of ACIS solids, and then optionally creates new ACIS solids from the common portions of pairs of intersecting solids, placing them on layer "Interferences." (6.1365)

Accessing the Command

command bar: **interfere** transparent: **'interfere** alias: **inf** menu bar: **Model | 3D Solids| Interfere** toolbar: **3D Solids |**  : **Interfere Prompts you in the command bar:** Select* first set of Acis objects or [Nested selection/Settings] <Nested selection>: **(Choose one or more 3D solids or 2D regions to make up the first set, or else type N or S)** Entities in set: 1 Select* first set of Acis objects or [Nested selection/Settings] <Nested selection>: **(Choose more ACIS entities, or else press Enter to continue)** Select* second set of entities or [Nested selection/Settings/checK first set] <checK first set>: **(Choose one or more 3D solids or 2D regions to form the second set, or choose an option)** Entities in set: 1 Select* second set of entities or [Nested selection/Settings/checK first set] <checK first set>: **(Choose more ACIS entities, or else press Enter to continue)** Comparing 1 solid against 1 solid. Interfering solids (first set): 1 (second set): 1 Interfering pairs: 1 Created 1 interference solid on layer Interferences The interference solid(s) remain(s) in the drawing when the command ends. * Entities which are on the layer set by the INTERFERELAYER system variable, are not accepted, as it is considered the output layer only .

Note: When you select an interference entity in the model or in the Structure panel (6.27.54), the originating entities, highlig

Command Options

Option	Description
Select first set of Acis objects	Specifies the first set of ACIS entities: choose one or more 3D solids and/or 2D regions. You can respond with **all** to place all ACIS entities into a set, and then later use the **Check first Set** option to check them against each other; this obviates the need to create two sets of entities.
Nested selection	Selects ACIS entities inside blocks or xrefs; prompts you:

1. **Select nested Acis objects for first set [eXit] <eXit>** - **(select a nested ACIS entity.)** Entities in set: 1

Settings	Displays a dialog box: (6.1366 on the next page) • **Create interference solids** - when on, makes new solids from the interference area or volume • **Layer** - specifies the layer on which interference entities are created. Default = Interferences Do not select a layer of selected entities as it is considered the output layer only. It is recommended to select an empty layer or accept the default layer. • **Color** - specifies the color of the interference entities; the color of the Interference layer is changed to match this color • **OK** - exit the dialog box and returns to the command
Select second set of Acis objects	Specifies the second set of ACIS entities: choose one or more 3D solids and/or 2D regions. The entities in the first set are compared with the entities in the second set.
checK first set	Checks the interference of entities in the first set, when it contains two or more entities, and then creates interference enty(ies) of them.

Settings

Name	Title	Description
INTERFERELAYER	Interference layer	Specifies the layer for interference entities.
INTERFERECOLOR	Interference color	Specifies the color for interference entities.
INTERFEREOBJVS	Interference object visual style	Specifies the interference entities visual style.
INTERFEREVPS	Interference viewport visual style	Specifies the interference checking visual style for the viewport.

Related Commands

Extrude (6.13.25) - extrudes 2D entities into 3D solid models. Intersect (6.17.20) - removes volumes not in common between two solid models. Figure 6.1371

6.17.20 Intersect

(6.2880 on page 5977) Performs Boolean intersection operations on 3D solids and 2D regions by removing all but portions in common.

Accessing the Command

command bar: **intersect** alias: **in** menu bar: **Model | 3D Solid Editing | Intersect** ribbon: **Solid | Edit | Boolean | Intersect** toolbar: **3D Solid Editing |**  : **Intersect Prompts you in the command bar:** Select ACIS object to intersect: **(Choose one 3D solid and/or 2D region)** Entities in set: 1 Select ACIS object to intersect: **(Choose another 3D solid and/or 2D region; you must choose at least two entities)** Entities in set: 2 Select ACIS object to intersect: **(Choose more ACIS entities, or else press Enter to perform the intersection operation)** Caution: if solids and regions do not intersect, BricsCAD erases them. The program removes all but the volumes and areas in common from the selected entities. Left: the entities selected; right: intersection result. (6.1372 on the next page) This command also applies to regions: (6.1373 on the following page)

Figure 6.1372

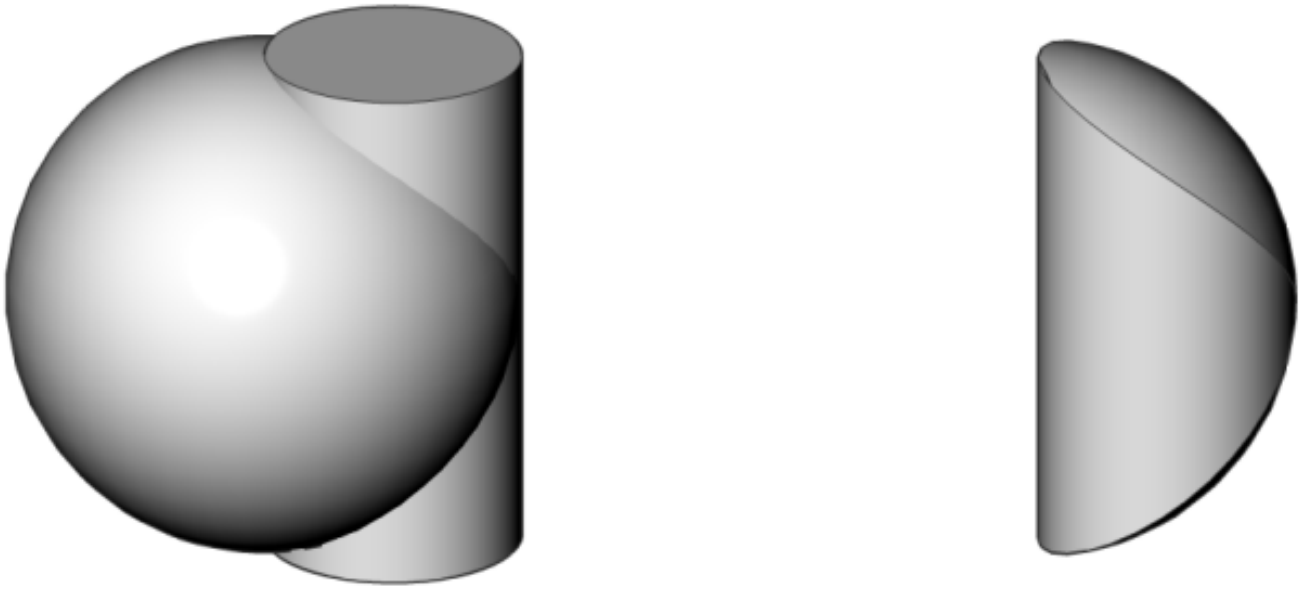

Figure 6.1373

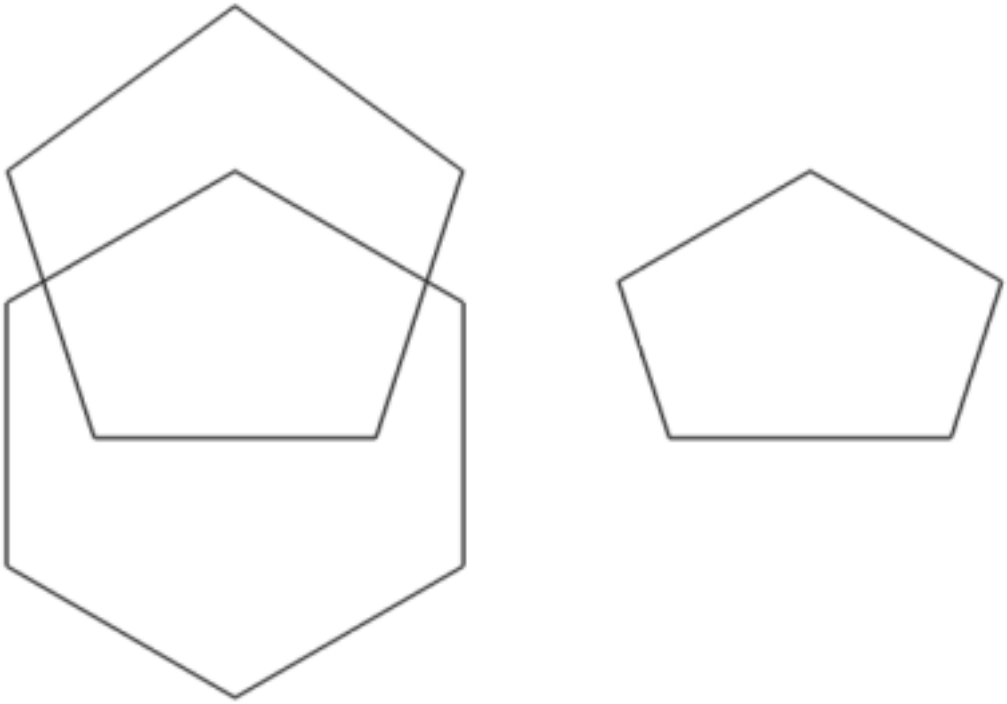


Command Options

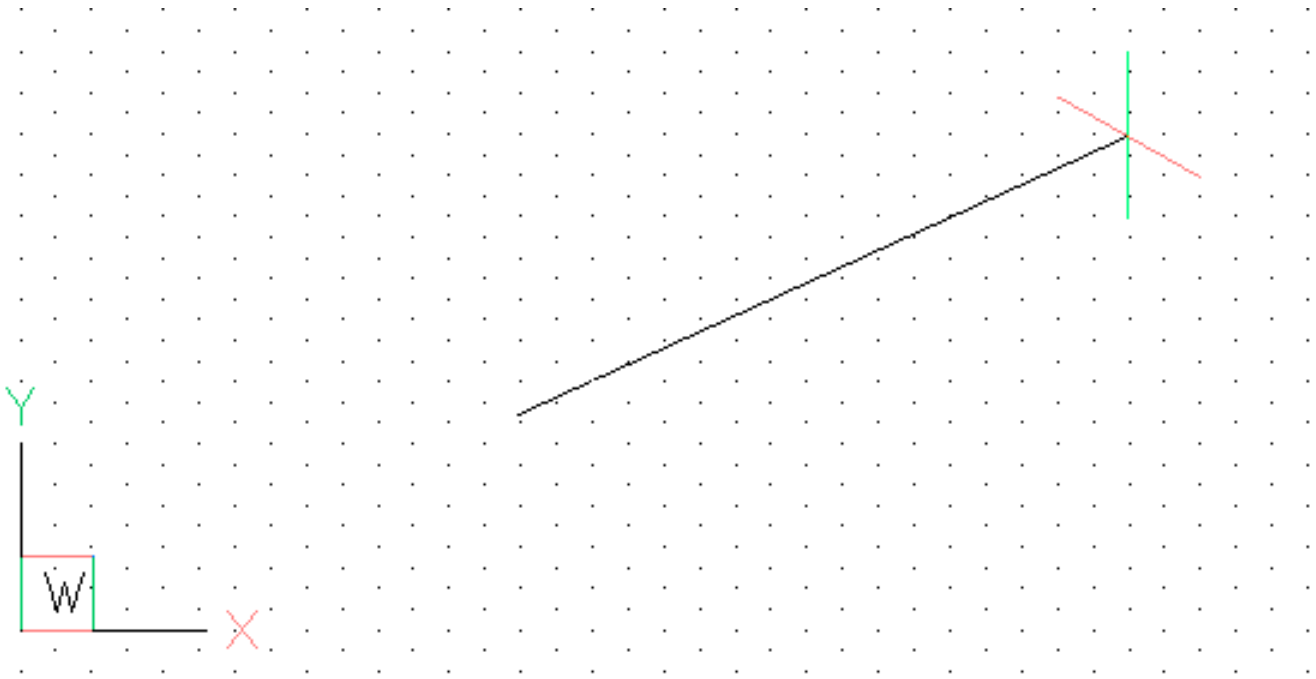
Option	Description
Select ACIS object to intersect	Specifies the 3D solids and/or 2D regions to be intersected. Choose two or more entities; non-ACIS entities are ignored. You may enter **all** to select all entities in the drawing. Caution: if solids and regions do not intersect, BricsCAD erases them. When this occurs, use the **U (6.30.3)** command to bring them back to life.

Related Commands

Extrude (6.13.25) - extrudes 2D entities into 3D solid models. Interfere (6.17.17) - creates 3D volumes of intersecting 3D solid models. MassProp (6.21.2) - reports the mass properties of 3D solid models and 2D regions. Region (6.26.18) - creates 2D regions from 2D entities. Revolve (6.26.45) - revolves 2D entities into 3D solid models. Section (6.27.11) - creates 2D regions from 3D models. Slice (6.27.40) - cuts 3D solids into two parts. SolidEdit (6.27.42) - edits the bodies, faces, and edges of 3D models. Subtract (6.27.58) - removes one solid model from a second. Union (6.30.6) - joins two or more solid models into a single entity.

Figure 6.1374

Figure 6.1375



6.17.21 Isoplane

(6.2981 on page 6079) Switches the isometric drafting plane and grid from left to top, to right. (6.1375)

Accessing the Command

command bar: **isoplane** transparent: **'isoplane** alias: is shortcut: **Ctrl+E F5** : **Isoplane Prompts you in the command bar:** Isoplane (Left) [TOGgle/keep using Left/switch to Right/switch to Top] <Switch to Top>: **(Enter an option, or else press Enter to accept the default)**

- To turn on isometric drafting mode: set the Snap (6.27.41) command's Style option to Isometric
- To turn on the isometric grid: set the Grid (6.15.23) command to On and GridStyle to On.
- To draw isometric circles: use the Ellipse (6.13.5) command's Isocircle option.

The grid does not display in isometric mode when GridStyle is off (grid displayed as lines). The crosshair cursor automatically takes on the isometric slant.

Command Options

Option	Description
Left	Switches the isoplane to left.
Right	Switches the isoplane to right.
Top	Switches the isoplane to top.
TOGgle	Toggles the isoplane from left to top to right.
Keep using ...	Keep using the current isoplane orientation.

Related Commands

Snap (6.27.41) - toggles isometric drawing mode. Ellipse (6.13.5) - draws isometric circles.

Figure 6.1376

6.17.22 IsolateObjects

(6.2981 on page 6079) Hides all but the entity(ies) selected.

Accessing the Command

command bar: **isolateobjects** aliases: **isolate** toolbar: **Hide/Show Entities |**  Quad: **Custom |**  : **IsolateObjects Prompts you in the command bar.** Select entities to isolate: **(Select one or more entities)** Entities in set: 1 Select entities to isolate: **(Select more entities, or else press Enter)** Selected entities display only. Other entities are hidden. Use the UnisolateObjects (6.30.7) command to make the hidden entities visible again.

Command Options

Options	Description
Select entities to isolate:	Select one or more entities to remain visible; after you press Enter, all other entities become invisible.

The OBJECTISOLATIONMODE variable controls what happens to the the hidden state of the entities that weren't selected to be hidden: (6.1377)

Figure 6.1377

[0] Objects are temporarily hidden for the current session. Interfered solids are selected together with the interference solids.
[1] Objects remain hidden between sessions. Interfered solids are selected together with the interference solids.
[2] Objects are temporarily hidden for the current session. Interfered solids are not selected together with the interference solids.
[3] Objects remain hidden between sessions. Interfered solids are not selected together with the interference solids.

Related Commands

LayIso (6.20.7) - isolates layers associated with entities selected in the drawing; locks or turns off all other layers. HideObjects (6.16.10) - hides the selected entities. UnisolateObjects (6.30.7) - unhides entities that were hidden.

6.18 J

6.18.1 Join

(7.3 on page 6132) Joins lines, lightweight and old-style 2D polylines, 3D polylines, arcs, elliptical arcs, polyarcs, splines, and helices at their common endpoints. The entity that results from the join depends on the input entities; see Rules, below.

Figure 6.1378

Accessing the Command

 command bar: **join** menu bar: **Modify | Join** toolbar: **Modify | Join** ribbon: **Change | Modify | Break | Join** Quad cursor menu: **Draw | Join** : **Join Prompts you in the command bar:** Select source entity or multiple entities to join at once: **(Select one or more entities, or enter all to select all entities in the drawing)** Select entities to join: **(Select more entities, or else press Enter to join the selected entities)** 2 entities joined into 1 polyline, 1 entity discarded from the operation

Rules

(Collinear means the entities lie in the same imaginary line; coplanar means the entities lie in the same plane.) Two 2D polylines are joined into a single

- **2D polyline** - when they are coplanar.
- **3D polyline** - when they are not coplanar and if they are composed only of straight segments
- **Spline** - when they are not coplanar and if at least one of the polylines has a bulged (arc) segment

A 2D polyline and a 3D polyline are joined into a single

- **2D polyline** - when they are coplanar
- **3D polyline** - when they are not coplanar and if the 2D polyline only has straight segments
- **Spline** - when they are not coplanar and if the 2D polyline has at least one arc segment

A line and a circular arc (or a polyline with arcs) are joined into a single

- **2D polyline** - when they are coplanar
- **Spline** - when they are not coplanar

The following pairs of entities are joined into a spline

- Line and an elliptical arc
- Spline and another open entity, such as a elliptical arc or polyline
- Helix and another open entity, such as a line or arc

Even when there are gaps between these entities, the command joins them into a single entity:

- **Collinear lines** - joined into a single line
- **Coplaner arcs** (with same radii and center points) - joined into an arc or a circle
- **Coplaner elliptical arcs** (with same major and minor axes) - joined into an elliptical arc or ellipse,

Circular and elliptical arcs are joined in a counterclockwise direction starting from the source arc. To join (close) an arc, use the Circle (6.9.12) command's **turn Arc into circle** option.

Command Options

Options	Description
Select source entity or multiple entities to join at once	Specifies the entities to be joined; you may enter **all** to select all entities in the drawing, and the program will filter out invalid ones.
Select entities to join	Select more entities, or else press **Enter** to finish the command and start the joining.

Procedures

- To join colinear lines (1.32.26)
- To join two arcs (1.32.26)

Related Commands

Break (6.6.21) - breaks entities. Explode (6.13.16) - reduces complex entities to simpler ones, such as blocks into constituent parts, and polylines into lines and arcs. Overkill (6.23.14) - deletes duplicate entities and overlapping lines, arcs or polylines and unifies partly overlapping or contiguous ones. PEdit (6.24.24) - joins entities into a polyline.

6.19 K

6.19.1 KeepMe

(6.2981 on page 6079) Adds changed entities to the source drawing, when two somewhat different drawings are being compared visually. **Note:** The command works only during a session begun by the DWGcompare (6.10.51) command.

Figure 6.1379

Accessing the Command

 command bar: **keepme** toolbar: **Compare |** : **KeepMe** Select entities: **(Select one or more entities, or else enter all to select all entities in the drawing)** Select entities: **(Select more entities, or else press Enter to end the command)** 1266 entities were kept

Command Options

Option	Description
Select entities	Selects the entities to compare: • Select one or more entities • **All** - selects all entities in the drawing • **Enter** ends the command The entities you select are added to the source drawing.

Procedures

Merging the compared drawings (1.19.10)

Related Commands

DwgCompare (6.10.51) - compares a selected drawing with the current drawing during a comparison session.
EndCompare (6.13.6) - exits a drawing comparison setting, started by the DwgCompare command.

6.20 L

6.20.1 Layer

(6.2947 on page 6049) Opens the Layers panel. See the LAYERSPANELOPEN (6.20.5) command.

Figure 6.1380

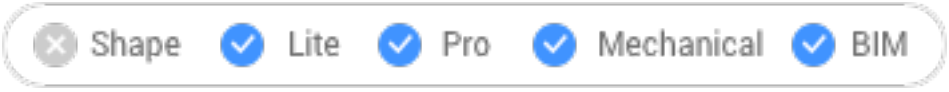


Figure 6.1381

6.20.2 LayCur

(7.3 on page 6132) Moves selected entities to the current layer.

Accessing the Command

command bar: **laycur** menu bar: **Settings | Layers | Move to current layer** ribbon: **Home | Layers** toolbar: **Entity Properties** : **LayCur Prompts you in the command bar:** Select entities to be moved to the current layer: **(Select one or more entities)** Entities in set: xx Select entities to be moved to the current layer**: (Select more entities, or else press Enter to move the selection set to the current layer)** xx entities were moved to the current layer ("<Layer Name>")

Command Options

Option	Description
Select entities to be moved to the current layer	Select one or more entities, and then press **Enter**. The program changes the layers assigned to the entities to the current layer.

Related Commands

Change (6.9.10) - changes the properties of entities, through the command bar. ChProp (6.9.11) - changes the properties of entities, with fewer options than the Change command

Figure 6.1382

6.20.3 -Layer

(6.2981 on page 6079) Creates and removes layers and layer states, and changes their properties through the command bar.

Accessing the Command

command bar: **-layer** transparent: **'-layer** alias: **-la** : **-Layer Prompts you in the command bar:** Layer [? to list/ New layer/ Make new current layer/ Set layer as current/ Color/ Linetype/ LineWeight/ TRansparency/MATerial/Plot/stAte/turn layer ON/turn layer OFf/ Freeze/ Thaw/ LOck/ Unlock]: **(Enter an option, or else press Enter to end the command)**

Command Options

Option	Description
? to list	Lists the names of layers in the current drawing. Press **F2** to flip to the Prompt window to see the list. Use wildcards, such as ? and *, to narrow down the list of names.
New layer	Creates new layers; prompts you: **Names for new layers** - **(enter one or more layer names. To create several new layers at the same time, separate each name with a comma, such as doors,windows,walls.)**
Make new current layer	Creates a new layer, and then makes it current. This option combines the New and Set options; prompts you: **New layer to make current** - **(enter a layer name; only one layer may be current.)**
Set layer as current	Sets a layer as the current one; prompts you: **New layer to make current** - **(enter a layer name; only one layer may be current.)**
Color	Changes the color of layers; prompts you: 1. **Color** - **(specify the color by number or name; see the Color (6.9.19) command.)** 2. **Layer(s) to be color <layername>** - **(specify the layer names or press Enter to change the color of the most-recently used layer; separate more than one layer name with commas.)**
Linetype	Changes the linetype of layers; prompts you: 1. **Linetype: ? to list <Continuous>** - **(enter an linetype name or an option)**; see the Linetype (6.20.32) and -Linetype (6.20.33) commands **? to list** - Lists the names of linetypes defined in the current drawing 2. **Layer(s) for linetype CONTINUOUS <CurrentLayer>** - **(enter the name(s) of layers, separating names with a comma, or else press Enter to apply the linetype to the default layer.)**

LineWeight

Changes the lineweight of layers; prompts you:

1. **Enter lineweight (0.00 - 2.11mm) - (enter a number between 0.00 and 2.11.)**
2. **Enter name list of layers(s) for lineweight 0.00 mm <CurrentLayer> - (enter the name(s) of layers, separating names with a comma, or else press Enter to apply the line weight to the default layer.)**

TRansparency

Sets the entity transparency factor between 0 (fully opaque) and 90 (fully transparent); prompts you:

- **Enter transparency (0 - 90) - (enter a number between 0 and 90; default is 0.)**
- **Layer(s) for transparency 0 <CurrentLayer> - (enter the name(s) of layers, separating names with a comma, or else press Enter to apply the transparency level to the default layer.)**

The 2DWireframe visual style ignores this setting; for it, use the TRANSPARENCYDISPLAY variable to control the level of transparency.

MATerial

Sets the material property for all entities on the layer; prompts you:

1. **Material: ? to list/<Global> - (enter an option)**: **? to list -** Displays a list of the materials and their description in the Prompt History window
2. **Layer(s) for material GLOBAL <CurrentLayer> - (enter the name(s) of layers, separating names with a comma, or else press Enter to apply the material to the default layer.)**

The default material is Global, which cannot be deleted or renamed. When you need to add more materials to the drawing, see the Materials (6.21.10) command.

Plot

Changes the plot status of layers (plot or no plot); prompts you:

1. **Enter a plotting preference [Plot/No] <Plot> - (enter an option.)**
2. **Enter layer name(s) for this plot preference <CurrentLayer> - (enter the name(s) of layers, separating names with a comma, or else press Enter to apply the plot status to the default layer.)**

stAte

Creates, edits, renames, restores, deletes, imports, and exports layer states. See the LayerState (6.20.9) command. Prompts you: **Enter an option [? to list layer states/ Save/ Restore/ Edit/ reName/ Delete/ Import/ eXport]** - **(enter an option)**:

- **? to list layer states** - lists the names of saved layer states and their description in the Prompt History (6.29.16) window
- **Save** - saves the current layer state; prompts you:

1. **Enter a name for the new Layer State** - **(type a name.)**
2. **Enter state to change [On/ Frozen/ Lock/ Color/ lineType/ lineWeight/plot Style/ Plot/New vp frozen]** - all states are on by default; **(enter a state name to toggle its setting.)**

- **Restore** - Restores a saved layer state; prompts you:

1. **Enter name of Layer State to restore or [?]** - **(type the name of saved layer state or type ? to list the saved layer states.)**

- **Edit** - Edits a saved layer state. prompts you:

1. **Enter the name of the Layer State to edit or [?]** - **(type the name of saved layer state or type ? to list the saved layer states.)**

- **Rename** - Renames a saved layer state; pPrompts you:
- **Type the name of saved layer state or type ? to list the saved layer states** - **(type the name of saved layer state or type ? to list the saved layer states.)**
- **Enter the new name** - **(type the new name for the selected layer state.)**
- **Delete** - deletes a saved layer state; prompts you:
- **Enter the name of the Layer State to delete or [?]** - **(type the name of saved layer state or type ? to list the saved layer states.)**
- **Import** - imports a layer state from a file into the current drawing:

1. Displays a File dialog. Select a layer state file (*.las).
2. Click the **Open** button

- **Export** - exports a saved layer state in the current drawing to a layer state file (*.las). Prompts you:

1. **Enter the name of the Layer State to export or [?]** - **(type the name of saved layer state or type ? to list the saved layer states.)**
2. Displays a File dialog. Type a name for the layer state file, then press the **Save** button.

turn layer ON	Turns layers on that had been turned off with the OFf option; prompts you: **Layer(s) to turn ON** - **(specify the names of layer name(s) to turn on; separating multiple layer names with commas.)**
turn layer OFf	Turns layers off to hide their entities from view; prompts you: **Layer(s) to turn OFF** - **(specify the names of layer name(s) to turn off; separating multiple layer names with commas.)** The current layer cannot be turned off. When layers are off, they are hidden from view. In most cases, you should probably use the Freeze option, as it offers more features.
Freeze	Freezes layers so that they are hidden from view; prompts you: **Layer(s) to Freeze** - **(specify the names of layer name(s) to freeze; separating multiple layer names with commas.)** The current layer cannot be frozen. When layers are frozen... • Entities are hidden from view • Entities cannot be edited • The extents of entities are ignored when the program calculates the drawing extents • Entities are not included in operations, such as ViewBase, Print, Export, and PDFout.
Thaw	Thaws layers that were previously hidden with the Freeze option; prompts you: **Layer(s) to Thaw** - **(specify the names of layer name(s) to thaw; separating multiple layer names with commas.)**
LOck	Locks layers so that their entities remain visible but cannot be edited; prompts you: **Layer(s) to Lock** - **(specify the names of layer name(s) to lock; separating multiple layer names with commas.)** The current layer **can** be locked.
Unlock	Unlocks layers that were locked form editing with the LOck option; prompts you: **Layer(s) to Unlock** - **(specify the names of layer name(s) to unlock; separating multiple layer names with commas.)**

Related Commands

ExpLayer (6.13.17) - creates layers and changes their properties in the Drawing Explorer. LayersPanelOpen (6.20.5) - opens the Layers panel, which allows to edit the layers in the current drawing. LayersPanelClose (6.20.4) - closes the Layers panel. LayerState (6.20.9) - saves and restores layer states. LayMCur (6.20.10) - changes the working layer to that of a selected entity LayFrz (6.20.12) - freezes layers associated with selected entities. LayThw (6.20.16) - thaws all frozen layers. LayIso (6.20.7) - isolates layers associated with selected entities. LayLck (6.20.8) - locks layers associated with selected entities. LayUlk (6.20.18) - unlocks layers associated with selected entities. LayOff (6.20.11) - turns off layers associated with selected entities. LayOn (6.20.13) - turns on all layers that have been turned off.

Figure 6.1383

6.20.4 LayersPanelClose

(6.2981 on page 6079) Closes the Layers panel opened by the LayersPanelOpen (6.20.5) command.

Accessing the Command

command bar: **layerspanelclose** : **LayersPanelClose** The Layers panel is closed.

Command Options

No command options.

Related Commands

LayersPanelOpen (6.20.5) - opens the Layers panel, which allows to edit the layers in the current drawing. - ToolPanel (6.29.37) - allows to control the display of tool panels, such as the Properties Bar, the Ribbon or the Sheet Sets panel from the command line.

Figure 6.1384

6.20.5 LayersPanelOpen

(6.2981 on page 6079) Opens the Layers panel, for editing layer names and properties in the current drawing, as well as create, edit, and apply layers, layer states, and layer filters. **Note:** This panel can remain open at all times, unlike the Drawing Explorer displayed by the Layer command.

Accessing the Command

command bar: **layerspanelopen** context menu: right-click the ribbon or any toolbar, and then choose **Layers** : **LayersPanelOpen** The Layers panel displayed when the drawing is in Model space: (6.1385) The Layers panel displayed additional VP layer properties when the drawing is in a layout tab, which apply to the current paper space layout or a viewport in the current layout. (6.1386 on the next page)

Figure 6.1385

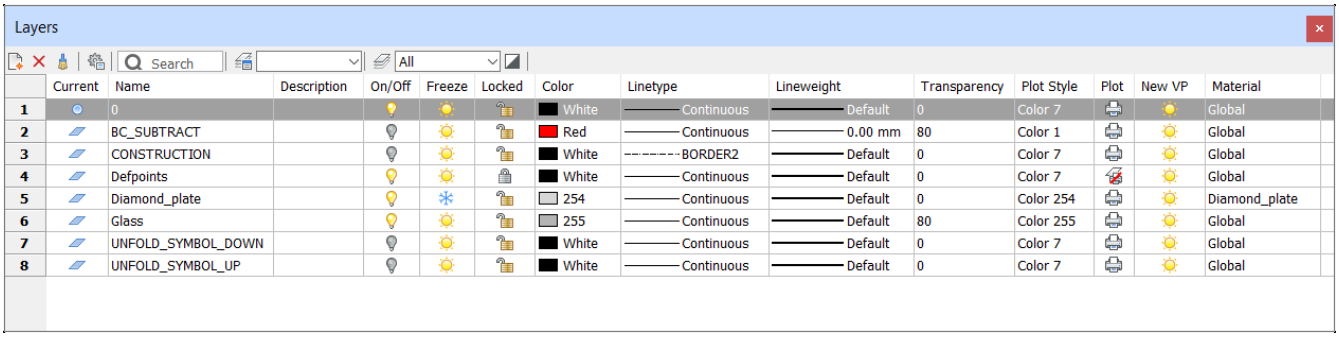

Figure 6.1386

	VP Freeze	VP Color	VP Linetype	VP Lineweight	VP Transparency	VP Plot Style
1		White	Continuous	Default	0	Color 7
2		Red	Continuous	0.00 mm	80	Color 1
3		White	BORDER2	Default	0	Color 7
4		White	Continuous	Default	0	Color 7
5		254	Continuous	Default	0	Color 254
6		255	Continuous	Default	80	Color 255
7		White	Continuous	Default	0	Color 7
8		White	Continuous	Default	0	Color 7

Command Options

Option	Description
New	Creates new layers with the generic name "NewLayer1". The new layer that is created copies the properties of the currently selected layer.
Delete	Deletes layers, except for the following, which cannot be deleted: • 0 • Any layer with entities
Purge	Purges layers from the current drawing, except for the following ones, which cannot be purged: • 0 • The current layer • Any layer with entities See the Purge (6.24.60) command.

Settings

Displays the Layers Settings dialog box: (6.1387 on page 4674)

- **Hide xref layers** - when on, hides layers that came from externally-referenced drawings
- **Apply layer filter to layer toolbar** - when on, shortens the list of layers displayed, according to the conditions of the filter. When off, displays all layer names.
- **Indicate layers in use** - when on, displays icons in the Current column that indicate whether the layer has entities assigned to it; unused layers can be purged:

 - Layer is not empty  - Layer is empty of entities

- **Show row numbers** - toggles the display of the number at the start of each row.

Toolbar Controls toggles the display of controls in the toolbar:

- **Search Layers** - toggles the display of the Search field on and off
- **Layer States** - toggles the display of the Layer States droplist
- **Layer Filters** - toggles the display of the Layer Filters droplist

OK - applies the changes and exit the dialog box
Cancel - exits the dialog box without applying the changes

(6.1388 on page 4674)

Filters the names of layers to shorten longer lists of layers. As you type characters, the program displays the layer names containing the text. Any layers containing the sequence of characters are listed, no matter where in the layer name the sequence is located. For example, entering "do" returns layers named DOOR and WINDOW.

Layer States Explorer

Displays the Layer States section of the Drawing Explorer. See the LayerState (6.20.9) command.

Layer States Used

Lists the layer states available in the drawing. Choose one from the droplist. See the LayerState (6.20.9) command.

Layer Explorer

Displays the Layer section of the Drawing Explorer. See the Layer (6.13.17) command.

Filter Used

Displays the current layer filter, if any are defined in the current drawing. Click the down-arrow button to choose a different layer filter The program creates the following layer filters automatically:

- **All** - the only layer filter that appears in all drawings, and displays all layers
- **Viewport Overrides** - you've overridden the properties of a viewport layer
- **Xref** - the drawing has externally referenced drawings attached
- 'xref name' - the name of each xref'ed drawing (note that layers from xref'ed drawings are prefixed automatically with the drawing's name)

Invert Filter	Inverts the content of current filter, so that the dialog box displays all layers not included in the filter. For example, to see all layers **not** in an xref'ed drawing, choose the **Xref** filter, and then click **Invert Filter**.
Header Options	**Description**
Current	Specifies the current working layer. Only one layer can be current at a time. When the **Indicate Layers In Use** option is turned on, then these additional icons are displayed: • - Layer is not empty • - Layer is empty In paper space layouts or viewports (model space with floating viewports), the following icons indicate that viewport overrides exist: • - Viewport overrides exist and layer is current • - Viewport overrides exist and layer is not empty • - Viewport overrides exist and layer is empty
Layer Name	Specifies the name of the layer. In long lists of layers, you can type a character to jump to the first layer starting with that character, such as 'd' for DOORS. To sort the layer names from A to Z, click the **Layer Name** header; to reverse the order from Z to A, click the header a second time. To rename a layer: 1. Click the name twice, slowly (or right-click the layer name and then choose **Rename**) 2. Enter the new layer name
Description	(optional) Describes the content of the layer. Click the field, and then type.
On/Off	Toggles the selected layers between on and off. To change the status, select one or more layers, and then click a lightbulb icon: • **On** - displays entities on the layer • **Off** - hides entities from view; entities are included in the calculation of extents

Freeze	Toggles the selected layers between frozen and thawed. To change the status, select one or more layers, and then click a sun/snowflake icon: •  **Thaw** - displays entities on the layer •  **Freeze** - hides entities from view; entities are excluded in the calculation of extents, and are not exported with commands such as WBlock
Locked	Toggles the selected layers between locked and unlocked. To change the status, select one or more layers, and then click a padlock icon: •  **Unlocked** - allows entities to be edited •  **Locked** - prevents entities from being edited; entities are still visible
Color	Specifies the color of the layer. The default color is white (black). To change the color: 1. Choose one or more layers 2. Click a color square to display the Select Color dialog box; see Color (6.9.19) command 3. Choose a color, and then click **OK**
Linetype	Specifies the linetype of selected layers. The default linetype is "Continuous." To change the linetype: 1. Choose one or more layers 2. Click a linetype sample 3. Choose one from the droplist (6.1389 on page 4674) To load additional linetype definitions: 1. Click the **Load** option. 2. In the Load Linetypes dialog box, choose a linetype, and then click **OK**. See Linetype (6.20.32) command.
Lineweight	Specifies the linetype of selected layers. Default is "Default." To change the lineweight: 1. Choose one or more layers 2. Click the lineweight sample 3. From the droplist, choose another lineweight (6.1390 on page 4674) See the LWeight (6.20.42) command.

Transparency	Sets the transparency of entities on the selected layer(s) between 0 (fully opaque) and 90 (fully transparent); the default is 0. To change the transparency: 1. Choose one or more layers 2. Click the transparency number 3. From the droplist, choose another number The 2DWireframe visual style ignores this setting; instead, use the TRANSPARENCYDISPLAY variable to control the level of transparency.
Plot Style	Specifies the plot style of selected layers, if plot styles are enabled in the current drawing. The default is "Color_7." To change the plot style" 1. Choose one or more layers 2. Click a plot style name 3. From the droplist, choose another style name By default, plot styles are not enabled in drawings. To add plot styles to the drawing, see the PlotStyle (6.24.28) command.
Plot	Toggles selected layers between being printed and not printed. To change the status, select one or more layers, and then click the printer icon: •  **Print**- prints the layer •  **No Print** - does not print the layer Some layers created by the program also do not print by default, such as DefPoints.
New VP	Specifies whether the layer is visible (thawed) or invisible (frozen) when you make a new viewport (VP) in a layout tab. To change the status, select one or more layers, and then click a sun/snowflake icon: •  **Thaw** - displays entities on the layer in the new viewport •  **Freeze** - initially hides entities from view when the viewport is created See the MView (6.21.37) command.
Material	Specifies the material of selected layers. The default is material is name "Global." To change the material assigned to one or more layers: 1. Select one or more layers. 2. Click the **Material** field. 3. Click again to display the droplist, containing the materials available in the drawing. 4. Select a material in the list. When you need to add more materials to the drawing, see the Materials (6.21.10) command.

Viewport Headers

The following headers appear when you switch from model tab to a layout tab:

Header Option	Description
VP Freeze	Freezes the layer in the current layout; overrides the freeze/thaw setting in model space
VP Color	Specifies the color of entities on this layer in the current layout; overrides the color setting in model space
VP Linetype	Specifies the linetype for entities in the current layout; overrides the linetype setting in model space
VP Lineweight	Specifies the lightweight in the current layout; overrides the lightweight setting in model space
VP Transparency	Specifies the transparency of entities on this layer in the current layout; overrides the transparency setting in model space
VP Plotstyle	Specifies the plot style name in the current layout; overrides the plot style setting in model space

Procedures

- To open or close a panel (1.15.7)
- To dock a panel (1.15.7)
- To dock a panel with respect to another docked panel (1.15.7)
- To stack panels in a tabbed panel (1.15.7)

Related Commands

-Layer (6.20.3) - creates layers and changes their properties in the command bar. Layer (6.13.17) - creates layers and changes their properties in the Drawing Explorer. LayersPanelClose (6.20.4) - closes the Layers panel. LayerState (6.20.9) - saves and restores layer states. LayMCur (6.20.10) - changes the working layer to that of a selected entity LayFrz (6.20.12) - freezes layers associated with selected entities. LayThw (6.20.16) - thaws all frozen layers. LayIso (6.20.7) - isolates layers associated with selected entities. LayLck (6.20.8) - locks layers associated with selected entities. LayUlk (6.20.18) - unlocks layers associated with selected entities. LayOff (6.20.11) - turns off layers associated with selected entities. LayOn (6.20.13) - turns on all layers that have been turned off. Materials (6.21.10) - Creates materials and edits their properties through the Drawing Explorer. - ToolPanel (6.29.37) - allows to control the display of tool panels, such as the Properties Bar, the Ribbon or the Sheet Sets panel from the command line. VpLayer (6.31.20) - changes the properties of layers in the current paperspace viewport. Explorer (6.13.15) - Opens the Drawing Explorer dialog box.

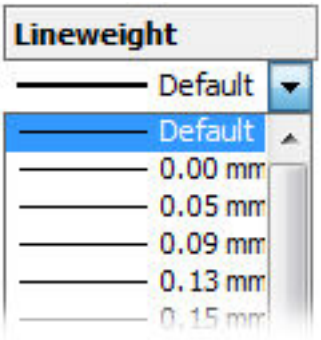

Figure 6.1391

6.20.6 LayerP

(6.2981 on page 6079) Undoes the previously applied change to layer properties and settings (short for Layer Previous). **Note:** This command operates only when LAYERPMODE (6.20.6) variable is on.

Accessing the Command

 command: **layerp** menu bar: **Settings | Layers | Layer Previous** tooblar: **Settings | Layers |**  : **LayerP** Previous layer settings were restored.

Command Options

No options. The following changes cannot be undone by the LayerP command:

- Layer names were renamed
- Layers that were deleted or purged (use the U command to bring back deleted layers)
- Layers were added
- No layer changes were made

This command has no effect when the LAYERPMODE variable is set to off.

Related Commands

Layer (6.13.17) - creates layers, changes their properties, and removes layers through the Drawing Explorer. - Layer (6.20.3) - creates layers, changes their properties, and removes layers through prompts in the command bar.

Figure 6.1392

6.20.7 LayIso

(6.2981 on page 6079) Isolates layers associated with entities that you select in the drawing; all other layers are either locked or turned off (hidden); short for "layer isolate." **Note:** Use the LayUnIso (6.20.20) command to unlock or unhide isolated layers.

Accessing the Command

command bar: **layiso** menu bar:**Settings | Layers | Isolate Layer** ribbon: **Home | Layers | isolate** toolbar: **Layers | Isolate** : **LayIso Prompts you in the command bar.** Current setting: Lock layers Select entities on the layer(s) to be isolated or [Settings]: **(Pick one or more entities, or type S)** Entities in set: 1 Select entities on the layer(s) to be isolated or [Settings]: **((Pick more entities, or type S or press Enter to exit the command))** Number of isolated layers: xx. Notes:

- When only one entity is selected (or multiple entities on the same layer) and this layer is not the current layer, BricsCAD reports: This layer has been isolated: <LayerName>. This layer is current: <LayerName>.
- When no entity on the current layer is selected, the layer of the most recently selected entity becomes the current layer. BricsCAD reports: Number of isolated layers: xx. This layer is current: <LayerName>.
- After running the LAYUNISO (6.20.20) command, the layer that was current before is current again.

Command Options

Option	Description
Select entities on the layer(s) to be isolated	Selects one or more entities whose layers should be isolated; the prompt repeats itself until you press **Enter** so that you can isolate more than one layer. All other layers are locked or turned off.
Settings	Specifies how layers and viewports should be isolated; prompts you: **Enter setting for layers not isolated [Off/Lock]** - **(enter an option)**: • **Off** - all other layers are turned off (made invisible) • **Lock** - all other layers are locked (visible and cannot be edited)

Related Commands

LayOff (6.20.11) - turns off layers associated with selected entities. LayOn (6.20.13) - turns on all layers that have been turned off. LayUnIso (6.20.20) - unisolates locked or turned off layers.

Figure 6.1393

6.20.8 LayLck

(6.2981 on page 6079) Locks the layer associated with an entity selected in the drawing; locked layers can be seen but not edited (short for "layer lock"). **Note:** Use the Layer (6.13.17) command to unlock specific layers that were locked with this command, or else use the LayUnlk (6.20.18) command to unlock all layers in the drawing at once.

Accessing the Command

command bar: **laylck** menu bar: **Settings | Layers | Lock Layer** ribbon: **Home | Layers | Lock** toolbar: **Layers | Lock** : **LayLck Prompts you in the command bar:** Select an entity on the layer to be locked: **(Choose an entity)** This layer has been locked: <LayerName> Locked layers can be shown faded. The LAYERLOCKFADECTL (1.17.10) variable sets the fading level between 0 (no fading) and 90 (very faded).

Command Options

Option	Description
Select an entity on the layer to be locked	Specifies the layer to be locked by the entity selected.

Related Commands

LayUlk (6.20.18) - unlocks layers associated with selected entities. Layer (6.13.17) - creates layers and changes their properties in the Drawing Explorer. -Layer (6.20.3) - creates layers and changes their properties in the command bar. LayerState (6.20.9) - saves and restores layer states. LayFrz (6.20.12) - freezes layers associated with selected entities. LayThw (6.20.16) - thaws all frozen layers. LayOn (6.20.13) - turns on all layers that have been turned off. LayUnlk (6.20.18) - unlocks locked layers.

Figure 6.1394

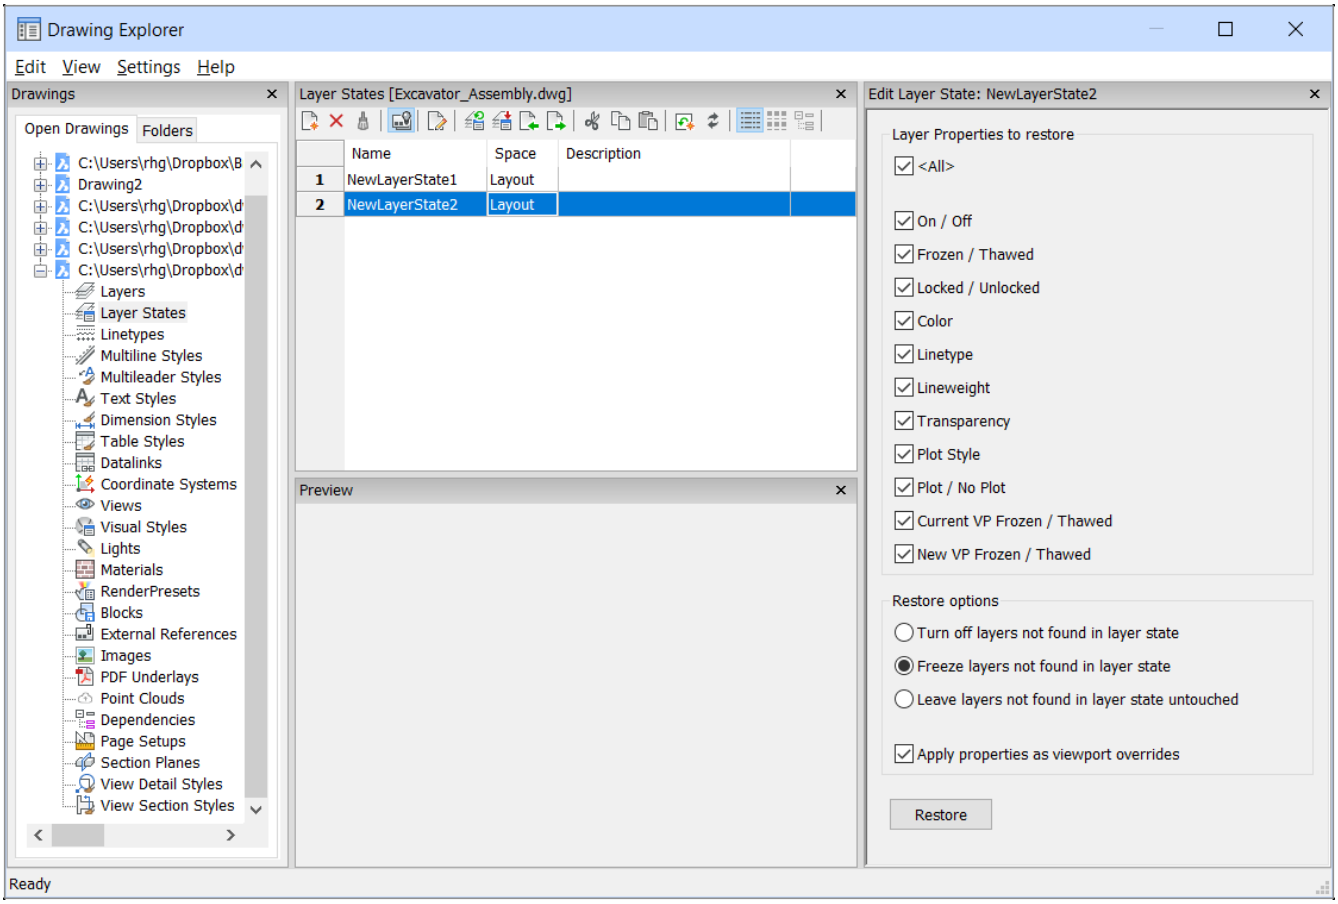
6.20.9 LayerState

(6.2981 on page 6079) Creates and edits layer states, which save the current state of the properties of layers, through the Layer States section of the Drawing Explorer.

Accessing the Command

command: **layerstate** alias: **las** menu bar: **Settings | Layers | Layer States... Tools | Drawing Explorer | Layer States...** ribbon: **Home | Settings | Drawing Explorer | Layer States Home | Layers | Layers | Layer States** toolbar: **Layers |**  : **LayerState** Displays the Layer States section of the Drawing Explorer: (6.1395 on the facing page) Create or choose a layer state, and then click **X**. Press **F1** to access help.

Figure 6.1395



Command Options

Toolbar Option	Description
New	Creates a new layer state with the default name of NewLayerState1. When a layer state is created, the program saves the current state of all layer properties, such as which layers are frozen, turned off, or locked.
Delete	Erases selected layer states. The program erases the layer state without warning.
Hide Xref Symbols On/Off	Toggles the display of layers from externally-referenced drawings (the word Symbols should be 'Drawings').
Edit Layer State	Displays the Edit Layer State dialog box to change the status of the layer state: • Adds layers from the layer state • Adds layers to the layer state • Changes which layer is current • Changes all properties of each layer But does not change the names of layers.
Restore	Restores the selected layer state. The properties of layer change their state after you close the Drawing Explorer dialog box.
Overwrite	Overrides the settings of the selected layer state with new settings changed by the Edit Layer State panel.

 Import	Imports layer states from a LAS file: 1. Displays the Import Layer States dialog box. Choose an LAS file. 2. Click **Open** to load the layer state into the current drawing
 Export	Exports layer states to an LAS file: 1. Displays the Export Layer States dialog box. Give a name to the LAS file. 2. Click **Save**. The layer state file can be imported into other drawings or send to clients.
Name	Names the layer state. Click to rename the state.
Space	Reports which space the layer state was saved: • **Model** - saved in model tab. • **Layout** - saved in layout tab. You must start the LayerState command in either model or a layout tab.
Description	Optional description of the layer state.
Edit Layer State Options <All>	**Description** Selects or unselects all properties. See the Layer (6.13.17) command for the meaning of the properties.
Restore Options	Determines what happens with layers not found in the layer state, such as those added after the layer state was created. The selected option applies to all layer states • Turn off • Freeze • Leave untouched
Apply properties as viewport overrides	Applies the layer state as viewport overrides (VP layer properties (6.13.17)) to the current layout viewport. This option is available only on a layout within a layout viewport.
Restore	Restores the selected layer state.

Procedures

- To save the current layer state (1.23.9)
- To edit a layer state (1.23.9)
- To restore a layer state (1.23.9)
- To copy layer states to another drawing (1.23.9)
- To export a layer state (1.23.9)
- To import a layer state (1.23.9)

Related Commands

LayLck (6.20.8) - locks layers associated with selected entities. LayUlk (6.20.18) - unlocks layers associated with selected entities. LayOff (6.20.11) - turns off layers associated with selected entities. LayOn (6.20.13) - turns on all layers that have been turned off. Explorer (6.13.15) - Opens the Drawing Explorer dialog box.

Figure 6.1396

6.20.10 LayMCur

(7.3 on page 6132) Changes the working layer to that of the entity selected (short for "layer make current").

Accessing the Command

Command bar: **laymcur** alias: **setlayer** menu bar: **Settings | Layers | Set Layer by Entity** ribbon: **Home | Layers | Make Object's Layer Current** Toolbar: **Entity Properties } Make Object's Layer Current** : **LayMCur Prompts you in the command bar:** Select entity to set the current layer: **(Choose one entity)**

Command Options

Option	Description
Select entity to set the current layer	Choose one entity whose layer will be made the current layer.

Related Commands

Layer (6.13.17) - creates layers and changes their properties through a dialog box. -Layer (6.20.3) - creates layers and changes their properties through the command bar. LayerState (6.20.9) - saves and restores layer states.

Figure 6.1397

6.20.11 LayOff

(6.2981 on page 6079) Turns off layers associated with entities selected in the drawing; off layers cannot be seen (short for "layer off"). Note: Use the Layer (6.13.17) command to turn on specific layers that were turned off with this command, or else use the LayOn (6.20.13) command to turn on all layers in the drawing at once.

Accessing the Command

command bar: **layoff** menu bar: **Settings | Layers | Layer Off** ribbon: **Home | Layers | Layer Off** toolbar: **Layers | Layer Off** : **LayOff Prompts you in the command bar.** Current setting: Viewports=Off, Block nesting level=Block Select an entity on the layer to be turned off or [Settings/Undo/selection options (?)]: **(Click an entity, or choose an option)** Entities in set: 1 Select an entity on the layer to be turned off or [Settings/Undo/selection options (?)]: **(Select more entities, or press Enter to exit the command)** This layer has been turned off:<LayerName> This layer has been turned off:<LayerName> ... This layer has been turned off:<LayerName> Note: When one or more entities on the current layer are selected, BricsCAD prompts you: This layer is current: DIMENSIONS. Do you want to turn off current layer? [Yes/No] <No>: Choose Yes to switch off the display of the current layer. It is recommended to keep the current layer visible though.

Command Options

Option	Description
Select an entity on the layer to be turned off	Selects entities whose layer is to be turned off. Either click an entity or use window selection to select multiple entities simultaneously. If ON, you can choose a window selection method in the Prompt Menu (1.15.6). This prompt repeats itself until you press **Enter** so that you can turn off more than one layer.
Undo	Undoes the previous selection.
Settings	Specifies how viewports, blocks, and xrefs should be turned off; prompts you: **Enter setting type for [Viewports/Block selection]** - **(enter an option)**: • **Viewports** - specifies how viewports should be turned off; prompts you: **In paper space viewport use [Freeze/Vpfreeze]** - **(type F or V.) Freeze** - turns off layers in all viewports (default) **Vpfreeze** - turns off layers in the current viewport only • **Block selection** - specifies how blocks and xrefs should be turned off; prompts you: **Enter Block Selection nesting level [Block/Entity/None]** - **(type B, E, or N.) Block** - turns off all layers associated with the block, includes of nested blocks **Entity** - turns off all layers associated with entities in the block or xref (entities that make up blocks might be on different layers) **None** - turns off the layer of the block, and ignores other layers associated with entities and nested block
selection options (?)	Allows to choose a selection method. See the Select (6.27.16) command.

Related Commands

LayOn (6.20.13) - turns on all layers that have been turned off. Layer (6.13.17) - creates layers and changes their properties in the Drawing Explorer. -Layer (6.20.3) - creates layers and changes their properties in the command bar. LayerState (6.20.9) - saves and restores layer states. LayFrz (6.20.12) - freezes layers associated with selected entities. LayThw (6.20.16) - thaws all frozen layers. LayIso (6.20.7) - isolates layers associated with selected entities. LayLck (6.20.8) - locks layers associated with selected entities. LayUlk (6.20.18) - unlocks layers associated with selected entities.

Figure 6.1398

6.20.12 LayFrz

(6.2981 on page 6079) Freezes the layers associated with entities that you select in the drawing (short for "layer freeze"). **Note:** Use the Layer (6.13.17) command to thaw specific layers that were frozen with this command, or else use the LayThw (6.20.16) command to thaw all layers in the drawing.

Accessing the Command

command bar: **layfrz** menu bar: **Settings | Layers | Freeze Layer** ribbon: **Home | Layers | Freeze** toolbar: **Layers | Freeze** : **LayFrz Prompts you in the command bar:** Current setting: Viewports=Freeze, Block nesting level=Block Select an entity on the layer to be frozen or [Settings/Undo/selection options (?)]: **(Pick an entity, or choose an option)** Entities in set: 1 Select an entity on the layer to be frozen or [Settings/Undo/selection options (?): **(Select more entities, or press Enter to exit the command)** This layer has been frozen :<LayerName> This layer has been frozen :<LayerName> ... This layer has been frozen :<LayerName> Note: The current layer cannot be frozen. When one or more entities on the current layer has been selected, BricsCAD reports: Cannot freeze layer: <LayerName>. It is the current layer.

Command Options

Option	Description
Select an entity on the layer to be frozen	Selects a single entity whose layer should be frozen. The prompt repeats itself until you press **Enter** so that you can freeze more than one layer.
Settings	Specifies the tricky case of how layers holding viewports and blocks (and xrefs) should be frozen; prompts you: **Enter setting type for [Viewports/Block selection]** - **(enter an option)**: • **Viewports** - specifies how viewports should be frozen; prompts you: **In paper space viewport use [Freeze/Vpfreeze]** - **(type F or V.)** – **Freeze** - freezes layers in all viewports (default) – **Vpfreeze** - freezes layers in the current viewport only • **Block selection** - specifies how blocks and xrefs should be frozen; prompts you: **Enter Block Selection nesting level [Block/Entity/None]** - **(type B, E, or N.)** – **Block** - freezes the layer the block has been inserted on (= same as None) - for Xrefs it freezes the layer of the selected entity within the xref. – **Entity** - freezes all layers associated with entities in the block or xref (entities that make up blocks might be on different layers) – **None** - freezes the layer of the block, and ignores other layers associated with entities and nested block

selection options (?)	Allows to choose a selection method. See the Select (6.27.16) command.

Figure 6.1400

Figure 6.1401

6.20.14 Layout

(6.2981 on page 6079) Creates, copies, renames, and deletes layouts. (6.1401)

Accessing the Command

command bar: **layout** menu bar: **Insert | Layout** ribbon: **Home | Settings Layouts** toolbar: **Insert |**  **Layout** | : **Layout Prompts you in the command bar:** Enter layout option [? to list/Set/New/Copy/Delete/Rename/SAve/Template/n <Set>: **(Enter an option)**

Command Options

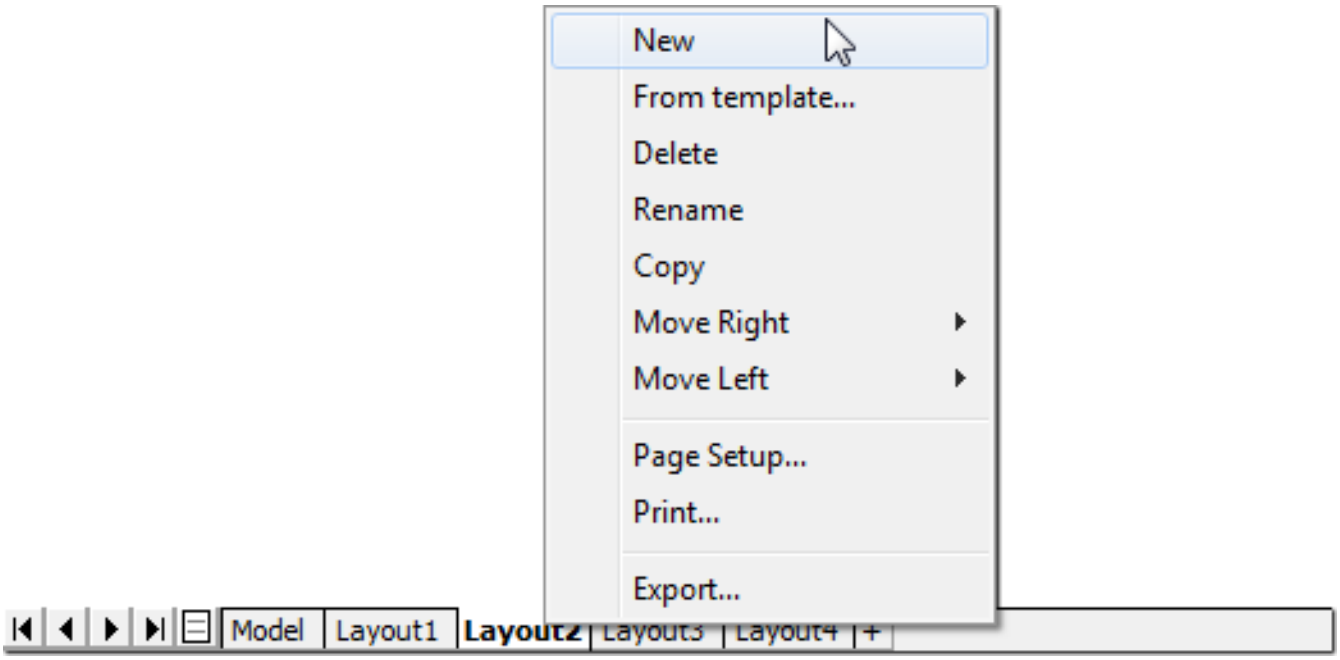
Option	Description
? to list	Lists the names of layouts already defined in this drawing: **Layout name:: Layout1 Block name:: *Paper_Space0 Layout name:: Layout2 Block name:: *Paper_Space1** If necessary, press **F2** to switch to the Prompt History window.
Set	Switches to the specified layout; prompts you: **Enter a layout name - (enter a name of a layout; the program immediately switches to the layout.)**
New	Creates new layouts; prompts you: **Enter new layout name <layoutn> - (specify the name of the new layout, or else press Enter to accept the offered name.)** The program adds the layout is added as a tab. The default name is "Layout**n**," where **n** is incremented with each new layout.
Copy	Creates a new layout by making a copy of an existing layout; prompts you: 1. **Enter the name of the layout to copy: <current> - (enter a name of an existing layout, or else press Enter to use the current layout name.)** 2. **Enter new layout name - (specify the name of the new layout; the program adds the copied layout as a new tab.)**
Delete	Erases layouts from the drawing; prompts you: 1. **Enter a layout name <current> - (specify the name of the layout to be removed, or else press Enter to use the current layout name.)** 2. The program displays a warning dialog box. Click **OK** to confirm the deletion or **Cancel** to preserve the tab The Model tab cannot be deleted.

Rename	Renames layouts; prompts you: 1. **Enter a layout name <current> - (enter a name of an existing layout, or else press Enter to use the current layout name.)** 2. **Enter new layout name - (specify the name of the new layout.)**
SAve	Saves layouts as DWG files, prompts you: 1. **Enter a layout name <current> - (enter a name of a layout, or else press Enter to use the current layout name.)** The program displays the Create Drawing File dialog box. 2. Enter a name for the drawing. 3. Choose whether to save the file in DWG or DXF format. 4. Click **Save**. The DWG file contains all layouts, including Model, but no drawing info. To use this file in another drawing, use the Import option.
Template	Imports layouts from DWG drawing files; displays the Select Template From File dialog box: 1. Choose a DWG or DXF file created by the SAve option. 2. Click **Open**. The program displays the Insert Layout(s) dialog box: (6.1406 on page 4693) 3. Choose one or more layout names. 4. Click **OK**. If the layout name already exists, then the program appends its name. For example, when the imported layout is named "Layout 2," the program names it "Layout3-Layout2."
neXt	Displays the next layout.
Previous	Displays the previous layout.

Layout Tabs

Right-click a tab for the following shortcut menu, which mimics the Layout command: (6.1402 on the following page) Use the arrow buttons (left end of the tabs) to move along the tab bar, when the drawing contains too many layout tabs to see them all. **Print Setup** displays the Print Setup dialog box for the current layout; see the CPageSetup (6.9.54) command. **Print** displays the Print dialog box, from which layouts are printed; see the Print (6.24.51) command.

Figure 6.1402

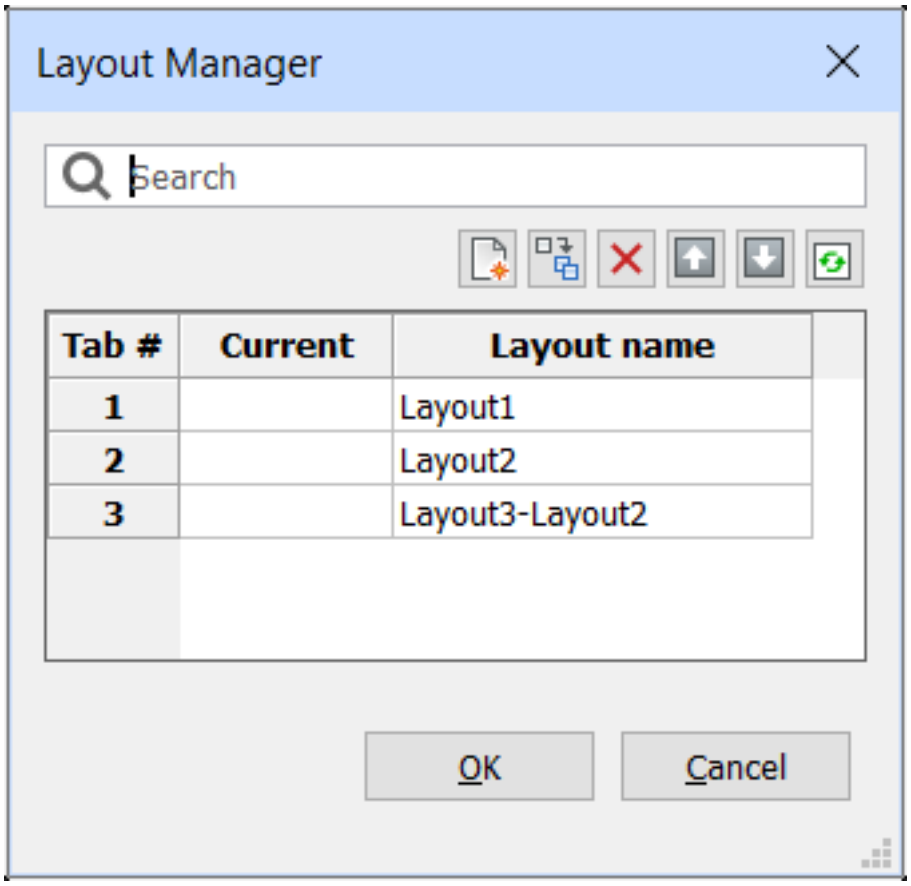


Layout Manager

Click the **Layout Manager** button on the layout tab to view the dialog box: (6.1403 on the next page)

Option	Description
Search	Searches for a layout name, useful when drawings contain many layouts
New	Creates a new layout
Copy Selected Layout(s)	Makes a copy of selected layouts, and adds them to the end of the list
Delete	Deletes the selected layouts
Up	Move the selected layouts up the list
Down	Move the selected layouts down the list
Clear Selection	Removes highlighting from layout names, thereby unselecting them
Current	Click in the Current column to make the layout current
Name	Double-click a layout name to exit the dialog box and make the layout current

Figure 6.1403



Status Bar Menu

Right-click TILE or LAYOUT on the status bar for the shortcut menu: (6.2741 on page 5846) (6.1405 on the next page)

Shortcut Menu Option	Description
Paper Space	(Available only in a layout tab) Switches the layout to paper space
Model Space	(Available only in a layout tab) Switches the layout to model space
Model	Switches the drawing editor to Model tab.
Layout1	Switches the drawing editor to Layout1.
Layout2	Switches the drawing editor to Layout2. When the drawing contains other layouts, they are also listed in the shortcut menu.

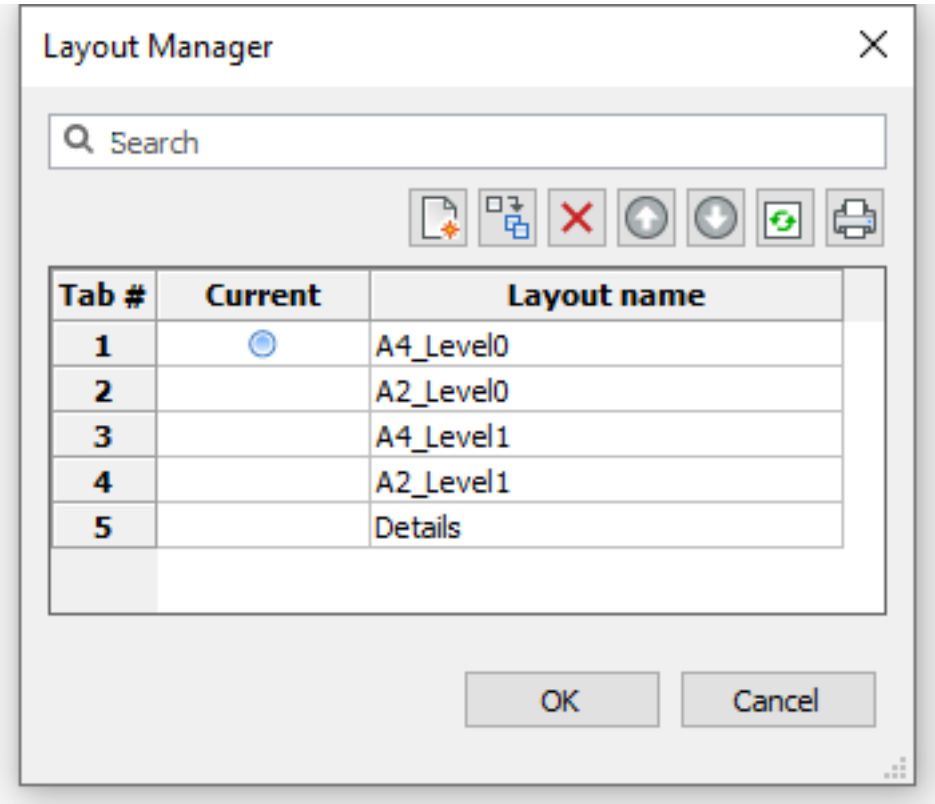
(6.2981 on page 6079) Manages layouts through a dialog box.

Accessing the Command

command bar: **layoutmanager** layout bar: (6.1408) : **LAYOUTMANAGER** Displays a dialog box: (6.1409 on the facing page)

Figure 6.1408

Figure 6.1409



Dialog Box Options

Option (6.1410)	Description
	Searches for a layout name, useful when drawings contain many layouts. The layout list is filtered as you type: only layouts that contain the search string display.
New	Creates a new layout. Type a name in the **Layout name** field to replace the default Layout name.
Copy Selected Layout(s)	Makes a copy of selected layouts, and adds them to the end of the list
Delete	Deletes the currently selected layout(s)
Up	Moves the currently selected layout(s) up in the list, and to the left in the layout tab bar.
Down	Moves the currently selected layout(s) down in the list, and to the right in the layout tab bar.
Clear Selection	Removes highlighting from layout names, thereby unselecting them.
Publish	Launches the PUBLISH (6.24.68) command with the selected layouts.
Tab #	Click to select all layouts.
Current	Click in the Current column to make the layout current.
Layout name	Click a name field, then click again to rename the layout. Double click a name field to open the layout and close the Layout Manager dialog box.

Related Commands

Layout (6.20.14) - creates, copies, renames, and deletes layouts.

Figure 6.1410

6.20.16 LayThw

Thaws all frozen layers, but does not change layers that are turned off (short for "layer thaw").

Accessing the Command

command bar: **laythw** menu bar: **Settings | Layers** ribbon: **Home | Layers | Thaw All Layers** toolbar: **Layers | Thaw All Layers** : **LayThw Prompts you in the command bar:** All layers have been thawed.

Command Options

No options.

Related Commands

LayFrz (6.20.12) - freezes layers associated with selected entities. LayUlk (6.20.18) - unlocks layers associated with selected entities. LayOff (6.20.11) - turns off layers associated with selected entities. LayOn (6.20.13) - turns on all layers that have been turned off.

Figure 6.1411

6.20.17 LayTrans

(7.3 on page 6132) Applies layer names and properties from another drawing to the current drawing.

Accessing the Command

command bar: **laytrans : laytrans** Displays the **Layer Translator** dialog box. All the layer names in the current drawing are displayed in the **Translate From** list. You can specify the layers to which you want them to map by loading layer information from an existing DWG, DWS, or DWT file. (6.1412 on the next page) You can also create new layers. Simply enter the layer name and properties to which you want to map existing layer. (6.1413 on the following page) You can select one or more layers from the current drawing, the list on the left, to map to a layer from the list on the right. If you choose **Map Same**, any layer names in the current drawing with corresponding names in the list on the right will inherit the properties from the list on the right. The layer mappings you select are displayed in the **Translation Mappings** list. (6.1414 on page 4699) You can double click on a layer or choose **Edit** to modify its layer mapping properties. You can also remove layers from the **Translation Mappings** list or save the mapping list to use again in the future. The **Options** dialog offers additional controls for layer mappings. (6.1415 on page 4699)

6.20.19 LConnect

(6.2932 on page 6037) Creates or modifies an L-connection between solids. Optionally disconnects L-connected solids.

Accessing the Command

command bar: **lconnect** menu bar: **BIM | BimConnect | Lconnect** toolbar: **BIM Connect** Quad Tab: **Model** (If solids are selected) Ribbon Tab | Panel: **Model | Modify 3D - Connect** : **LConnect Prompts you in the command bar:** Select entities* to connect [selection options (?)]: **(Select the first solid or solid face.)** Select entities* to connect [selection options (?)]: **(Select the second solid or solid face.)** Select base solid [Switch] <Accept>: **(Press Enter to accept the connection or repeatedly press the Ctrl key to cycle the variants.)** * When solids are selected the larger part of the solid is kept; otherwise select the faces to be connected. L-Connecting walls (select solids or faces)

(6.1418 on the next page) Before	(6.1419 on the following page) Result

L-Connecting roof slabs (select solids or faces)

(6.1420 on page 4703) Before	(6.1421 on page 4703) Result

(6.1422 on page 4704) Before	(6.1423 on page 4704) Result

L-Connecting solids (select faces)

(6.1424 on page 4705) Before	(6.1425 on page 4705) Result

Command Options

Option	**Description**
Switch	Allows to choose between two butted L-connections: (6.1426 on page 4705)or (6.1427 on page 4706) or a mitered L-connection: (6.1428 on page 4706) or a touching (disconnected) connection. (6.1429 on page 4706) Prompts you: **Select base solid [Switch] <Accept>:** 1. Do one of the following to cycle the L-connect options: • Click the **Switch** option in the command prompt. • Click **Switch** in the prompt menu (1.15.6). • Press the Ctrl key. • Type **S** + Enter. Press Enter or right click to accept the current connection type. If the HOTKEYASSISTANT = ON, the the Hotkey Assistant indicates the currently selected L-connection type. (6.1430 on page 4706)

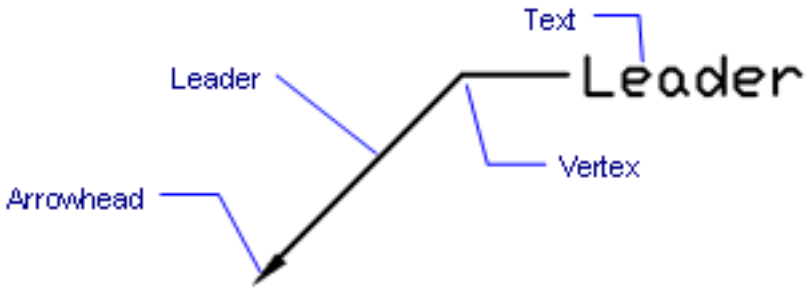
Figure 6.1433



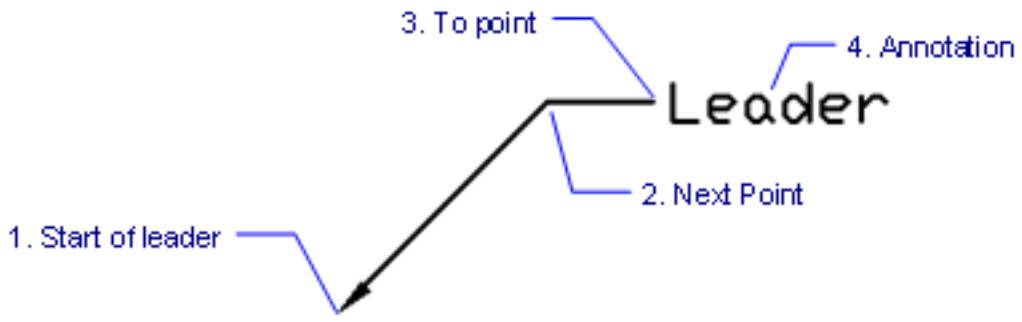
6.20.21 Leader

(6.2981 on page 6079) Draws leaders. (6.1433)

Accessing the Command

command bar: **leader** aliases: **le lead** : **Leader Prompts you in the command bar:** Start of leader: **(Pick a point)** Next point: **(Pick a point)** To point [Format/Undo/Annotation] <Annotation>: **(Pick a point, or else enter an option)** (6.1434)

Figure 6.1434



Command Options

Option	Description
To point	Specifies the next vertex: . • Pick a point. • Press **Enter** to stop adding vertices and start the Annotation option.
Format	Specifies the leader style; prompts you: **[Arrow/None/SPline/STraight/Exit] <Exit> - (enter an option.)** • **Arrow** - Draws an arrowhead at the leader's start point (default) • **None** - Draws no arrowhead • **Spline** - Draws the leader as a spline (6.27.63) • **Straight** - Draws the leader as straight line segments (default) • **Exit** - Returns to the previous prompt
Undo	Undoes the last leader line segment
Annotation	Starts adding text to the end of the leader line. The annotation is created as an Mtext (6.21.38) entity; prompts you: 1. **First line of annotation text <options> - (type a line of text, and then press Enter to start a second line of text. Alternatively, press Enter right away to choose the Options option; see below.)** 2. **Next line of annotation text - (press Enter to stop adding text, or else type the next line, then press Enter.)** Caution: the annotation is independent of the leader line; when moving a leader, be sure to include the annotation in the selection set.
Options	Specifies the type of annotation; prompts you: **Dimension text options [Block/Copy/None/Tolerance/Mtext] <Mtext> - (enter an option)**: • **Block** - uses a block as the annotation; displays prompts identical to that of the -Insert (6.17.14) command • **Copy** - uses any other text entity in the drawing as the annotation; prompts you: **Select an entity** - select a existing text (6.29.12) or mtext (6.21.38) entity, and converts text entities to mtext • **None** - creates a leader without annotation. • **Tolerance** - enter the annotation as a tolerance notation through the Geometric Tolerance (1.29.15) dialog box • **Mtext** - enter annotation as mtext through a Text Formatting toolbar; see the Mtext (6.21.38) command

Related Commands

DimLeader (6.11.13) - places leaders with text, blocks, entities, or tolerances. QLeader (6.25.3) - draws leaders. Lets you specify the properties of the leader through a dialog box and reuse them for a series of leaders. MLeader (6.21.19) - creates multileader entities using the current multileader style. DimLinear (6.11.12) - places linear dimensions in drawings: horizontal, vertical, and rotated. DimAligned (6.11.3) - places aligned dimensions. DimBaseline (6.11.6) - places additional dimensions from a common baseline. DimContinue (6.11.8) - continues dimensions. DimDiameter (6.11.9) - places diameter dimensions. DimRadius (6.11.16) - places radius dimensions. DimCenter (6.11.7) - places center marks. DimAngular (6.11.4) - places angular dimensions. DimOrdinate (6.11.14) - places x and y ordinate dimensions. Tolerance (6.29.26) - places tolerance tags in drawings. Dim (6.11.1) - places and edits dimensions at the 'Dimensioning command:' prompt. Dim1 (6.11.2) - places and edits a single dimension at the 'Dimensioning command:' prompt. DimEdit (6.11.11) - changes the wording and angle of dimension text; changes the angle of extension lines. DimTEdit (6.11.23) - changes the position of dimension text. DdEdit (6.10.13) - edits dimension text. Properties (6.24.54) - edits the properties of dimensions through a palette. DimStyle (6.11.19) - creates and edits dimension styles through the Drawing Explorer. -DimStyle (6.11.21) - saves and applies dimensions styles at the command line. Style (6.27.55) - sets the text style used by dimensions. DimOverride (6.11.15) - overrides the values of the current dimension style.

Accessing the Command

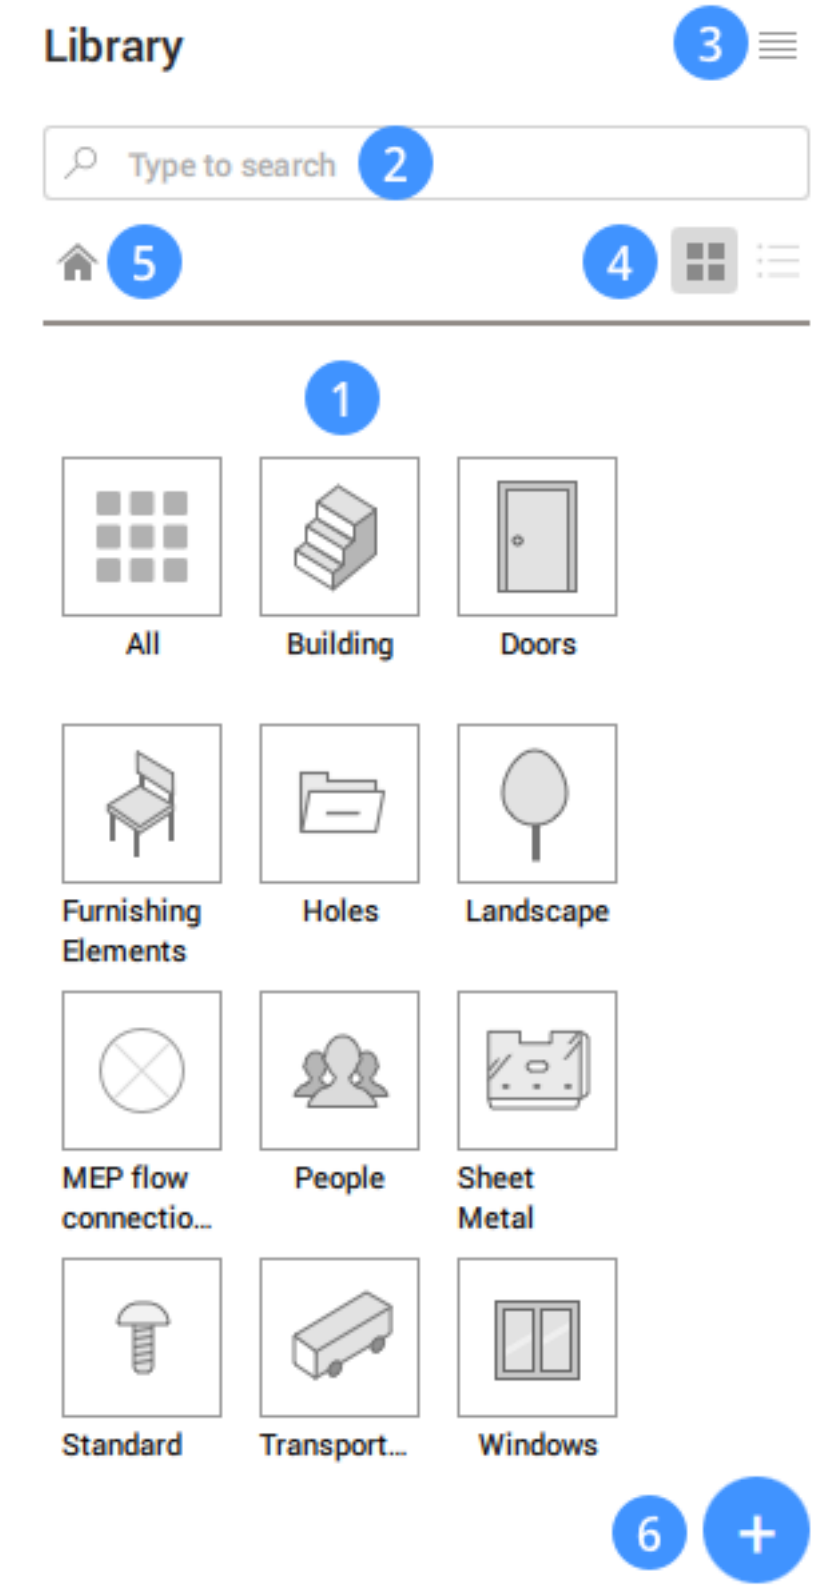
Keyboard: **librarypanelopen** context menu: right-click any toolbar or ribbon item, and then choose **Panels > Library : librarypanelopen** Displays the Library panel: (6.1437 on the facing page)

1. Block library: Category and Block thumbnails
2. Search field.
3. Options menu
4. View options
5. Navigation toolbar
6. Add Block button

Figure 6.1437



Command Options

Option Description Block library The block library is organized by categories. Select a category to view its blocks and/or sub-categories. Categories and blocks may be user-defined or pre-defined by BricsCAD. You can scroll through the categories and blocks using the mouse wheel or the scroll bar. The availability of pre-defined blocks depends on your license level. Search field Searches the library for words you enter in the search box. All blocks in all categories that contain the current search string are listed. Options Menu (6.1438 on the next page) **Generate thumbnails**: Generates or updates the thumbnail images of all blocks. **Manage libraries**: Allows to select folders with user-defined blocks (4). Opens the Settings dialog with the Library Directory Path (COMPONENTSPATH) system variable selected. To edit the directory path list, do the following:

1. Click the **Browse** () button at the right hand side of the settings field to open the **Path List** dialog: (6.1439 on page 4716)
2. Click the **New** button (), then click the **Browse** button () at the right hand side of the settings field. The **Choose a Folder** dialog displays.
3. Select the folder, then click the **Select Folder** button.
4. (option) Click the **Delete path** button () to remove a folder.
5. (option) Select a path, then click the arrow buttons to change the order.

Content of the library

1. Bricsys Mechanical library: C:\Program Files\Bricsys\BricsCAD V21 en_US\UserDataCache\Support\en_US\DesignLib
2. Bricsys BIM library: C:\Program Files\Bricsys\BricsCAD V21 en_US\UserDataCache\Support\en_US\Bim\Components
3. Bricsys 2D library: (not implemented yet)
4. User library (C:\ProgramData\Bricsys\Components) and user defined folder paths (if any) as defined by the COMPONENTSPATH system variable (see above).

View options You can choose between **Grid** (left) or **List** (right) view. Use the mouse wheel or the scroll bar to browse. (6.1440 on page 4717) (6.1441 on page 4718) Navigation toolbar (6.1442 on page 4719) Displays the path to the current folder.

- Click a folder in the path to open it.
- Click the Home icon () to return to the root.

Thumbnails All Click to display all blocks alphabetically in all folders and subfolders of the currently

selected libraries in the options menu. **Folder** thumbnail: Click to display the components and

subfolders (if any). **Block** thumbnail: Click then move the cursor to the drawing to insert the block. Add Block Click the + button to launch the CREATELIBRARYBLOCK (6.9.55) command.

6.20.24 Lengthen

(6.2981 on page 6079) Changes the length of open objects, such as lines, polyline segments, and arcs. **Note:** This command is largely superseded by grips editing, as well as by the Trim (6.29.35) and Extend (6.13.21) commands.

Accessing the Command

command bar: **lengthen** aliases: **len editlen** menu bar: **Modify | Lengthen** toolbar:**Modify |** : **Lengthen Prompts you in the command bar:** Edit length: DYnamic/Increment/Percent/Total/<Select entity to list length>: **(Enter an option, or choose an entity)**

Command Options

Option	Description
Select entity to list length	Select a valid entity, and then the program reports the current length of an open entity in the current units,such as **Current length: 7'-11 7/8"**
DYnamic	Changes the length interactively; prompts you: **Select entity to change or [edit Mode]** - **(select an entity; the prompt that appears next depends on the entity you selected)**: • Line: **New end point for line** - drag the line longer or shorter • Arc: **New start point** - drag the arc longer or shorter • Polyline: **New end point** - drag the segment longer or shorter **edit Mode** option returns to original prompt to switch lengthening modes.)
Increment	Changes the length or angle by a specified amount; prompts you: **Enter length to increment or [Angle] <0">** - **(specify a positive number to lengthen the entity, or a negative number to shorten it, or else enter A)**: • **Select entity to change or [edit Mode]** - **(select the entity to lengthen.)** • **Enter angle increment <0>** - **(specify the angle by which to change the entity (applies to arcs only).)**
Percent	Changes the length of entities by a percentage; prompts you: **Enter percent length <0.0000>** - **(enter a number to lengthen or shortens the entity to a percentage of the current length.)** For example, enter 25 (for 25%), and a 1"-long line is shorted to 0.25". Enter 150%, and the 1" line becomes 1.5".

Total	Changes the length to the amount specified; prompts you: **Angle/<Enter total length (0.0000)>** - **(enter an option)**: • **Enter total length** - specifies the size to which to lengthen or shorten the entity; for example, enter 2 and a 1"-long line is lengthened to 2". • **Enter angle increment** - specifies the angle to which to size the arc; for example, enter 45 and a 180-degree arc is shortened to 45 degrees

Procedures

- Change the length of an entity dynamically (1.32.23)
- Modify the included angle of an arc (1.32.23)

Related Commands

Extend (6.13.21) - lengthens open entities. Stretch (6.27.52) - stretches entities longer and shorter. Change (6.9.10) - changes the length of lines. Trim (6.29.35) - shortens entities.

6.20.30 Light

(7.3 on page 6132) Places light glyphs in drawings for generating more realistic renderings.

Accessing the Command

command bar: **light** alias: **lighting** ribbon: **View | Lights | Create | Light**
: **Light Prompts you in the command bar:** Enter light type [Point/Spot/Web/Distant] <Spot>: **(Enter an option, or else press Enter to create a spot light).**

Command Options

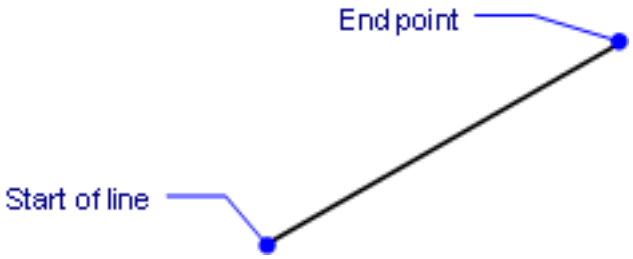
Option	Description
Point	Creates a point light; see the POINTLIGHT (6.24.47) command for the meaning of its options
Spot	Creates a spot light; see the SPOTLIGHT (6.27.47).command for the meaning of its options
Web	Creates a web light; see the WEBLIGHT (6.33.4) command for the meaning of its options
Distant	Creates a distant light; see DISTANTLIGHT (6.10.34) command for the meaning of its options

Related Commands

Distantlight (6.10.34) - creates a distant light. Lightlist (6.20.36) - displays the Drawing Explorer - Lights dialog window. Materials (6.21.10) - creates materials and edits their properties through the Drawing Explorer. Pointlight (6.24.47) - creates a point light. Render (6.26.21) - calculates a photorealistic image of the 3D model. Spotlight (6.27.47) - creates a spot light. Sunproperties (6.27.70) - displays the Sun Properties of the Active Viewport editor in the Drawing Explorer - Lights dialog. Weblight (6.33.4) - creates a web light.

Figure 6.1452

Figure 6.1453



6.20.31 Line

(7.3 on page 6132) Draws line segments. (6.1453)

Accessing the Command

Command bar: **line** aliases: **l, 3dline** menu bar: **Draw | Line** quad Tab: **Draw | Line** ribbon: **Draw | Draw | Line Model | Draw | Line Sketch | Draw | Line** toolbar: **Draw**
: **Line The first time you use the Line command in a drawing, prompts you:** Start of line: **(Pick a point, or enter x,y,z coordinates)** Set end point or [Angle/Length/Undo]: **(Pick a point, enter x,y,z coordinates, or else choose an option)** Set end point or [Angle/Length/Follow/Undo]: **(Pick a point, enter x,y,z coordinates, choose an option, or else press Enter to exit)** Set end point or [Angle/Length/Follow/Close/Undo]: **(Pick a point, enter x,y,z coordinates, choose an option, or else press Enter to exit) The next time you use the command in the drawing, prompts you:** Start of line or [Follow] <Last point> **- ((Pick a point, enter x,y,z coordinates, or else choose an option)**

Command Options

Option	Description
Start of line	Specifies the starting point of the first line segment: • Pick a point, optionally using entity snaps or an other modifier • Enter x,y coordinates to start a 2D line • Enter x,y,z coordinates to start a 3D line
Last point	Starts the new line at the end of the previously-drawn line: Press **Enter** to use the most recently specified point. (6.1455 on page 4732)
End point	Specifies the endpoint of each line segment: • Pick another point, optionally using entity snaps or an other modifier • Enter x,y coordinates to continue a 2D line • Enter x,y,z coordinates to continue a 3D line

Angle	Draws the line at a user-specified angle and distance; prompts you: 1. **Angle of line - (specify the angle, which is measured counter-clockwise from the positive x-axis.)** 2. **Length of line - (specify the length of the segment.)** (6.1456 on page 4733)
Length	Draws the line at a user-specified distance and angle; prompts you: • **Length of line - (specify the length of the segment.)** • **Angle of line - (specify the angle, measured counterclockwise from the positive x-axis.)**
Undo	Undoes (erases) the last line segment.
Follow	Draws the next line segment at the same angle as the previous segment; prompts you: **Length of line - (specify the length of the segment.)** (6.1457 on page 4733)
Close	Closes the "polygon" by drawing a line segment between the current endpoint and the first start point. (6.1458 on page 4733)

Grips Editing

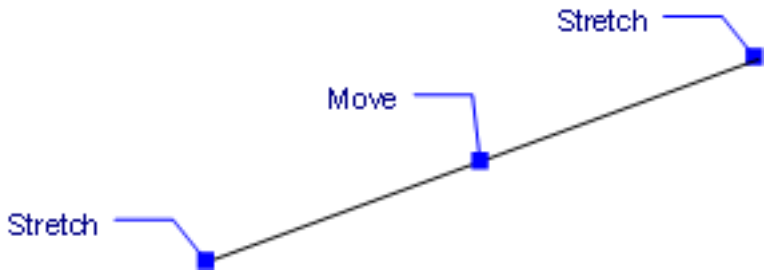
Lines can be edited directly through grips:

1. Select the line. Notice that it has three grips.
2. Drag the grips to perform the following actions

- Drag an endpoint grip to stretch the line.
- Drag the midpoint grip to move the line.

(6.1454)

Figure 6.1454



Procedures

- Drawing lines (1.25.10)

Related Commands

MLine (6.21.33) - draws multilines. PLine (6.24.27) - draws connected lines and arcs. Ray (6.26.1) - draws semi-infinite lines. Sketch (6.27.69) - draws sketched (freehand) lines. Trace (6.29.32) - draws wide line segments. XLine (6.34.6) - draws infinite lines. Properties (6.24.54) - changes the properties of lines through a dialog box. Change (6.9.10) - changes the properties of lines through the command bar.

Shape Classic Pro Platinum Mechanical BIM

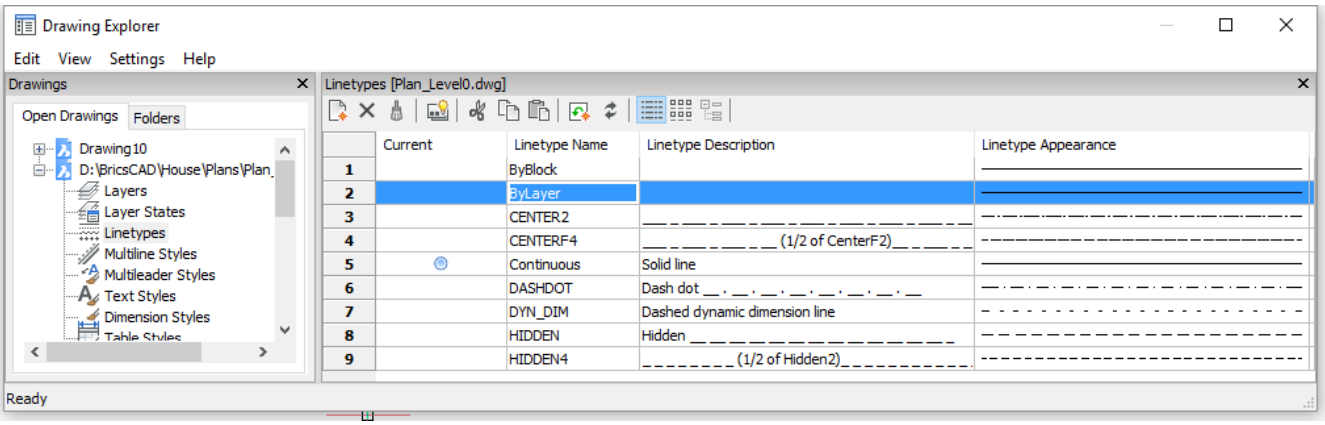
6.20.32 Linetype

(6.2981 on page 6079) Loads, sets, and creates linetypes through the Drawing Explorer.

Accessing the Command

command bar: **linetype** transparent: **'linetype** aliases: **lt ddltype expltypes** menu bar: **Tools | Drawing Explorer | Linetypes** status bar: **Linetype** field ("ByLayer") : **Linetype** Displays the Linetypes node of the Drawing Explorer dialog box: (6.1460) Add linetypes or modify their properties, and then click **X**. Press **F1** to access help. New drawings contain at least these linetype definitions: Continuous, ByLayer, and ByBlock. Any other linetype must be loaded into the drawing before it can be used: click the **New** button to load the linetype. To start new drawings with all linetypes loaded, create and save the drawing as a DWT template file.

Figure 6.1460



Command Options

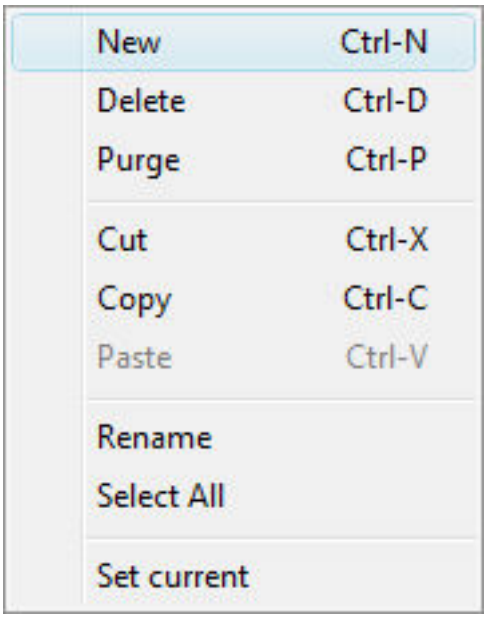
Option	Description
 New	Loads additional linetype definitions into the drawing. Displays the Load Linetypes dialog box: (6.1464 on page 4738) (To add linetypes from a different LIN file, click the **File** button.) 1. Select one or more linetypes. 2. Click **OK**. The linetype(s) are added to the Drawing Explorer's list.
 Delete	Erases linetype definitions from the drawing. The following linetype definitions cannot be deleted: • Continuous • ByLayer • ByBlock • Any linetype in use
 Purge	Removes all unused linetype definitions from the drawing. The following linetypes cannot be purged: • Continuous • ByLayer • ByBlock • Any linetype in use

Shortcut Menu Options

(6.1461 on the next page) The keystrokes shown below work only inside the Drawing Explorer:

Option	Keystroke	Description
New	Ctrl+N	Adds a linetype definition by displaying the Load Linetypes dialog box.
Delete	Ctrl+D	Erases the selected linetypes, except for the ones listed above.
Purge	Ctrl+P	Purges unused linetypes from the current drawing, except for the ones listed above.
Copy	Ctrl+C	Copies the selected linetype to the Clipboard. (The Cut option does not work with linetypes.)
Paste	Ctrl+V	Pastes the linetype definition into this or another drawing.
Rename		Renames the selected linetype.
Select All		Selects all linetype definitions.
Set Current		Sets the selected linetype as current.

Figure 6.1461



Status Bar Menu

Right-click ByLayer (or other linetype name) on the status bar for the shortcut menu: (6.2741 on page 5846) (6.1466 on page 4740)

Shortcut Menu	Description
ByLayer, ByBlock, Continuous	Chooses the default linetype. When the drawing contains additional linetypes, their names are listed here.
Properties	Opens the Linetypes section of the Drawing Explorer.

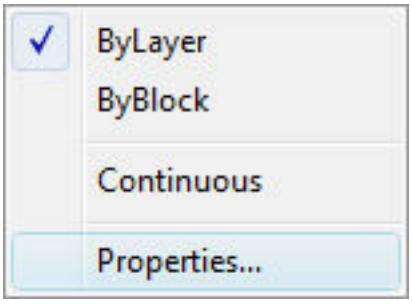
Figure 6.1463



Related Commands

-Linetype (6.20.33) - sets and loads linetypes through the command bar. LWeight (6.20.42) - specifies lineweights. Settings (6.27.25) - sets linetype parameters. Layer (6.13.17) - assigns linetypes to layers. Properties (6.24.54) - change linetypes through a palette. Change (6.9.10) and ChProp (6.9.11) - change linetypes through the command bar. Explorer (6.13.15) - Opens the Drawing Explorer dialog box.

Figure 6.1464

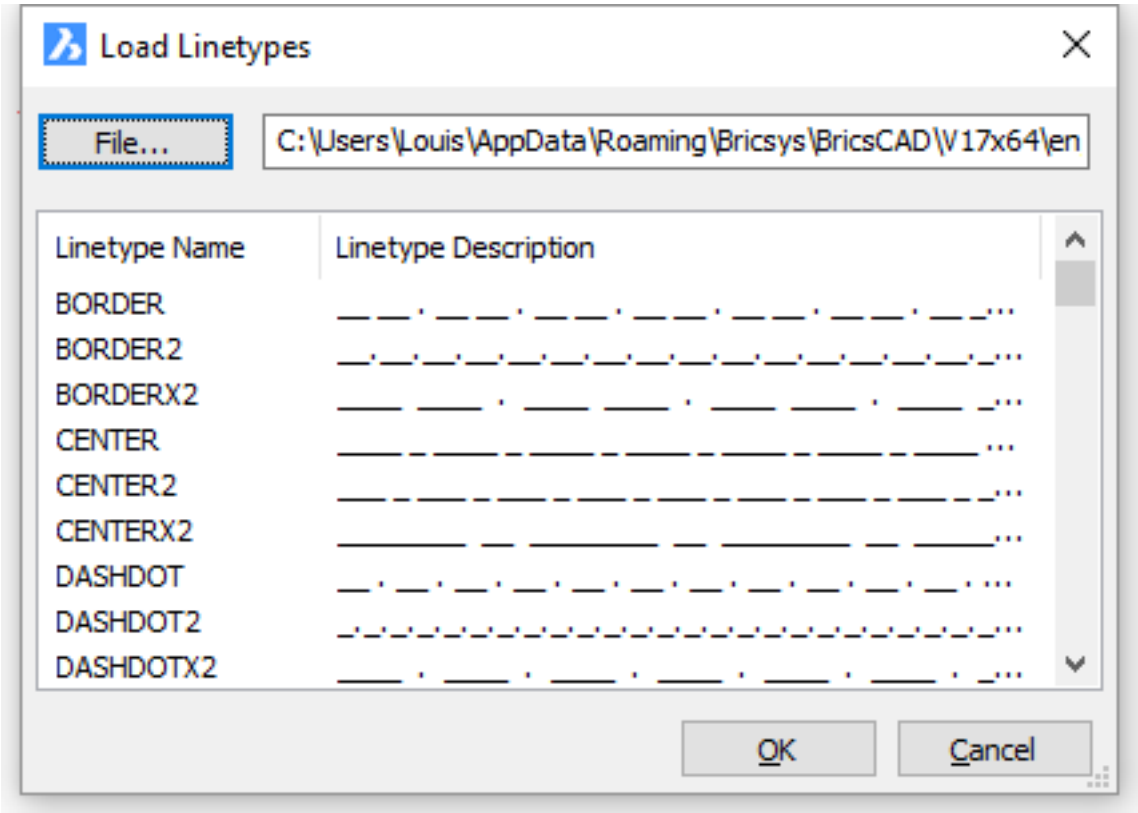


Figure 6.1465

6.20.33 -Linetype

(6.2981 on page 6079) Loads, sets, and creates linetypes through prompts in the command bar.

Accessing the Command

command bar: **-linetype** transparent: **'-linetype** alias: **-lt** status bar: **ByLayer** : **-linetype Prompts you in the command bar:** Linetype [? to list/Create/Load/Set]: **(Enter an option, or press Enter to end the command)**

Command Options

Option	Description
? to list	Displays the Select Linetype File dialog box: (6.1467 on page 4742) 1. Choose a LIN file, such as **iso.lin** 2. Click **Open**. The program lists the names and details of the file's linetype definitions in the Prompt History window, like this: **BORDER Border __ __ . __ __ . __ __ . __ __ . __ __ . 12.700, -6.350, 12.700, -6.350, 0, -6.350**
Create	Creates new linetype definitions; prompts you: 1. **Name for new linetype - (enter a name, such as legaleBorder.)** 2. The program opens the Create or Append Linetype File dialog box: (6.1468 on page 4743) 3. Select a file or enter a new name 4. Click **Open**. The program checks if the name exists in the file: **One moment... Checking existing linetypes for "legalBorder."** 5. **Linetype description - (enter a description of the linetype, such as "Legal border".)** 6. **Linetype definition (positive numbers for lines, negative for spaces) - (enter the code that defines the linetypes)**: • **Dashes** - shown by positive numbers, such as 0.5. • **Spaces** - shown by negative numbers, such as 0.25. • **Dots** - shown by zero (0). Separate numbers with commas, such as 0.5, -.25, 0.7. Press **Enter** to finish the definition. The program adds the definition to the LIN file, and then reports: **Linetype "new" was defined in "C:\...default.lin"**

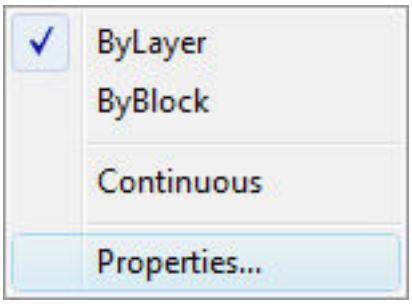
Load	Loads a linetype definition from a LIN file. Prompts you: 1. **Enter linetype to load - (specify the name of the linetype, such as 'border'.)** 2. The program displays the Select Linetype File dialog box, so choose a LIN file. 3. Click **Open**. The program reports, "Linetype 'BORDER' loaded."
Set	Sets a loaded linetype as the current (working) linetype; prompts you: **? to list linetypes in drawing/Linetype to set as current <BORDER> - (enter an option)**: • **?** - lists the linetype definitions in the drawing. • Enter the name of a linetype • Press **Enter** to accept the default

Status Bar Menu

Right-click **ByLayer** (or other linetype name) on the status bar for the shortcut menu: ===ERROR WITH DOWNLOADED IMAGE=== (6.1466)

Shortcut Menu	Description
ByLayer, ByBlock, Continuous	Chooses the default linetype. When the drawing contains additional linetypes, their names are listed here.
Properties	Opens the Linetypes section of the Drawing Explorer; see Linetype (6.20.32) command.

Figure 6.1466



Related Commands

Linetype (6.20.32) - sets and loads linetypes through the Drawing Explorer. LWeight (6.20.42) - specifies lineweights. Settings (6.27.25) - sets linetype parameters. Layer (6.13.17) - assigns linetypes to layers. Properties (6.24.54) - change linetypes through a palette. Change (6.9.10) and ChProp (6.9.11) - change linetypes through the command bar.

Figure 6.1467

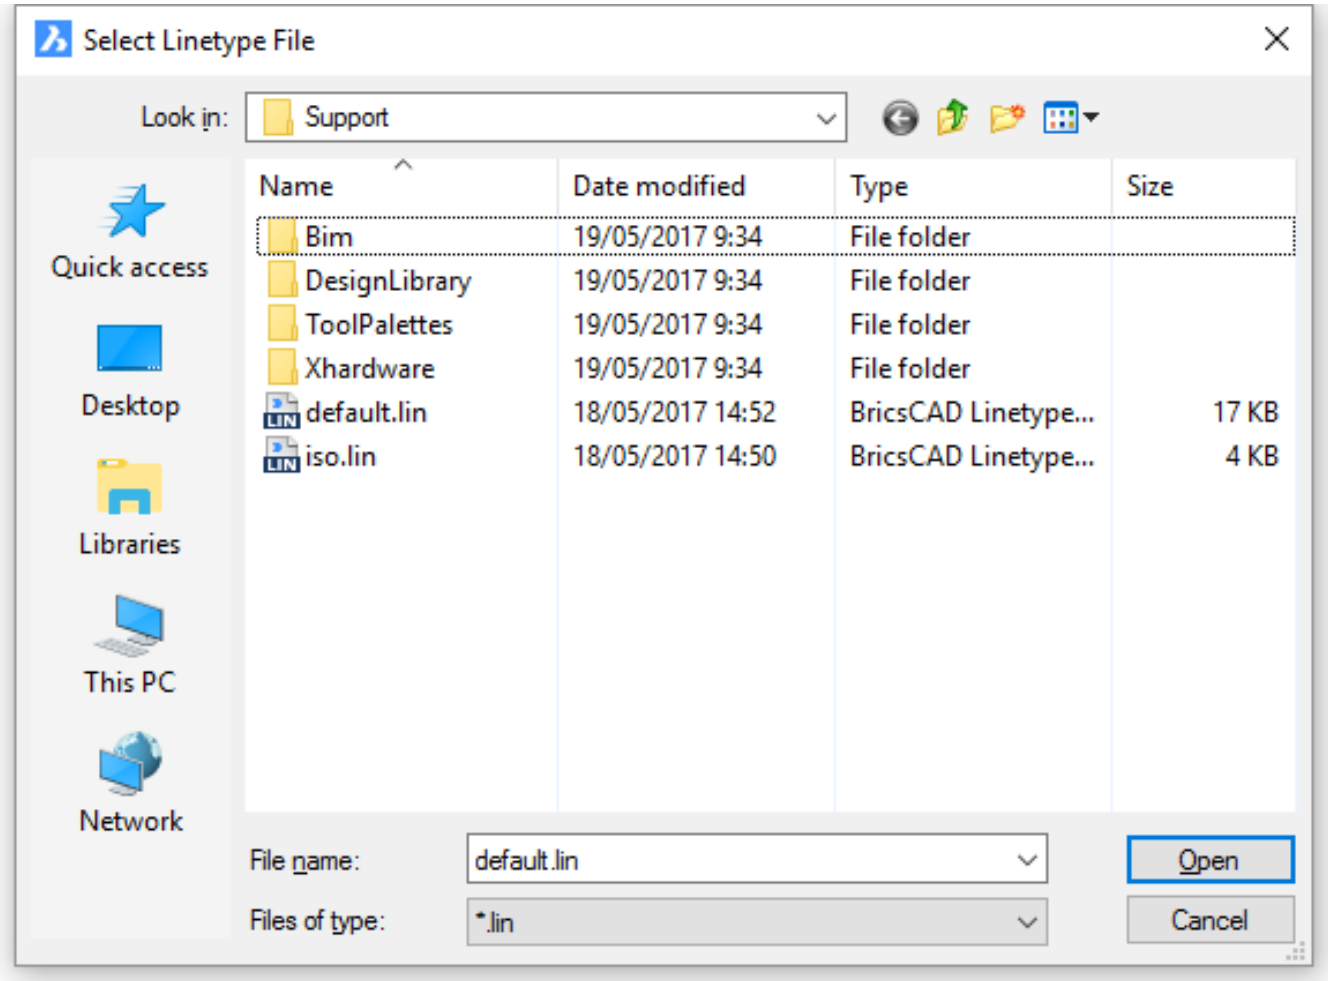


Figure 6.1468

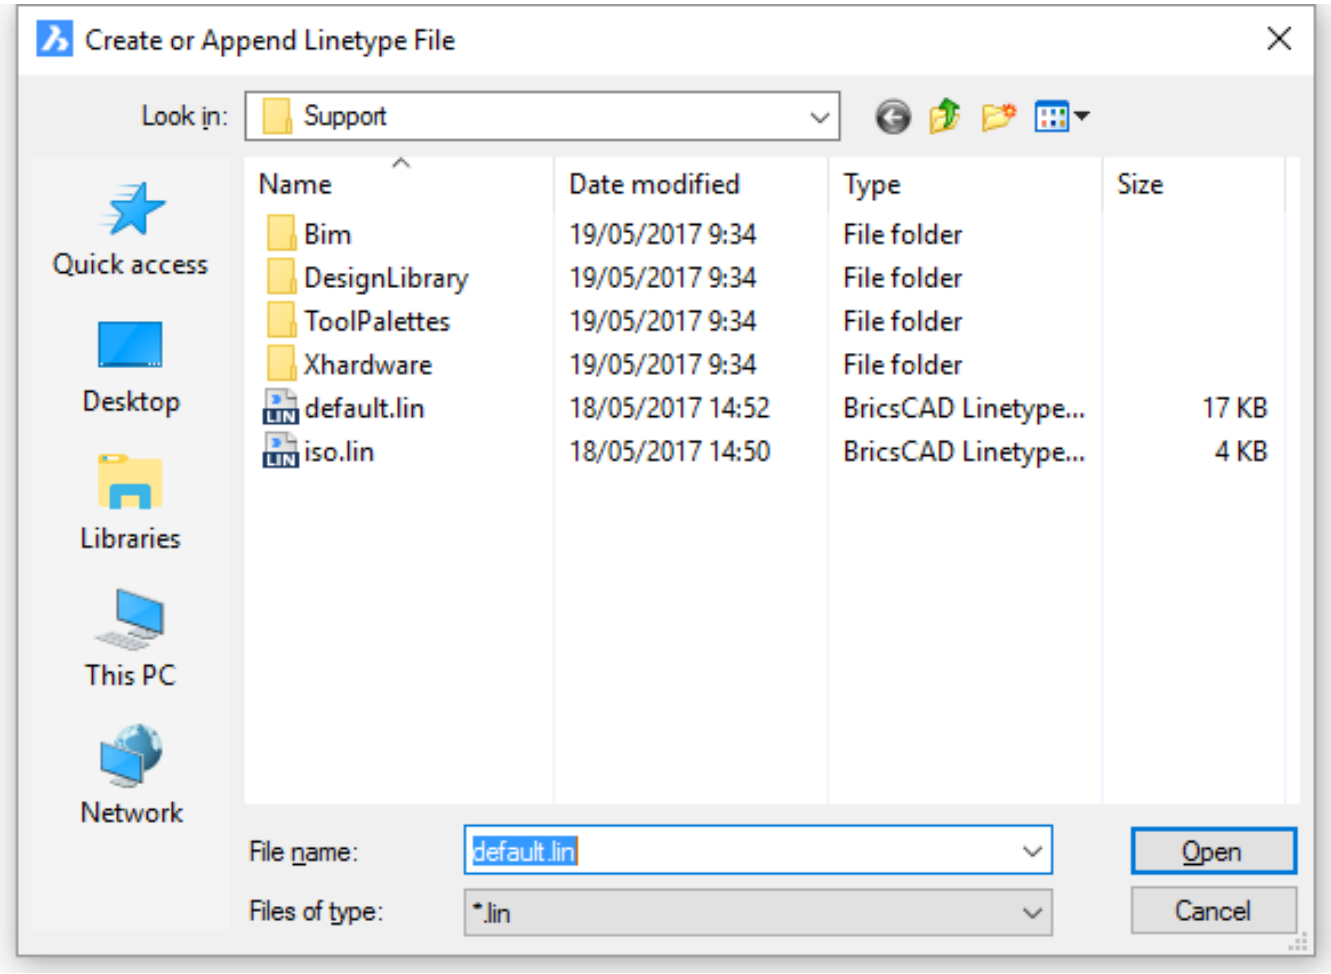

Figure 6.1469

6.20.34 List

(7.3 on page 6132) Lists the properties of selected entities. **Note:** This command is largely superseded by the Properties (6.24.54) command.

Accessing the Command

 command bar: **list** aliases: **li, ls** menu bar: **Tools | List Entities** ribbon: **Tools | Inquiry | List Entity Info** toolbar: **Inquiry |**  : **List Prompts you in the command bar:** SOrt/Tracking/<Select entities to list>: **(Choose one or more entities, or enter an option.)** This command returns long lists of data, so press F2 to switch to the Prompt History window. When listing gets too long, press Esc to end it.

Command Options

Option	Description
SOrt	Switches from sequential to sort mode; prompts you: **SEquential/Tracking/<Select entities to list>** - **(enter an option)**: • **SEquential** - lists entities in the order by which you selected them • **Tracking** - specifies the number of lines of text to display before 'Press ENTER to continue' appears; prompts you: **Number of command lines to track <256>** - **(enter a number)** • **Select entities to lis**t - choose one or more entities, and then press **Enter** When you select more one entity, this option lists them sorted by entity. For example, select a line, an arc, and another line. This option lists them as line 1, line 2, and arc 1.

A typical List listing looks like this: **------ Line 0 ---------- Handle: B9 Current space: Model Layer: 0 Color: 256(BYLAYER) Linetype: ByLayer From point: X= -36.0000 Y= 16.5000 Z= 0.0000 To point: X= -24.5000 Y= 11.5000 Z= 0.0000 Length: 12.5399 Angle in UCS XY plane: 337 Delta values: X= 11.5000 Y= -5.0000 Z= 0.0000**

Related Commands

Area (6.4.18) - reports the area, circumference, and perimeter of entities. DbList (6.10.5) - reports parameters of every entity in the drawing. Dist (6.10.36) - reports the 2D and 3D distances between two points. Id (6.17.4) - reports the x,y,z coordinates of picked points. MassProp (6.21.2) - reports the properties of solid models and regions. Properties (6.24.54) - lists the area and other parameters of entities in a palette.

Figure 6.1470

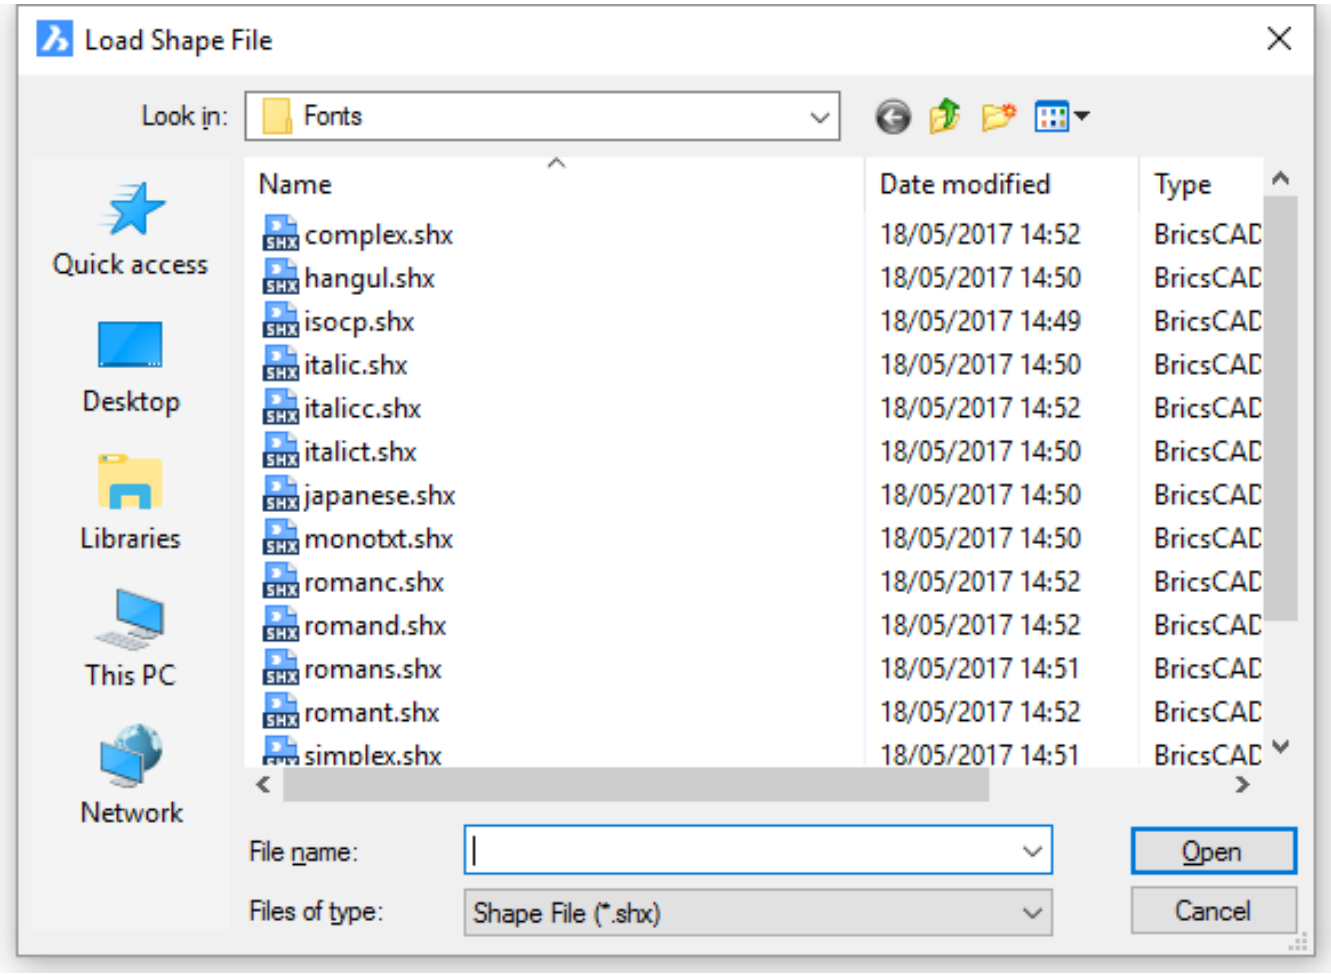
6.20.35 Load

(6.2981 on page 6079) Loads SHX shape files into the current drawing. **Note:** This command works only with **shape** SHX files, and not with **font** SHX files. Use the Text and MText commands to work with font SHX files.

Accessing the Command

command bar: **load** : **Load** Displays a dialog box: (6.1471 on the following page) Choose an SHX file, and then click **Open**. Shapes are placed with the Shape (6.27.35) command. SHX files are compiled SHP shape files, which are used to define fonts, shapes, and complex linetypes. See the **Customizing BricsCAD** reference guide on creating custom shapes. Shapes are an early version of highly efficient blocks, but are difficult to create. This command remains in BricsCAD for compatibility reasons.

Figure 6.1471



Command Options

No options.

Related Commands

Shape (6.27.35) - inserts shapes into drawings. Insert (6.17.13) - inserts blocks into drawings.

Figure 6.1472

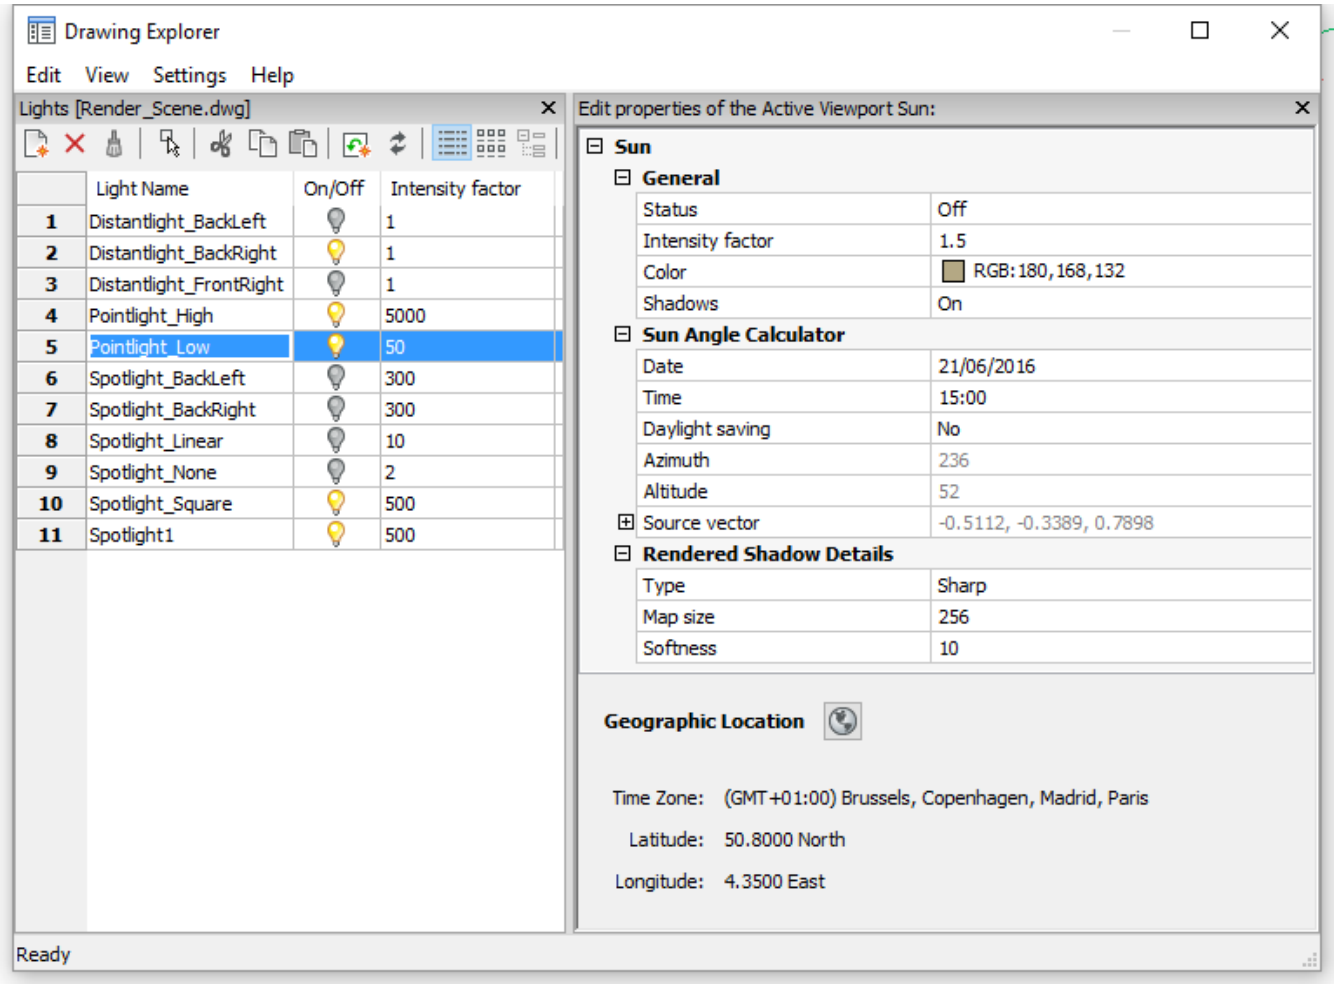
6.20.36 LightList

(6.2981 on page 6079) Creates and edits lights in the current drawing through the Light section of the Drawing Explorer dialog box.

Accessing the Command

 command bar: **lightlist** alias: **LL** menu bar: **View | Rendering | Lights | Lights Tools | Drawing Explorer | Lights** ribbon: **Home | Settings | Drawing Explorer | Lights View | Lights | Lights** toolbar: **Lights |** 
: **LightList** Displays the Lights section of the Drawing Explorer dialog box: (6.1473 on the facing page)

Figure 6.1473



Command Options

Toolbar Option	Description
 New	Adds a light to the current drawing. The Drawing Explorer disappears, and then you are prompted at the command line by the Light command. When done, the Drawing Explorer returns. See the Light (6.20.30) command.
 Delete	Deletes the selected light(s) without confirmation.
Select in drawing	Displays a light's properties int he Properties panel: 1. Click the **Select in Drawing** button. The Drawing Explorer disappears. 2. Select a light's glyph in the drawing. Its properties appear in the Properties panel. The Drawing Explorer does not return, so you need to enter the LightList command again.

Lights Options	Description
Light Name	Specifies the name of the light; click to rename.
 ON /  OFF	Turns the selected light(s) on or off.
Intensity Factor	Specifies an intensity factor that makes the light light brighter or dimmer, at its source.
Edit Properties of the Active Viewport Sun	Edits the properties of a distance light named Sun, which simulates sunlight. See SunProperties (6.27.70) command.

Context Menu Options	Description
Rename	Edits the name of the light.
Select all	Selects all lights in the light list.
Invert Selection	Inverts the lights that are selected, by unselecting the selected ones and vice versa.

Related Commands

Light (6.20.30): Creates a new light. Render (6.26.21): Calculates a photorealistic image of the 3D model. Sunproperties (6.27.70): Displays the Sun Properties of the Active Viewport editor in the Drawing Explorer - Lights dialog. GeographicLocation (6.15.15): Sets the geographic location of the drawing. Explorer (6.13.15) - Opens the Drawing Explorer dialog box.

6.20.37 Loft

(6.2932 on page 6037) Creates 3D solids or 3D surfaces passing through two or more cross sections, as shown below. (6.1479 on page 4754) (6.1480 on page 4754)

Figure 6.1476

Accessing the Command

 command bar: **loft** menu bar: **Model | 3D Solids | Loft** ribbon: **Solid | Create | Loft** toolbar: **3D Modeling** |  : **Loft Prompts you in the command bar:** Select cross sections in lofting order [MOde]: **(Select a 2D entity or a planar face of a 3D solid; or choose the Mode option)** Select cross sections in lofting order [MOde]: **(Select a 2D entity or a planar face of a 3D solid; or choose the Mode option)** The first part of the lofted 3D solid is created. Select cross sections in lofting order [MOde]: **(Select more 2D entities or planar faces; or choose the Mode option; or press Enter to stop selecting cross sections)** The the lofted 3D solid is created. 3 cross sections selected Enter an option [Guides/Cross sections only/Settings] <Cross sections only>: **(Press Enter to end the command, or else choose an option)** Examples of cross-sections (left) and resulting 3D surfaces (right) (6.1477 on the facing page) (6.1478 on the next page) Examples of 3D faces used as cross-sections (left) and resulting 3D solid (right): (6.1479 on page 4754) (6.1480 on page 4754) The program uses cross sections and optionally guidelines to determine the shape of the loft. Cross-sections (at left, in red) specify the shape of the loft at the two ends, and possibly in the mid-sections. The program draws the loft by the most expedient method (right). (6.1481 on page 4755) (6.1482 on page 4755) Guidelines specify the shape of the loft between cross-sections. In the figure below, guidelines force the loft along a curve: (6.1483 on page 4756)

Figure 6.1477

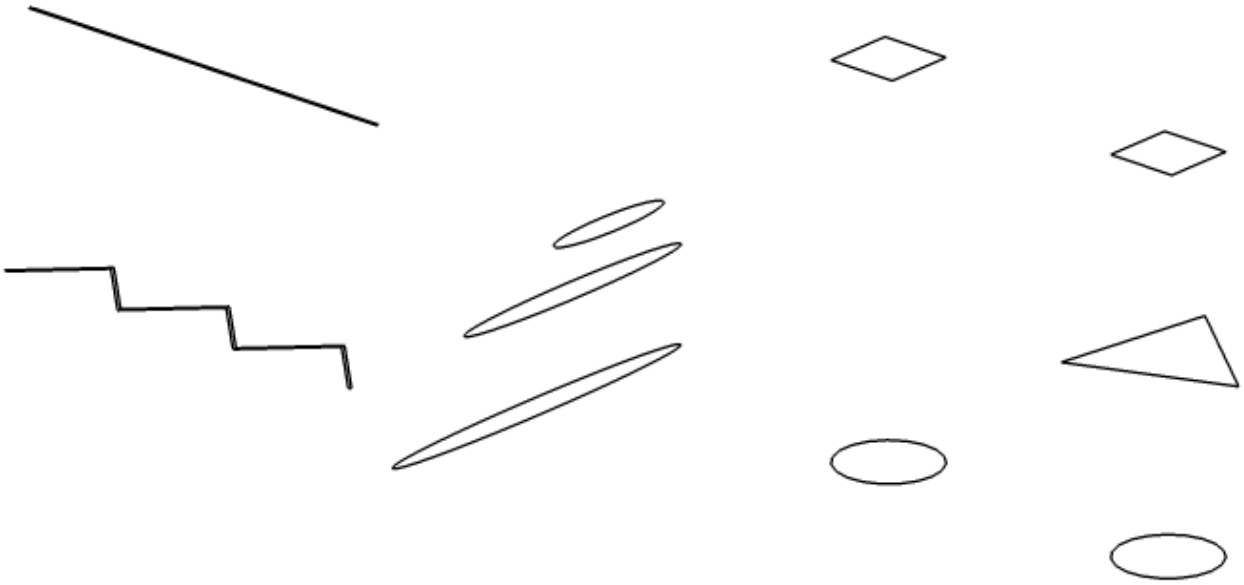

Figure 6.1478

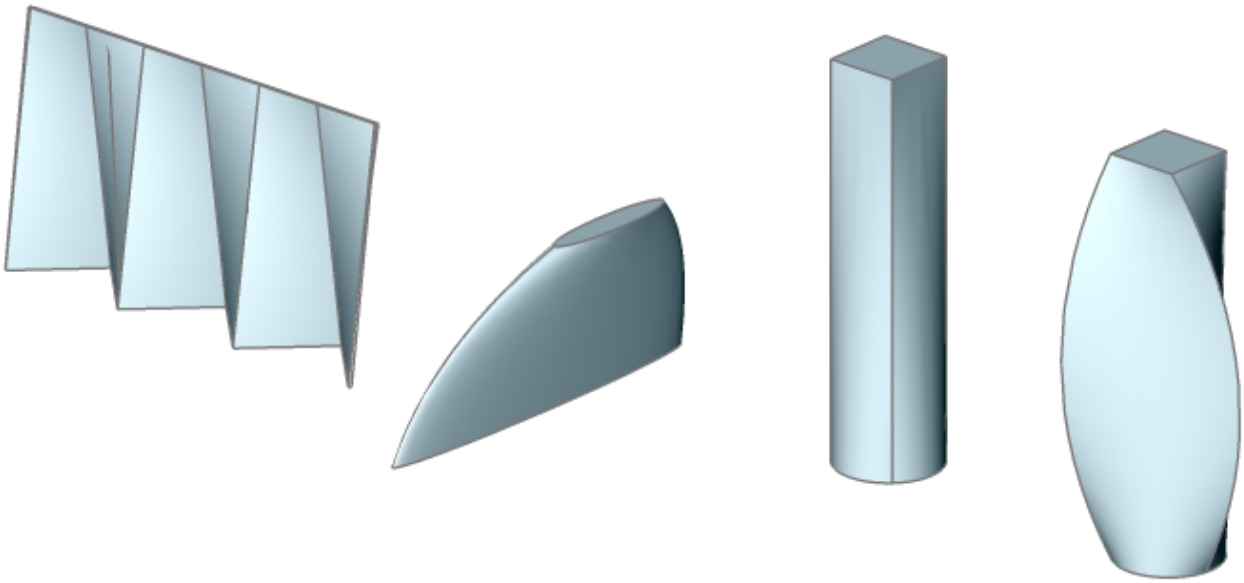

Figure 6.1479

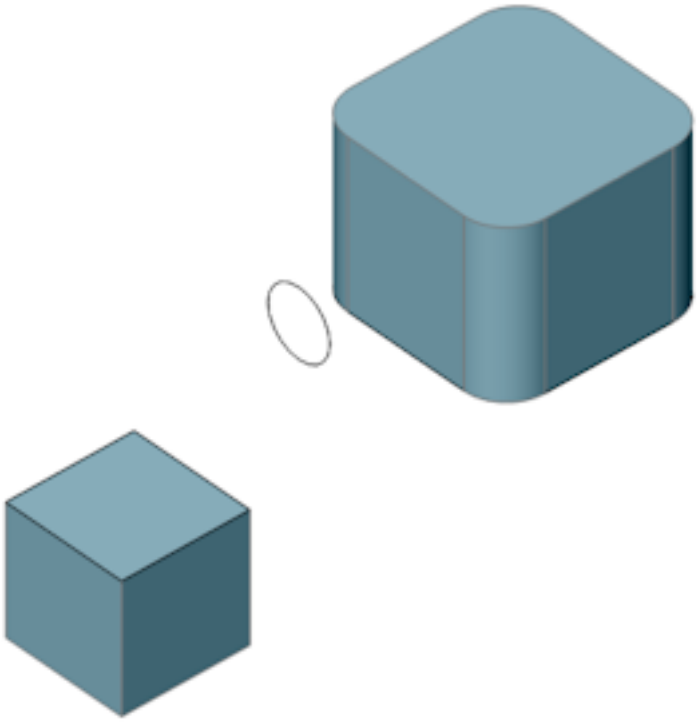

Figure 6.1480

Figure 6.1481

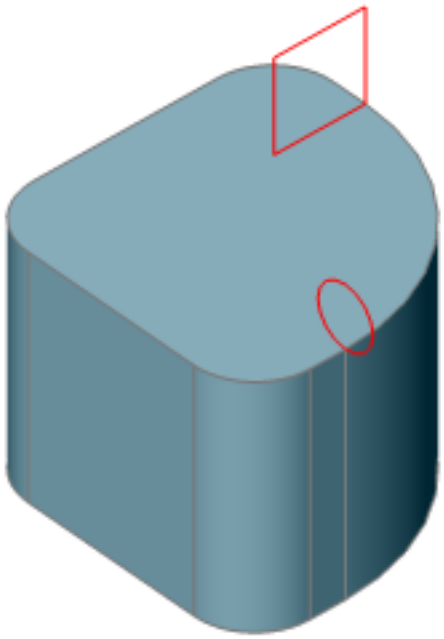

Figure 6.1482

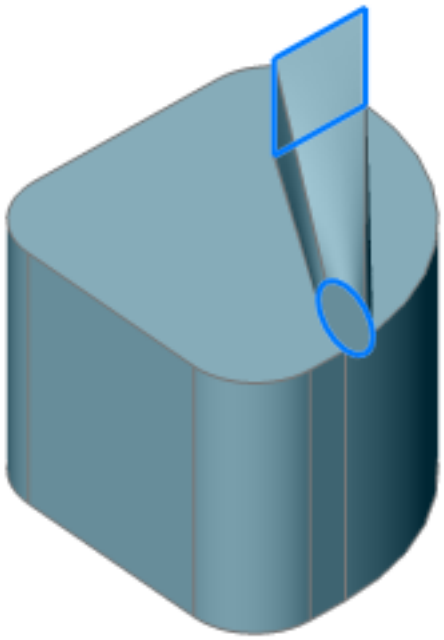

Figure 6.1483

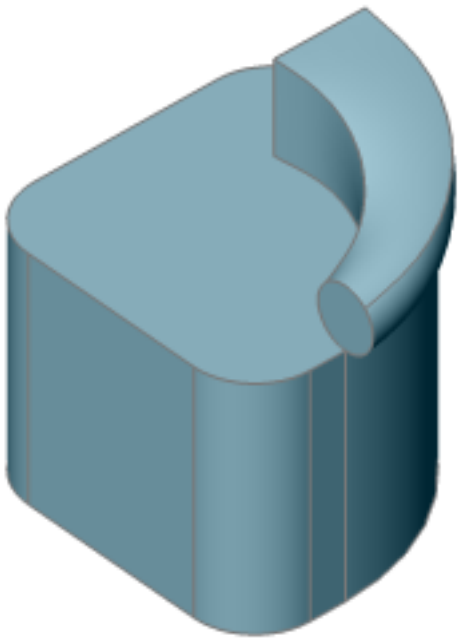

Command Options

Option	Description
Select cross sections in lofting order	Select the entities that represent the cross-section profiles of the loft. Pick any • 2D entity • Planar (flat) face of any 3D solid • Press **Enter** to end entity selection The pick order is important, so keep in mind which one you picked first and so on.
Mode	Determines if the resulting loft is a solid (left) or a surface (right); prompts you: (6.1484 on page 4759) **Choose type of created entity [SOlid/SUrface] <SOlid>** - **(enter an option)**: • **SOlid** - Creates lofts as solids • **SUrface** - Creates lofts as surfaces
Cross Sections only	Uses only cross section entities to create the loft, and no guides. (6.1485 on page 4759) (When DELOBJ = 1 or 2, the selected 2D entities are deleted.)
Guides	Uses both cross-sections (shown in red below) and guide lines (blue) between the selected cross sections to create the loft; prompts you: (6.1486 on page 4759) 1. **Select guide curves** - **(select a planar entity (a line, arc, elliptical arc, splines, single-segment 2D polyline, or edge of a 3D solid).)** 2. **Select guide curves** - **(select more linear entities or else press Enter to carry on.)** (When DELOBJ = 2, the selected guide entities are deleted.)

Settings	Sets variables that affect how the loft is constructed; prompts you: **Current option is Smooth. Enter an option [Ruled/Smooth fit/Normal to/Draft angles] <eXit>** - **(enter an option)**: • **Ruled** - draws straight surfaces between the cross sections; features sharp edges at each cross-section (6.1487 on page 4760) • **Smooth fit** - draws smooth surfaces between cross-sections. (6.1488 on page 4760) • **Normal to** - draws surfaces normal to the cross-sections; prompts you: **Specify normal to [Start/End/Both/All/eXit] <eXit>** - **(enter an option)**: **Start** - loft is normal at the starting cross-section (shown at left, below) **End** - loft is normal at the ending cross-section (middle image) **Both** - loft is normal at the starting and ending cross-sections (at right) **All** - loft is normal at the all cross-sections (6.1489 on page 4760)(6.1490 on page 4761)(6.1491 on page 4761) • **Draft Angles** - specifies the angle at starting and ending cross-sections; prompts you: **Specify [1A to start angle/1M to start magnitude/2A to end angle/2M to end magnitude/eXit] <eXit>** - **(enter an option, or press Enter to return to the previous promtp)**: **Angle -** specifies the angle at which the loft starts from a cross-section **Magnitude** - sets the relative distance of the surface from the cross section in the direction of the draft angle before the surface starts to bend toward the next cross section. **1A** - angle at the starting cross-section **1M** - magnitude at the starting cross-section **1A** - angle at the ending cross-section **2M** - magnitude at the ending cross-section In the figure below, 1A = 45° and 2A = 135° (6.1492 on page 4761) In the figure below, both loft angles = 90 degrees (at left), and 0 degrees (right): (6.1493 on page 4762)(6.1494 on page 4762) In the figure below, both loft angles = 180 degrees (6.1495 on page 4762)

6.20.38 Limits

(6.2981 on page 6079) Limits the extent of the drawing and, optionally, of the grid. (6.1497)

Accessing the Command

 command bar: **limits** transparent: **'limits** menu bar: **Settings | Drawing Limits** toolbar: **Settings | Limits** : **Limits Prompts you in the command bar:** Limits are off: Set lower left corner or [turn limits ON] <0,0>: **(Enter x,y coordinates, pick a point in the drawing, press Enter to accept the default, or else enter ON)** Upper right corner <420,297>: **(Enter x,y coordinates, pick a point, or else press Enter to accept the default coordinates)**

- When the LIMITSCHECK variable is on, you cannot draw outside of the area defined by this command; the command reports, "Selected point is outside limits. Please select another point."
- This commands limits the extent of the grid display when 1 flag of the GRIDDISPLAY (6.15.23) variable is not set.

Command Options

Option	Description
ON	Turns on limits.
OFF	Turns off limits.
Lower left corner	Specifies the lower left corner of the limits.
Upper right corner	Specifies the upper right corner of the limits.

Related Commands

Grid (6.15.23) - uses the limits to specify the extent of the grid display. Plot (6.24.42) and Print (6.24.51) - plot to the limits of the drawing. Zoom (6.35.7) - zooms to the limits (or extents) with the All option.

Figure 6.1498

6.20.39 LogFileOff

(6.2981 on page 6079) Turns off log file recording. **Note:** Log files record all prompts from the program and all of your keyboard input. It does not record mouse actions or other non-keyboard activities.

Accessing the Command

command bar: **logfileoff** : **LogFileOff** No prompts at the command bar. The resulting log file is found in the folder specified by the LogFilePath system variable. The default name of the file is **drawingname_year-month-date_hour-minutes-seconds.log**, such as **drawing1_2029-08-31_08-32-46.log**. You can open the resulting log file in Notepad or another text editor.

Command Options

No options.

Related Commands

LogFileOn (6.20.40) - turns on log file recording. Settings (6.27.25) - sets up log file parameters in the Log Files section of the Settings dialog box. CopyHist (6.9.59) - copies command history from the Text window.

Figure 6.1499

6.20.40 LogFileOn

(6.2981 on page 6079) Turns on log file recording. **Note:** Log files record all prompts from the program and all of your keyboard input. It does not record mouse actions or other non-keyboard activities.

Accessing the Command

command bar: **logfileon**
: **LogFileOn** No prompts at the command bar. BricsCAD records all command text to the LOG file located in the folder specified by the LogFilePath system variable. The default name of the file is **drawingname_year-month-date_hour-minutes-seconds.log**, such as **drawing1_2029-08-31_08-32-46.log**. Use the LogfilePath variable to remind yourself of the location of the log file.

Command Options

No options.

Related Commands

LogFileOff (6.20.39) - turns off log file recording. Settings (6.27.25) - sets up log file parameters in the Log Files section of the Settings dialog box.

6.20.41 LookFrom

(7.3 on page 6132) Controls the display of the Look From widget.

Accessing the Command

command bar: **lookfrom** alias: **navvcube** menu bar: **View | LookFrom**
: **LookFrom Prompts you in the command bar:** LookFrom [ON/OFf/Settings] <ON>: **(Choose an option, or press Enter to accept the default)**

Command Options

Option	Description
ON	Displays the Look From widget, which is located in the position determined by the NAVVIEWCUBELOCATION variable. The default location is the top right corner of the drawing area.  Move the cursor over the Look  From control to activate it:
OFF	Switches off Look From widget.
Settings	Displays the Look From control settings in the Settings dialog box. (6.1501 on the facing page)

Procedures

- Setting the Look From Control system variables and user preferences (1.23.7)
- Setting the Look From mode (1.23.7)
- Using the Look From control in Isometric mode (1.23.7)
- Using the Look From control in Twist mode (1.23.7)

Related Commands

6.20.42 LWeight

(6.2981 on page 6079) Controls the display of lineweights in the drawing, through the Settings dialog box.

Accessing the Command

command bar: **lweight** toolbar: **Entity Properties |**(6.1503) status bar: **LWT** : **LWeight** Displays the Lineweights section of the Settings dialog box: (6.1504 on the next page) Change settings, and then click **X**. Lineweights are be specified by the following commands:

- The Layer (6.13.17) command
- The droplist in the Entity Properties toolbar
- The droplist in the Properties (6.24.54) palette

Figure 6.1503

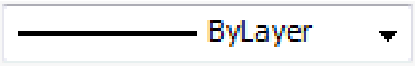

Figure 6.1504

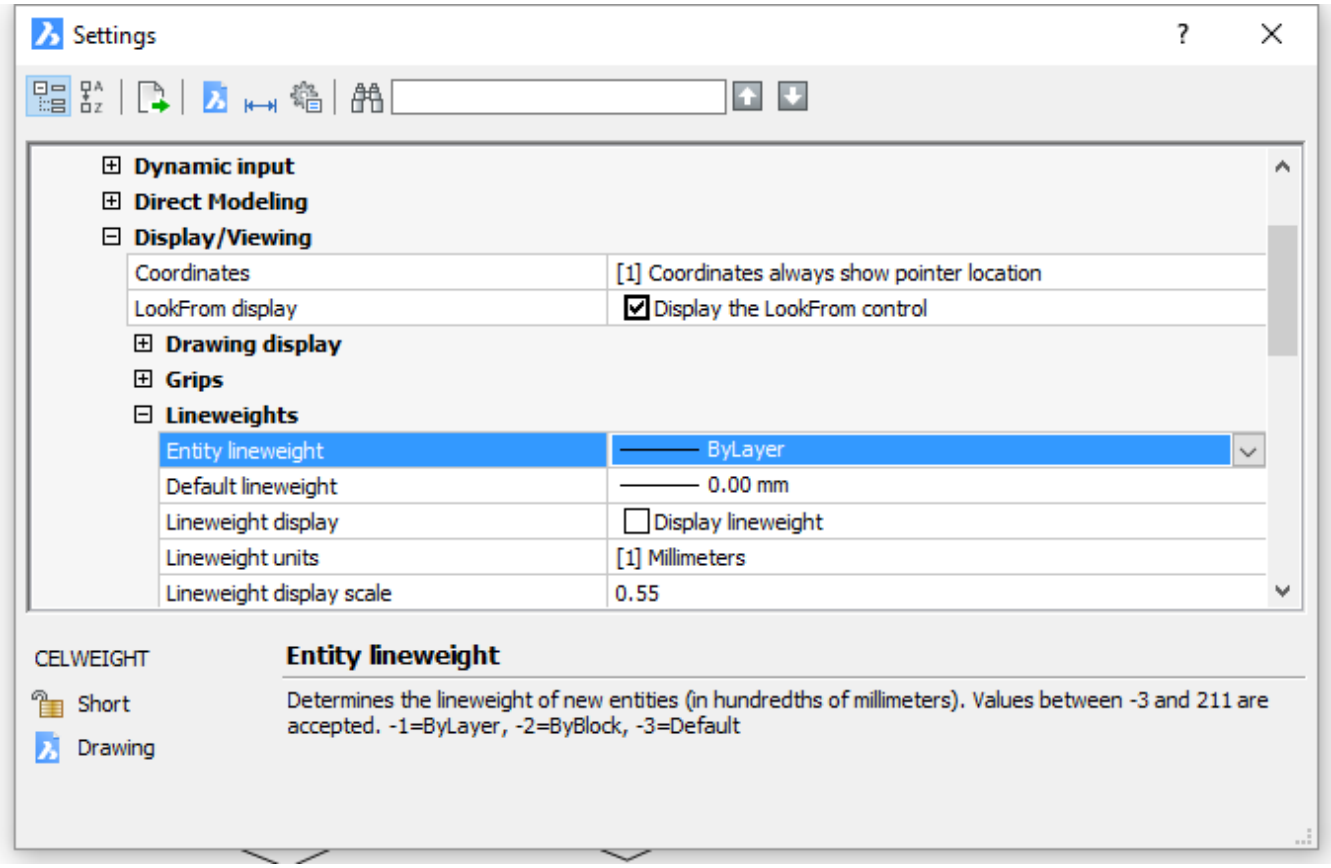


Command Options

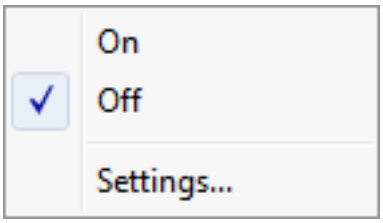
Option	Description
Entity Lineweight	Specifies the lineweight for entities drawn from now on; choose a preset lineweight from the droplist. (6.1507 on page 4771) This sets the current lineweight in the Entity Properties droplist and Properties palette. Lineweights cannot be customized, unlike linetypes.
Default Lineweight	Specifies the default lineweight for all new drawings; choose a preset lineweight from the droplist.
Lineweight Display	Toggles the display of lineweights: • **On** - displays lineweights • **Off** - does not display lineweights; all entities have the same lineweight
Lineweight Units	Specifies the unit of measurement: • **Millimeters** - measures the width in millimeters • **Inches** - measures the width in inches
Lineweight Display Scale	Specifies the relative scale of lineweights; applies to lineweights in Model tab only

Status Bar Menu

Right-click **LWT** on the status bar for the shortcut menu: (6.2741 on page 5846) (6.2622 on page 5746)

Shortcut Menu	Description
On	Turns on lineweights
Off	Turns off lineweights
Settings	Opens the Lineweights section of the Settings dialog box, as described above

Figure 6.1506



Related Commands

Settings (6.27.25) - sets lineweight parameters. Layer (6.13.17) - assigns lineweights to layers. Properties (6.24.54) - change lineweight through a palette. Change (6.9.10) and ChProp (6.9.11) - change lineweight through the command bar. Plot (6.24.42) and Print (6.24.51) - optionally plot entities with lineweights.

Figure 6.1507

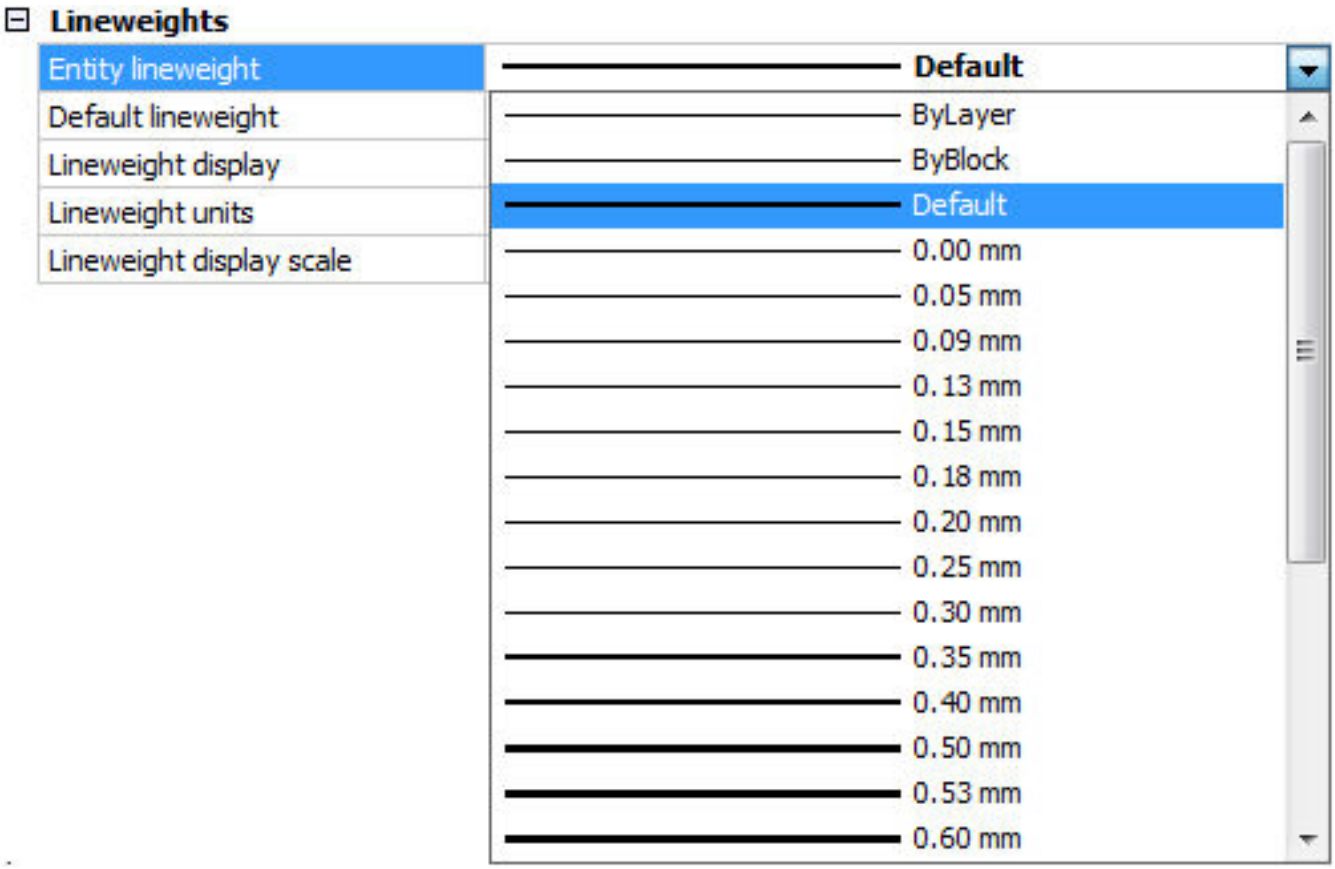


Figure 6.1508

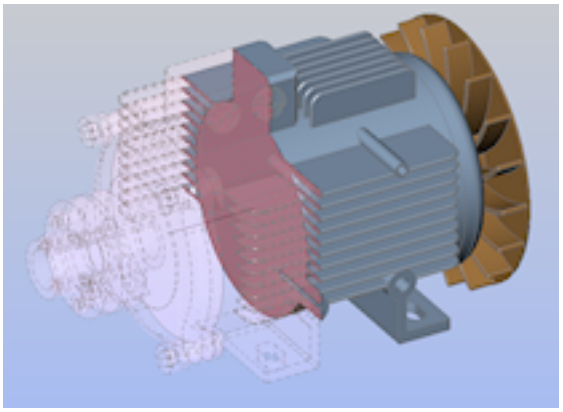
Figure 6.1509



6.20.43 LiveSection

(6.2981 on page 6079) Toggles the Live Section property of a section plane, which exposes the insides of 3D models. (6.1509) **Notes:**

- Before you can use this command, you have to create at least one section plane in the drawing with the SectionPlane (6.27.18) command.
- It is recommended to use the **Clip Display** property instead of Live Section. The Clip Display status can be set for multiple section entities simultaneously.

Accessing the Command

command bar: **livesection** : **LiveSection Prompts you in the command bar:** Select a section entity: **(Click a section entity in the drawing)** When the Live Section property of a section plane was off, it is turned on -- and vice versa.

Command Options

Option	Description
Select a section entity	Selects the section entity for which the plane should be toggled. If the section plane is displayed, then this command turns it, and vice versa.

Related Commands

ClipDisplay (6.9.22) - toggles the Clip Display property of a section plane or a BIM section entity. BimSection (6.7.54) - creates a BIM section entity. BimSectionOpen (6.7.49) - opens the drawing file related to a BIM section entity; or the 3D BIM model related to a BIM section drawing. BimSectionUpdate (6.7.43) - exports or updates the result of a BIM section in a drawing. Section (6.27.11) - creates section planes of 3D solids; the results are region entities. SectionPlane (6.27.18) - creates a section entity that creates sections of 3D solids. SectionPlaneSettings (6.27.12) - defines the properties of a section plane entity in the Drawing Explorer - Section Planes dialog. SectionPlaneToBlock (6.27.13) - saves the selected section plane to a 2D cross section / elevation block or a 3D cutaway section block.

Related Command

eTransmit - packages drawing files and their support files for transmission by email and other methods.

Figure 6.1513

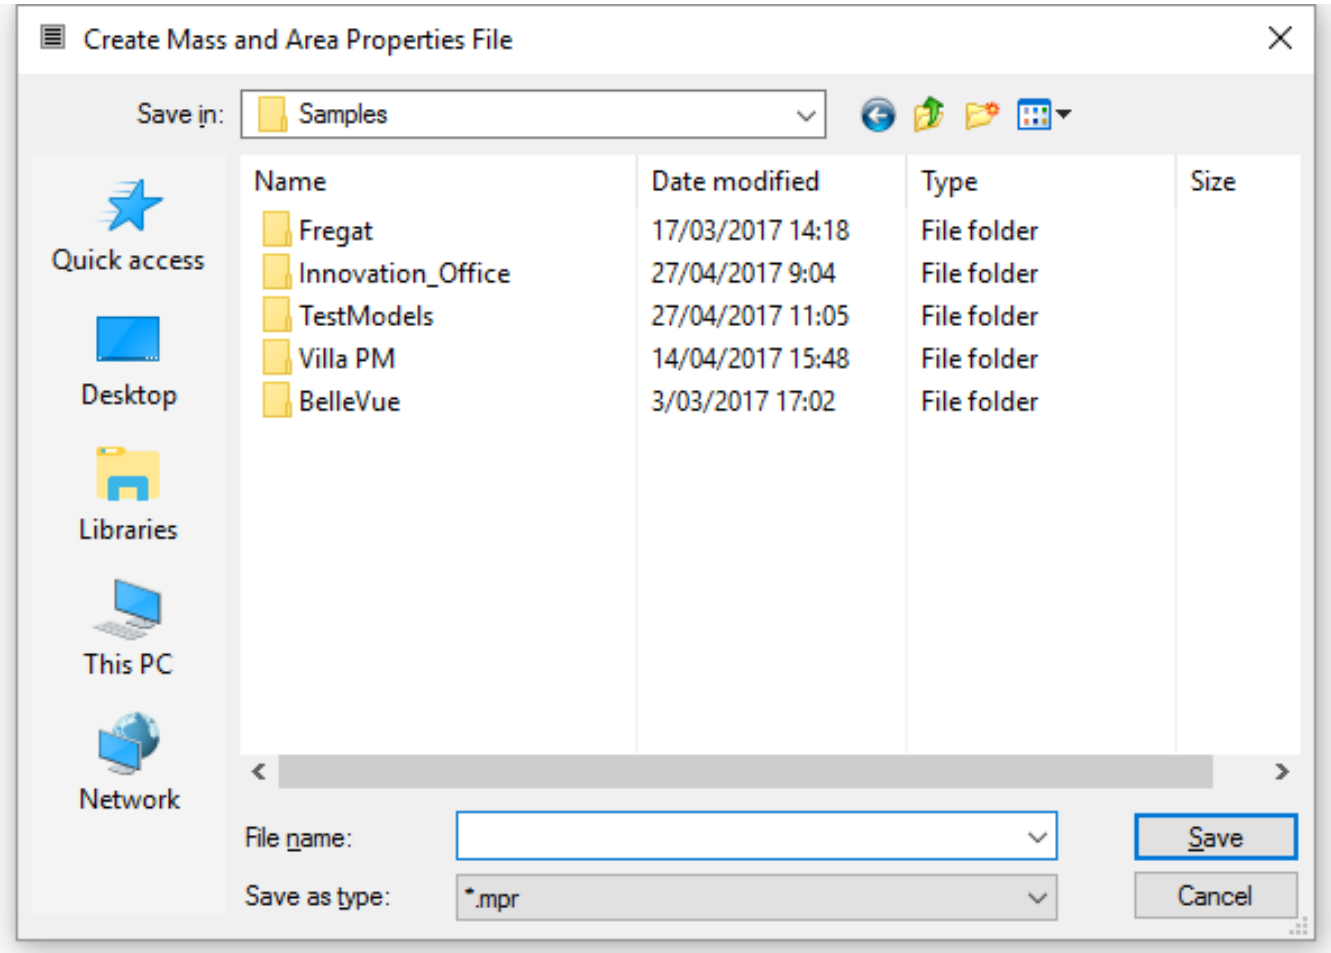
6.21.2 MassProp

(6.2981 on page 6079) Reports the area, perimeter, and other mathematical properties of 3D solids and 2D regions (short for "mass properties").

Accessing the Command

command bar: **massprop** menu bar: **Tools | Inquiry | Mass Properties** ribbon: **Tools | Inquiry | Mass Properties** toolbar: **Inquiry |** : **MassProp Prompts you in the command bar:** Select entities: **(Choose one or more entities; the program filters out any that are not ACIS objects)** Entities in set: 1 Select entities: **(Choose more ACIS objects, or else press Enter to produce the report)** Displays report in the command bar; press F2 to view report in the Prompt History (6.29.16) window: The command continues: Write analysis to a file? **(Type Y or N)** When you enter Y, displays dialog box: (6.1514 on the next page) Name the file, and then click Save. The report is stored in an MPR file, which can be opened in any text editor. MPR is short for "mass properties report."

Figure 6.1514



Command Options

Option	Description
Select entities	Specifies the entities on which to report properties. Choose 3D solid models and 2D region entities; all other entities are ignored by the program.
Write analysis to a file?	Writes the report to a text file. Type Y or N: • **Yes** - saves the report to a file; opens the Mass and Area Properties File dialog box: 1. Enter a file name 2. Click **Save**. The report is stored in an MPR file, which can be opened with any text editor • **No** - does not save the report to a file

Related Commands

Box (6.6.18) - creates 3D boxes as solid models. Cone (6.9.46) - creates 3D cones as solid models. Cylinder (6.9.49) - creates 3D cylinders as solid models. Dish (6.10.42) - creates the lower half of 3D balls as solid models. Dome (6.10.35) - creates the upper half of 3D balls as solid models. Extrude (6.13.25) - extrudes 2D entities into 3D solid models. Interfere (6.17.17) - creates 3D volumes of intersecting 3D solid models. Intersect (6.17.20) - removes volumes not in common between two solid models. Region (6.26.18) - creates 2D regions from 2D entities. Revolve (6.26.45) - revolves 2D entities into 3D solid models. Section (6.27.11) - creates 2D regions from 3D models. Slice (6.27.40) - cuts 3D solids into two parts. SolidEdit (6.27.42) - edits the bodies, faces, and edges of 3D models. Sphere (6.27.50) - creates 3D balls as solid models. Subtract (6.27.58) - removes one solid model from a second. Torus (6.29.29) - creates 3D donuts as solid models. Union (6.30.6) - joins two or more solid models into a single entity. Wedge (6.33.6) - creates 3D wedges as solid models.

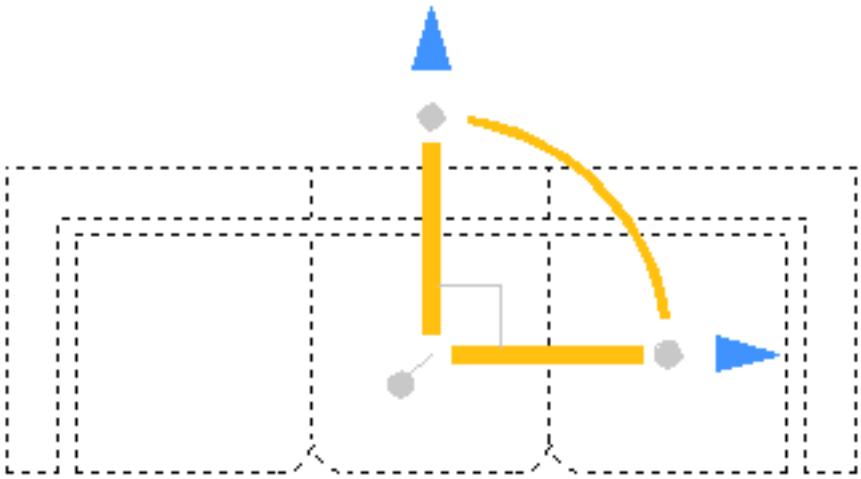
Figure 6.1516



6.21.3 Manipulate

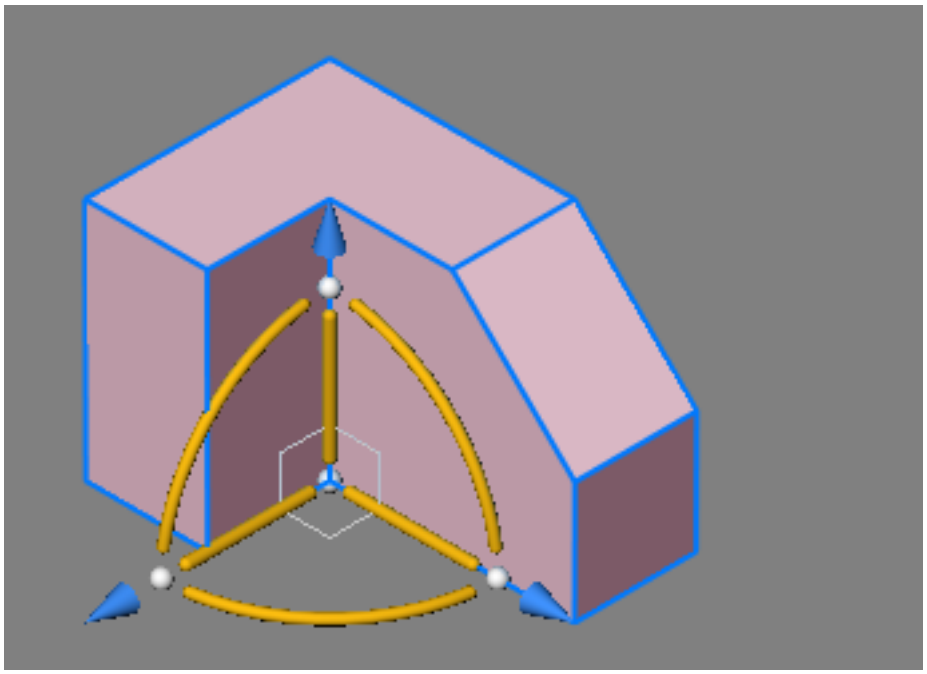
(7.3 on page 6132) Launches the manipulator widget to rotate, move, copy, mirror, and/or scale 2D entities and 3D models. **Note:** The manipulator widget appears automatically any time you select an entity, when the MANIPULATOR variable is set to 1 or 2. (6.1516)

Accessing the Command

 command bar: **manipulate** quad: **Modify | Manipulate** : **Manipulate Prompts you in the command bar:** Select entities: **(Select one or more entities)** Entities in set: 1 Select entities: **(Select more entities, or else press Enter)** The manipulator widget appears near the selected entities: (6.1517 on the facing page) The manipulator widget stays visible until you press **Esc**. **Note:** You don't need to use the Manipulate command to turn on the widget; it appears automatically with the MANIPULATOR system variable:

- **0** - manipulator widget is displayed only when you enter the Manipulate command
- **1** - manipulator widget is displayed automatically each time you select an entity
- **2** - (default) widget is displayed automatically when you hold down the left mouse button longer than the value of the MANIPULATORDURATION variable (default = 250 milliseconds, a quarter-second)

Figure 6.1517



Command Options

Option	Description
Select an axis	Moves or copies* the selection along the selected axis: 1. Place the cursor over one of the axes. 2. Click, and then move the cursor to move the selection along the axis. (6.1518 on page 4784) 3. To complete the operation, do one of the following actions: • Pick a point in the drawing • If dynamic input (1.21.9) is on, type a distance into the distance field • Eyeball the distance with the ruler (see figure above), and then click
Select a plane	Moves or copies* a selection in a plane. 1. Place the cursor over one of the plane swatches. The swatch under the cursor highlights. (6.1519 on page 4784) 2. Click when the swatch of the desired plane highlights. The selection moves along with the cursor in the selected plane. 3. Do one of the following: • Pick a point • If Dynamic Input (1.21.9) is ON, type a distance in the dynamic entry fields. Hit the TAB-key to switch between the entry fields; press Enter to confirm the current values. (6.1520 on page 4785)

Select an arrowhead	Mirrors or scales the selection; optionally creates a copy* of the selection. Right click when the cursor is over the manipulator to display a context menu. Choose **Arrowhead act as** , then select the desired action: 3D Scale or 3D Mirror (default). (6.1521 on page 4785) **To mirror the selection:** 1. Place the cursor over an arrowhead. The Mirror swatch displays in a plane through the selected axis and perpendicular to the mirror plane. The selection will be mirrored about the plane that is perpendicular to the axis of the selected arrowhead. (6.1522 on page 4786) 2. Click when the desired mirror plane displays. The selection is mirrored dynamically when you move the cursor. 3. Do one of the following: • Pick a point. • If Dynamic Input (1.21.9) is on, type a distance in the dynamic entry field. (6.1523 on page 4786) **To scale the selection:** 1. Place the cursor over an arrowhead. The arrowheads are doubled with a large arrowhead. (6.1524 on page 4787) 2. Click to start scaling the selection. The selection is scales dynamically when you move the cursor. You are prompted in the command bar: *** MANIP_SCALE *** New scale factor [Reference]: (6.1525 on page 4787) 3. Do one of the following: • Pick a point. • Type a scale factor at the command prompt. • Type R Prompts you: **Enter reference length - (use entity snaps to pick two points in the model.) New length [Reference] - (type the desired distance between the picked points.)**

Select a rotation arc	Rotates the selection about one of the manipulator axes; optionally creates a copy* of the selection. 1. Place the cursor over one of the three rotation arcs. The rotation arc under the cursor expands and the rotation axis displays. (6.1526 on page 4788) 2. Click when the desired rotation axis displays. The selection rotates dynamically when you move the cursor. 3. Do one of the following: • Pick a point. • If Dynamic Input (1.21.9) is on, type a value in the dynamic entry field. (6.1527 on page 4788)
Select the anchor handle	**ManipulatorHandle=0:** Moves the Manipulator. Specify a point to relocate. **ManipulatorHandle=1:** Moves the selected entities unrestrictedly; optionally creates a copy* of the selection. Specify a point to locate the selection. Moves the Manipulator when you hold down the left mouse button a little longer to select the handle.

*** To copy the selection set,** Do one of the following:

- Hold down the Ctrl-key when starting the action (release the Ctrl-key when you move the cursor).
- When moving an axis, plane or the anchor handle:
  - Type **c** (copy) then press Enter or right click. Repeatedly click to create copies. Right click to stop.
  - (option) When the first copy is created, type **r** (repeat) then right click to create multiple copies at equal intervals. Move the cursor and click when the desired number of copies displays.

Procedures

- To define the manipulator settings (1.32.10)
- The manipulator layout (1.32.10)
- To control the location and orientation of the manipulator (1.32.10)
- To relocate the manipulator (1.32.10)

Related Commands

Copy (6.9.35) - copies entities. dmMove (6.12.16) - moves solids, faces or edges of a solid, or inserts using a vector. dmRotate (6.12.24) - rotates faces of a solid around an axis. Move (6.21.29) - moves entities. Rotate (6.26.29) - rotates entities in 2D. Rotate3D (6.26.31) - rotates entities about an axis in 3D space. Scale (6.27.6) - resizes entities.

6.21.4 MatBrowserClose

(6.2981 on page 6079) Closes the materials browser.

Accessing the Command

command bar: **matbrowserclose** context menu: right-click the ribbon or any toolbar, then choose **Render Materials** : **MatBrowserClose**

Command Options

No options.

Related Commands

MatBrowserOpen (6.21.6) - opens the materials browser to shows available materials for high-resolution renderings. -ToolPanel (6.29.37) - toggles the display of all tool panels, such as the Properties Bar, the Ribbon or the Sheet Sets panel from the command line.

Figure 6.1529

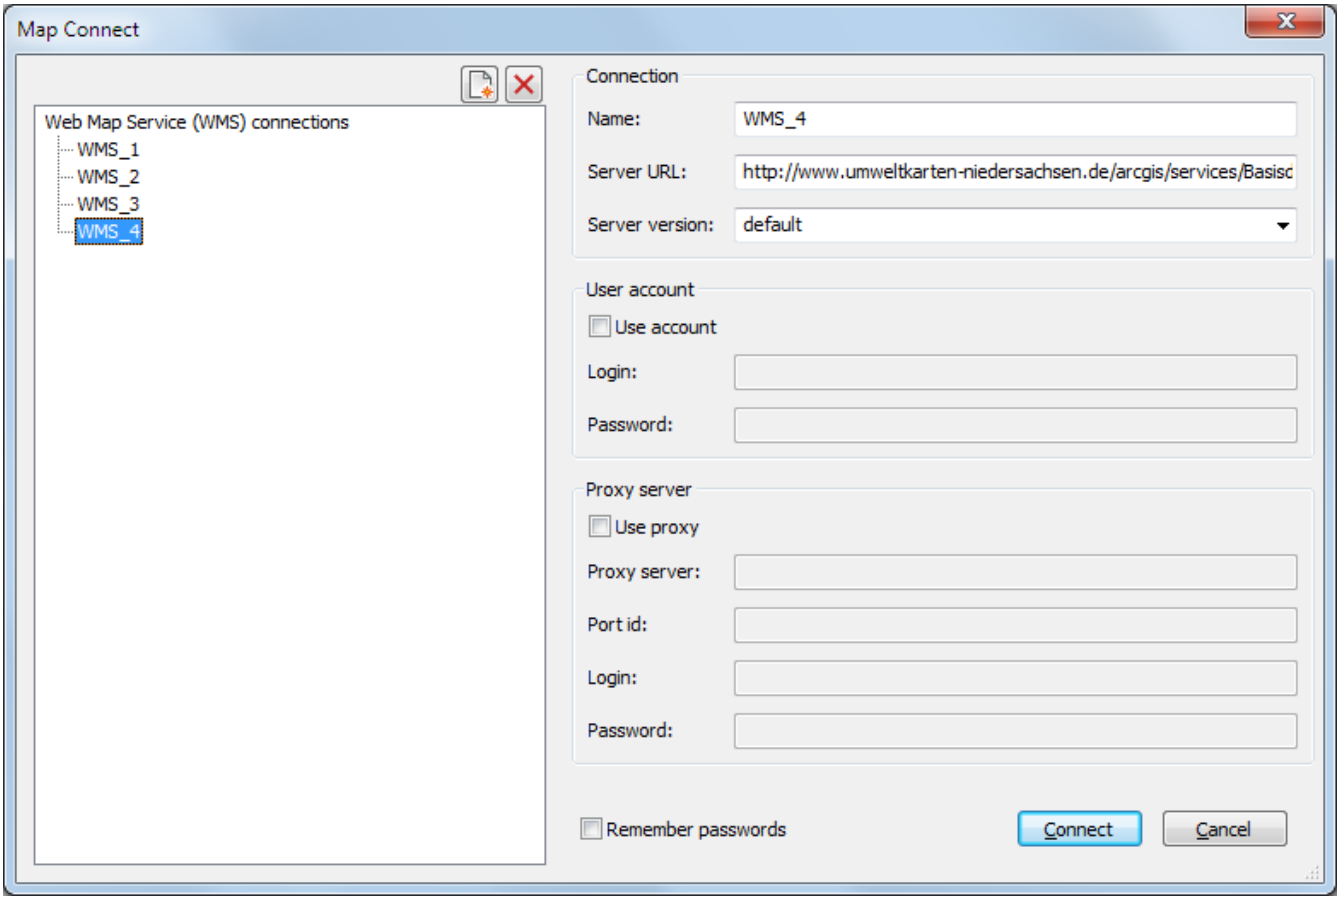
6.21.5 MapConnect

(6.2880 on page 5977) Allows to set up a connection with a Web Map Service through a dialog box. **Note:** Before adding map data to a drawing with this command, you must run the GeographicLocation (6.15.15) command to define the geographic location of the drawing.

Accessing the Command

command bar: **mapconnect** : **MapConnect** Displays a dialog box: (6.1530 on the next page)

Figure 6.1530



Command Options

Option	**Description**
Name	(Optional) Names the connection. Type a name to replace the default WMS<x> name. The ten most recently used connections are saved.
Server URL	Specifies the URL of a Web Map Service.
Server version	Specify a server version, or else select one from the droplist.
User Account Option	**Description**
Use Account	• **Off** - no login or password needed • **On** - the Web Map Service need a valid login and password to access it
Login	Specifies the login information
Password	Specifies the password
Proxy Server	**Description**
Use Proxy	• **Off** - a proxy server is not being used • **On** - specify a proxy server to connect to the Web Map Server
Proxy server	Specifies the URL of the proxy server
Port Id	Specifies the port to use for the connection
Login	Specifies the login for the proxy
Password	Specifies the password for the proxy lognin

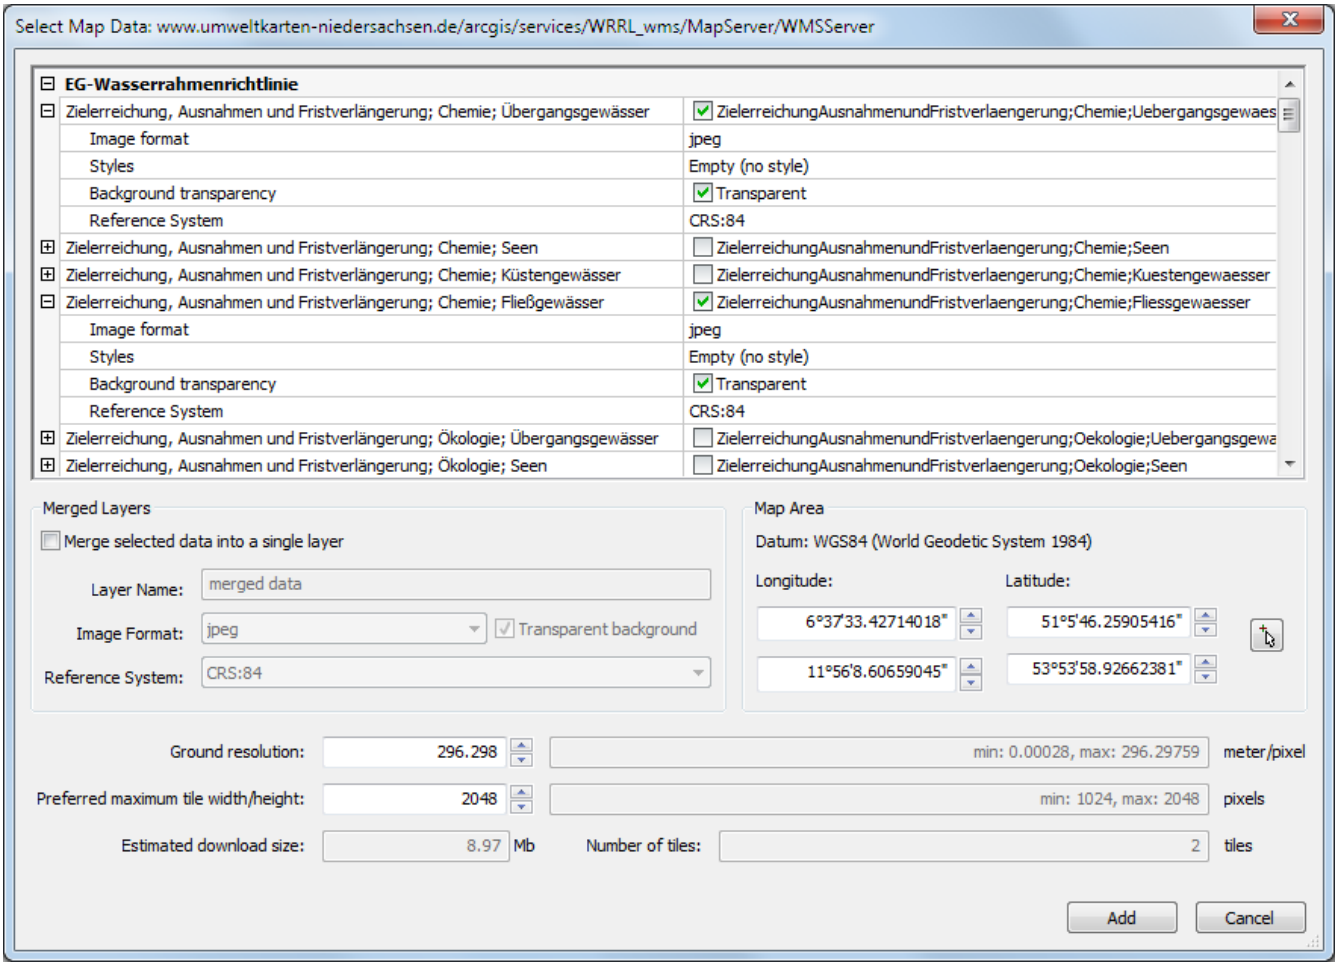
Remember passwords	• **Off** - the program does not remember your passwords for greater security • **On** - passwords will be remembered for future use
Connect	Connects to the map server and then displays the Select Map Data dialog box

A dialog box displays: (6.1531 on the facing page) Do the following:

1. Select one or more data layers.
2. Specify the desired ground resolution and the preferred maximum dimensions of a tile.
3. An estimate of the download size displays in the **Estimated download size** field.
4. Press the **Add** button.

The program stores downloaded map tiles as regular image files in the folder in which the drawing is saved. The definition of the supported Coordinate Reference Systems (CRS) is stored in the new **geodatabase.xml** file located in the folder pointed to by the ROAMABLEROOTPREFIX variable, such as **C:\Users\John\AppData\Roaming\Bricsys\BricsCAD** The **geodatabase.xml** files lists cities and their WGS84 geo coordinates used by the **Choose Location** function of the Geographic Location dialog box.

Figure 6.1531



Related Commands

Geographiclocation (6.15.15) - sets the geographic location of the drawing. Image (6.13.13) - inserts images in drawings through the Drawing Explorer.

Figure 6.1532

6.21.6 MatBrowserOpen

(6.2981 on page 6079) Opens the Render Materials panel to access materials used for renderings. **Note:** Most rendering materials are not installed with the program, but must first be downloaded using this panel.

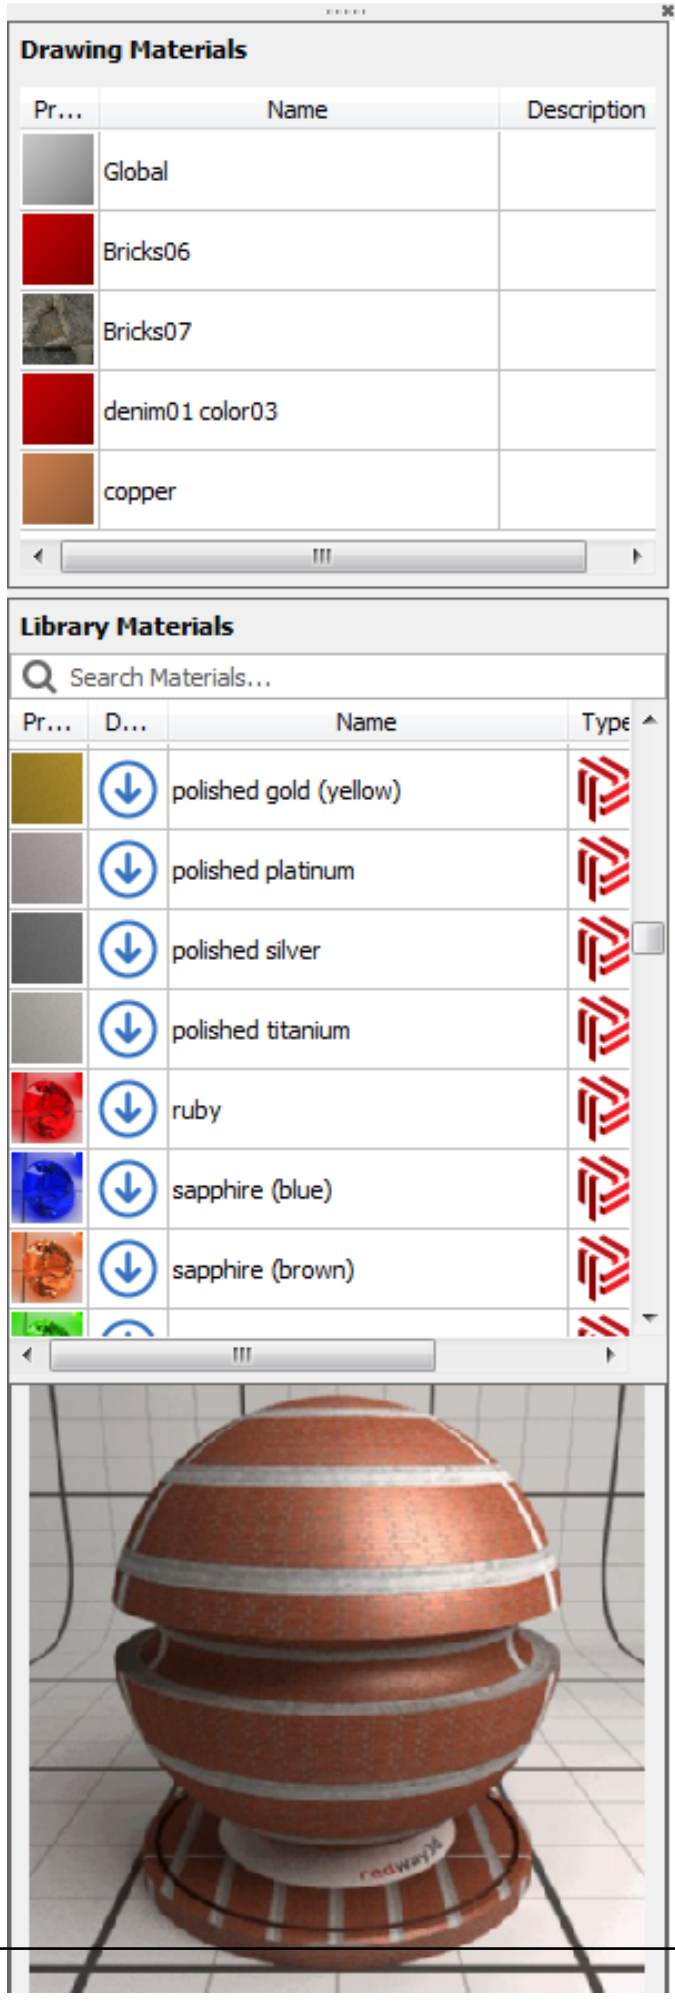
Accessing the Command

command bar: **matbrowseropen** aliases: **matb, matlib** context menu: right-click the ribbon or any toolbar, then choose **Render Material** : **MatBrowserOpen** Displays a panel with lists of materials:

- **Drawing Materials** pane (top panel) - lists materials used in the drawing
- **Library Materials** (middle pane) - list materials available to be downloaded from the master library
- **Preview** (lowest pane) - previews the selected material

(6.1533 on the following page)

Figure 6.1533



Command Options

Option	Description
Drawing Materials pane	Lists the material definitions contained in the current drawing. To add materials from the external library to the Drawing Materials list (and to this drawing): • Drag a material from the Library Materials list onto an entity in the drawing • Select one or more materials in the Library Materials list, right-click, and then choose **Add Material(s) to Drawing** (6.1534 on the next page) • **Add material(s) to library** - copies the selected material(s) to the materials library in the folder defined by the RenderMaterialPath preference. • **Change row height** - sizes the rows bewteen **Small**, **Medium**, and **Large** (6.1535 on page 4799)
Library Materials pane: Search Field	Seaches for materials by name: (6.1536 on page 4799) As you type text in the search field, materials that contain the text in their names are listed. The material list is updated as you type. Click the **X** button to clear the search field.
Library Materials Pane	Click the **Download**, **Name**, and other headers to sort the lists alphabetically. Click again to reverse the sort order. (6.1537 on page 4799) Right click a material to display a context menu: (6.1538 on page 4799) • **Add material(s) to drawing** - copies the selected material(s) to the current drawing. • **Delete material(s)** - removes the selected material(s) from the materials library • **Cancel download** - stops an ongoing material definition download • **Change row height** - sets the row height to **Small** , **Medium** or **Large** in the context menu. (6.1539 on page 4799) Download column uses the blue arrow to indicate materials that have not yet been downloaded: double click to download the material. Downloaded materials are saved in the folder which is defined by the RenderMaterialPath preference, such as C:\ProgramData\Bricsys\RenderMaterials. To assign a material to an entity, drag its name from this panel onto an entity The definition is added to the current drawing and the Drawing Materials list. When you drag a material that has not yet been downloaded onto an entity, then the material appears red in color. Once the download is complete, the material appears correctly.

Procedures

- To open or close a panel (1.15.7)

- To dock a panel (1.15.7)
- To dock a panel with respect to another docked panel (1.15.7)

Related Commands

MaterialMap (6.21.9) - allows to adjust how a texture is mapped to regions, faces and faces of a 3D solid. MatBrowserClose (6.21.4) - closes the materials browser. -ToolPanel (6.29.37) - allows to control the display of tool panels, such as the Properties Bar, the Ribbon or the Sheet Sets panel from the command line.

6.21.7 MatchPerspective

(7.3 on page 6132) Matches the current model space view with a background image after you select three or more point pairs. **Note:** This command operates only in perspective mode. (6.1541)

Accessing the Command

 command bar: **matchperspective** menu bar: **View | Match Perspective** ribbon: **View | View | Viewpoint | Match Perspective** toolbar: **View |**  To turn on Perspective viewing mode:

- Set the **Perspective** variable to on
- In the **View** toolbar, click **Perspective** ()
- In the **View** menu, click **Perspective**
- In the ribbon's **View** panel and **View** tab, click **Perspective** ()

Figure 6.1542

: **MatchPerspective Prompts you in the command bar.** Enter Model Point: **(Specify a point on the 3D model)** Enter Image Point or [Undo]: **(Click the corresponding point in the image)** Enter Model Point or [Undo]: **(Specify another point on the 3D model)** Enter Image Point or [Undo]: **(Click the corresponding point in the image)** Enter Model Point or [Undo]: **(Specify yet another point on the 3D model)** Enter Image Point or [Undo]: **(Click the corresponding point in the image)** Enter Model Point or [Undo] <Match>: **(Specify more point pairs, or else press Enter to match the view)** As you pick pairs of matching points between the model and image, they are connected by green lines. After you press **Enter**, the model matches the perspective of the background image. Optionally use the View (6.31.2) command to save the view. (6.1542)

Command Options

Option	Description
Enter Model Point	Specify a point on the 3D model; it can be helpful to use entity snaps for precision
Enter Image Point	Click the corresponding point in the image
Undo	Removes the previous point pair.
Match	Matches the model space view with the background image.

Related Commands

Background (6.6.3) - sets the model space background for the current viewport and saved views. Camera (6.9.1) - Creates perspective views. -View (6.31.3) - Creates and sets named views through the command bar. View (6.31.2) - Creates and sets named views through the Drawing Explorer.

Figure 6.1543

6.21.8 MaterialAssign

(7.3 on page 6132) Applies the material specified by the **CMaterial** variable to 3D entities that you select.

Accessing the Command

 Keyboard: **materialassign** Transparent: **'materialassign : MaterialAssign Prompts you:** Select object to assign material to: **(Select one or more 3D entities)** Select object to assign material to or [Undo]: **(Select more 3D entities, or type u to undo the material assignment)** Select object to assign material to or [Undo]: **(Hold down the Alt key to pick a material)** Select material from object: **(Pick another 3D entity with the material you wish to copy)** Select object to assign material to or [Undo]: **(Select more 3D entities, or type u to undo the material assignment, or else press Enter to end the command)**

Command Options

Option	Description
Select object to assign material to	To pre-designate a material, enter its name into the **CMaterial** variable before starting this command. Select one or more 3D objects to which you want the current material assigned. Notice the paintbrush cursor; use it to "paint" entities with the material.  To see the change in material, ensure that the visual style is set to "Rendering" with the Properties panel Visual Style setting.
Undo	Removes the material you assigned to the previously-selected entities.
Select material from object	Hold down the **Alt** key to copy the material from another 3D entity; notice the dropper cursor.  When the program next prompts you "Select material from object," pick another 3D entity with the material you wish to copy.

Related Command

Materials (6.21.10) - creates and edit rendering materials.

Figure 6.1544

6.21.9 MaterialMap

(7.3 on page 6132) Adjusts the placement of texture images onto 3D solids, 3D faces, wide polylines, and polygon meshes to create a more realistic look, such as matching a brick pattern to the wall of a house.

Accessing the Command

 command bar: **materialmap** transparent: **'materialmap** alias: **setuv** menu bar: **View | Rendering | Material Map** toolbar: **Rendering |** : **MaterialMap Prompts you in the command bar:** Select an option [Box/Planar/Spherical/Cylindri mapping to (Y)/Reset mapping)] <Box>: **(Choose an option)** Select faces or entities: (**Select one or more entities)** Entities in set: 1 Select faces or entities: (Se**lect more entities, or press Enter to end the command)**

Command Options

Option	Description
Select faces or entities	Specifies the entities whose material maps are to be adjusted. The entities you select are included in the yellow bounding box. When you select entities, blue grips and the manipulator (6.21.3) widget appear: • Drag blue grips to change the scale of the material, horizontally and vertically • Click different parts of the manipulator to move, scale, and rotate the material (6.1545 on page 4806) **Scale the mapped image - (drag one of the blue arrow grips to scale the texture in the X-, Y- or Z direction.) Move the mapped image - (follow these steps)**: 1. Place the cursor over the one of the tripod axes 2. Click when the second arrowhead appears at the other end of the axis 3. Move the cursor to adjust the position of the pattern; in the image below the red Y-axis is selected. (6.1546 on page 4806) **Rotate the mapping image - (move the cursor over one of the rotation handles and then click when the handle expands.)** 1. The rotation axis in the color of the selected handle displays. The material map rotates dynamically around the selected axis. (6.1547 on page 4807) 2. Click a point to define the rotation angle.

Box

Wraps the texture around the six faces of a the bounding box of the selected entity or entities; prompts you: (6.1548 on page 4807) **Edit the mapping or [reseT/sWitch mapping mode] <Accept current mapping>** - **(choose an option)**:

- **Enter** - accepts the material mapping, and returns to the previous prompt
- **reseT** - restores the default mapping; reverses all previously applied adjustments.
- **sWitch mapping mode** - switches to a different mapping mode; prompts you: **Select an option [Box/Planar/Spherical/Cylindrical/Copy mapping to (Y)/Reset mapping)] <Box>** - **(select an option.)**

Planar

Aligns the texture to a single face. To select a face of a 3D solid, set SELECTIONPREVIEW (1.17.10) = 2 or 3 or check the **Select Faces** option of the SELECTIONMODES (1.17.10) variable.

1. Place the cursor over the 3D solid face and then click when the face highlights. Repeatedly hit the **Tab** key to select an obscured face

(6.1549 on page 4808) Prompts you: **Edit the mapping or [reseT/sWitch mapping mode] <Accept current mapping>** - **(choose an option.)**

- **Enter** - accept the material mapping
- **reseT** - restores the default mapping; reverses all previously applied adjustments.
- **sWitch mapping mode** - switches to a different mapping mode; prompts you: **Select an option [Box/Planar/Spherical/Cylindrical/Copy mapping to (Y)/Reset mapping)] <Box>**- **(select an option.)**

Spherical

Aligns the texture to a spherical shape. The top and bottom edges of the image are compressed to a point at the north and south poles of the sphere. Spherical mapping of a brick pattern (left) compared to box mapping (right). (6.1550 on page 4808) Prompts you: **Edit the mapping or [reseT/sWitch mapping mode] <Accept current mapping>** - **(choose an option)**: (6.1551 on page 4809)

- **Enter** - accepts the material mapping, and returns to the previous prompt
- **reseT** - restores the default mapping; reverses all previously applied adjustments.
- **sWitch mapping mode** - switches to a different mapping mode; prompts you: **Select an option [Box/Planar/Spherical/Cylindrical/Copy mapping to (Y)/Reset mapping)] <Box>** - **(select an option.)**

Cylindrical	Aligns the texture to a cylinder shape. The vertical edges of the image are wrapped together. The height of the image is scaled along the axis of the cylindrical shape. Cylindrical mapping of a wood pattern (left) compared to a box mapping (right). (6.1552 on page 4810) Prompts you: **Edit the mapping or [reseT/sWitch mapping mode] <Accept current mapping>** - **(choose an option)**: (6.1553 on page 4811) • **Enter** - accepts the material mapping, and returns to the previous prompt • **reseT** - restores the default mapping; reverses all previously applied adjustments. • **sWitch mapping mode** - switches to a different mapping mode; prompts you: **Select an option [Box/Planar/Spherical/Cylindrical/Copy mapping to (Y)/Reset mapping)] <Box>** - **(select an option.)**
copY mapping to	Applies mapping from the source entity or face to the selected entities, thus duplicating the mapping, including any adjustments, to other entities. All entities share the same mapping origin, axes and scale. As a result the texture image is extended seamlessly from one entity to another. Prompts you: 1. **Select face or entity** - **(select the source entity.)** 2. **Select the entities to copy the mapping to: Select faces or entities** - **(select the target entity.)** 3. **Entities in set: 1 Select faces or entities** - **(select more target entities or press Enter.)**
reseT mapping	Restores the default mapping; reverses all previously applied adjustments.

Related Commands

MatBrowserOpen (6.21.6) - opens the materials browser, which shows an overview of available high-resolution render materials. Materials (6.21.10) - creates materials and edits their properties through the Drawing Explorer.

6.21.10 Materials

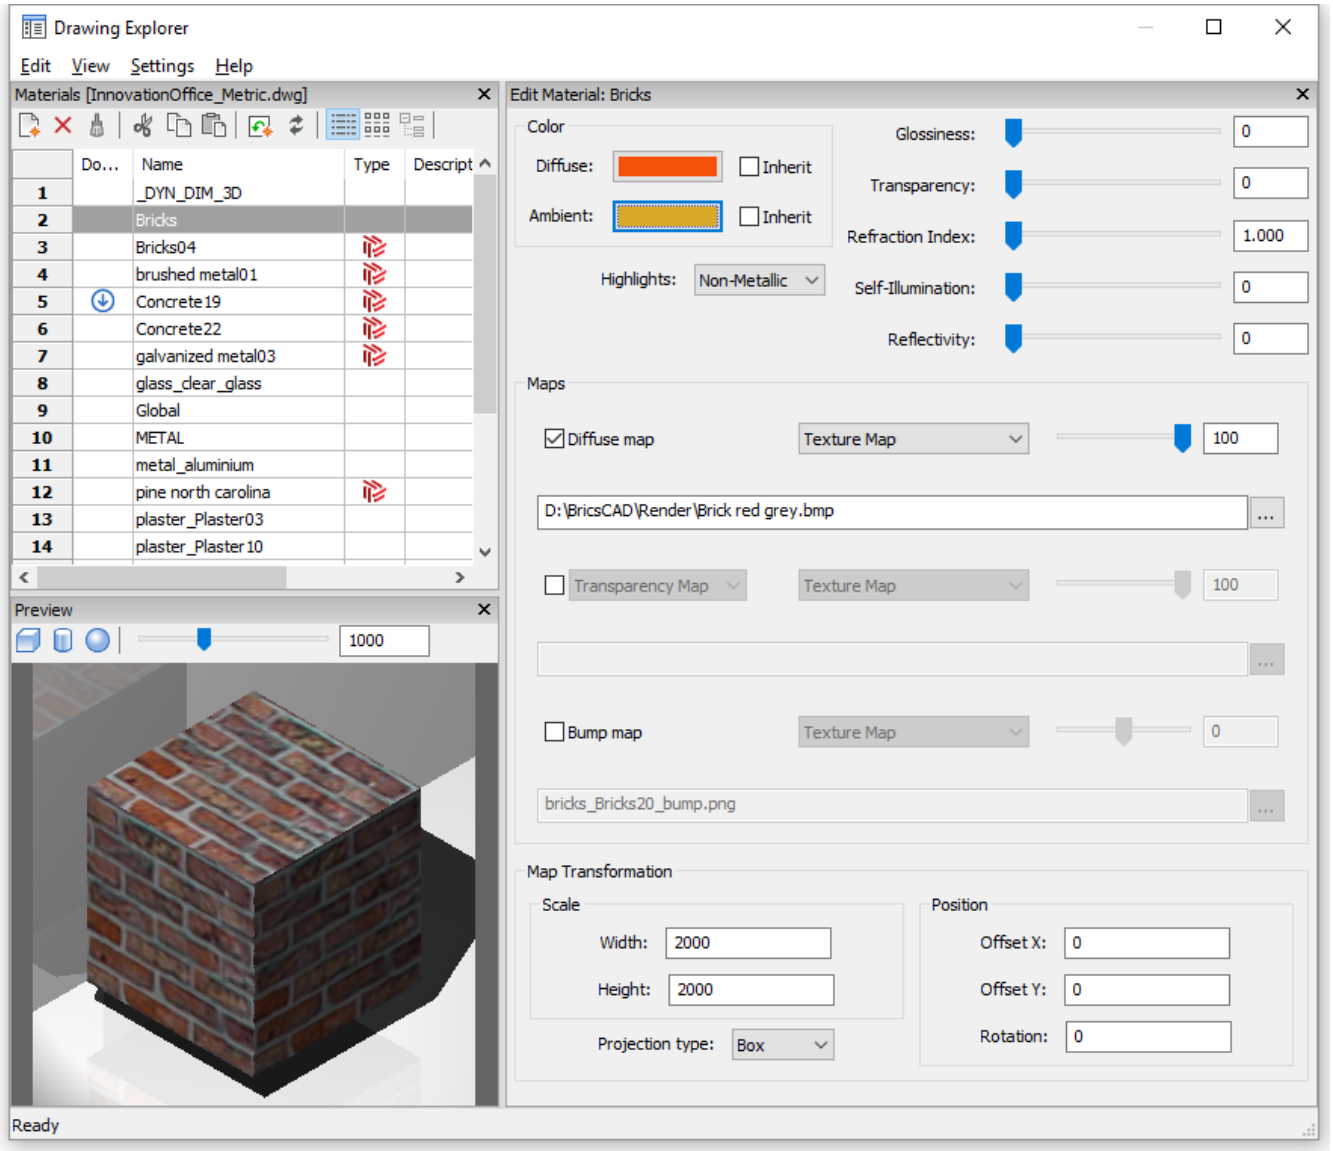
(6.2981 on page 6079) Creates and edits materials used for renderings through the Drawing Explorer dialog box.

Note: Materials provided by RedWay ( ) cannot be edited initially and so their settings are greyed-out, except for **Map Transformation**. To edit these materials, right-click a Redway material, and then choose **Convert to regular material** from the context menu.

Accessing the Command

 command bar: **materials** aliases: **mat, finish, rmat** menu bar: **Tools | Drawing Explorer | Materials View | Rendering | Materials** ribbon: **Home | Settings | Drawing Explorer | Materials View | Materials | Materials** toolbar: **Rendering|** 
: **Materials** Displays the Materials section of the Drawing Explorer (1.19.2) dialog box: (6.1555 on the facing page)

Figure 6.1555



Command Options

Materials Toolbar Option	Description
 New	Creates a new material: 1. Click **New**. 2. Name the material. 3. (Optional) Fill out the **Description** field.
 Delete	Deletes selected material(s). The Global material cannot be deleted.

Preview Options	Description
 Cube	Displays a preview of the selected material applied to a cube.
===ERROR WITH DOWNLOADED IMAGE=== Cylinder	Displays a preview of the selected material applied to a cylinder.
 Sphere	Displays a preview of the selected material applied to a sphere.
Light Intensity	Sets the light intensity in the Preview window: (6.1556 on page 4817) • Drag the slider • Click before or after the slider

Edit Material Option	Description
Name	Type a name for the material. The material name must be unique. The Global material cannot be renamed.
Description	Type a description for the material. The material description is optional.

Color Option	Description
Diffuse Ambient	Sets the diffuse and ambient color: • Check the **Inherit** option to apply the entity color • Click the colored tile, then choose the color in the **Color** dialog box
Highlights	Sets the highlight property of the material: 1. Click the Highlights droplist 2. Choose either **Non-Metallic** or **Metallic**
Glossiness Transparency Refraction Index Self-Illumination Reflectivity	Defines a property of the material surface: • Drag the slider • Click before or after the slider • Type the desired value in the settings field **Glossiness** - range = 0 - 100 **Transparency** - range = 0 - 100 **Refraction Index** - range = 1.00 - 3.00 **Self-Illumination** - range = 0 - 100 **Reflectivity** - range = 0 - 100

Maps Option	Description

Maps

Texture maps add detail to a surface, which is not included in the 3D model itself. To apply a texture map:

1. Turn on the **Diffuse, Transparency** and/or **Bump Map** options.
2. Do one of the following:
   - Select **Wood** or **Marble** from the **Texture Map** option button
   - Choose **Texture Map**, then press the **Browse** button () and select a texture bitmap file (*).
3. Set the **Blend factor** for the texture map:
   - Diffuse and Transparency maps: range = 0 to 100
   - Bump map: range = -1000 to 1000
   - Use the slider or type the factor in the settings field.
   - The **Blend factor** sets the intensity of the texture map.

(*) The TextureMapPath (1.17.10) user preference defines the search path for texture map images. In the BricsCAD program folder exist three subfolders under **Textures** , each containing a number of texture files of the same name. Images in folder **1** have a size of 256 x 256 pixels, folder **2** contains images of 512 x 512 pixels, images in folder **3** have a size of 1024 x 1024 pixels. If the **Diffuse map** setting of a material uses the image name only (not path), you can control the quality of a rendered image by setting the **TextureMapPath** user preference to folder **1** , **2** or **3** .

Diffuse Map

Diffuse maps apply a texture to the surface of a material such as wood grains, bricks or tiles. Drag the slider to blend the texture map with the Color (6.9.19) settings. (6.1557 on page 4818)

Transparency Map (6.1558 on page 4818)

The selected **Texture Map** can be applied as **Transparency Map** or as **Cutout Map**. In the examples below, this image is used as transparency map and cutout map:  If **Transparency Map** is selected, the selected **Texture Map** image defines a transparency map. The image is recommended to be a grayscale image. White pixels will be invisible, black pixels will be opaque and gray pixels will be transparent.

- Colored images are converted to grayscale images in the background.
- The meaning of black and white is the inverse of **Cutout Map** textures.
- The alpha channel of the image is ignored.

Blend factor: the transparency values in the texture will approach the scalar **Transparency** setting as the blend factor approaches 0. This means that if the **Blend factor** is 100, then the transparency value will controlled completely by the **Texture Map** image. If the **Blend factor** is 0, the transparency texture will be completely ignored and the scalar **Transparency** value will be used. (6.1559 on page 4818) If **Cutout Map** is selected, then the selected transparency map defines cutouts: parts of the objects will be fully visible and parts not visible at all, depending on the pixels of the selected image. The image is recommended to be a bitonal black-and-white image, without grays. White pixels are visible, and black pixels are invisible. The **Cutout Map Inverted** option inverts the effect: visible parts become invisible and vice versa.

- Gray scale and color images are converted to black-and-white images in the background.
- The meaning of black and white is the inverse of **Transparency Map** textures.
- The alpha channel of the image is ignored.
- (6.1560 on page 4819)

Bump Map

Bump mapping is a technique for simulating bumps and wrinkles on the surface of an object. The result is an apparently bumpy surface although the surface of the underlying object is not modified. Blend factor range = -1000 / +1000 (6.1561 on page 4819) Left: Diffuse Map only; Right: Bump Map applied.

Map Transformation

Scale

The texture map image is applied at a size of 1 drawing unit multiplied by the **Width** and **Height** factors. E.g. if the **Width** and **Height** factors or both set to 10, the size of the texture image is 10 x 10 drawing units.

Position

Offset	Texture maps maps are tiled starting from the origin of the WCS. To adjust the tiling you can define an Offset X and Offset Y. The offsets are expressed in drawing units.
Rotation	Sets the rotation of the texture maps. Type the desired rotation in the **Rotation** field.

Related Commands

MatBrowserOpen (6.21.6) - opens the materials browser, which shows an overview of available high-resolution render materials. MaterialMap (6.21.9) - allows to adjust how a texture is mapped to regions, faces and faces of a 3D solid. Render (6.26.21) - calculates a photorealistic image of the 3D model. Light (6.20.30) - creates a new light in the drawing. VisualStyles (6.31.15) - creates and controls visual style definitions in the Drawing Explorer. Explorer (6.13.15) - opens the Drawing Explorer dialog box.

6.21.11 Measure

(6.2981 on page 6079) Places points or blocks along entities at equally-spaced distance that you specify. (6.1563)

Accessing the Command

 command bar: **measure** menu bar: **Modify | Measure** ribbon: **Draw | Draw | Points | Measure** toolbar: **Modify | Measure/Divide |**  : **Measure Prompts you in the command bar:** Select entity to measure: **(Choose a line, polyline, spline, arc, circle, helix, or ellipse)** Segment length [insert Block]: **(Enter a number, or type B)** Note: Points are usually invisible, so use the PdMode (6.24.30) variable to make them larger.

Command Options

Option	Description
Select entity to measure	Chooses a single entity: a line, polyline, spline, helix, arc, circle, or ellipse.
Segment length	Specifies the distance between segments; the segment is measured beginning at the pick point.
Insert block	Uses blocks in place of points; prompts you: 1. **Name of block to insert [? to list] - (specify the name of the block; the block must exist in the drawing.) ? to list** - lists the name of the blocks in the drawing. 2. **Align blocks with entity? [Yes-align blocks/No-do not align] <Yes-Align blocks> - (toggles whether blocks are aligned with the entity)**: • **Yes** - rotates blocks to match the entity alignment • **No** - does not rotate blocks; they maintain their orientation

Procedures

- To measure an entity using points (1.32.38)
- To place blocks a specified interval along an entity (1.32.38)

Related Commands

Divide (6.21.12) - places evenly-spaced points along entities. Point (6.24.30) - places points in drawings. DdPType (6.10.20) - specifies the look and size of point entities through the Settings dialog box

Figure 6.1564

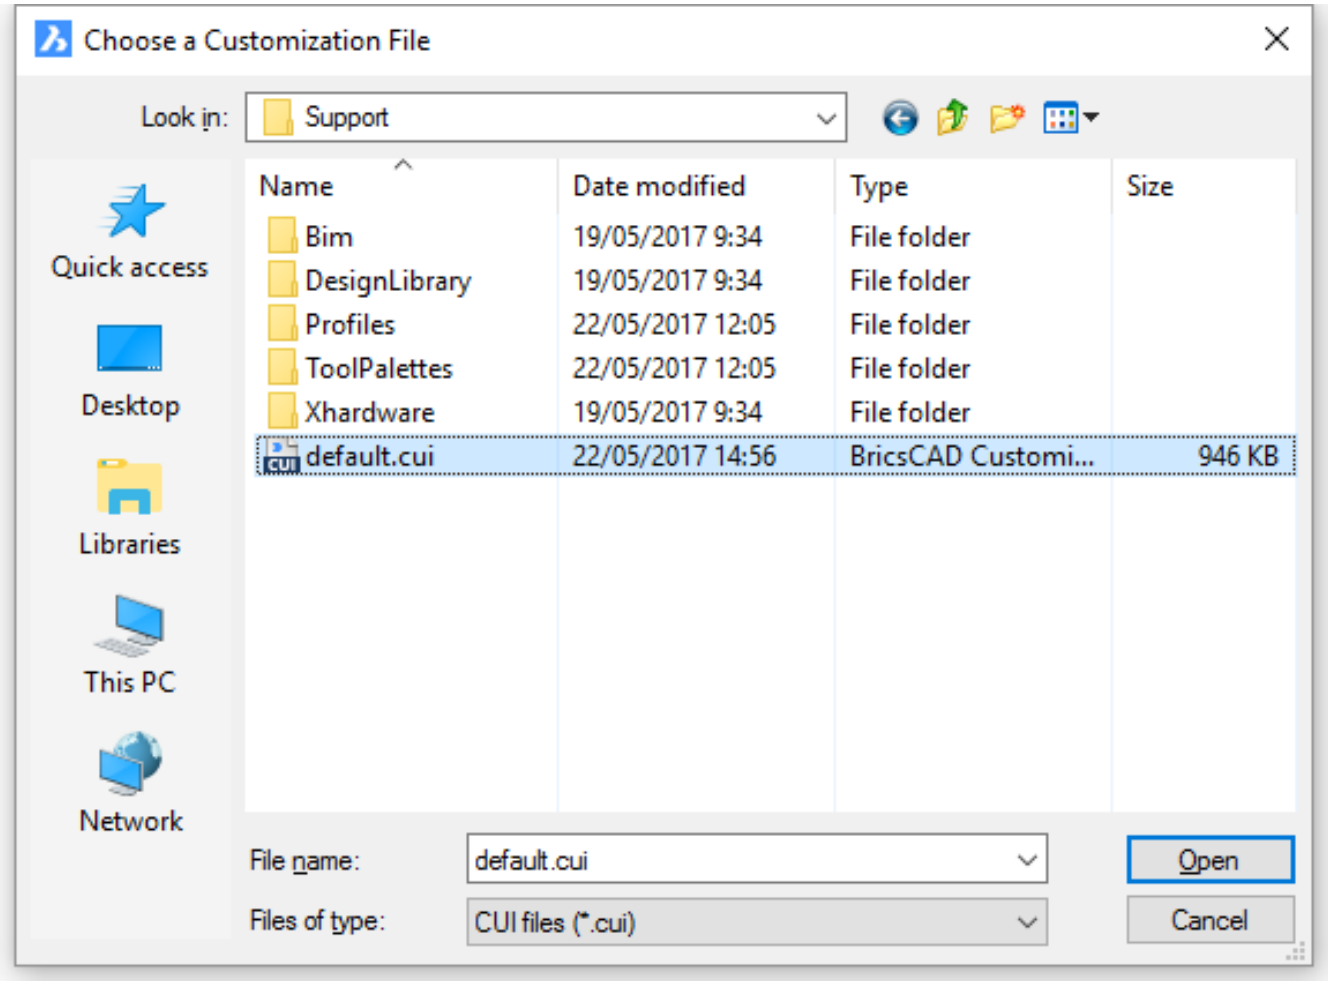
6.21.12 Menu

(6.2981 on page 6079) Loads a variety of menu files into the program that modify its user interface.

Accessing the Command

 command bar: **menu** menu bar: **Tools | Load menu** ribbon: **Tools | Customization | Load Menu** toolbar: **Tools |**  : **Menu** Displays a dialog box: (6.1565 on the following page) Choose a menu file, and then click **Open**.

Figure 6.1565



Command Options

Option	Description
File name	Specifies the name of the menu file.
File type	Specifies the format of menu file: • **CUI** - compatible with AutoCAD 2007 and later • **ICM** - compatible with IntelliCAD menu files • **MNU** - compatible with AutoCAD 2006 and earlier • **MNS** - LISP source code used with MNU files
Open	Opens the menu file. **Caution**: loading a menu file can replace the user interface of BricsCAD unexpectedly.

Related Commands

CuiLoad (6.9.56) and CuiUnload (6.9.51) - loads and unloads menu files. Customize (6.9.47) - customizes the user interface. Menu (6.21.12) - loads menu files into BricsCAD's user interface. MenuLoad (6.21.14) - loads CUI (user interface customization), MNU (menu), MNS (LISP code), and ICM (IntelliCAD menu) files. MenuUnload (6.21.13) - unloads menu files.

Figure 6.1566

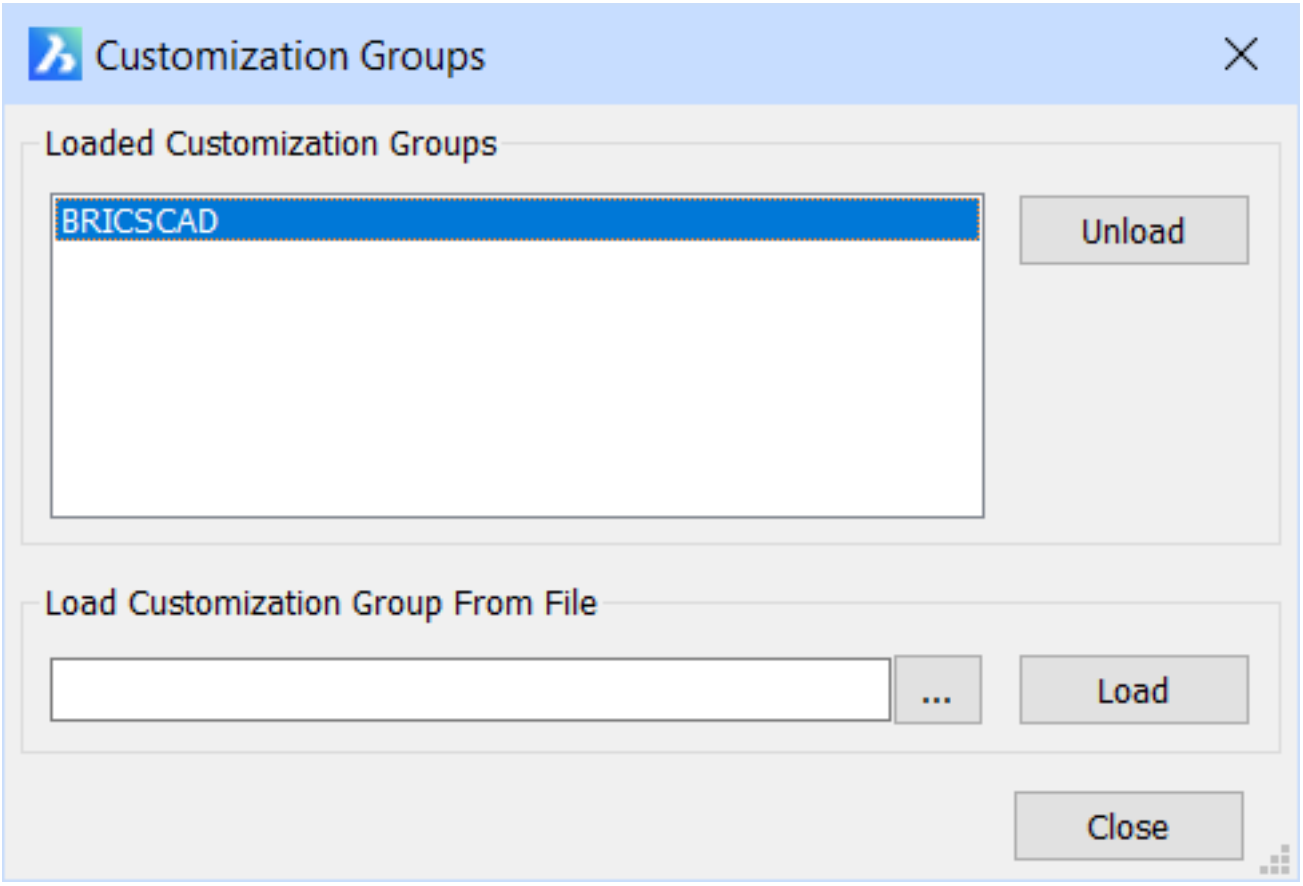
6.21.13 MenuUnload

(6.2981 on page 6079) Loads CUIX and CUI (user interface customization), MNU (menu), MNS (LISP code), and ICM (IntelliCAD menu) files into the program.

Accessing the Command

command bar: **menuunload** transparent: **'menuunload** aliases: **menuload, cuiunload, cuiload** menu bar: **Tools | MenuLoad** : **MenuUnload** Displays a dialog box: (6.1569 on page 4827)

Figure 6.1567



Command Options

Option	Description
Loaded Customization Groups	Lists the names of customization files loaded in BricsCAD.
Unload	Unloads the selected customization group. **Caution**: unloading 'BricsCAD' causes most user interface elements to disappear.
Browse (...)	Displays the Choose a Customization File dialog box. Choose a CUIX, CUI, MNU, MNS, or ICM file, and then click **Open**.
Load	Loads the opened customization file. **Caution:** loading a customization file changes the program's user interface.

Related Commands

AddInMan (6.4.3) - loads and unloads VBA functions through a dialog box. AppLoad (6.4.17) - selects external routines to load when BricsCAD starts. Commands (6.9.23) - lists the names of internal and external commands. CuiUnload (6.9.51) - unloads menu files. Customize (6.9.47) - customizes the user interface. Menuload (6.21.13) - loads and unloads menu files. Netload (6.22.3) - loads a .NET application. VbaLoad (6.32.2) and -VbaLoad (6.32.3) - loads VBA projects. VbaRun (6.32.6) and -VbaRun (6.32.7) - runs VBA macros. VbaIde (6.32.1) - opens the VBA integrated development environment. VbaMan (6.32.4) - manages VBA projects. VbaUnload (6.32.9) - unloads VBA projects.

Figure 6.1570

6.21.15 MInsert

(6.2981 on page 6079) Inserts a block as a rectangular array, a combination of the -Insert (6.17.14) and -Array (6.4.20) commands (short for "multiple insertion"); creates a MInsert Block entity. (6.1574 on page 4830)

Accessing the Command

command bar: **minsert** transparent: **'minsert** : **MInsert Prompts you in the command bar:** ? to list blocks in drawing/~ to open the file dialog/<Block to insert>: **(Type the name of a block, press Enter to accept the name of the previously inserted block, or choose an option)** Insertion point for block or [Multiple blocks/Scale]: **(Pick a point to insert the block, or choose an option)** [Corner] <1.000000>: **(Pick a point, type a value to define the X scale factor, or press Enter to accept the default)** Y scale factor: < Equal to X scale (2.000000)>: **(Pick a point, type a value to define the Y scale factor, or press Enter to set the Y scale equal to the X scale)** Rotation angle for block <0>: **(Pick a point, specify a rotation angle , or press Enter to accept the default)** Number of rows in the array <1>: **(Enter the number of rows)** Number of columns <1>: **(Enter the number of columns)** Vertical distance between rows, or spacing rectangle: **(Specify the distance between rows, or pick two points)** Horizontal distance between columns: **(Specify the distance between columns)**

Command Options

Option	Description
Block to insert	Specifies the name of the block to be inserted.
? to list blocks in drawing	Type **?** to list the names of all blocks in the current drawing. Prompts you: **Block(s) to list [* for all]** - **(press Enter to list all blocks, or enter part of a name to view some blocks; you may use wildcards like ? and *.)** If necessary, press **F2** to view the full list in the Prompt Screen window. See TextScr (6.29.16) command.
~ to open the file dialog	Type **~** the Insert Block dialog box: 1. Choose a DWG file 2. Click **Open**
Multiple blocks	Allows you to insert the same block many times quickly by repeating the following prompt a the end of the command -- until you press **Enter** or **Esc**: **Insertion point for next block** - **(specify a point.)**
Scale	Allows to set the X and Y scale factor equally; prompts you: **Scale factor for block** - **(type a value.)**
Corner	Specifies the size of the block by picking a second corner to show the size. (The insertion point is the first corner.) Prompts you: **Select other corner for scale or enter X scale factor** - **(pick a second corner, or enter a number for the x scale factor.)** (6.1572 on page 4830)

Y scale factor	Specifies the scale factor of the block in the y direction: • Enter a number larger than 1 to make the block larger • Enter a number smaller than 1 to make it smaller • Enter a negative number to mirror the block • Press **Enter** to make the y scale = x scale
Rotation angle for block	Specifies the rotation angle of the block about its insertion point: • Enter a value • Pick a point to show the rotation angle
Number of rows in the array	(6.1573 on the following page) Specifies the number of rows: • Enter a number • For a linear array, enter 1 • To draw the array downwards, enter a negative number
Number of columns	Specifies the number of columns: • Enter a number • For a linear array, enter 1 • To draw the array to the left, enter a negative number.
Vertical distance between rows	Specifies the distance between rows of blocks: • Enter a number for the distance • Pick two points
Spacing rectangle	Specifies two points that indicate the spacing between rows and columns.
Horizontal distance between columns	Specifies the distances between columns of blocks. (6.1574 on the next page) • Enter a number for the distance • Pick two points

Procedures

- To insert multiple instances of a block in a rectangular array (1.30.5)

Related Commands

3dArray (6.3.2) - creates 3D arrays. Array (6.4.19) - creates 2D arrays. ArrayPath (6.4.26) - distributes entity copies evenly along a path into multiple rows, and levels. ArrayPolar (6.4.41) - distributes entity copies evenly in a circular pattern about a center point or axis of rotation, using multiple rows, and levels. ArrayRect (6.4.28) - distributes entity copies into any number of rows, columns, and levels. Block (6.6.11) - creates blocks. Insert (6.17.13) - inserts blocks.

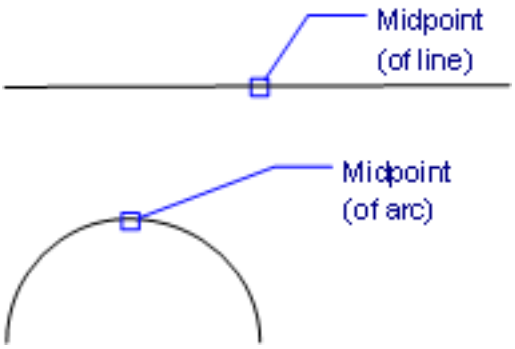
Figure 6.1576



6.21.16 Midpoint

(6.2981 on page 6079) Toggles midpoint entity snap; snaps to the middle of lines, arcs, and other open entities, and to the edges of 3D solids. (6.1787 on page 5005)

Accessing the Command

command bar: **midpoint** transparent: **mid** ribbon: **Home | Entity Snaps | Snap to Midpoint** toolbar: **Entity Snaps |** 
: **Midpoint** Displays no prompt in the command bar. When midpoint entity snap is on, the cursor snaps to the midpoints of entities. This entity snap works with 3D solid models.

Command Options

Option	Description
Midpoint	Entering the command toggles Midpoint entity snap. It snaps to the midpoint of entities. This command can be entered transparently during commands, but must be entered without the apostrophe prefix (').

Related Commands

OSnap (6.23.16) - toggles entity snap modes in the Settings dialog box. -OSnap (6.23.13) - toggles entity snap modes in the command bar. Aperture (6.4.14) - sizes the aperture cursor for entity snaps. 2dIntersection (6.2.1) - toggles apparent intersection snap mode. 3dIntersection (6.3.7) - toggles intersection snap mode. Apparent (6.4.16) - toggles apparent intersection snap mode. Center (6.9.3) - toggles center snap mode. Endpoint (6.13.7) - toggles endpoint snap mode. Extension (6.13.22) - toggles extension snap mode. From (6.14.13) - allows to enter relative coordinates with respect to a reference point. GCenter (6.15.5) - toggles Geometric Center (GCenter) entity snap. Insertion (6.17.18) - toggles insertion snap mode. Intersection (6.17.19) - toggles intersection snap mode. Mtp (6.21.35) - allows to specify a point as the midpoint between two points. Nearest (6.22.2) - toggles nearest snap mode. Node (6.22.7) - toggles node (point) snap mode. None (6.22.8) - turns off all entity snap modes. Parallel (6.24.5) - toggles parallel snap mode. Perpendicular (6.24.25) - toggles perpendicular snap mode. Quadrant (6.25.7) - toggles quadrant snap mode. Tangent (6.29.10) - toggles tangent snap mode. Zmidpoint (6.35.4) - toggles the 3D midpoint snap. Snaps to the midpoint of a face edge.

Figure 6.1577

6.21.17 Mirror

(7.3 on page 6132) Mirrors entities about a mirror line in a 2D plane.

Accessing the Command

command bar: **mirror** alias: **mi** menu bar: **Modify | 2D Mirror** ribbon: **Change | Arrange | 2D MIrror** toolbar: **Modify |**  : **Mirror Prompts you in the command bar:** Select entities to mirror: **(Choose one or more entities)** Entities in set: 1 Select entities to mirror: **(Choose more entities, or press Enter to continue)** Start of mirror line: **(Pick a point, or enter x,y coordinates)** End of mirror line: **(Pick another point)** Delete the original entities? [Yes-delete entities/No-keep entities] <No-Keep entities>: **(Type Y or N)**

Command Options

Option	Description
Select entities to mirror	Chose one or more entities to be mirrored.
Start of mirror line	Specifies the start point for the line about which entities are mirrored. This line is temporary; as soon as you pick the second point, it disappears. To mirror vertically or horizontally, hold down the **Shift** key when specifying the second point or use Polar Tracking (1.21.18).
End of mirror line	Specifies the second point of the mirror line.
Delete the original entities?	Determines whether the original entities are erased: • **Y** - erases the original entities, leaving only the mirrored ones • **N** - does not erase the original entities, leaving them in place

Procedures

- Mirroring entities about a line (1.32.13)
- Mirroring entities about a plane (1.32.13)
- To mirror entities using grips (1.32.3)

Related Commands

Mirror3D (6.21.20) - mirrors entities in 3D space. InsertAligned (6.17.15) - inserts mirrored blocks.

Figure 6.1578

6.21.18 MatchProp

(7.3 on page 6132) Copies the properties and styles from one entity and then applies them to one or more other entities, with control over which properties are copied (short for "match properties").

Accessing the Command

 command bar: **matchprop** transparent: **'matchprop** alias: **ma** ribbon: **Home | Edit | Match** quad :

- **No Selection | Edit** (Drafting)
- **No Selection | Modify** (Modeling, BIM, Mechanical)

toolbar: **Standard |**  : **MatchProp Prompts you in the command bar:** Select entity to copy properties from: **(Choose one entity.)** Active Settings: 'Color' 'Layer' 'Linetype' 'Linetype Scale' 'Lineweight' 'Transparency' 'Thickness' 'Plot Style' 'Dimension' 'Polyline' 'Material' 'Text' 'Shadow Display' 'Hatch' 'Multileader' Select entities to copy properties to or [Settings]: **(Choose one or more entities, or type S) Select entities to copy properties to** or [Settings]: **(Choose additional entities, or press Enter to exit the command)**

Command Options

Option	Description
Select entity to copy properties from	Specifies the entity whose properties will be copied. The currently active settings display in the command bar, such as 'Color' 'Layer' 'Linetype' 'Linetype Scale' 'Lineweight' 'Transparency' 'Thickness' 'Plot Style' 'Dimension' 'Polyline' 'Material' 'Text' 'Shadow Display' 'Hatch' 'Multileader'
Select entities to copy properties to	Specifies the entities whose properties are to be changed.

Settings	Specifies which properties are to be copied. The dialog box lists applicable properties, along with the current value of each one. The Special section lists the styles that will be copied: **Dimensions** - dimension style and annotative property of dimensions, leaders, and tolerances **Hatch** - all hatch properties and annotative scaling **Materials** - adds or removes materials, depending on whether the source entities has a material definition or not **Multileaders** - multileader style and annotative scaling **Polylines** - width and linetype generation settings, but other settings are ignored, such as taper and spline **Shadow Displays** - all properties **Tables** - table style **Text** - text style and annotative property of text and mtext **Viewports** - viewport-specific properties, such as on or off, snap and grid status, and scale factor, but not other properties, such as clipping or frozen layer states (6.1579 on the facing page) 1. Choose some or all properties 2. Click **OK** 3. Select entities at the prompt: **Select entities to copy properties to or [Settings] - (select entities.)**

Procedures

- To copy properties between entities (1.32.5)
- Copy properties between entities with BIM data (1.32.5)

Related Commands

Color (6.9.19) - assigns the working color. Copy (6.9.35) - copies entities. Layer (6.13.17) - assigns properties to layers. Linetype (6.20.32) - assigns the working linetype. LWeight (6.20.42) - assigns the working lineweight. Properties (6.24.54) - changes properties assigned to entities. SetByLayer (6.27.34) - sets the property overrides of selected entities to ByLayer. -SetByLaye (6.27.24)r - sets the property overrides of selected entities to ByLayer.

Figure 6.1579

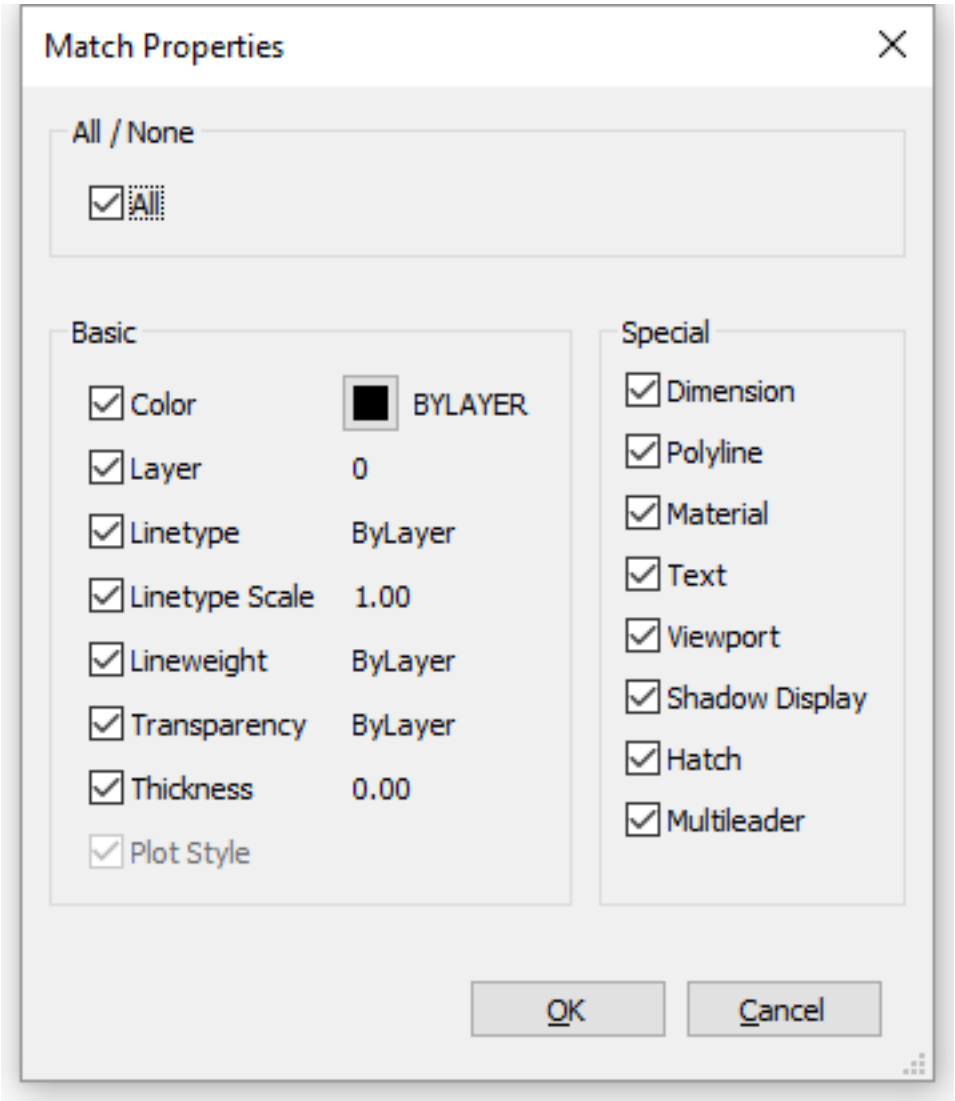


Figure 6.1580

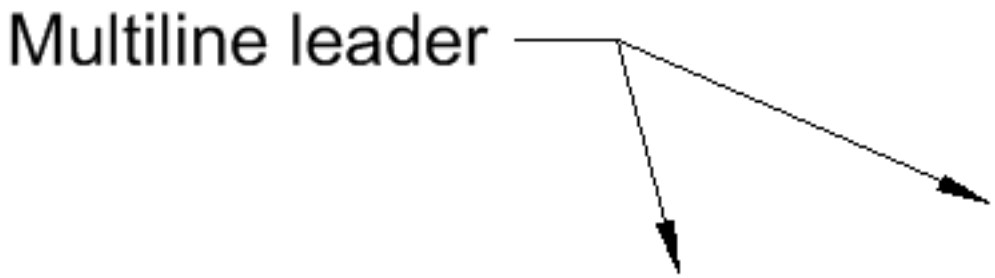
Figure 6.1581



6.21.19 MLeader

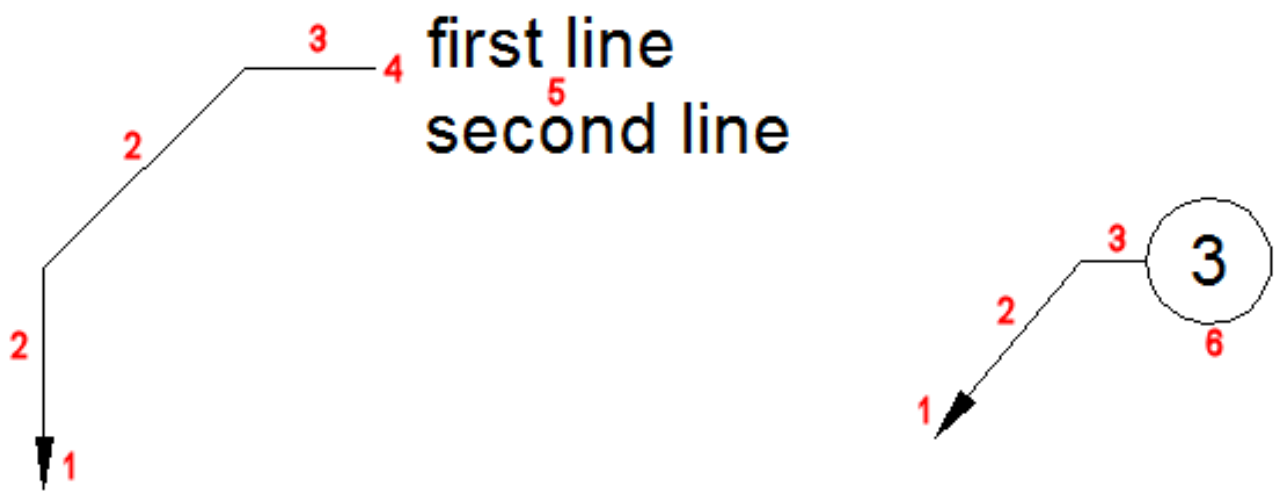
(6.2981 on page 6079) Creates multileader entities using the current multileader style. **Notes:** A multileader entity consists of three components: (1) a leader line with an optional arrowhead, (2) a landing line, and (3) the content, such as text or a block. Multileaders support more than one leader line per content, as shown below. Leaders can be added, removed, and content from multiple leaders can be aligned and combined. The look of the mleader is determined by options during this command and by the MLeaderStyle (6.21.24) command. (6.1581)

Accessing the Command

 command bar: **mleader** menu bar: **Dimension | Multileader** ribbon: **Draw | Leaders | Leaders | Multileader** toolbar: **Dimensions |**  : **MLeader When the draw order option is set to "Content first," prompts you in the command bar:** Specify first corner of text or [leader arrowHead first/leader Landing first/Options] <Options>: **(Specify the a corner point for the text or enter an option)** Specify the opposite corner: **(Specify the other corner for the mtext bounding box)** Specify leader arrowhead location: **(Pick the location of the arrowhead; the rest of the leader is drawn automatically)** The prompts appear in a different order when you choose the "leader Landing first" or "leader Arrowhead first" options. (6.1596 on page 4853)

1. Arrowhead
2. Segment
3. Landing

Figure 6.1582



4. Landing gap
5. Mtext
6. Block

Command Options

Option	Description
leader Arrowhead first	Begins drawing the multileader from the arrowhead end; prompts you: 1. **Specify leader arrowhead location or [leader Landing first/Content first/Options] <Options> - (pick a point or choose an option.)** 2. **Specify leader landing location - (pick a point.)** 3. The program launches the Mtext (6.21.38) command, in which you enter text. 4. Click **OK** to exit the MText editor, and finish the MLeader command.
leader Landing first	Begins drawing the multileader from the landing, the short horizontal line between the content and the rest of the leader; prompts you: 1. **Specify leader landing location or [leader arrowHead first/Content first/Options] <Options> - (pick a point or choose an option.)** 2. **Specify leader arrowhead location - (pick a point.)** 3. The program launches the Mtext (6.21.38) command, in which you enter text. 4. Click **OK** to exit the MText editor, and finish the MLeader command.
Content First	Begins drawing the multileader from the content end. The prompts shown here are for mtext: 1. **Specify first corner of text or [leader arrowHead first/leader Landing first/Options] <Options> - (pick a point for the mtext bounding box, or choose an option.)** 2. **Specify the opposite corner - (pick a point.)** 3. The program launches the Mtext (6.21.38) command, in which you enter text; click **OK** to exit the MText editor, and the following prompt appears: 4. **Specify leader arrowhead location - (pick a point.)**

Options	Sets overrides to the current multileader style; prompts you: **Enter an option [Leader type/leader lAnding/Content type/Maxpoints/First angle/Second angle/eXit options] <eXit options>** - **(enter an option)**: • **Leader type** - sets the leader type: straight, spline or none; prompts you: **Select a leader type [Straight/sPline/None] <Straight>** - **(choose an option)**: **Straight** - the leader is drawn from straight segments **sPline** - a spline is drawn, using the pick points as the control points **None** - no leader is drawn • **leader lAnding** - specifies whether to draw the leader landing, or not; prompts you: **Use landing [Yes/No] <Yes>** - **(enter an option.)** • **Content type** - specifies the content type of the multileader; prompts you: **Select a content type [Block/Mtext/None] <Mtext>** - **(choose an option.) Block** - uses a block; prompts you for the name of the block **Mtext** - uses mtext; displays the MText editor **None** - draws no content • **Maxpoints** - specifies the maximum number of bends in the leader line; prompts you: **Enter the maximum points for leader line <2>** - **(enter a number between 2 and 2147483647.)** • **First angle** - constrains the first leader segment; prompts you: **Enter first angle constraint <0>** - **(enter an angle, such as 15 The angle of the first leader segment is constrained to this value, or to a multiple of this angle, such as 0, 15, 30, 45, and so on. Enter 0 for unconstrained leader line.)** • **Second angle** - constrains the second leader segment; prompts you: **Enter second angle constraint <0>** - **(enter an angle, such as 45 The angle of the second leader segment is also constrained to this value or a multiple of it.)** • **eXit options** - exits the Options section of the command

Grips Editing

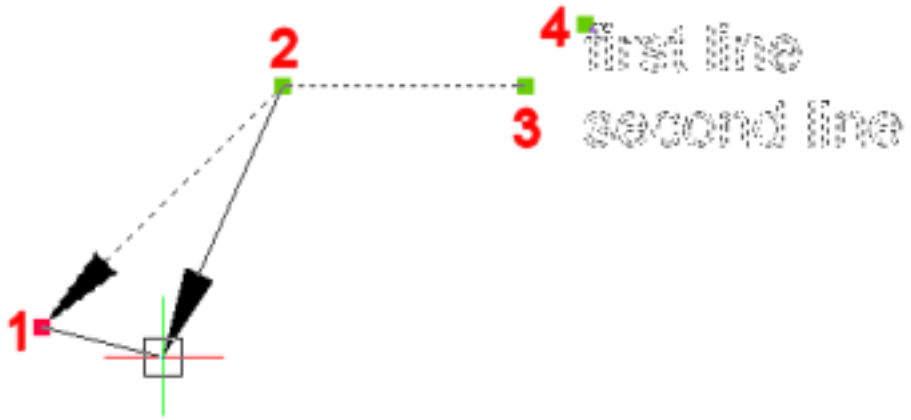
MLeaders can be edited through grips.

1. Select the MLeader in the drawing. For a single segment leader entity, four grips display: Endpoint (1), Vertex (2), Landing (3) and Text (4).
2. Drag the grips to perform the following actions:

- Move the arrowhead (1)
- Move the landing and the mleader content (2)
- Edit the landing length(3)
- Move text (4)

(6.1583 on the facing page)

Figure 6.1583



Procedures

- To create a multileader (1.29.13)
- Adding vertices to a leader line of a multileader (1.29.13)
- Removing vertices from a leader line of a multileader (1.29.13)
- Adding leader lines to a multileader (1.29.13)
- Removing leader lines from a multileader (1.29.13)

Related Commands

MLeaderEdit (6.21.22) - adds leader lines to and removes leader lines from a multileader entity. MLeaderStyle (6.21.24) - Creates and manages multileader styles in the Drawing Explorer dialog box. BimTag (6.7.59) - creates associative tags in generated BIM section drawings for the corresponding building entities in a 3D BIM model. BmBalloon (6.8.2) - creates associative balloon entities for assembly components in Model Space and for their generated views in a Paper Space layout. Dimleader (6.11.13) - places leaders with text, blocks, entities, or tolerances. Leader (6.20.21) - places leaders with text, blocks, entities, or tolerances. QLeader (6.25.3) - draws leaders. Lets you specify the properties of the leader through a dialog box and reuse them for a series of leaders.

Figure 6.1584

6.21.20 Mirror3D

(7.3 on page 6132) Mirrors entities about a mirror plane in 3D space.

Accessing the Command

command bar: **mirror3d** aliases: **3m, 3dmirror** menu bar: **Modify | 3D Mirror** ribbon: **Solid | Edit | Mirror | 3D Mirror** toolbar: **Modify |** : **Mirror3D Prompts you in the command bar:** Select entities: **(Choose one or more entities)** Entities in set: 1 Select entities: **(Choose more entities, or press Enter to continue>** Define mirror plane by [Entity/Last/View/Z axis/X-Y plane/Y-Z plane/Z-X plane/3 points] <3 points>: **(Enter an option)** Delete the original entities? [Yes-delete entities/No-keep entities] <No-Keep entities>: **(Type Y or N)**

Command Options

Option	Description
Select entities	Chooses one or more entities to mirror.
Entity	Defines the mirror plane by extrusion direction; prompts you: **Pick an entity that has an extrusion direction - (select entities with a thickness.)** This option does not work with flat entities or 3D solids. To give an entity an extrusion, use the Properties command's Thickness option.
Last	Reuses the last mirror plane; does not prompt you.
View	Defines the mirror plane as the current view plane; prompts you: **Point on view plane <0,0,0> - (specify the x,y,z coordinates of the view plane.)**
Zaxis	Defines the mirror plane by the z axis and a point on the view plane; prompts you: 1. **Point on view plane** - defines the view plane by a point. 2. **Point on the z-axis (normal) of the plane - (specify the height of the view plane.)**
XY	Specifies the mirror plane as the x,y plane; prompts you: **Point on XY plane <0,0,0> - (specify the location of the plane through x,y,z coordinates.)**
YZ	Specifies the mirror plane as the y,z plane; prompts you: **Point on YX plane <0,0,0> - (specify the location of the plane through x,y,z coordinates.)**
ZX	Specifies the mirror plane as the z,x plane; prompts you: **Point on ZX plane <0,0,0> - (specify the location of the plane through x,y,z coordinates.)**
3points	Defines the mirror plane by three points; prompts you: 1. **Second point on plane - (specify the second point; the first point is specified by the 3points prompt.)** 2. **Third point on plane - (specify the third point.)** Three points define a 2D plane in space.

Delete the original entities?	Determines whether the original entities are erased: • **Y** - erases the original entities, leaving only the mirrored ones. • **N** - does not erase the original entities, leaving all in place.

Related Commands

Mirror (6.21.17) - mirrors entities about a mirror line in a 2D plane. InsertAligned (6.17.15) - inserts mirrored blocks.

Figure 6.1585

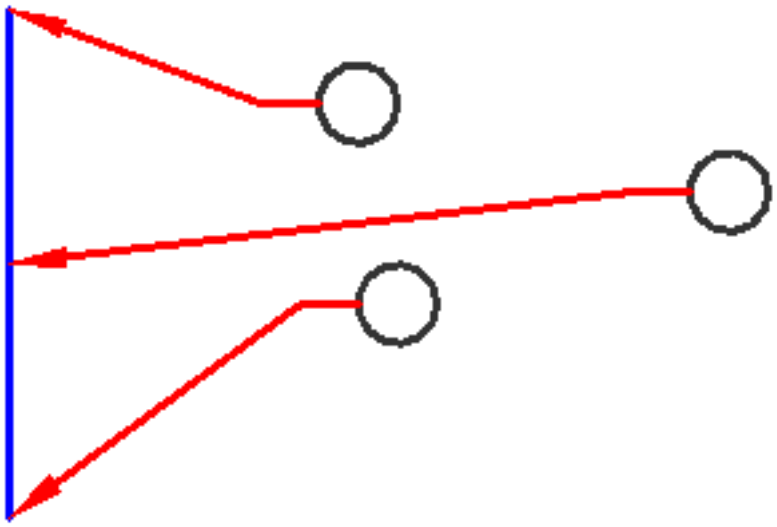
6.21.21 MLeaderAlign

(6.2981 on page 6079) Aligns the balloons of two or more multileaders.

Accessing the Command

Keyboard: **mleaderalign** Menu: **Dimension | Align Multileader** Toolbar: **Dimension | Align Multileader** **:MLeaderAlign Prompts you:** Select multileaders: **(Select two or more multileaders, or else enter all to select all of them in the drawing)** Entities in set: 3 Select multileaders: **(Press Enter to finish the selection process and continue with the command)** Specify first point or [Options]: **(Pick an alignment point, or else enter o for options)** Specify second point: **(Pick a second alignment point)** Before: (6.1586 on the next page)

Figure 6.1586



Command Options

Option	Description
Select multileaders	Select two or more multileaders. Enter **all** to select all of them in the drawing
Specify first point	Pick an alignment point
Specify second point	Pick a second alignment point. The blocks at the end of the multileaders will be aligned between the two pick pints.
Options	Prompts you: **Enter an option: [byMleader/onpolyLine/Parallel/Spacing/Circle]:** • **byMleader** - aligns other multileaders to a selected one • **onpolyLine** - aligns multileaders along an imaginary polyline • **Parallel** - aligns other multileaders to one that you select • **Spacing** - prompts you to specify the spacing between multileaders • **Circle** - arrays the multileaders around a circle
byMleader	Aligns other multileaders to a selected one: 1. **Select multileader to align** - **(choose one multileader to which other multileaders will be aligned.)** 2. **Specify direction** - **(move the cursor to indicate the alignment direction.)**

onpolyLine	Aligns multileaders along an imaginary polyline: 1. **Specify first point - (pick the point at which the imaginary polyline begins.)** 2. **Specify point - (pick a second point; at least two points must be picked.)** 3. **Specify point - (pick another point, or else press Enter to end the command.)** As you pick points, the program draws a temporary polyline made of yellow lines so that you can see the path. (6.1587 on the facing page)
Parallel	Aligns other multileaders to one that you select: • **Select multileader to align - (select one multileader, and then the program aligns the others in parallel)** (6.1588 on the next page)
Spacing	Prompts you to specify the spacing between multileader blocks: 1. **Specify spacing <0.00> - (enter a value or pick two points to indicate the distance.)** 2. **Select multileader to align - (select one or more multileaders.)** 3. (6.1589 on page 4846)
Circle	Prompts you for the center and radius of a circle around which the align the multileaders: 1. **Specify center - (pick the center point of the circle.)** 2. **Specify radius - (specify the radius of the circle)** As you indicate the radius, the program draws a temporary circle drawn in yellow so that you can see the path. (6.1590 on page 4847)

Related Commands

MLeader (6.21.19) - draws multiline leaders. MLeaderCollect (6.21.25) - collects mleaders with block content into a single mleader. MLeaderEdit (6.21.22) - edits multileaders. MLeaderEditExt (6.21.23) - adds and removes leader lines and vertices from multileaders. MLeaderStyle (6.21.24) - creates and edits named styles for multileaders.

6.21.22 MLeaderEdit

(6.2981 on page 6079) Adds and removes leader to and from multileader entities.

Accessing the Command

 command bar: **mleaderedit** menu bar: **Dimension | Edit Multileader - Multileader Add Leaders Dimension | Edit Multileader - Multileader Remove Leaders** ribbon: **Draw | Leaders | Leaders | Edit Multileader** toolbar: **Dimensions |**  : **MLeaderEdit Prompts you in the command bar:** Select a multileader: **(Select an mleader entity)** Specify leader arrowhead location or [Remove leaders]: **(Pick a point or press R)** Specify leader arrowhead location or [Remove leaders]: **(Pick a point, or press Enter to end the command)**

Command Options

Option	Description
Select a multileader	Select a multileader entity
 Add leaders	Adds leaders to the selected mleader entity; prompts you: **Specify leader arrowhead location or [Remove leaders]** - **(choose an action)**: • Pick a another point to locate another new leader • Press **R** to remove leaders • Press **Enter** to end the comma
 Remove leaders	Removes leaders from the selected mleader entity. **Select leaders to remove or [Add leaders]** - **(choose an option)**: • Choose one or more leaders to remove • Press **A** to add leaders • Press **Enter** to end the command

Procedures

- Adding vertices to a leader line of a multileader (1.29.13)
- Removing vertices from a leader line of a multileader (1.29.13)
- Adding leader lines to a multileader (1.29.13)
- Removing leader lines from a multileader (1.29.13)

Related Commands

MLeader (6.21.19) - creates multileader entities using the current multileader style. MLeaderEditExt (6.21.23) - adds and removes leader lines, adds and removes vertices from a multileader entity. MLeaderStyle (6.21.24) - Creates and manages multileader styles in the Drawing Explorer dialog box. BimTag (6.7.59) - Creates associative tags in generated BIM section drawings for the corresponding building entities in a 3D BIM model.

Figure 6.1592

6.21.23 MLeaderEditExt

(6.2981 on page 6079) Adds and removes leader lines, adds and removes vertices, and changes the landing length of a multileader entity (short for "muliline leader edit extended").

Accessing the Command

command bar: **mleadereditext** quad: (6.1593) : **MLeaderEditExt You are prompt:** Select option [Add vertex/add vertex at ENd/Remove vertex/Stretch vertex/add Leader/rEmove Leader/lengthen LAnding]: **(Enter an option)**

Option	Description
Add vertex	Adds a vertex to the leader line; prompts you: **Select vertex - (follow these steps)**: 1. Ignore the wording and instead select a leader line segment 2. Click to select it; a new vertex is added to the selected leader segment 3. Move the vertex, stretching the attached leader lines 4. Click to pick the location of the new vertex
add vertex at ENd	Adds a vertex and a new leader line at the arrowhead; prompts you: 1. **Select a leader of multileader - (choose a the leader of multileader.)** 2. **Select vertex - (move the cursor to locate the new vertex and leader line.)**
Remove vertex	Removes a vertex from the leader line; prompts you: **Select vertex - (move the cursor over a vertex, and then click to remove it. Removing the vertex between the leader and the landing removes the entire mleader.)**

Figure 6.1593

Stretch vertex	Stretch a leader line by moving a vertex; prompts you: **Select vertex** - **(follow these steps)**: 1. Move the cursor over a vertex 2. Click to select it 3. Move the vertex, stretching the attached leader lines 4. Click to pick the new vertex location
add Leader	Adds one or more leader lines to an existing mleader; prompts you: 1. **Select multileader** - **(select a multileader, and a new leader is drawn.)** 2. **Specify leader arrowhead location** - **(move the cursor to locate the arrowhead, and then click to place it.)** Specify leader arrowhead location - the command repeats so that you can add more leaders to this mleader; press **Esc** to end the command.
rEmove Leader	Removes a leader and associated vertex from the leader line; prompts you: **Select vertex** - **(ignore the wording and instead select a leader line segment, which is removed.)**
lengthen LAnding	Changes the length of the landing; prompts you: 1. **Select leader landing point** - **(select a landing; the point you pick is where the landing is lengthened.)** 2. **Specify leader landing location** - **(move the cursor to change the size of the landing, and then click to locate it.)**

Using the Quad is probably the best way to employ this command:

Quad Icon	Tool name	Description
	Add vertex	Adds a vertex to a multileader line.
	Remove vertex	Removes a vertex from a multi-leader
	Add Leader	Adds an leader line to a multileader.
	Remove Leader	Removes a leader line from a multi-leader.

Procedures

- Adding vertices to a leader line of a multileader (1.29.13)
- Removing vertices from a leader line of a multileader (1.29.13)
- Adding leader lines to a multileader (1.29.13)
- Removing leader lines from a multileader (1.29.13)

Related Commands

MLeaderEdit (6.21.22) - Adds leader lines to and removes leader lines from a multileader entity.

Figure 6.1594

6.21.24 MLeaderStyle

(6.2981 on page 6079) Creates and manages multileader styles through the Drawing Explorer dialog box.

Accessing the Command

command bar: **mleaderstyle** transparent: **'mleaderstyle** menu bar: **Tools | Drawing Explorer | Multileader Styles** ribbon: **Home | Settings | Drawing Explorer | Multileader Styles Draw | Leaders | Leaders | Multileader Styles** : **MLeaderStyle** Displays the Multileader Style section of the Drawing Explorer dialog box: (6.1595 on the facing page) (6.1596 on the next page)

1. Arrowhead
2. Segment
3. Landing
4. Landing gap
5. Mtext
6. Block

Figure 6.1595

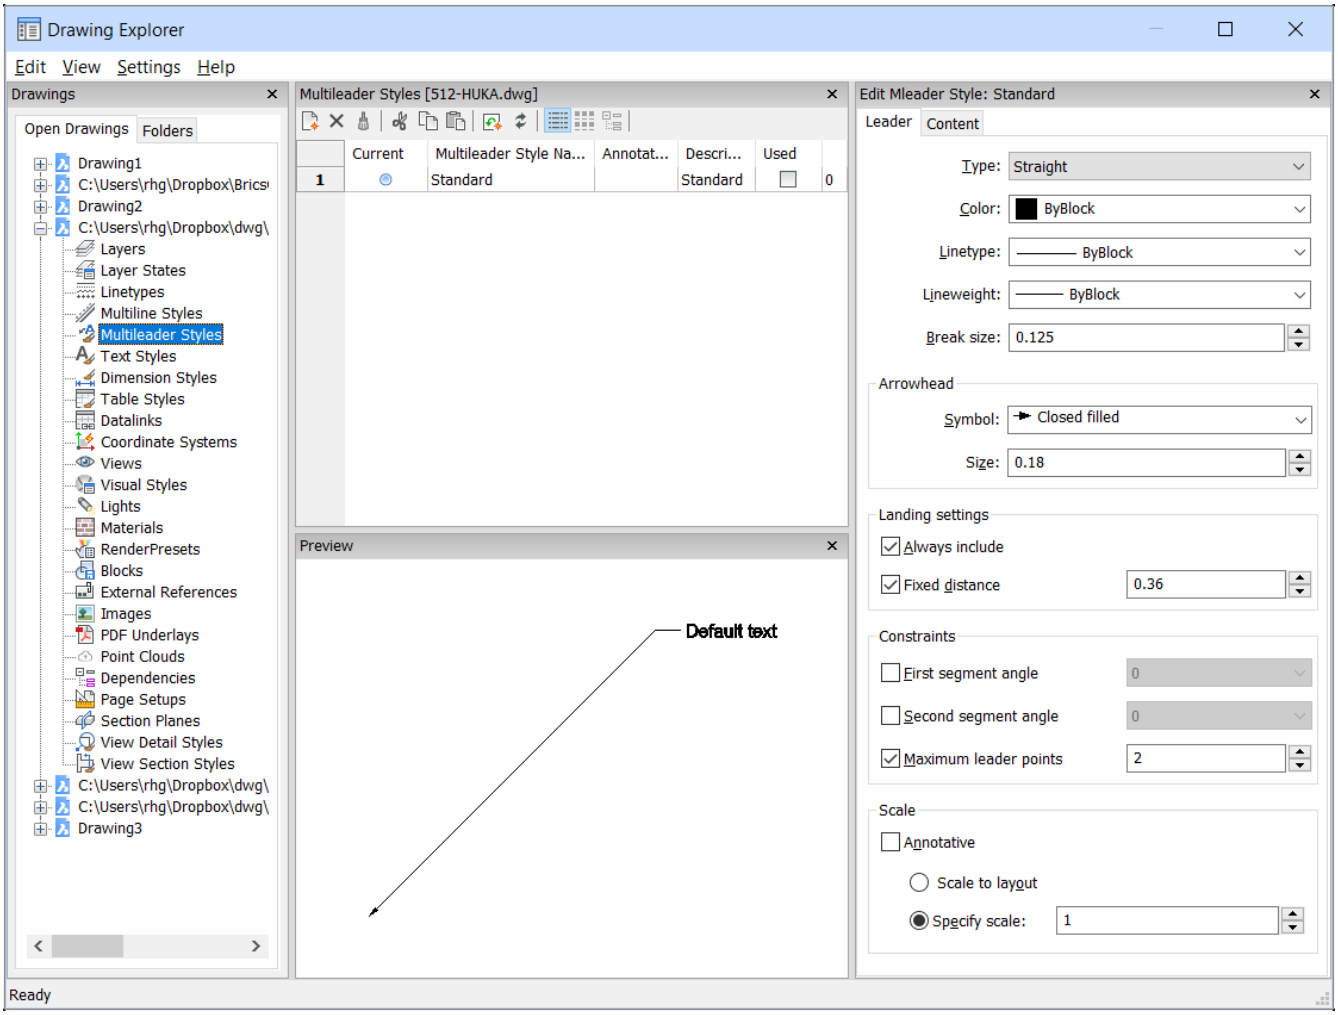

Figure 6.1596

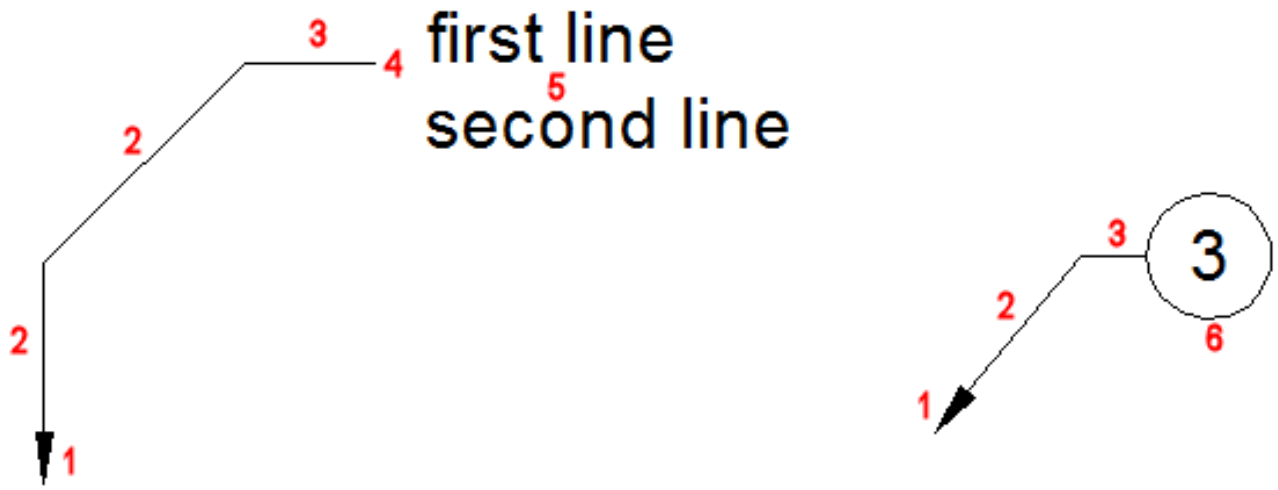

Command Options

Option	Description
 New	Creates a new multileader style; displays a dialog box: (6.1597 on page 4858) 1. Type a name in the **Name** field. 2. (Optional) Select an existing style to create the new one as a copy of it. 3. Click **Create**.
 Delete	Deletes the selected multileader style. You cannot delete the Standard style or a style that is being used by the drawing.

Leader Options	Description
Type	Specifies the default style of the leader line: (6.1598 on page 4858) • **Straight** - the leader is drawn from straight segments • **sPline** - a spline is drawn, using the pick points as the control points • **None** - no leader is drawn
Color	Sets the color for the the leader and the arrowhead: • Choose a color from the droplist • Choose **Select Color** to choose a color from the color dialog box
Linetype	Sets the linetype for the the leader: • Choose a linetype from the droplist • Choose **Load** to choose a linetype from the linetype dialog box
Lineweight	Sets the line weight for the the leader; choose a line weight from the droplist
Break Size	(This option is not yet implemented.) Specifies the width of the break when the DimBreak (6.11.17) command is applied to the multileader is selected.
Arrowhead	Determines the appearance of the leader arrowhead: (6.1599 on page 4858) **Symbol** - select an arrowhead style, or choose • **None** - no arrowhead is drawn • **Select arrow** - displays the Select Custom Arrow Block dialog box, from which you select a block that is in the current drawing: (6.1600 on page 4859) **Size** - type a value to specify the length of the arrowhead (in drawing units) or click the up-down arrows to change the size

Landing Settings	Controls the creation and size of the leader landing: (6.1601 on page 4859) **Always include** - determines if a horizontal segment is drawn between the leader and the content: • **Yes** - the landing is drawn • **No** - the landing is not drawn, the content is placed next to the leader **Size** - type a value to specify the length of the landing (in drawing units) or click the up-down arrows to change the size
Constraints	Determines how the mleader entity is constrained as you draw it: (6.1602 on page 4859) • **First segment angle** - specifies the angles to which the first leader segment is constrained. For example, enter 15, and the leader is constrained to multiples of this angle, such as 0, 15, 30, 45, and so on. Enter 0 for unconstrained leader line • **Second segment angle** - specifies the angles to which the second leader segment is constrained • **Maximum leader points** - when on, specifies the maximum number of leader vertices; minimum is 2
Scale	Controls the scaling of the multileader entity: (6.1603 on page 4859) • **Annotative** - when on, sets the annotative property of the multileader entity • **Scale to layout** - applies a scaling factor relative to model space and paper space viewports, when annotative property is off • **Specify scale** - specifies the overall multileader scale, when annotative property is off

Content Options	**Description**
Content type	Sets the content type of the mleader entity. • **Block** - uses a block; displays options for the block • **Mtext** - uses mtext; displays options for the text • **None** - draws no content and displays no options

Block

Specifies the properties for the block being used as content for the mleader: (6.1604 on page 4860) **Source Block** - choose the name of a block from the droplist **Attachment** - determines where the block is attached to the leader:

- **Center extents** - attaches the leader to the center of the extents of the block
- **Insertion point** - attaches the leader to the block's insertion point (base point)

Color - specifies the color of the block; **(choose an option from the droplist)**:

- **ByBlock** - uses the colors of the block itself
- **ByLayer** - applies the colors of the layer on which the block is located
- **Color** - choose a swatch from the list
- **Select Color** - choose a color from the Color dialog box

Scale - **(type a value to specify the overall size of the block (in drawing units) or click the up-down arrows to change the size.)**

Mtext: Text Options

Determines the appearance of the mtext being used as content for the mleader: (6.1605 on page 4860) **Default text** - specifies the default text that will always be included with the mleader; click the ... button to access the Mtext editor. **Text style** - choose a style name from the droplist; to add more styles to the drawing, use the Style (6.27.55) command or copy them from other drawings with the Drawing Explorer **Text color** - specifies the color of the text; chose an option from the droplist:

- **ByBlock** - uses the colors of the block itself
- **ByLayer** - applies the colors of the layer on which the block is located
- **Color** - choose a swatch from the list
- **Select Color** - choose a color from the Color dialog box

Text angle - specifies the angle of the mtext:

- **Always right reading** - text is always right-side up
- **As inserted** - text remains at the angle at which you inserted
- **Keep horizontal** - text is always kept horizontal (0 degrees)

Text height - sets the height of the text (in drawing units) **Left justify** - when on, forces the mtext to always be left-justified **Frame text** - when on, adds a rectangle around the mtext

Mtext: Leader Connection	Determines how the mtext connects to the leader: (6.1606 on page 4861) **Attachment type** - specifies where the mtext connects to the leader; choosing Horizontal or Vertical presents different attachment droplists: **Horizontal** attachment type offers Left or Right attachments, so that you can specify where the mtext attaches to the leader separately for the right and left sides: • **Left attachment** - **(select an attachment style from the droplist.)** • **Right attachment** - **(select an attachment style from the droplist.)** **Vertical** attachment type offers Center or Overlines attachments, so that you can specify where the mtext attaches to the leader separately for the top and bottom sides: • **Top attachment** - **(choose Center (text is centered on the mline) or Overline and Center (landing line extends over the top of the mtext).)** • **Bottom attachment** - **(choose Center (text is centered under the mline) or Overline and Center (landing line extends underneath the mtext).)** **Landing gap** - defines the distance between the landing line and the mtext; if the Text Frame option is turned on, then the gap is between the Mtext and the text frame. **Extend leader to text** (this option is available only when attachment type is horizontal) - when checked, the landing line goes all the way to the text, rather than stopping at the mtext bounding box.

Procedures

- To create a multileader (1.29.13)
- Adding vertices to a leader line of a multileader (1.29.13)
- Removing vertices from a leader line of a multileader (1.29.13)
- Adding leader lines to a multileader (1.29.13)
- Removing leader lines from a multileader (1.29.13)

Related Commands

MLeader (6.21.19) - creates multileader entities using the current multileader style. MLeaderEdit (6.21.22) - adds leader lines to and removes leader lines from a multileader entity. Explorer (6.13.15) - opens the Drawing Explorer dialog box. BmBalloon (6.8.2) - creates associative balloon entities for assembly components in Model Space and for their generated views in a Paper Space layout. Dimleader (6.11.13) - places leaders with text, blocks, entities, or tolerances. Leader (6.20.21) - places leaders with text, blocks, entities, or tolerances. QLeader (6.25.3) - draws leaders. Lets you specify the properties of the leader through a dialog box and reuse them for a series of leaders.

6.21.25 MLeaderCollect

(6.2981 on page 6079) Collects two or more mutliline leaders into a single leader; works only with mleaders that have blocks as content.

Accessing the Command

Keyboard: **mleadercollect** Menu: **Dimension | Collect Multileader** Toolbar: **Dimension | Collect Multileader** **:MLeaderCollect Prompts you:** Select entities: **(Select at least two multileaders, or else enter all to select all of them in the drawing)** Entities in set: 3 Select entities: **(Select more multileaders, or else press Enter to end entity selection)** Specify collected multileader location or [Vertical/Horizontal/Wrap/Sorting/Collapsing]: **(Pick a point, or else enter an option)** BricssCAD collects the callout blocks to a single leader. Before: (6.1608 on the next page) After: (6.1609 on the facing page)

Figure 6.1608

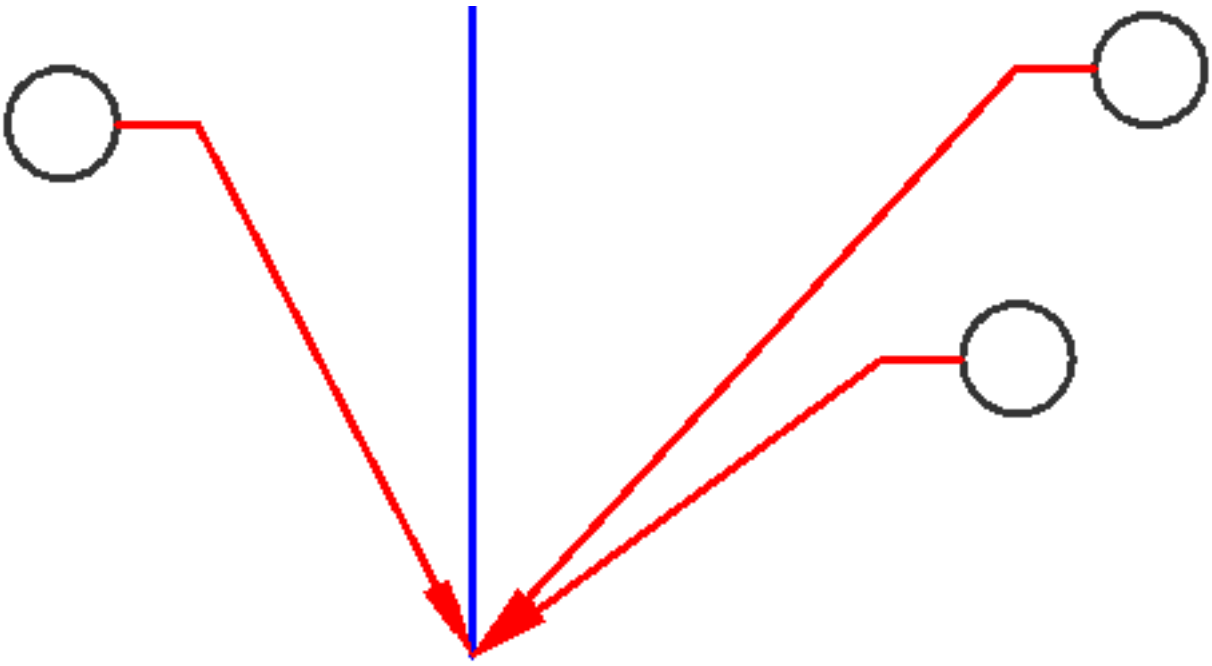

Figure 6.1609

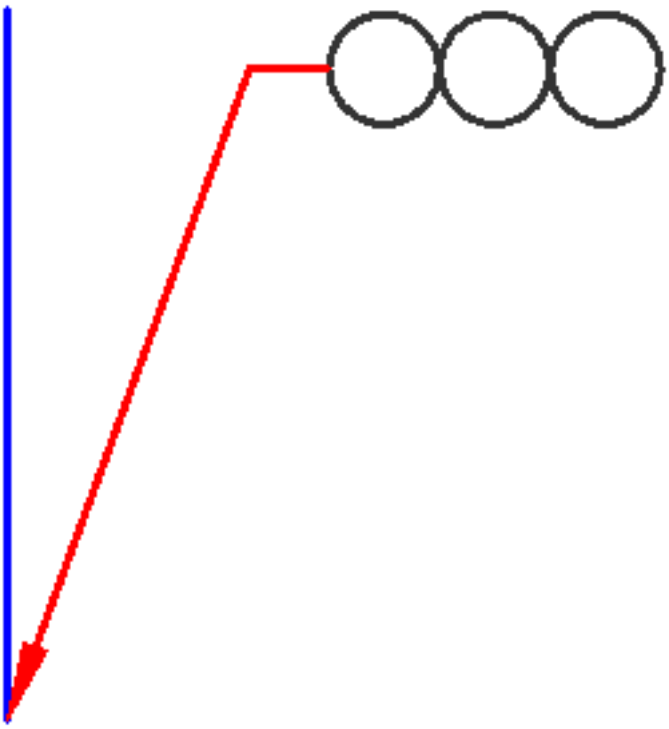


Command Options

Option	Description
Select entities	Select two or more multileaders. Enter **all** to select all of them in the drawing. Press Enter to end entity selection
Specify collected multileader location	Pick at point at which to collect the new multileader
Vertical	Arranges the content blocks vertically
Horizontal	Arranges the content blocks horizontally
Wrap	Arranges the content blocks horizontally to a maximum width, and then places the remainder in the row below
Sorting	Sorts the content by name; prompts you: **Specify mode [None/Ascending/Descending]** - **(enter an option.)** • **None** - does not sort the blocks • **Ascending** - sorts from A to Z • **Descending** - sorts from Z to A
Collapsing	Arranges the content blocks horizontally

Related Commands

MLeader (6.21.19) - draws multiline leaders. MLeaderAlign (6.21.21) - aligns two or multileaders into geometric patterns. MLeaderEdit (6.21.22) - edits multileaders. MLeaderEditExt (6.21.23) - adds and removes leader lines and vertices from multileaders. MLeaderStyle (6.21.24) - creates and edits named styles for multileaders.

Figure 6.1610

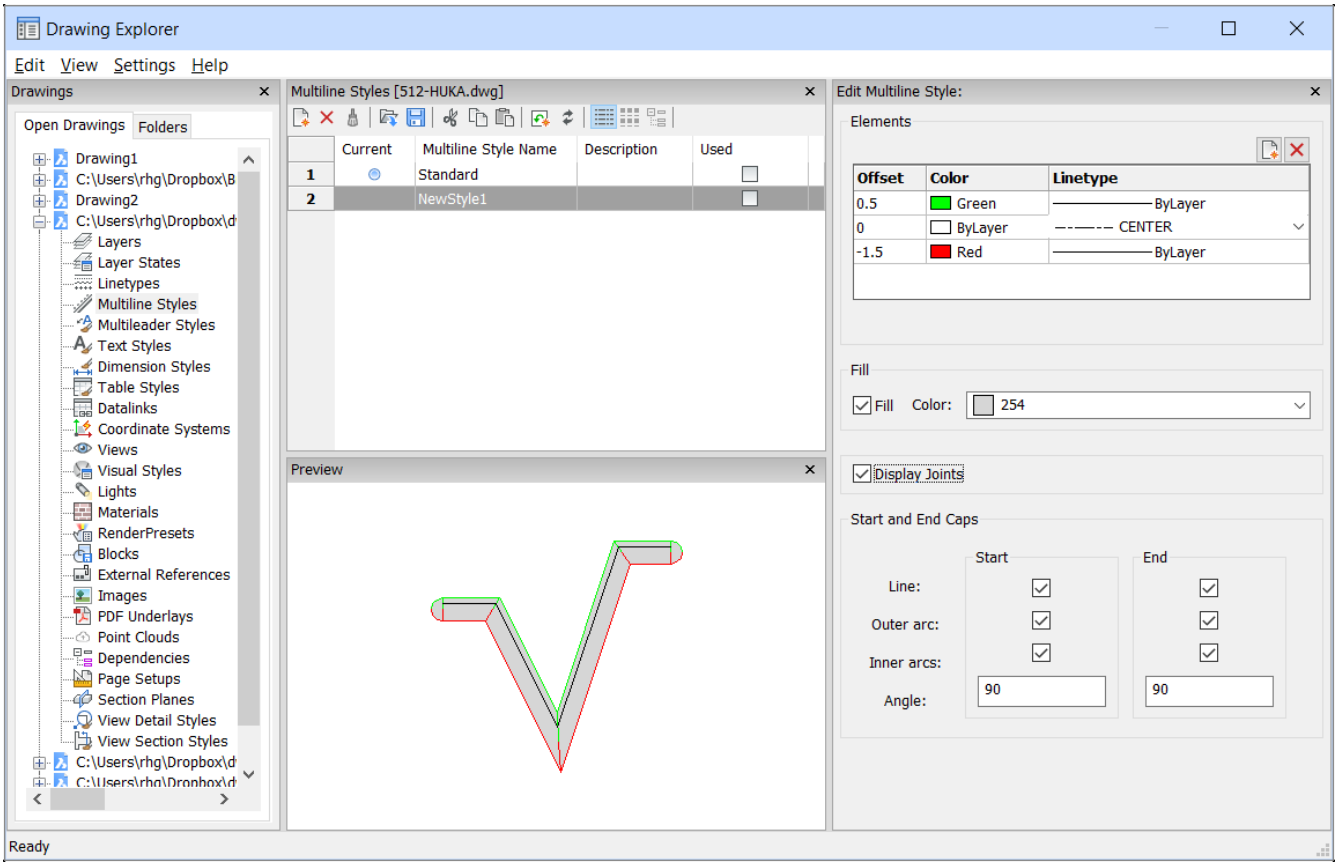
6.21.26 MlStyle

(6.2981 on page 6079) Creates, edits, saves, and removes multiline styles used by the Mline (6.21.33) command.
Note: Some properties defined by this command can be overridden by options in the MLine command.

Accessing the Command

command bar: **mlstyle** transparent: **'mlstyle** menu bar: **Tools | Drawing Explorer | Multiline Styles** ribbon: **Home | Settings | Drawing Explorer | Multiline Styles** : **MlStyle** Displays the Multiline Styles section of the Drawing Explorer dialog box: (6.1611 on the following page)

Figure 6.1611



Command Options

Toolbar Option	Description
New	Creates a new multiline definition; displays a dialog box: (6.1612 on page 4869) 1. Type a name in the Name field. Spaces are not accepted. 2. (Optional) Select an existing multiline style to use as a template for the new style 3. Click **Create** 4. After the New Multiline Style dialog closes, the program adds the new style to the Details pane. (Optional) Type a description in the Description field.
Delete	Deletes the selected style(s). Press and hold the **Ctrl** key to select multiple styles. The 'Standard' style and styles in use cannot be deleted.
Purge	Purges the selected style(s). The 'Standard' style and styles in use cannot be purged.

 Load from mln file	Loads multiline styles from a multiline (*.mln) file; displays a file dialog box: (6.1613 on page 4870) 1. Click **File**. 2. Select an MLN file. 3. Click **Open**. 4. Choose an mline style name in the list. 5. Click **OK**.
 Save to mln file	Saves all multiline styles in the drawing to a multiline (*.mln) file for use by other CAD systems; displays a file dialog box: 1. Enter a name for the file. 2. Click **Save**.

Multiline Styles Options	Description
Current 	The current multline style is marked by the dot. Click the tile in front of a style to make it current.
Multiline Style Names	Lists the names of multiline styles stored in the drawing. To rename it, click on it twice slowly, and then enter the new name.
Description	(Optional) Type a description for the style, such as 'Brick wall'.
Used	Toggles the use of the style in the drawing (this option seems to have no effect): • **Yes** - styles is to be used • **No** - style is not to be used

Edit Multiline Styles Option	Description

 Add	Adds a line to the multiline definition using the default properties: • Offset = 0 drawing units • Color = Bylayer • Linetype = Bylayer Once added, edit the table to change its look: (6.1614 on page 4870) **Offset** - specifies how far each line is from the center line of the mline **Color** - specifies the color of each line: 1. Click the color swatch 2. From the Select Color dialog box, choose a color 3. Click **OK** to close the color dialog box **Linetype** - specifies the linetype for each line: 1. Click the droplist 2. Choose a linetype from the list, or else choose Load to access additional linetypes. As you add elements and change properties, the preview pane shows what the mline now looks like: (6.1615 on page 4871) You must add at least one new style to use this option; the Add button does not work with the Standard style.
 Delete	Erases a line from the multiline definition without warning. You must add at least one new style to use this option; the Delete button does not work with the Standard style.
Fill	When turned on, a solid fill floods the mline between the outer lines: (6.1616 on page 4871) **Color** - choose a color from the droplist, or else choose Select Color for the full palette.
Display joints	When selected, the mline draws joints (diagonal lines) between segments: (6.1617 on page 4871)
Start and End Caps	Closes the end segments of open multilines by a variety of methods: (6.1618 on page 4872) The numbers match the section of the dialog box shown below: (6.1619 on page 4872)

Related Commands

Mline (6.21.33) - creates multilines. Explorer (6.13.15) - opens the Drawing Explorer dialog box.

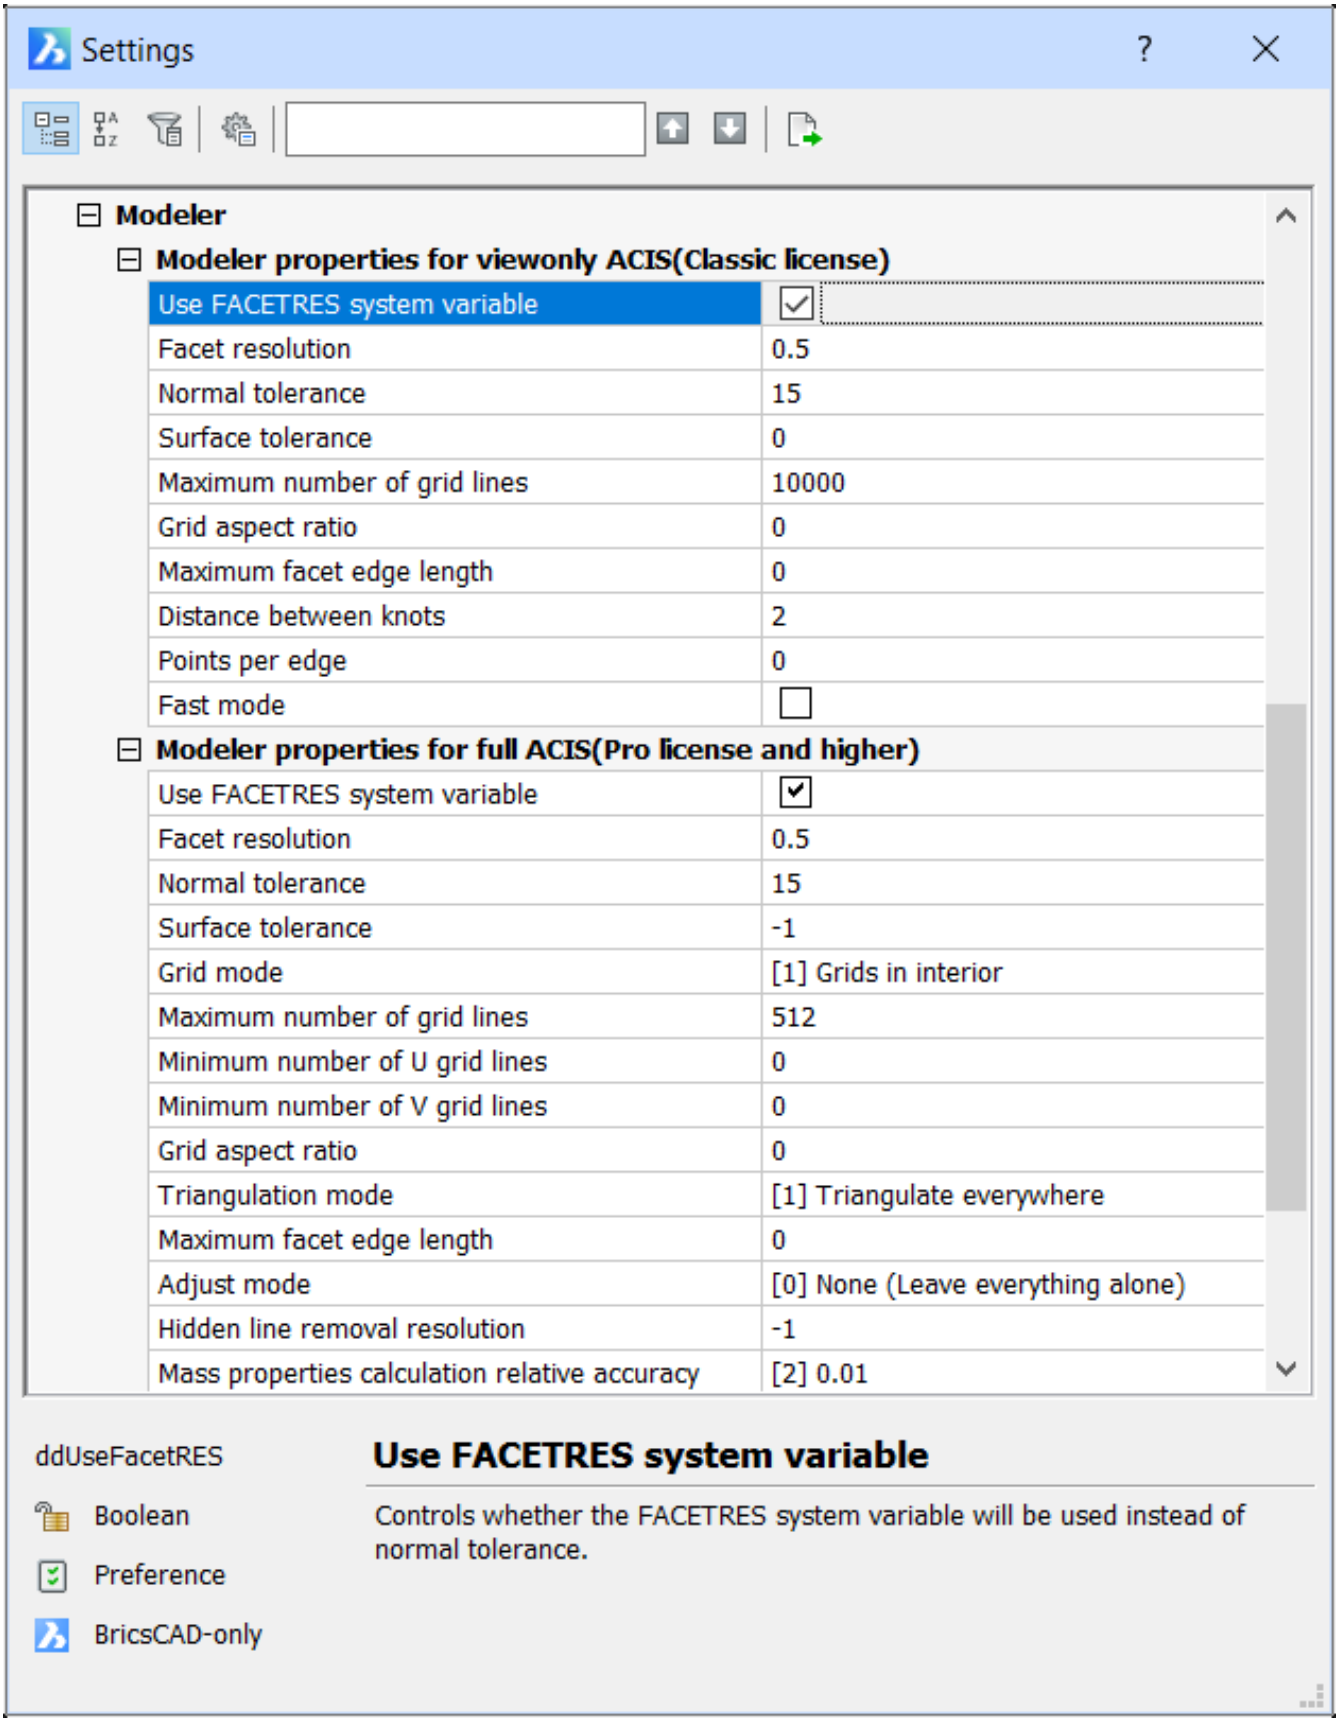
6.21.27 ModelerProperties

(6.2981 on page 6079) Specifies settings for the ACIS modeler through the Settings dialog box. **Note:** There is a separate section for the Classic version of the program, as it does only views ACIS models and cannot create or edit them.

Accessing the Command

command bar: **modelerproperties**
: **ModelerProperties** Displays the Modeler Properties for ACIS section of the Settings dialog box: (6.1621 on the following page)

Figure 6.1621



Command Options

Option	Description
Use FACETRES system variable (editable in Classic)	Toggles the use of the the FACETRES variable: • **0** = do not use Facetres • **1** = use Facetres Sets the ddUseFacetRes variable.
Facet Resolution	Determines how smoothly shaded and rendered objects are displayed; range is 0.01 to 10. Smaller values render more quickly but more coarsely. Sets the FaceTRes variable.
Normal tolerance	Specifies the maximum normal deviation allowed between normals on two adjacent nodes, in degrees. The proper value is usually independent of the model size Sets the spaNormalTol variable; spa is short for "Spatial," the maker of ACIS.
Surface tolerance	Specifies the maximum distance between a facet edge and the true surface; the value is dependent on the model size. Sets the spaSurfaceTol variable.
Grid mode	Controls how grids are used in the meshing process: • **0** - no grids used • **1** - grids used in the interior only • **2** - grids divide model edges • **3** - grids run in one direction only, either u or v Sets the spaGridMode variable.
Maximum number of grid lines	Specifies the maximum number of grid subdivisions to prevent the facet data of a face from getting too large. Sets the spaMaxNumGridLines variable..
Minimum number of U grid lines	Controls the minimum number of U grid lines: at least this number of grid lines are generated in U direction. Sets the spaMinUGridLines variable.
Minimum number of V grid lines	Controls the minimum number of V grid lines: a least this number of grid lines are generated in V direction. Sets the spaMinVGridLines variable..
Grid aspect ratio	Specifies the approximate aspect ratio of each cell in the grid. If the value is close to 1, then the cell is close to a square. This does not guarantee the aspect ration of the facet, which may consist of only part of a cell. Sets the spaGridAspectRatio variable.
Triangulation mode	Identifies which portion of the mesh is to be triangulated: • **0** - no triangulation is performed • **1** - everything is triangulated • **2** - triangulation goes up to boundaries • **3** - first level grids are triangulated • **4** - up to three levels of fringe are triangulated • **5** - up to three levels of fringe are triangulated Sets the spaTriangMode variable.
Maximum facet edge length	Specifies the maximum length of a side of a cell in object space. As a facet can be not larger than the cell, this determines the maximum facet size. Sets the spaMaxFacetEdgeLength variable.

Adjust mode	Determines how triangles are smoothed: • **0** - no adjustments made • **1** - adjusts points surrounded by triangles by moving ndoes in the center of surrounding nodes • **2** - adjusts all grid nodes Sets the spaAdjustMode variable.
Hidden line removal resolution	Specifies the accuracy to be used for mass properties calculations, this number being is the smallest distance taken into consideration during Hidden Line Removal calculations. it is highly recommended to use a negative number: • Acceptable range is from 0.01 to 0.000000000001 (1.e-2 to 1.e-12) • Accuracy is relative to the magnitude of the calculated value. • Negative value employs auto-calibration based on the size of the model • Use a value of 0.001 or smaller when dealing with objects of very small sizes Sets the AcisHlrResolution variable.
Mass Properties Calculation Relative Accuracy	Specifies the relative accuracy required for mass properties calculations. Since the specified accuracy is relative, the calculation result depends on the magnitude of the calculated value. A proper value lies between 1.e-2 and 1.e-12. Sets the MassPropAccuracy variable.

Related Commands

-ModelerProperties (6.21.28) - controls the various settings of the Acis modeler through the command bar.

Figure 6.1622

6.21.28 -ModelerProperties

(6.2981 on page 6079) Specifies settings for the ACIS modeler through the command line. **Note:** The Classic version of the program displays the settings but can only edit the **USe facetres** setting, as it dos not include a full ACIS license.

Accessing the Command

command bar: -**modelerproperties** : -**ModelerProperties Prompts you in the command bar:** [view Properties/USe facetres/Surface tolerance/Normal tolerance/Max grid lines/Edge length/grid aspect Ratio/Adjust mode/Grid mode/Triangulation mode/min U grid lines/min V grid lines/mass properties aCcuracy/eXit]<eXit>: **(Select an option) Note:** This command leaves out the FaceTRes and Hidden Line Accuracy settings found in the Model-Properties (6.21.27) command.

Command Options

Option	Description
view Properties	Reports the value of each variable, such as **FACETRES enabled : Yes Surface tolerance : -1" Normal tolerance : 1'-3" Maximum number of grid lines : 512 Maximum facet edge length : 0" Grid aspect ratio : 0.0000 Adjust mode : None Grid mode : Interior Triangulation mode : All Minimum number of U grid lines : 0 Minimum number of V grid lines : 0**
USe facetres (editable in Classic)	Toggles the use of the the FACETRES variable; prompts you: **Enable FACETRES: [Yes/No] <Yes>** - **(enter a value)**: • **No** = do not use Facetres • **Yes** = use Facetres Sets the ddUseFacetRes variable.
Surface tolerance	Specifies the maximum distance between a facet edge and the true surface; the value is dependent on the model size; prompts you: **Enter surface tolerance: <-1">** - **(enter a value.)** Sets the spaSurfaceTol variable.
Normal tolerance	Specifies the maximum normal deviation allowed between normals on two adjacent nodes, in degrees. The proper value is usually independent of the model size; prompts you: **Enter normal tolerance: <1'-3">** - **(enter a value.)** Sets the spaNormalTol variable; spa is short for "Spatial," the maker of ACIS.
Max grid lines	Specifies the maximum number of grid subdivisions to prevent the facet data of a face from getting too large; prompts you: **Maximum number of grid lines: <512>** - **(enter a value.)** Sets the spaMaxNumGridLines variable.
Edge length	Specifies the maximum length of a side of a cell in object space. As a facet can be not larger than the cell, this determines the maximum facet size; prompts you: **Maximum facet edge length: <0">** - **(enter a value.)** Sets the spaMaxFacetEdgeLength variable.

grid aspect Ratio	Specifies the approximate aspect ratio of each cell in the grid. If the value is close to 1, then the cell is close to a square. This does not guarantee the aspect ration of the facet, which may consist of only part of a cell; prompts you: **Grid aspect ratio: <0.0000>** - **(enter a value.)** Sets the spaGridAspectRatio variable.
Adjust mode	Determines how triangles are smoothed; prompts you: **Enter adjust mode [None/non Grid/All]: <None>** - **(enter a value)**: • **None** - no adjustments made • **non Grid** - adjusts points surrounded by triangles by moving nodes in the center of surrounding nodes • **All** - adjusts all grid nodes Sets the spaAdjustMode variable.
Grid mode	Controls how grids are used in the meshing process; prompts you: **Enter grid mode [None/Interior/to Edges/One direction]: <Interior>** - **(enter a value)**: • **None** - no grids used • **Interiror** - grids used in the interior only • **to Edges** - grids divide model edges • **One direction** - grids run in one direction only, either u or v Sets the spaGridMode variable.
Triangulation mode	Identifies which portion of the mesh is to be triangulated; prompts you: **Enter triangulation mode [None/All/fringe 1/fringe 2/fringe 3/fringe 4]: <All>** - **(enter a value)**: • **None** - no triangulation is performed • **All** - everything is triangulated • **fringe 1** - triangulation goes up to boundaries • **fringe 2** - first level grids are triangulated • **fringe 3** - up to three levels of fringe are triangulated • **fringe 4** - up to three levels of fringe are triangulated Sets the spaTriangMode variable.
min U grid lines	Controls the minimum number of U grid lines: at least this number of grid lines are generated in U direction; prompts you: **Minimum number of U grid lines: <0>** - **(enter a value.)** Sets the spaMinUGridLines variable.
min V grid lines	Controls the minimum number of V grid lines: a least this number of grid lines are generated in V direction; prompts you: **Minimum number of V grid lines: <0>** - **(enter a value.)** Sets the spaMinVGridLines variable..
mass properties aCcuracy	Specifies the relative accuracy required for mass properties calculations. Since the specified accuracy is relative, the calculation result depends on the magnitude of the calculated value. A proper value lies between 1.e-2 and 1.e-12; prompts you: **Mass properties calculation relative accuracy: <3/256">** - **(enter a value.)** Sets the MassPropAccuracy variable.
eXit	Exits the command.

Related Commands

6.21.29 Move

(7.3 on page 6132) Moves entities. (6.1624)

Accessing the Command

command bar: **move** alias: **m** menu bar: **Modify | Move** ribbon: **Change | Arrange | Move** toolbar: **Modify |** : **Move Prompts you in the command bar:** Select entities to move: **(Choose one or more entities)** Entities in set: 1 Select entities to move: **(Choose more entities, or press Enter to continue)** Enter base point [Displacement] <Displacement>: **(Pick a point, enter x,y coordinates, or type D)** Enter second point <Use base point as displacement>: **(Pick another point, or press Enter)**

Command Options

Option	Description
Select entities to move	Specifies the entities to be moved.
Enter base point	Specifies the starting point: • Pick a point in the drawing • Enter x,y,z coordinates The z-coordinate is optional. If not specified, then z = 0. Use entity snap modes to ensure accuracy. To move entities horizontally or vertically, hold down the **Shift** key.
Enter second point	Specifies the destination for the entities: • Pick a point in the drawing • Enter x,y,z coordinates
Displacement	Specifies the displacement vector to move the entities; prompts you: **Enter displacement vector <100,200,0>** - **(enter x,y,z coordinates to specify the displacement vector from the origin of the current UCS (user-defined coordinate system).)** "Vector" is fancy term for distance and angle being specified at the same time.
Use base point as displacement	Uses the x,y,z coordinates of the base point (from the drawing origin of 0,0,0) as the displacement vector.

Procedures

- Using the Move command (1.32.11)
- Moving entities using grips (1.32.11)

Figure 6.1625

6.21.30 MoveGuided

(6.2981 on page 6079) After selecting the entities, their relation to their reference curves will automatically guide you to moving the entities in a similar location. The command can be executed in pre-pick mode : select entities first, then launch the command; or post-pick mode: select entities in the command workflow.

Accessing the Command

Keyboard: **moveguided : moveguided Prompts you:**

If a selection set exists: Select reference curves or [Region select]: **(Select the first reference curves.) Entities in set: 1 Select reference curves or [Region select]: (Select more reference curves, or press Enter.)**

Else: Pick first point of rectangular window or [Polygonal]: **(Specify a point or choose an option.) A selection rectangle displays dynamically.** Selected entities display in yellow; candidate reference curves display in blue. (6.1626) Opposite Corner: **(Specify a point. Make sure the selection rectangle overlaps at least one candidate reference curve entity.)** All entities within the selection window will be moved. Entities crossing the selection window will be used as reference curves. A copy of the selected entities displays dynamically. Blue arrows indicate the anchor points (3) of the reference curves. (6.1627 on the following page) Pick to place entities or [Region]**: (Move the selection over a similar location or choose an option.) The reference curves snap to matching lines under the cursor.** (6.1628 on the next page) **(Move the cursor to the other side of the reference curves to mirror the selection set.)**
(6.1629 on the following page) **(Click to place the entities or type a distance in the dynamic entry fields. Press the TAB key to jump to the other field. Press Enter to confirm the distance.)** (6.1630 on page 4883)

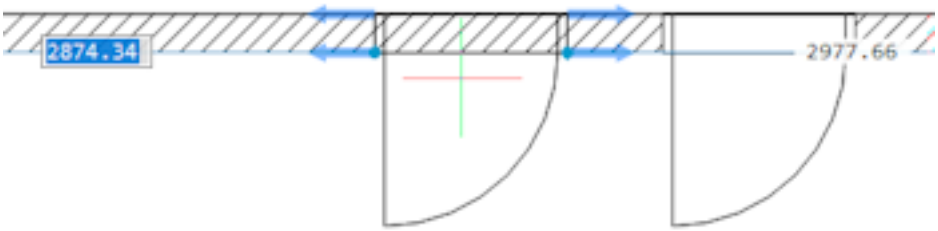

Figure 6.1629

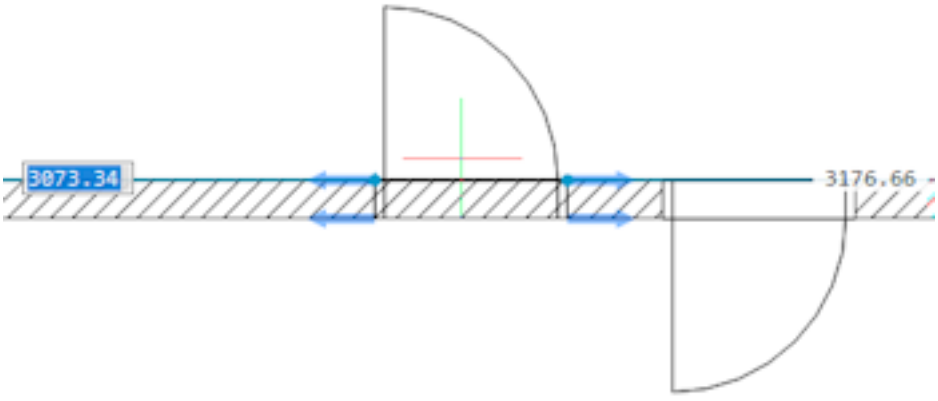

Figure 6.1630

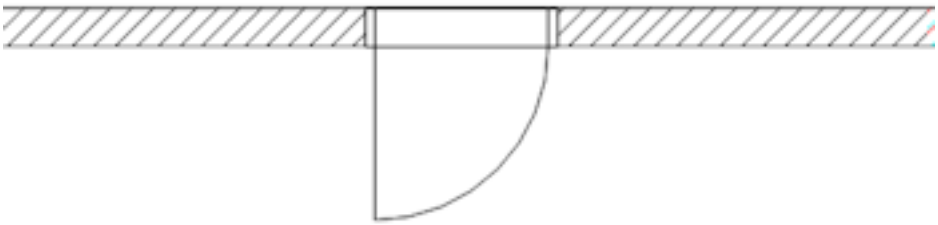


Command Options

Option	Description
Rectangle	Creates a rectangular selection window. Prompts you to specify two opposite points of the selection rectangle.
Polygon	Creates a polygonal selection window. Prompts you to specify multiple points to define the selection polygon. Press Enter or right click to stop adding points.
Entities	Pastes the entities inside the selection window.
Region	Pastes the clipped area inside the selection window.

Related Commands

CopyGuided (6.9.50) - makes copies entities using reference geometry

Figure 6.1631

6.21.31 MSlide

(6.2981 on page 6079) Creates slides (just like a screen grab) of the current drawing (short for "make slide") and then saves them to disc in these formats:

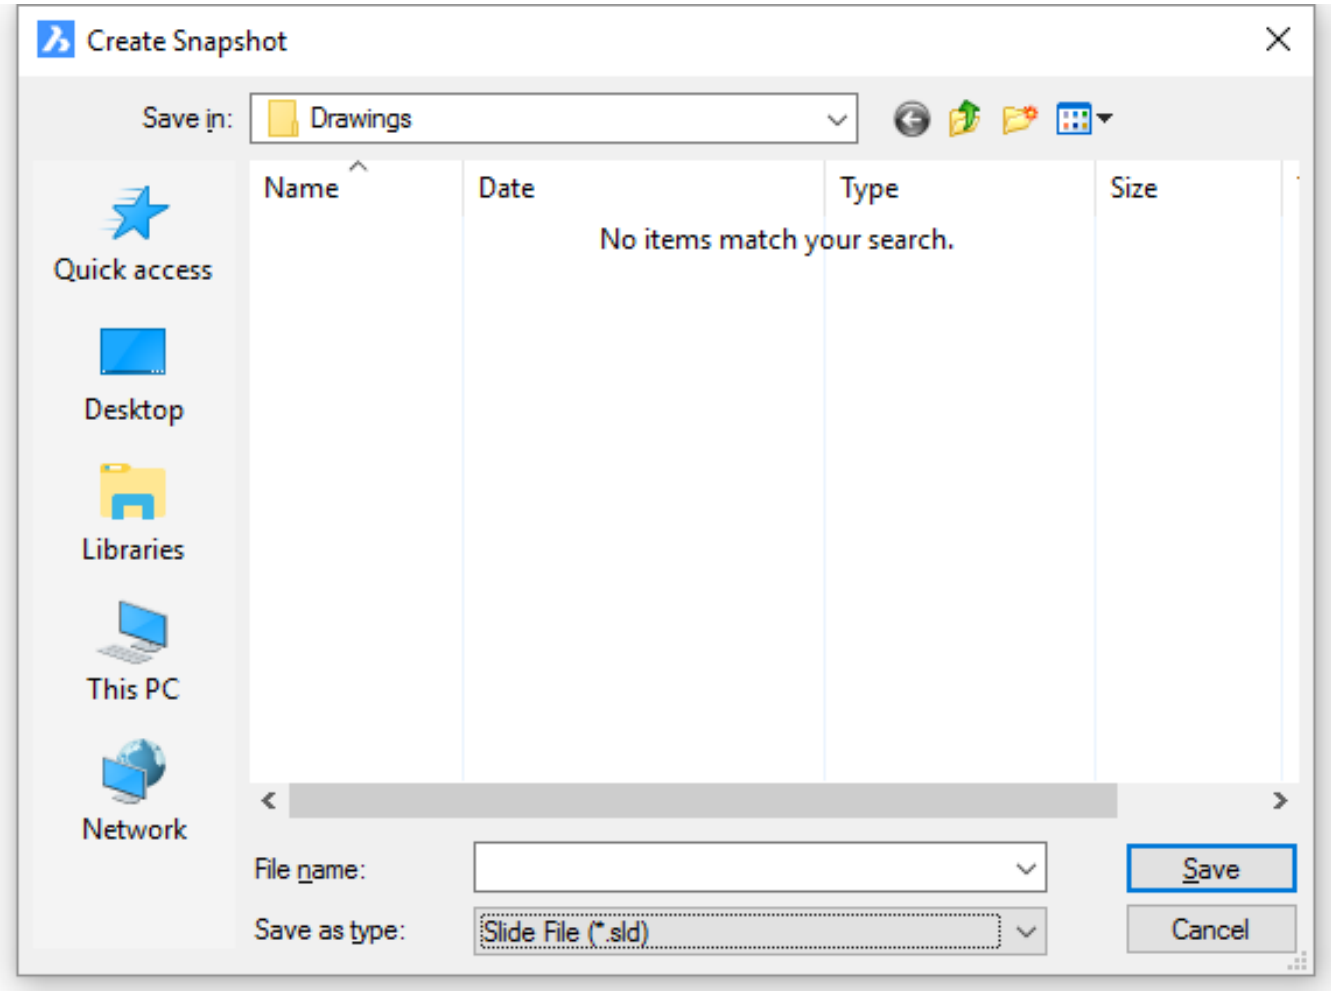
- **SLD** - compatible with other CAD programs
- **EMF** - enhanced WMF format
- **WMF** - Windows meta format

Notes: This command on Linux exports only to the Slide File (*.sld) format. To view slide files made with this command, use the VSlide (6.31.24) command.

Accessing the Command

command bar: **mslide** alias: **msnapshot** menu bar: **Tools | Make Snapshot** ribbon: **Tools | Action Recorder | Make Snapshot** toolbar: **Tools |** : **MSlide** Displays a dialog box: (6.1632 on the next page) Enter a file name, choose a format, and then click **Save**.

Figure 6.1632



Command Options

Option	Description
File name	Specifies the name of the slide (snapshot).
Save as type	Specifies the file format: • **SLD** - compatible with other CAD programs • **EMF** - enhanced WMF format • **WMF** - Windows meta format
Save	Saves the slide file.

Related Commands

VSlide (6.31.24) - views WMF, EMF, and SLD files. BmpOut (6.6.20) - exports drawings in BMP format. Export (6.13.18) - exports drawings in BMP, DWF, DXF, DWT, PDF, WMF, EMF, SLD, and older DWG formats. WmfOut (6.33.12) - exports drawings in WMF, EMF, and SLD formats.

6.21.32 MSpace

(6.2981 on page 6079) Switch from paper space to model space viewport in a layout tab. **Note:** This command operates only when a layout tab is in paper space mode. (6.1634)

Accessing the Command

command bar: **mspace** shortcut: **double-click inside the viewport** alias: **ms** status bar: **P.Layout** : **MSpace** Displays no prompt in the command bar. To reverse the action of this command, use the PSpace (6.24.59) command, or else double-click outside the viewport border.

Command Options

No options.

Status Bar Menu

Right-click M:Layout on the status bar for the shortcut menu: (6.1635 on page 4889) (6.1636 on page 4889)

Shortcut Menu	Description
Paper Space	Switches to paper space in the current layout.
Model Space	Switches to model space in the current layout.

Layout1	Switches the drawing editor to Layout1.
Model	Switches the drawing editor to Layout1.
Layout2	Switches the drawing editor to Layout2. When the drawing contains other layouts, they are also listed in the shortcut menu.

Figure 6.1635

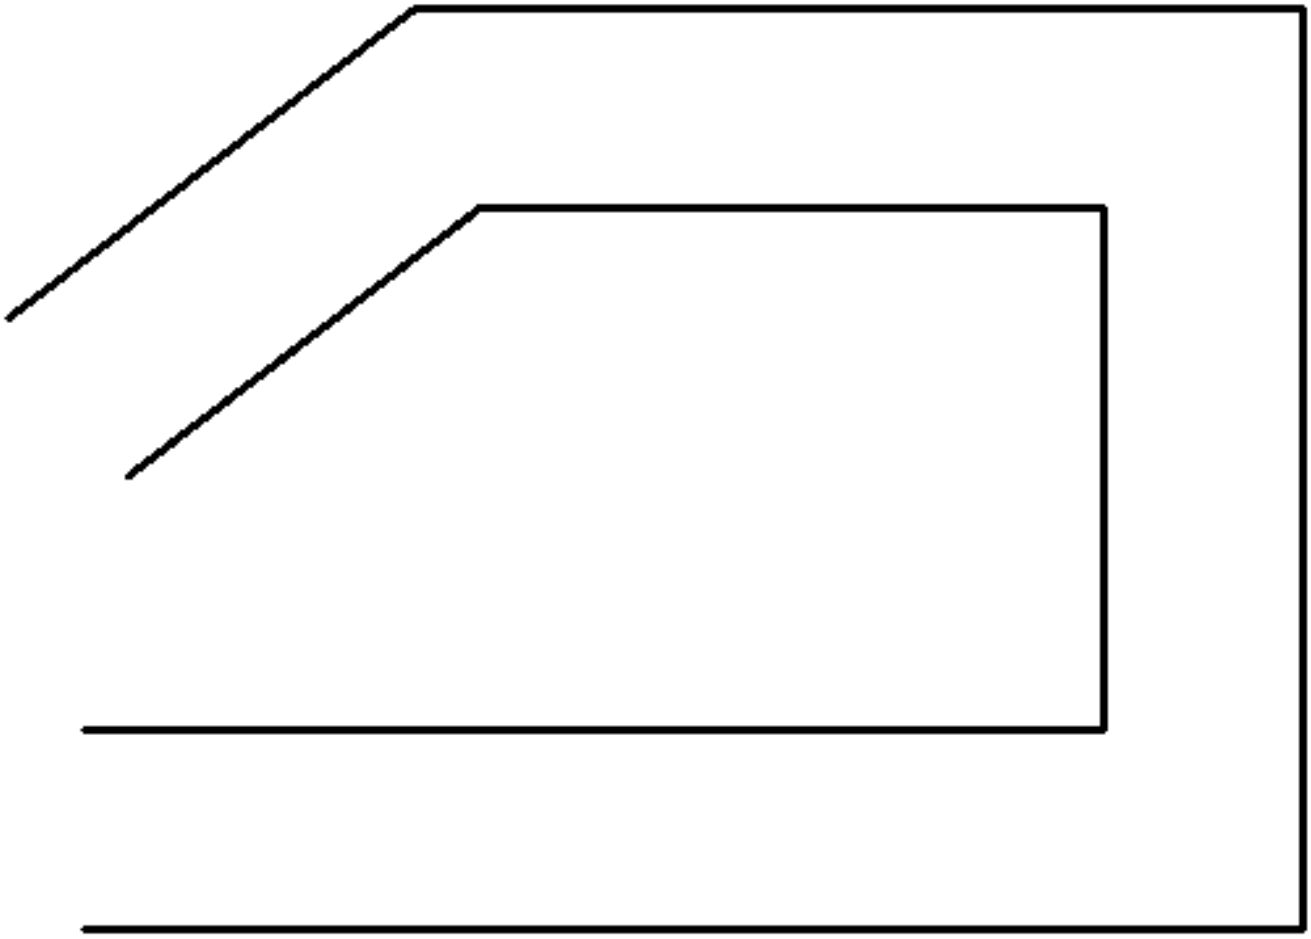
Related Commands

ChSpace (6.9.13) - Moves entities from paper space to model space and vice versa. MView (6.21.37) - creates viewports in paper space. VpClip (6.31.18) - clips viewports. PSpace (6.24.59) - switches to paper space. VPorts (6.31.26) - creates viewports in model space. RedrawAll (6.26.10) - redraws all viewports. RegenAll (6.26.24) - regenerates the drawing in all viewports. Zoom (6.35.7) - utilizes the XP option to specify the zoom factor in paper space relative to model space.

Figure 6.1637

Figure 6.1638



6.21.33 MLine

(6.2981 on page 6079) Draws multilines made of two or more parallel lines, according to the style specified by the MlStyle (6.21.26) command. (6.1638)

Accessing the Command

command bar: **mline** alias: **ml** menu bar: **Draw | Multiline** ribbon: **Draw | Draw | Line | Multiline** toolbar: **Draw | Lines | Multiline** : **MLine Prompts you in the command bar:** Start of line or [Justification/Scale/STyle/Follow] <Last point>**: (Pick a point in the drawing, or enter x,y,z coordinates, or else choose an option)** Set end point or [Angle/Length/Undo]: **(Pick another point, or choose an option)** Set end point or [Angle/Length/Follow/Undo]**: (Pick another point, or choose an option)** Set end point or [Angle/Length/Follow/Close/Undo]: **(Pick another point, choose an option, or else press Enter to stop)**

Command Options

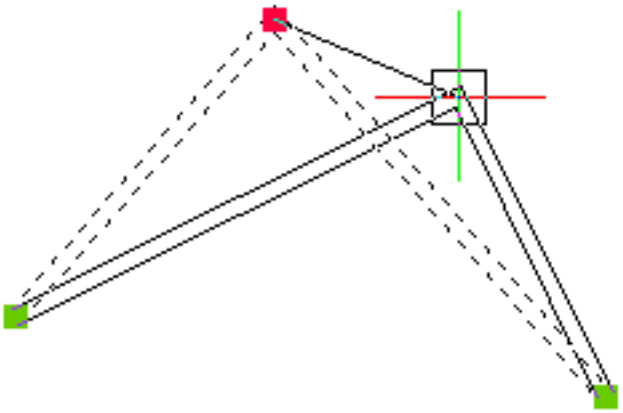
Option	Description
Start of line	Specifies the starting point of the first multiline segment; the mline segment does not appear until you click the next point.

Last point	Press **Enter** to use the most recently specified point; this prompt is not seen when this command is first used in a drawing.
Justification	Specify the justification of the multiline relative to the point you pick; prompts you: **Enter MLine justification type [Top/Zero/Bottom] <Top>** - **(enter an option)**: • **Top** - the top of the multiline passes through the points you pick • **Zero** - the center of the multiline passes through the points you pick • **Bottom** - the bottom of the multiline passes through the points you pick The justification is saved in the CMLJUST (1.17.10) variable.
Scale	Specifies the overall scale of the multiline' prompts you: **Enter MLine scale <1.00>** - **(type a scale factor.)** The scale is saved in the CMLSCALE (1.17.10) variable.
Style	Select the style to use for the multiline, as defined by the MlStyle (6.21.26) command; prompts you: **Enter MLine style name [? to list available styles]** - **(enter the name of a saved multiline style or else type ? to see a list of available styles.)** The current style is saved in the CMLSTYLE (1.17.10) variable.
Follow	Uses the endpoint of the previously drawn multiline, polyline, line or arc as the start point for the next mline segment. The segment is drawn at the same angle of the previous line, multiline or polyline segment or tangent in case of an arc or polyline arc segment.
End point	Specifies the endpoint of the mline segment; this prompt repeats until you press **Enter** to end the command.
Angle	Draws the mline segment at an angle and distance that you specify; prompts you: 1. **Angle of line** - **(specify the angle (measured counter-clockwise from the positive x-axis).)** 2. **Length of line** - **(specify the length of the segment.)**
Length	Draws the segment at a distance and angle that you specify; prompts you: 1. **Length of line** - **(specify the length of the segment.)** 2. **Angle of line** - **(specify the angle (measured counterclockwise from the positive x-axis).)**
Undo	Undoes (erases) the last segment.
Close	Closes the "polygon" by drawing an mline segment between the current endpoint and the first start point.

Grips Editing

1. Select the multiline. Notice that it has two or more grips: at the start and endpoint and at each vertex.
2. Drag a grip to stretch the multiline segment(s).

Figure 6.1639



(6.1639)

Related Commands

MlStyle (6.21.26) - creates and edits multiline styles. Line (6.20.31) - draws line segments. PLine (6.24.27) - draws connected lines and arcs.

Figure 6.1640

6.21.34 MvSetup

(6.2981 on page 6079) Creates multiple paper space viewports, and then aligns, rotates and scales them (short for "multiple viewports setup"). **Note:** This command operates differently, depending on whether it starts in Model tab or a layout tab.

Accessing the Command

command bar: **mvsetup** transparent: **'mvsetup** : **MvSetup When in model space, prompts you in the command bar.** Enable paper space? [No/Yes] <Yes>: **(Enter N to stay in Model tab; pressing Y switches to to the most recently used layout and the carries on with the paper space prompts; see below)** Enter units type [Scientific/Decimal/Engineering/Architectural/Metric]: **(Choose a unit type)** Example of Metric scales: 10 is 1:10 Enter scale: **(Enter a number that represents the scale factor)** Enter paper width: **(Type the paper width in drawing units)** Enter paper height: **(Type the paper height in drawing units)** Draws a rectangle representing the paper sheet with at the specified scale, with the lower left corner at the origin of the current coordinate system. **When in paper space, prompts you in the command bar.** Enter an option [Align/Create/Scale viewports/Undo]: **(Enter an option)**

Command Options

Paper Space Option	Description
Align	Pans the display in a viewport to align it with a base point in a reference viewport; prompts you: **Enter an option [Angled/Horizontal alignment/Vertical alignment/Rotate view/Undo]** - **(enter an option.)** Depending on the relative position of the two viewports, the display of the panned viewport might be shifted outside of the viewport boundary.
Angled	Pans the view in the second viewport is panned over the specified distance and angle. 1. **Specify basepoint** - **(pick a point in the reference viewport.)** 2. **Specify point in viewport to be panned** - **(pick a point, which will be used as the anchor point.)** 3. **Specify offset distance from base** - **(specify the desired distance between the basepoint and the anchor point. Either type the distance or pick two points.)** 4. **Specify angle from base** - **(specify the desired angle of the line between the basepoint and the anchor point. Either type the angle or pick two points.)**
Horizontal	Pans the view in the second viewport vertically to align the base point and the anchor point horizontally; prompts you: 1. **Specify basepoint** - **(pick a point in the reference viewport.)** 2. **Specify point in viewport to be panned** - **(pick a point, which will be used as the anchor point.)**

Vertical	Pans the view in the second viewport horizontally to align the base point and the anchor point vertically; prompts you: 1. **Specify basepoint - (pick a point in the reference viewport.)** 2. **Specify point in viewport to be panned - (pick a point, which will be used as the anchor point.)**
Rotate view	Rotates the view in the viewport by the specified angle; prompts you: 1. **Specify basepoint in the viewport to be rotated - (pick a point to define the basepoint of the rotation.)** 2. **Specify rotation angle - (enter a rotation angle or pick a second point.)** When the VPROTATEASSOC variable is on, the display in a viewport is rotated if you rotate the viewport.
Undo	Undoes the previous alignment action and returns to the alignment options prompt.
Create	Creates viewports in the current layout; prompts you: **Enter an option [Delete objects/Create viewports/Undo] <Create viewports> - (enter an option.)**
Delete entities	Deletes viewport entities; prompts you: **Select entities - (select the viewports you want to delete.)**

Create Viewports	Creates new viewports; prompts you: **Enter choice for layout options <0-3> [None/Single/Std. Engineering/Array of viewports] <0> - (enter an option)**: • **0 (None)** - makes no viewports • **1 (Single)** - makes a single viewport; prompts you: 1. **Specify first corner of bounding area for viewport(s) - (pick a point.)** 2. **Other corner of rectangle - (pick a point.)** • **2 (Std Engineering)** - makes four viewports preset to top, front, right and south-east isometric viewpoints; prompts you: (6.1641 on page 4897) 1. **Specify first corner of bounding area for viewport(s) - (pick a point.)** 2. **Other corner of rectangle - (pick a point.)** 3. **Specify distance between viewports in X direction <0.000> - (enter a horizontal spacing distance between viewports.)** 4. **Specify distance between viewports in Y direction <0.000> - (enter a vertical spacing distance between viewports.)** • **3 (Array of viewports)** - creates the number of viewports that you want; prompts you: 1. **Specify first corner of bounding area for viewport(s) - (pick a point.)** 2. **Other corner of rectangle - (pick another point.)** 3. **Enter number of viewports in X direction <1> - (type the number of viewports you want placed across the drawing horizontally.)** 4. **Enter number of viewports in Y direction <1> - (type the number of viewports you want vertically.)** 5. **Specify distance between viewports in X direction <0.000> - (enter a horizontal spacing distance between viewports.)** 6. **Specify distance between viewports in Y direction <0.000> - (enter a vertical spacing distance between viewports.)**
Undo	Undoes the creation of viewports.

Scale Viewports	Specifies the scaling inside viewports; prompts you: 1. **Select entities - (select the viewport entities you want to scale.) Entities in set: 20** 2. **Select entities - (select more viewports, or press Enter to stop selecting viewports.)** 3. **Set the scaling mode of viewports: Interactively/<Uniform> - (press Enter to scale all viewports equally, or else choose Interactively to set the scale for each viewport separately.)** 4. **Enter the number of paper space units <1.0> - (enter a number.)** 5. **Enter the number of model space units <1.0> - (enter a number.)**
Undo	Undoes all operations executed by the current MvSetup command session.

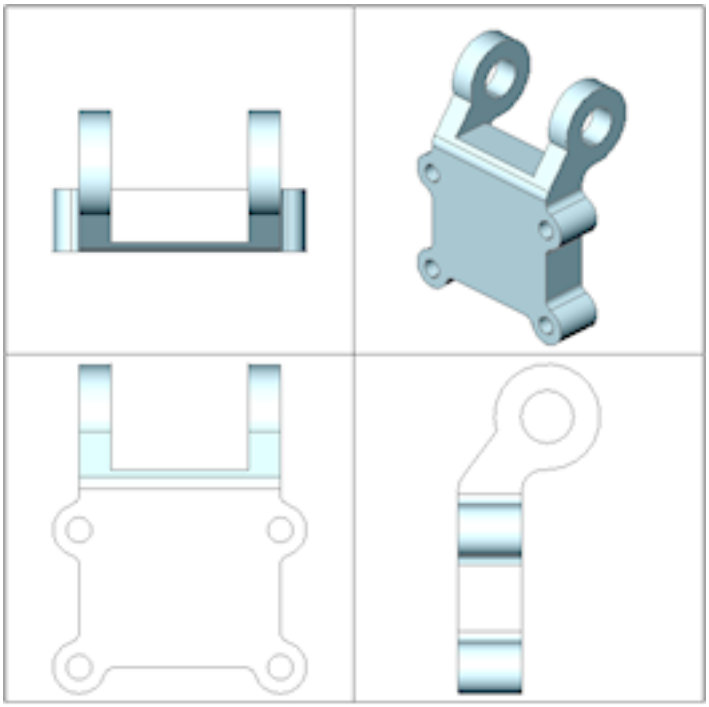
Procedures

- Creating an array of layout viewports (1.23.16)
- Setting the scale of a selection of viewports (1.23.16)
- To rotate the display in a viewport (1.23.16)
- To align viewports (1.23.16)

Related Commands

AlignSpace (6.4.10) - adjusts viewport angle, zoom factor and pan position based on alignment points specified in model space and paper space. MView (6.21.37) - creates one or more viewports in layout tabs. MSpace (6.21.32) - switches to model space. PSpace (6.24.59) - switches to paper space. VpClip (6.31.18) - clips viewports. VPorts (6.31.26) - creates viewports in model space. RedrawAll (6.26.10) - redraws all viewports. RegenAll (6.26.24) - regenerates the drawing in all viewports. Zoom (6.35.7) - utilizes the XP option to specify the zoom factor in paper space relative to model space.

Figure 6.1641



6.21.35 Mtp

   Allows to specify a point as the midpoint between two points whenever a command prompts to enter a point (transparent command).

Accessing the Command

transparent: **mtp** alias: **m2p** toolbar : **Entity Snaps**  **: Mtp Prompts you in the command bar:** First point of mid: (Identify the first reference point) Second point of mid: (Identify the second reference point)

Command Options

None

Related Commands

OSnap (6.23.16) - toggles entity snap modes in the Settings dialog box. -OSnap (6.23.13) - toggles entity snap modes in the command bar. Aperture (6.4.14) - sizes the aperture cursor for entity snaps. 3dIntersection (6.3.7) - toggles intersection snap mode. Apparent (6.4.16) - toggles apparent intersection snap mode. Center (6.9.3) - toggles center snap mode. Endpoint (6.13.7) - toggles endpoint snap mode. Extension (6.13.22) - toggles extension snap mode. From (6.14.13) - allows to enter relative coordinates with respect to a reference point. GCenter (6.15.5) - toggles Geometric Center (GCenter) entity snap. Insertion (6.17.18) - toggles insertion snap mode. Intersection (6.17.19) - toggles intersection snap mode. Midpoint (6.21.16) - toggles midpoint snap mode. Nearest (6.22.2) - toggles nearest snap mode. Node (6.22.7) - toggles node (point) snap mode. None (6.22.8) - turns off all entity snap modes. Parallel (6.24.5) - toggles parallel snap mode. Perpendicular (6.24.25) - toggles perpendicular snap mode. Quadrant (6.25.7) - toggles quadrant snap mode. Tangent (6.29.10) - toggles tangent snap mode.

Figure 6.1642

6.21.36 Multiple

(6.2981 on page 6079) Repeats commands until you press **Esc**. **Note:** This command is useful for commands that do not repeat automatically.

Accessing the Command

command bar: **multiple** transparent: **'multiple** : **Multiple Prompts you in the command bar:** Enter command name to repeat: **(Enter the name of a command)** The command is executed and then repeated until you press Esc.

Command Options

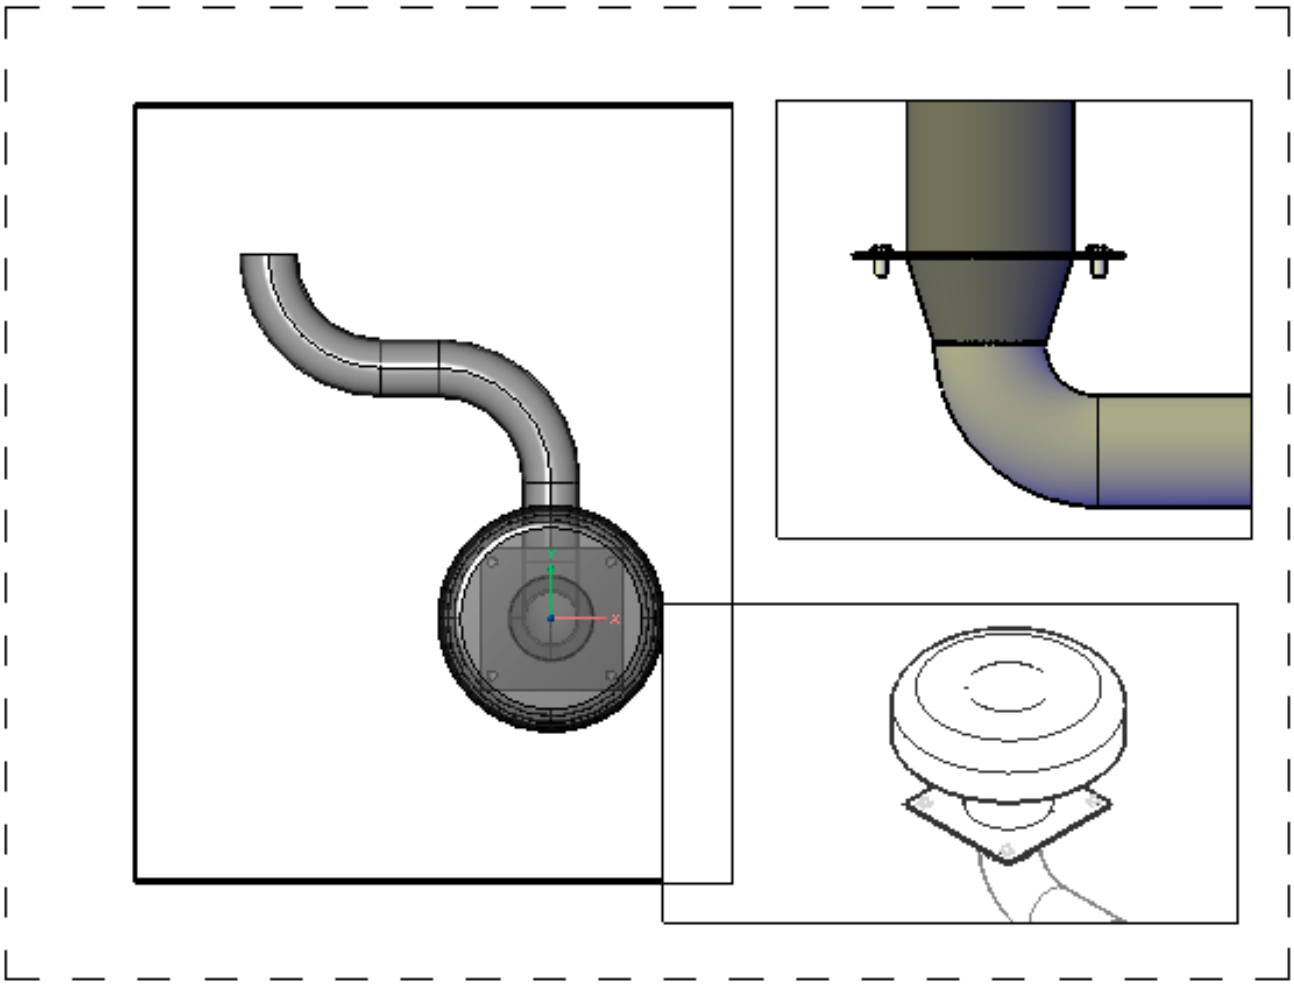
Option	Description
Enter command name to repeat	Enter the name of a command. The command is executed, and then repeated until you press **Esc**.

Related Commands

All.

Figure 6.1643

Figure 6.1644



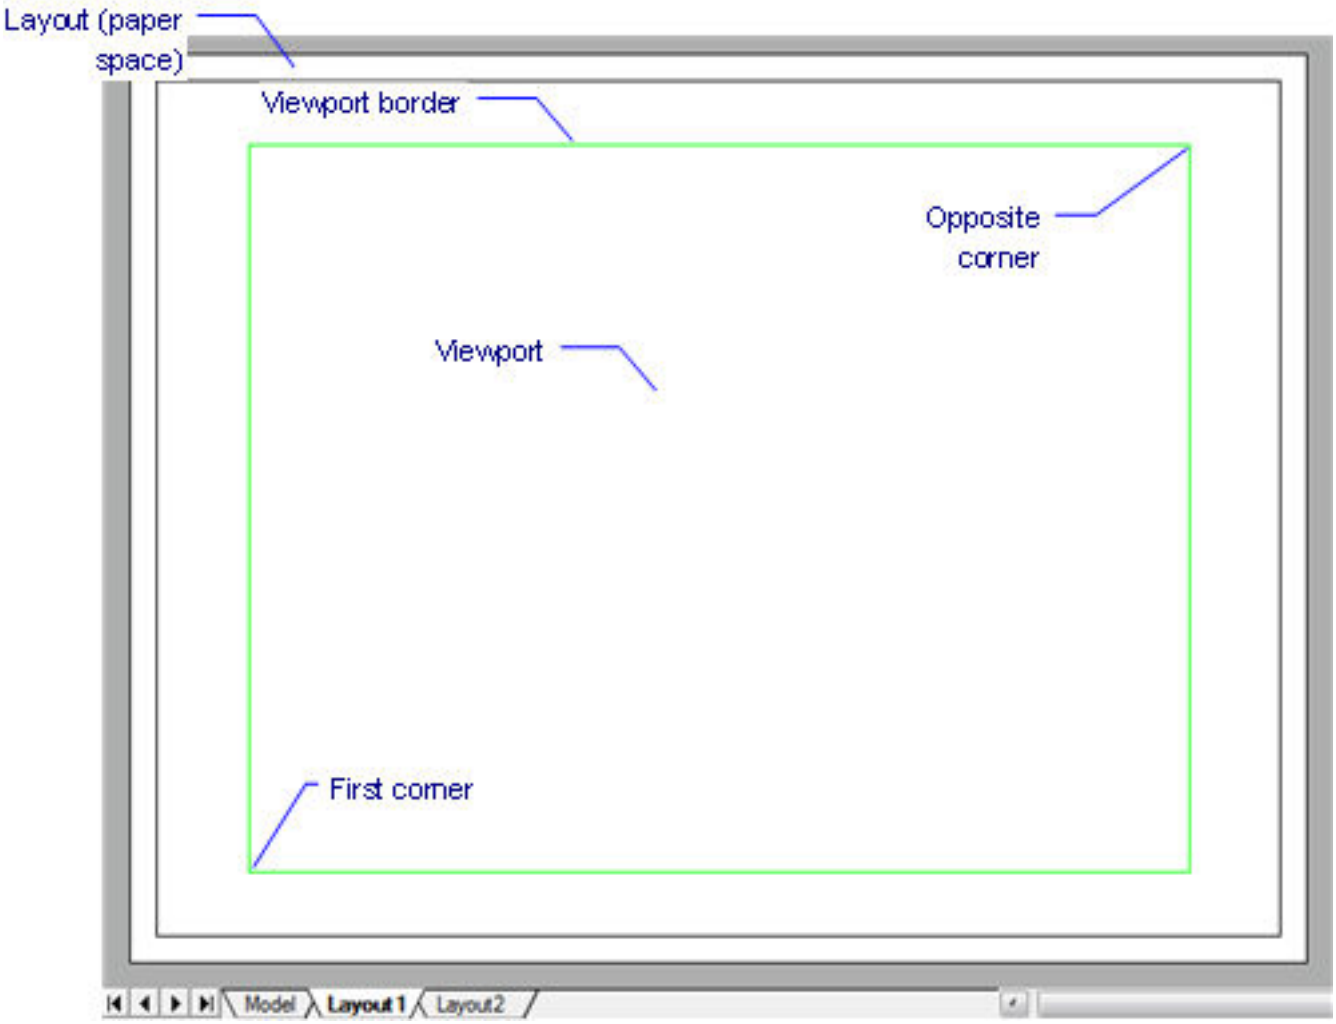
6.21.37 MView

(6.2981 on page 6079) Creates one or more viewports in layout tabs (short for "make viewports") to display entities drawn in Model tab. Each viewport can have its own settings, shown below. **Note:** This command is for making viewports in layout tabs. To create viewports in Model tab, use the VPorts (6.31.26) command. (6.1644)

Accessing the Command

 command bar: **mview** alias: **mv** menu bar: **View | Paper Space Views** ribbon: **View | View | Paper Space Views** toolbar: **View |**  : **MView Prompts you in the command bar:** Viewports: Set first corner or [ON/OFf/Lock/Fit/create 2 viewports/create 3 viewports/create 4 viewports/Object/Polygonal]: **(Pick a point, or enter an option) Opposite corner:** (Pick another point.) (6.1645 on the facing page)

Figure 6.1645



Command Options

Option	Description
First corner	Specifies one corner for a new, rectangular viewport. Pick a point, or enter x,y coordinates.
Opposite corner	Specifies the other corner for a new viewport.
ON	Turns on viewports that are turned off; prompts you: **Select viewports to turn on** - **(choose one or more viewports.)**
OFF	Turns off viewports; prompts you: **Select viewports to turn off** - **(choose one or more viewports.)** This option hides the content of the viewport; the viewport border remains visible. To hide the viewport border, place it on a separate layer, and then freeze the layer.
Lock	Locks the viewport's scale factor, relative to model space; prompts you: **Viewport locking [ON/OFf] <On>** - **(type ON or OFF.)** • **ON** - locks the viewport's scale factor • **OFf** - unlocks the viewport's scale factor Set the scale factor with the Zoom (6.35.7) command's XP option.
Fit	Draws a rectangular viewport that fits the current layout. (6.1646 on page 4904)
2	Draws two rectangular viewports; prompts you: 1. **Two viewports [Horizontal/Vertical] <Vertical>** - **(enter an option.)** 2. **First corner of bounding rectangle or [Fit (6.21.37)]** - **(pick a point or choose the Fit option)** 3. **Opposite corner** - **(Pick a point.)**
Horizontal	Draws two horizontal viewports of equal size: (6.2854 on page 5954)
Vertical	Draws two vertical viewports of equal size: (6.2855 on page 5954)
3	Draws three rectangular viewports; prompts you: 1. **Three viewports [Horizontal/Vertical/Above/Below/Left/Right] <Right>** - **(enter an option.)** 2. **First corner of bounding rectangle or [Fit (6.21.37)]** - **(Pick a point or choose the Fit option.)** 3. **Opposite corner** - **(Pick a point.)**
Horizontal	Draws three horizontal viewports of equal size: (6.2856 on page 5954)
Vertical	Draws three vertical viewports of equal size: (6.2857 on page 5955)
Above	Draws one viewport above two side-by-side viewports. (6.1651 on page 4905)
Below	Draws two side-by-side viewports above one viewport. (6.2859 on page 5955)

Left	Draws one viewport to the left of two stacked viewports. (6.2860 on page 5955)
Right	Draws one viewport to the right of two stacked viewports. (6.2861 on page 5956)
4	Draws four rectangular viewports of equal size; prompts you: 1. **First corner of bounding rectangle or [Fit (6.21.37)] - (Pick a point or choose the Fit option.)** 2. **Opposite corner - (Pick a point.)** (6.2862 on page 5956)
Object	Converts an object into a viewport border; prompts you: **Select an object to clip viewport - (specifies a closed object.)** The viewport is traced over the object; the original object remains in the drawing. This option is useful for ensuring a viewport border precisely matches an outline. (6.1656 on page 4907)
Polygonal	Draws non-rectangular viewports made of lines and arcs; prompts you: 1. **Specify start point - (specifiy the starting point for the polygon.)** 2. **Set next point or [draw Arcs/Distance/Follow] - (specify a point, or enter an option.)** 3. **Set next point or [draw Arcs/Distance/Follow/Undo] - (specify a point, or enter an option.)** 4. **Set next point or [draw Arcs/Close/Distance/Follow/Undo] - (specify a point, enter an option, or press Enter to close the polyline.)** • **draw Arcs** - enters arc drawing mode; prompts you: **Set end of arc or [draw Lines/ Angle/ CEnter /Direction/ Radius/ Second point] - (enter an option; see the Arc (6.4.21) command Use the Draw Lines option to exit arc drawing mode.)** • **Close** - closes the polygon and exits the command. • **Distance** - draws the next line segment at a specified distance and angle; prompts you: **Distance for segment - (type a value.) Angle of segment - (type a value.)** • **Follow** - draws the next line segment at the same angle; prompts you: **Set next point or [draw Arcs/Distance/Follow/Undo] - (pick a point or enter an option.)** • **Undo** - undoes (undraws) the last segment.

6.21.38 MText

(6.2981 on page 6079) Places formatted, paragraph text in a bounding box that limits the extent of the text. (6.1660 on the next page)

Accessing the Command

command bar: **mtext** aliases: **t, mt** menu bar: **Draw | Multiline Text** ribbon: **Draw | Text | Multiline Text** toolbar: **Draw |** : **MText Prompts you in the command bar:** Multiline Text: First corner for block of text: **(Pick the first point for the bounding box, or else enter x,y coordinates)** Select Opposite corner for block of text or [Justification/Rotation angle/text Style/text Height/Direction/Width]: **(Pick another corner for the bounding box, or enter an option)** Displays the Text Formatting toolbar and bounding box: (6.2590 on page 5717) Enter text in the bounding box, format it, and then click **OK**. (6.1660 on the next page)

Figure 6.1659

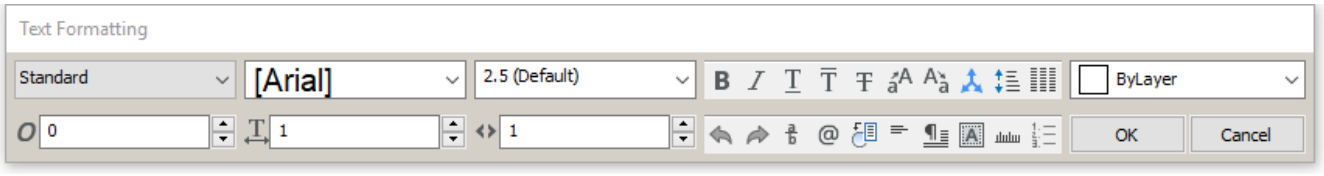

Figure 6.1660

Command Options

Option	Description
Style	Specifies the style: (6.1662 on page 4913) Choose a style name from the droplist. See Style (6.27.55) command.
Font	Specifies the font. (6.1663 on page 4914) Choose a font name from the droplist; this overrides the font specified by the style. BricsCAD can use any font installed on your computer. To apply a font to just one or more words: 1. Highlight the word 2. Choose the font from the droplist To apply a font to just one or two words, **highlight them**, and then choose the font from the droplist.
Height	Specifies the text height. (6.1664 on page 4914) • Choose a preset text height from the droplist • Enter a value To change the height of a few words, highlight them, and then specify the height.
Bold	Toggles boldfacing of text. SHX fonts cannot be boldfaced. To apply boldfacing : 1. Select some or all of the text 2. Click the **B** button. To remove boldfacing, repeat the procedure.
Italic	Toggles italicization of text. To apply italics: 1. Select some or all of the text 2. Click the **I** button Repeat the procedure to remove italics. SHX fonts cannot be italicized.
Underline	Toggles the underlining of text; to apply underlining : 1. Select some or all of the text 2. Click the **U** button Repeat the procedure to remove underlines.

Overline	Toggles overlining of text; to apply overlining: 1. Select some or all of the text 2. Click the **O** button. Repeat the procedure to remove overlines.
Strikethrough	Toggles the strikethrough of the text; to apply strikethrough: 1. Select some or all of the text 2. Click the **T** button. Repeat the procedure to remove strikethroughs.
Upper case	Sets selected text in upper case letters, like ABC.
Lower case	Sets selected text in lower case letters, like abc.
Annotative	Toggles the annotative property of the MText. Click the annotative button to apply or remove the annotative scale.
Line spacing	Sets the line spacing. (6.1665 on page 4914)
Color	Specifies the color of the text. (6.1666 on page 4914) 1. Select some or all of the text. 2. Click the **Color** button. 3. Choose a color from the droplist.
Oblique Angle	Specifies the angle by which to slant the text: (6.1667 on page 4914) Enter an angle, or else click the spinners to change the value. • Less than 0 degrees - characters slant backwards • 0 - characters are upright • More than 0 degrees - characters slant forwards
Width Factor	Specifies the width of character: (6.1668 on page 4914). • Smaller than 1 - characters are narrow • 1 - characters have normal width • Greater than 1 - characters are wide
Character Spacing	Specifies the spacing between characters: (6.1669 on page 4914) • Smaller than 1 - characters spacing is tight • 1 - characters have normal spacing • Greater than 1 - characters spacing is loose
Undo	Undoes the last format applied.
Redo	Redoes the last undo.

Stack Fractions

Stacks text according to the special characters -- / # or ^ -- embedded in the text:

- **/** - stacks vertically (separated by a horizontal line)
- **#** - stacks diagonally (separated by a diagonal line)
- **^** - stacks vertically not separated by a line (tolerance stack)

To stack fractions:

1. Enter fraction text, such as 3/4 (6.1670 on page 4915)
2. Select the fraction text; e.g. double click: (6.1671 on page 4915)
3. Click the **Stack Fraction** button ( ): (6.1672 on page 4915)
4. Repeat steps 2 and 3 to unstack the fractions.

To edit the stack properties:

1. Double click the stacked text. The Stack Properties dialog displays: (6.1673 on page 4915)
2. **Text** - type values in both fields of the text to be stacked
3. **Alignment** - select an alignment option: Bottom, Center, or Top
4. **Style** - select an stack style: Diagonal Fraction, Horizontal Fraction, or Tolerance
5. **Text size** - specify how much larger or smaller the stacked text should be in the range of 25% to 125%, or else enter a value.
6. Click the **OK** button to apply the changes.

Insert Symbol

Inserts special symbols. Click the button, and then choose a symbol. (6.1674 on page 4916) You can enter the symbols directly by typing their codes, such as **%%d** for the degree symbol.

Field

Inserts a field. See the Field (6.14.7) command.

Text justification

Specifies the text justification (alignment) within the bounding box. Click the button, and then choose an alignment from the droplist. (6.1675 on page 4916) The icon on the button indicates the current justification mode.

Paragraph

Specifies the text alignment of a paragraph. Click the button, and then choose an alignment from the droplist. (6.1676 on page 4916)

Background Mask

Sets the background mask; displays a dialog box: (6.1677 on page 4917)

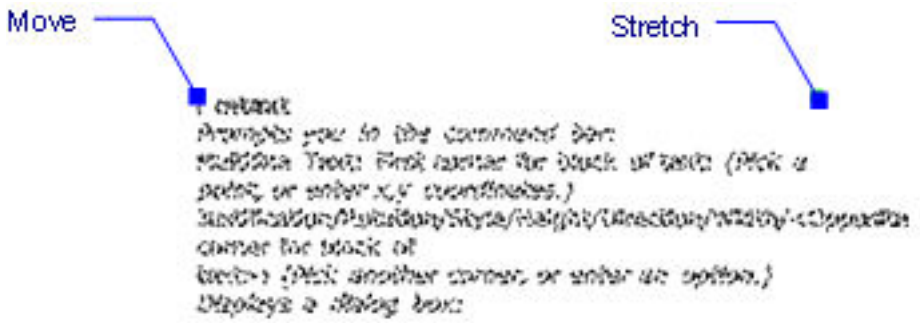
Ruler	Toggles the display of the ruler. (6.1678 on page 4917) 1. First line indent marker 2. Second line indent marker 3. Right indent marker 4. Tab type
Lists	Creates numbered and bulleted lists. Click the button, and then choose an option from the droplist. ===ERROR WITH DOWNLOADED IMAGE=== • **Enable lists and bullets** - turns on list making • **Allow automatic lists indexing** - pressing **Enter** adds a new list item
Columns	Divides the text in columns. Right click and choose **Columns** in the context menu. (6.1679 on page 4917) The Column Properties dialog box displays: (6.1680 on page 4918) • **Column type** - defines how the number of columns is controlled. • **Column number** - number of columns • **Height** - maximum height of the columns. • **Width** - width of each column. • **Gutter width** - space between the columns. Click the **Column type** list button and select a column type in the list: (6.1681 on page 4919) • **Dynamic (auto height)** option: (6.1682 on page 4919) Type a value in the **Height**, **Width**, and **Gutter width** fields. The number of columns is calculated automatically. Optionally, adjust the column height by dragging the control button. • **Dynamic (manual height)** option: (6.1683 on page 4919) Type a value in the **Width**, and **Gutter width** fields. The number of columns is calculated automatically. The **Height** is controlled by dragging the control button for each column separately. • **Static** option: (6.1684 on page 4920) Type a value in the **Column number**, **Height**, **Width**, and **Gutter width** fields. Optionally, adjust the column height by dragging the control button.

Grips Editing

Mtext bounding boxes can be edited directly through grips:

1. Select the mtext. Notice that it has two grips.
2. Drag the grips to perform the following actions:

Figure 6.1661



- Drag the left grip to move the mtext.
- Drag the right grip to stretch the width of the bounding box (make it wider or narrower; the text reflows automatically to accommodate the change in width).

(6.1687 on page 4923)

Procedures

- To create single line text (1.29.20)
- To create multiline text (1.29.20)
- Including special text characters and symbols (1.29.20)
- To add a background mask (1.29.20)
- To add a text frame (1.29.20)
- General procedure to create fields (1.29.23)
- Defining text system variables (1.29.17)

Related Commands

-MText (6.21.40) - places paragraph text. Text (6.29.12) - places single-lines of text in drawings. -Text (6.29.12) - places text and evaluates LISP expressions. TXT2MTXT (6.29.38) - combines a selection of Text and MText entities into a single MText entity. AttDef (6.4.31) - defines attribute text. DdEdit (6.10.13) - edits text. Field (6.14.7) - inserts a field in a multiline text, table cell or attribute. Updatefield (6.30.10) - Updates fields in selected Mtexts. Style (6.27.55) - creates and modifies text styles through the Drawing Explorer. -Style (6.27.56) - creates and modifies text styles through the command bar. QText (6.25.5) - toggles between text and rectangular representations. Change (6.9.10) - changes the position of text. TxtExp (6.29.36) - explodes text into polylines. Spell (6.27.44) - checks the spelling of text in drawings. Find (6.14.8) - finds and replaces text. Properties (6.24.54) - modifies the properties of text.

6.21.39 MoveEData

(6.2981 on page 6079) Moves extended entity data from one entity to one or more others.

Accessing the Command

command bar: **moveedata** transparent: **'moveedata** menu bar: **Tools | Entity Data | Move Entity Data** toolbar: **Entity Data |**  : **MoveEData Prompts you in the command bar:** Move Entity Data: Name of application or [? to list application names]: **(Enter name of application, or type ?)** Select entity from which to move data: **(Choose one entity)** Select entity to which to move data: **(Choose another entity)** Select entity from which to move data: **(Choose another entity, or press Enter to exit the command)**

Command Options

Option	Description
Name of application	Specifies the name of the application that generated the extended entity data.
? to list application names	Lists the names of registered applications.
Select entity From which to move data	Selects the source entity from which to move edata. The entity must contain edata, which can be created with the EditEData (6.13.3) command.
Select entity to which to move data	Specifies the target entity to receive the edata.

Related Commands

CopyEData (6.9.37) - copies extended entity data to other entities. DelEData (6.10.28) - erases extended entity data from entities. EditEData (6.13.3) - creates and edits extended entity data. ReAssocApp (6.26.2) - associates applications with entities.

Figure 6.1686

6.21.40 -MText

(6.2981 on page 6079) Places formatted, paragraph text in a bounding box that limits the extent of the text; uses the command bar to enter and format the text. **Note:** The text does not appear in the drawing until you end the command (by pressing **Enter** at the 'Mtext' prompt.

Accessing the Command

command bar: **-mtext** : **-MText Prompts you in the command bar:** Multiline Text: First corner for block of text: **(Pick the first point for the bounding box, or else enter x,y coordinates)** Select Opposite corner for block of text or [Justification/Rotation angle/text Style/text Height/Direction/Width]: **(Pick another corner for the bounding box, or enter an option)** Mtext: **(Enter text)** Mtext: **(Enter more text, or press Enter to exit the command)**

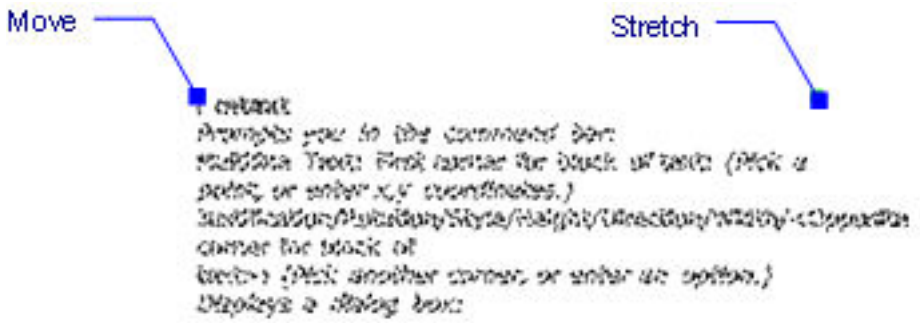
Command Options

Option	Description
First corner for block of text	Specifies one corner of the rectangle that bounds the text block.
Opposite corner for block of text	Specifies the other corner.
Justification	Specifies the justification (1.29.20) (horizontal alignment) of the text inside the bounding box; prompts you: **Specify text block justification [Top-Left/Top-Center/Top-Right/MiddLe-left/Middle-Center/Middle-Right/Bottom-Left/Bottom-Center/Bottom-Right] <Top Left>** - **(enter a justification mode.)**
Rotation	Specifies the rotation angle of the text block; prompts you: **Rotation angle for block of text <0>** - **(enter an angle.)** Positive angles rotate the text block counter-clockwise.
Style	Specifies the text style to use for the mtext; prompts you: **Text style to use or [? to list] <Standard>** - **(enter the name of a text style.)** Enter **?** for a list of styles defined in the current drawing. See Style (6.27.55) command.
Height	Specifies the height of the text; prompts you: **Height of text <0.2000>** - **(enter a number.)** This option is unavailable when the style specifies the text height.
Direction	Specifies the direction in which the bounding box is expanded; prompts you: **Specify drawing direction [Left-to-right/Top-to-bottom/by-Style] <Left-to-Right>** - **(enter an option)**: • **Left to right** - text is placed at the left, and expands the bounding box to right. • **Top to bottom** - text is placed at the top, and expands the bottom of the bounding box. • **By Style** - returns to the previous prompt.
Width	Specifies the width of the bounding box; prompts you: **Width of text box** - **(enter a value.)** When set to 0, the box has "infinite" width.
Mtext	Specifies the text; prompts you: **Mtext** - specifies the text to be placed in the drawing. This prompt repeats until you press **Enter** to end the command.

Grips Editing

Mtext bounding boxes can be edited directly through grips:

Figure 6.1687



2. Drag the grips to perform the following actions:

- Drag one grip to move the mtext.
- Drag the other grip to stretch the width of the bounding box (make it wider or narrower; the text reflows automatically to accommodate the change in width).

(6.1687)

Procedures

- To create single line text (1.29.20)
- To create multiline text (1.29.20)
- Including special text characters and symbols (1.29.20)
- To add a background mask (1.29.20)
- General procedure to create fields (1.29.23)
- Defining text system variables (1.29.17)

Related Commands

Text (6.29.12) - places single-lines of text in drawings. -Text (6.29.12) - places text and evaluates LISP expressions. MText (6.21.38) - places paragraph text. TXT2MTXT (6.29.38) - combines a selection of Text and MText entities into a single MText entity. AttDef (6.4.31) - defines attribute text. DdEdit (6.10.13) - edits text. Style (6.27.55) - creates and modifies text styles through the Drawing Explorer. -Style (6.27.56) - creates and modifies text styles through the command bar. Change (6.9.10) - changes the position of text. QText (6.25.5) - toggles between text and rectangular representations. TxtExp (6.29.36) - explodes text into polylines. Spell (6.27.44) - checks the spelling of text in drawings. Find (6.14.8) - finds and replaces text. Properties (6.24.54) - modifies the properties of text.

6.22 N

6.22.1 Navigate

(7.3 on page 6132) Walks and flies through 3D models with the keyboard, as used in computer games.

Figure 6.1688

Accessing the Command

 command bar: **navigate** menu bar: **View | Navigate** toolbar: **View |**  Quad: **General |**  : **navigate**
Prompts you in the command bar: Flight mode is Off, STEPSIZE=30, STEPSPERSEC=10 »Press Esc to quit or right click to modify navigation settings. Hover the mouse cursor over the target location and then hold down a key to navigate; see list below. Move the cursor to change the target location.

Command Options

Keyboard Option Description A Left Arrow Moves to the left W Up Arrow Moves forward S Down Arrow Moves backwards D Right Arrow Moves to the right F Toggles flight mode:

- **On** - flight mode
- **Off** - walk mode restricts movement to the xy-plane.

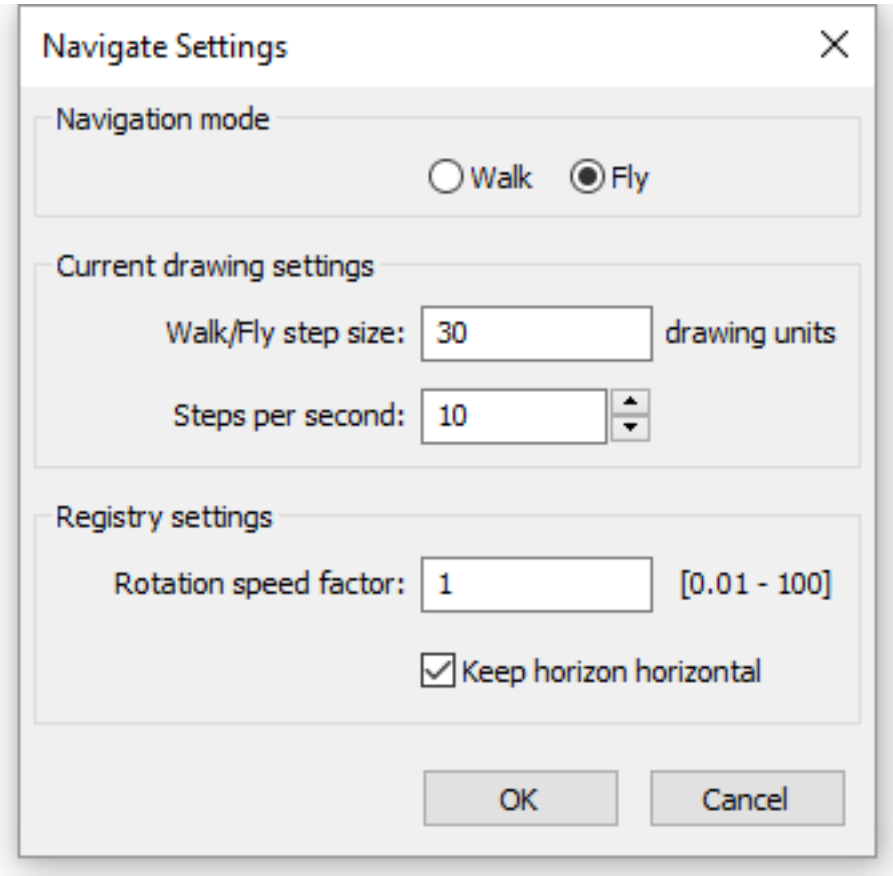
Esc Exits the command.

Mouse Option	Description
Hold down left button and drag the mouse	Look around mode
Right click	Brings up the Navigation Settings dialog box; see below.

(6.1689 on the following page)

Navigate Settings Options	Description
Navigation Mode	Toggles between Walk and Fly modes: • **Flight mode** - permits movements in all three dimensions • **Walk mode** - restricts movement to the xy-plane.
Current Drawing Settings	**Walk/Fly step size** - enter a number in drawing units; this is the distance the view travels with each press of the key **Steps per second** - specifies how quickly the view changes when a travel key is held down (This section refers to settings saved with the drawing, and so will be different in other drawings.)
Registry Settings	**Rotation speed factor** - specifies how quickly the view rotates **Keep horizon horizontal** - keeps the flight level; this option is grayed-out for Walk mode (This section refers to settings saved with the registry, and so will be the same in other drawings.)
OK	Exits the dialog box and returns to Navigate mode.

Figure 6.1689



Related Commands

RtRot (6.26.37) - rotates 3D drawings in real-time. RtWalk (6.26.47) - walk left / right and forward / backward in a 3D scene.

Figure 6.1690

Figure 6.1691

6.22.2 Nearest

(6.2981 on page 6079) Toggles Nearest entity snap mode; snaps to geometry on a 2D and 3D entity nearest to the cursor. (6.1795 on page 5007)

Accessing the Command

 command bar: **nearest** transparent: **nea** ribbon: **Home | Entity Snaps | Snap to Nearest** toolbar: **Entity snaps** |  : **nearest** Displays no prompts in the command bar. When nearest entity snap is on, the cursor snaps to the nearest geometry. This entity snap works with 2D and 3D entities.

Command Options

Option	Description
Nearest	Entering the command toggles Nearest entity snap. It snaps to the nearest geometry on entities. This command can be entered transparently during commands, but must be entered without the apostrophe prefix (').

Related Commands

OSnap (6.23.16) - toggles entity snap modes in the Settings dialog box. -OSnap (6.23.13) - toggles entity snap modes in the command bar. Aperture (6.4.14) - sizes the aperture cursor for entity snaps. 2dIntersection (6.2.1) - toggles apparent intersection snap mode. 3dIntersection (6.3.7) - toggles intersection snap mode. Apparent (6.4.16) - toggles apparent intersection snap mode. Center (6.9.3) - toggles center snap mode. Endpoint (6.13.7) - toggles endpoint snap mode. Extension (6.13.22) - toggles extension snap mode. From (6.14.13) - allows to enter relative coordinates with respect to a reference point. GCenter (6.15.5) - toggles Geometric Center (GCenter) entity snap. Insertion (6.17.18) - toggles insertion snap mode. Intersection (6.17.19) - toggles intersection snap mode. Midpoint (6.21.16) - toggles midpoint snap mode. Mtp (6.21.35) - allows to specify a point as the midpoint between two points. Node (6.22.7) - toggles node (point) snap mode. None (6.22.8) - turns off all entity snap modes. Parallel (6.24.5) - toggles parallel snap mode. Perpendicular (6.24.25) - toggles perpendicular snap mode. Quadrant (6.25.7) - toggles quadrant snap mode. Tangent (6.29.10) - toggles tangent snap mode. Znearest (6.35.5) - toggles the 3D nearest entity snap. Snaps to a point on the face of a 3D entity that is nearest to the cursor.

Figure 6.1692

6.22.3 Netload

(6.2981 on page 6079) * Command only available on the Windows platform Loads .NET applications.

Accessing the Command

command bar: **netload** : **netload** Displays a dialog box: select the application to be loaded, and then press the **OK** button. When the FILEDIA variable is off, **you are prompted in the command bar:** Assembly file name: **(Type the name of the application to be loaded, and then press Enter)**

Command Options

Option	Description
Assembly file name	1. Type the name of the application to be loaded. 2. Press **Enter**.

Related Commands

AddInMan (6.4.3) - loads and unloads VBA functions through a dialog box. Appload (6.4.17) - loads DRX, LISP, and SDS applications to run inside BricsCAD. Commands (6.9.23) - lists the names of internal and external commands. CuiLoad (6.9.56) and CuiUnload (6.9.51) - loads and unloads menu files. Customize (6.9.47) - customizes the user interface. MenuLoad (6.21.14) and MenuUnload (6.21.13) - loads and unloads menu files. Security (6.32.8) - depending on the selected security level (Low, Medium or High) VBA macros are allowed to run automatically or not. VbaLoad (6.32.2) and -VbaLoad (6.32.3) - loads VBA projects. VbaRun (6.32.6) and -VbaRun (6.32.7) - runs VBA macros. VbaIde (6.32.1) - opens the VBA integrated development environment. VbaMan (6.32.4) - manages VBA projects. VbaUnload (6.32.9) - unloads VBA projects.

Figure 6.1693

6.22.4 NewSheetSet

(6.2981 on page 6079) Creates a new sheet set by several methods:

- Starting from scratch
- Creating a new one from a sheet set template
- Borrowing settings from an existing sheet set
- Borrowing the structure from existing drawings

Note: A sheet set is a collection of drawings used in projects that can be viewed, edited, and published (printed) as a set.

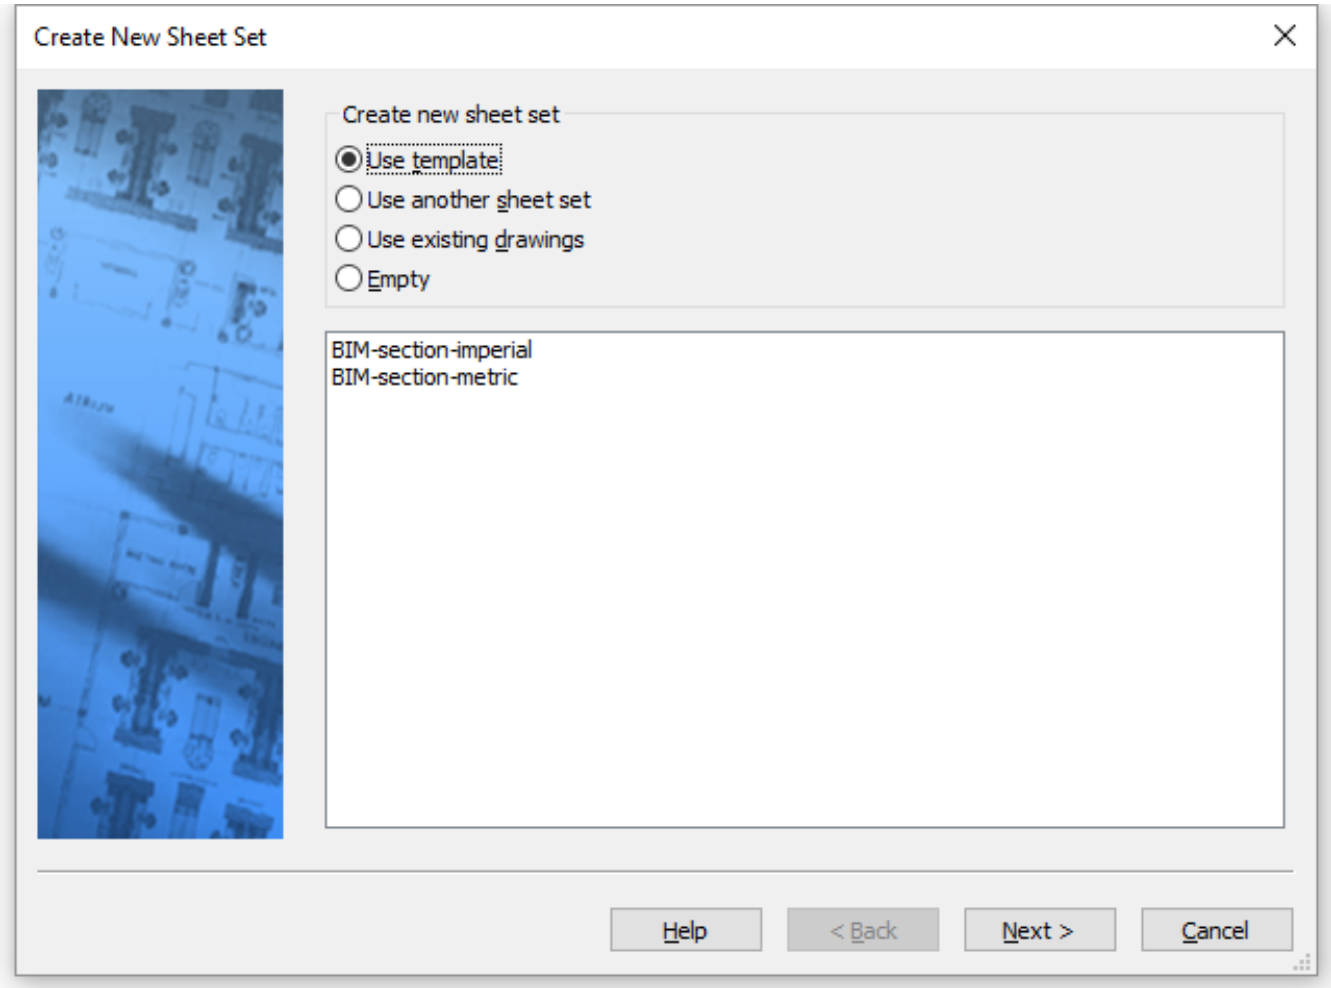
Accessing the Command

 command bar: **newsheetset** menu: **File | New Sheet Set** ribbon: **Home | File | New Sheetset** toolbar: **Drawing Explorer | Sheets |**  : **newsheetset** Displays a dialog box that offers four ways to create the new sheet set:

- **Use template** - select a DST sheet set template file from the list shown in the dialog box
- **Use another sheet set -** borrow settings from another DST sheet set file
- **Use existing drawings** - borrow the structure from existing DWG drawing files
- **Empty** - create a new sheet set by starting from scratch

(6.1694 on the next page)

Figure 6.1694



Command Options

Option	Description
Use Template	Creates a new sheet set from a template. Sheet set templates are stored as DST files in the folder set by the SheetSetTemplatePath (1.17.10) preference (default path is **C:\Users\<UserName>\AppData\Local\Bricsys\BricsCAD\V[Versi Sets**) (6.1695 on page 4935) 1. Choose **Use Template.** 2. Select a template sheet set from the list shown in the dialog box 3. Click **Next**. (6.1696 on page 4935) 4. Type a name for the sheet set file in the **Save sheet set file as** field. 5. Click **Browse** .... 6. In the Save New Sheet Set As dialog box, select a folder in which to save the sheet set. **Important**: you cannot progress until you select a folder. 7. Click **Save**. 8. (Optional) Type a description in the **Description** field. 9. Click **Next**. (6.1697 on page 4936) 10. Review the summary of the sheet set that will be created, and then click**Finish** to create the new sheet set file. The program opens the Sheet Set panel with the new sheet set.

Use another sheet set

Creates a new sheet set from the settings in an existing sheet set: (6.1698 on page 4936)

1. Choose **Use Another Sheet Set.**
2. Click **Browse** ....
3. Select a sheetset file from Select a Sheet Set file dialog box.
4. Click **OK**.
5. Click **Next**. (6.1699 on page 4937)
6. Type a name for the sheet set file in the **Save sheet set file as** field.
7. Click **Browse** ....
8. In the Save New Sheet Set As dialog box, select a folder in which to save the sheet set. **Important**: you cannot progress until you select a folder.
9. Click **Save**.
10. (Optional) Type a description in the **Description** field.
11. Click **Next**. (6.1700 on page 4937)
12. Review the summary of the sheet set that will be created, and then click **Finish** to create the new sheet set file. The program opens the Sheet Set panel with the new sheet set.

Use existing drawings	Create a new sheet set from an existing set of drawings: (6.1701 on page 4937) 1. Choose **Use Existing Drawings.** 2. Click **Next**. (6.1702 on page 4938) 3. Click **Select Folder**. 4. Select a folder from the Choose a Folder dialog box. This is the folder in which the sheet set will be stored. 5. Click **Select Folder**. Notice that the dialog box fills with names of drawings and their layouts (see figure above). 6. Choose among the options; is is usually best to keep both options turned on: **Create subsets from folder structure** - uses the folders in the main folder to determine how the sheet set is structured **Prefix sheet titles with drawing file names** - adds the drawing file's name to the start of the sheet set titles, which makes it easier to track the source of the files 7. Click **Next**. (6.1703 on page 4938) 8. Type a name for the sheet set file in the **Save sheet set file as** field. 9. Click **Browse** .... 10. In the Save New Sheet Set As dialog box, select a folder in which to save the sheet set. **Important**: you cannot progress until you select a folder. 11. Click **Save**. 12. (Optional) Type a description in the **Description** field. 13. Click **Next**. (6.1704 on page 4939) 14. Review the summary of the sheet set that will be created, and then click **Finish** to create the new sheet set file. The program opens the Sheet Set panel with the new sheet set.

Empty	Creates an empty sheet set" (6.1705 on page 4939) 1. Choose **Empty.** 2. Click **Next**. (6.1706 on page 4939) 3. Type a name for the sheet set file in the **Save sheet set file as** field. 4. Click **Browse** .... 5. In the Save New Sheet Set As dialog box, select a folder in which to save the sheet set. **Important**: you cannot progress until you select a folder. 6. Click **Save**. 7. (Optional) Type a description in the **Description** field. 8. Click **Browse** ... next to **Default Template for New Sheets**. 9. In the Select Drawing Template file dialog box, select a DWT or DWG as the template file. **Important**: you cannot progress until you select a template. 10. Click **Open**. 11. Click **Next**. (6.1707 on page 4940) 12. Review the summary of the sheet set that will be created, and then click **Finish** to create the new sheet set file. The program opens the Sheet Set panel with the new sheet set.

Related Commands

SheetSet (6.27.38) - manages sheet sets. Opens the **Sheet Sets** panel. OpenSheetSet (6.23.10) - opens an existing sheet set.

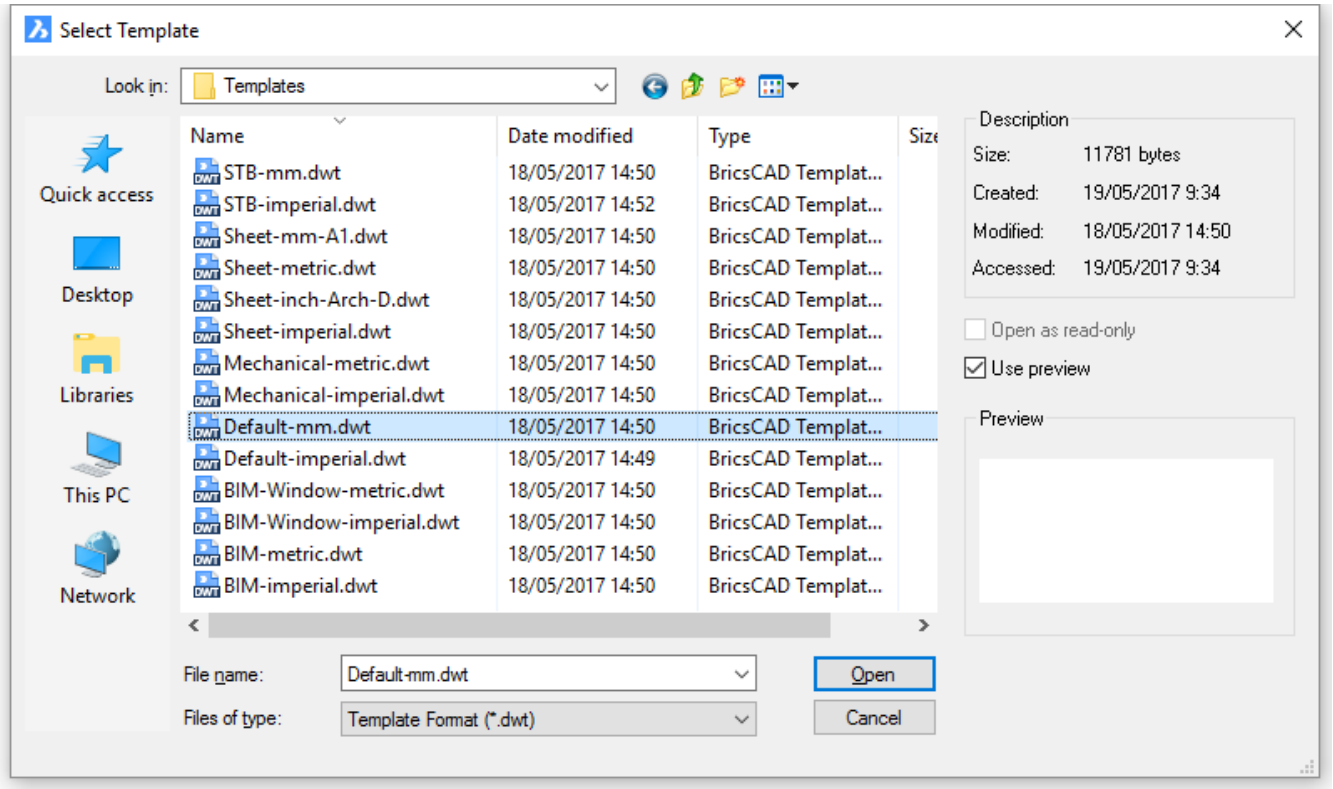
6.22.5 New

(7.3 on page 6132) Prompting you to select a DWT template file, and then starts a new drawing based on it. **Note:** The QNew (6.25.1) command starts new drawings without selecting a template.

Accessing the Command

command bar: **new** shortcut: **Ctrl+N Note:** The "New" options on the menu bar and ribbon run the QNew command. : **new** Opens Select Template dialog to the folder defined by the TemplatePath preference, by default **C:\Users\userid\AppData\Local\Bricsys\BricsCAD\V19x64\en_US\Templates**. (6.1709 on the following page) Choose a DWT template file or DWG drawing file, and then click **Open. Note**: This command instead displays the New Wizard dialog box when the StartUp variable is on; see NewWiz (6.22.6) command.

Figure 6.1709



Command Options

Option	Description
File name	Specifies the file name. To open more than one file at a time, hold down the **Ctrl** key while selecting file names.
Files of Type	Chooses the type of drawing file: • **DWT** - template files define the settings and content of new drawings; the program makes a copy of the DWT file and then opens a new DWG file based on it • **DWG** - drawing files are opened like the Open (6.23.8) command.
Open as read-only	Toggles read-only status of drawings: • **On** - opens drawings read-only; they can be edited but not saved to the same file name • **Off** - open drawings normally Use the SaveAs (6.27.3) command to save by another name. Template drawings are always opened as read-only.
Use Preview	Toggles previews of the drawing: • **On** - displays preview image in Preview area • **Off** - does not display preview image Many template files are empty, and so appear to not have a preview.
Open	Opens the file.

Procedures

- Working with document tabs (1.15.2)
- To create a drawing using a default template drawing (1.19.1)
- To set the default template drawing (1.19.1)
- To create a drawing from scratch (1.19.1)

Figure 6.1710

6.22.6 NewWiz

(6.2981 on page 6079) Creates new drawings by several methods with the New Drawing Wizard:

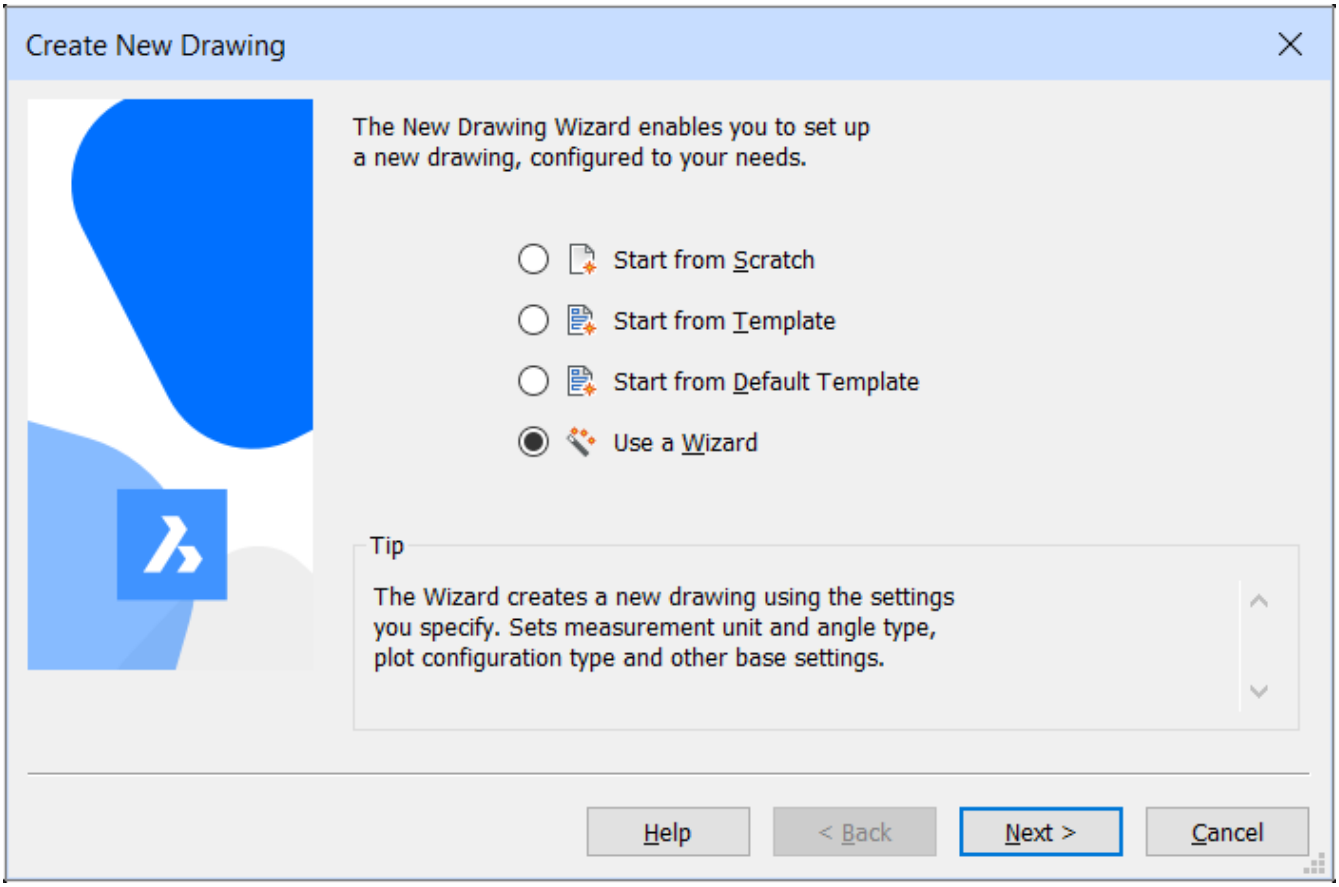
- Starting from scratch
- Creating a new drawing from a drawing template
- Starting with the default DWT template file
- Using a wizard to step you through the process

Note: A wizard is a series of dialog boxes that guide you through a complex setup process.

Accessing the Command

command bar: **newwiz** alias: **ddnew** menu bar: **File | New Wizard** ribbon: **Home | File | New Wizard** : **newwiz** Displays a dialog box: (6.1711 on the following page) Choose an option, and then click **Next**.

Figure 6.1711



Command Options

Option	Description
Start from Scratch	Starts the new drawing using the default template file specified by the BaseFile variable: (6.1712 on page 4948) 1. Choose **Start from Scratch**. 2. Click **Next**. 3. Choose a measurement system: (6.1713 on page 4948) • **Imperial (feet and inches)** - new drawing is based on the **default-imperial.dwt** file and so uses Imperial measurements. • **Metric** - new drawing is based on the **default-mm.dwt** file and so uses metric measurements. 4. Click **Finish**. Notice that the program opens a new drawing whose content depends on the default template file.

Start from Template	Starts the new drawing with a template file: (6.1714 on page 4948) 1. Choose **Start from Template**. 2. Click **Next**. (6.1715 on page 4949) 3. Choose a file to act as the template in one of the following ways: • Under **Select a Template**, choose one of the DWT file names. These files are stored in the folder specified by the TemplatePath variable; the default location is **C:\Users\useid\AppData\Local\Bricsys\BricsCAD\V19** • Click **Browse**, and then navigate to a folder with drawing files; you can use the following kinds of file types for a template: **DWG** - drawing files **DWT** - template files **DXF** - drawing interchange files 4. Turn on **Use the selected template as default** option when you wan to use this file as the template from now on. If so, then the program updates the value of the BaseFile variable. 5. Click **Finish**. Notice that the program opens a new drawing whose content depends on the template file you selected.
Start from Default Template	Starts new drawings with the default template defined by the BaseFile variable: (6.1716 on page 4949) 1. Choose **Start From Default Template**. 2. Click **Finish**. Notice that the program opens a new drawing whose content depends on the default template file.

Use a Wizard

Starts the new drawing by stepping through a wizard that guides you along the way: (6.1717 on page 4950)

1. Choose **Use a Wizard**.
2. Click **Next**. (6.1718 on page 4950)
3. Choose a measurement system:
   - **Imperial (feet and inches)** - new drawing is based on the **default-imperial.dwt** file and so uses Imperial measurements.
   - **Metric** - new drawing is based on the **default-mm.dwt** file and so uses metric measurements.
4. Click **Next**.
5. Select a linear unit of measurement and display precision. (6.1719 on page 4950)
   - **Unit of Measurement** - choose one from the list. If you are unsure, choose Decimal; you can always change the units any time later with the Units (6.30.8) command.

     ```
     Unit Name            Measures
     ```

   - **Precision** - click the droplist and choose a level of precision. If you are unsure, choose the defaults, as you can always change the precision any time later with the Units (6.30.8) command. Note that this is a display precision: the program makes calculations internally always to eight decimal places.
6. Click **Next**.
7. Select an angular unit of measurement and display precision: (6.1720 on page 4951)
   - **Angle of Measurement** - choose one form the list. If you are unsure, choose Decimal/Degrees; you can always change the units any time later with the Units (6.30.8) command.

     ```
     Angle Name                  Measures In
     ```

   - **Precision** - click the droplist and choose a level of precision. If you are unsure, choose the defaults, as you can always change the precision any time later with the Units (6.30.8) command.
8. Click **Next**.
9. Determine which kinds of plot style the drawing should employ: (6.1721 on page 4951)
   - **Color Dependent (CTB) -** these plot styles are simpler to employ, but less flexible.
   - **Named (STB)** - plot styles are more flexible but more complex, because they control every aspect of every entity property during plotting.

   If you are unsure, choose Color-dependent.

Procedures

- To create a drawing using a default template drawing (1.19.1)
- To set the default template drawing (1.19.1)
- To create a drawing from scratch (1.19.1)
- To set the Plot style policy (1.19.1)
- To create a drawing using a template drawing (1.19.1)
- To create a drawing using the New command (1.19.1)
- To set the Template Path variable (1.19.1)
- To create a drawing using a wizard (1.19.1)

Related Commands

Units (6.30.8) - sets units through the Settings dialog box. -Units (6.30.9) - sets units through the command bar. New (6.22.5) - starts new drawing in Imperial or metric units. QNew (6.25.1) - opens new drawings.

6.22.7 Node

(6.2981 on page 6079) Toggles Node entity snap mode, which snaps to the following entities with nodes:

- Point entities
- Text insertion points
- Mtext insertion points
- Attribute insertion points
- Table insertion points

(6.1789 on page 5005)

Accessing the Command

command bar: **node** transparent: **node** alias: **nod** ribbon: **Home | Entity Snaps | Snap to Node** status bar: right-click **ESNAP**, choose **Node** toolbar: **Entity Snaps |**
: **node** Displays no prompts in the command bar. When node entity snap is on, the cursor snaps to point entities, including mtext entities.

Command Options

Option	Description
Node	Each time the command is entered, it toggles Node entity snap on and off. When on, it snaps to point, mtext, and other entities. This command can be entered transparently during commands, but must be entered without the apostrophe prefix (').

Related Commands

OSnap (6.23.16) - toggles entity snap modes in the Settings dialog box. -OSnap (6.23.13) - toggles entity snap modes in the command bar. Aperture (6.4.14) - sizes the aperture cursor for entity snaps. 2dIntersection (6.2.1) - toggles apparent intersection snap mode. 3dIntersection (6.3.7) - toggles intersection snap mode. Apparent (6.4.16) - toggles apparent intersection snap mode. Center (6.9.3) - toggles center snap mode. Endpoint (6.13.7) - toggles endpoint snap mode. Extension (6.13.22) - toggles extension snap mode. From (6.14.13) - allows to enter relative coordinates with respect to a reference point. Figure 6.1726

6.22.9 Number

(6.1726) Creates incremental number tags for BIM entities.

Accessing the Command

Keyboard: **number : number Prompts you:** Select entities to number and press Enter: **(Select the BIM entities to number.)** Entities in set: xx Select entities to number and press Enter: **(Select more BIM entities or press Enter to stop.)** Provide First index or [Increment/Prefix/Suffix/Number style/Entities sorting/Overwrite Numbers] <1>: **(Choose an option or press Enter to accept the default.)** Total number of entities numbered is xx Total number of entities skipped is yy

Command Options

Option	Description
First Index	Sets the first index. Type an integer.
Increment	Sets the increment for the numbering. Prompst you: **Provide the increment** <1>: **Type an integer.**
Prefix	Specifies a prefix for the numbering. Prompts you: **Provide the prefix** <"">: **Type a string.**
Suffix	Specifies a suffix for the numbering. Prompts you: **Provide the prefix** <"">: **Type a string.**
Number Style	Defines the number style. Prompts you: **Select number formatting** [arabic (0)/roman (1)/roman lowercase (2)/letters (3)/letters lowercase (4)] <Arabic>: **Choose an option:** • **0**: arabic numbers (1, 2, 3, ...) • **1**: roman uppercase numbers (I, II, III, ...) • **2**: roman lowercase numbers (i, ii, iii, ...) • **3**: uppercase letters (A, B, C, ...) • **4**: lowercase letters (a, b, c, ...)
Entities Sorting	Allows to specify the sorting order. Prompts you: **Current sorting orde**r = **Select a coordinate to sort by or press Enter to stop [X/Y/Z/None] <None>: Choose an option.** • **None**: from oldest to most recent. • **X**: based on the value of the x-coordinate, from low to high. • **Y**: based on the value of the y-coordinate, from low to high. • **Z**: based on the value of the z-coordinate, from low to high.

Overwrite Numbers	Allows to overwrite or keep existing numbers. Prompts you: **Existing Number are** [Kept/Overwritten] <Overwritten>: **Choose an option.** • **Kept**: Existing numbers are kept. • **Overwritten**: Existing numbers are overwritten.

Procedures

Renumber grid labels (2.5.12)

Related Commands

BimGrid (6.7.21): Creates 2-dimensional rectangular and radial grids.

6.23 O

6.23.1 ObjectScale

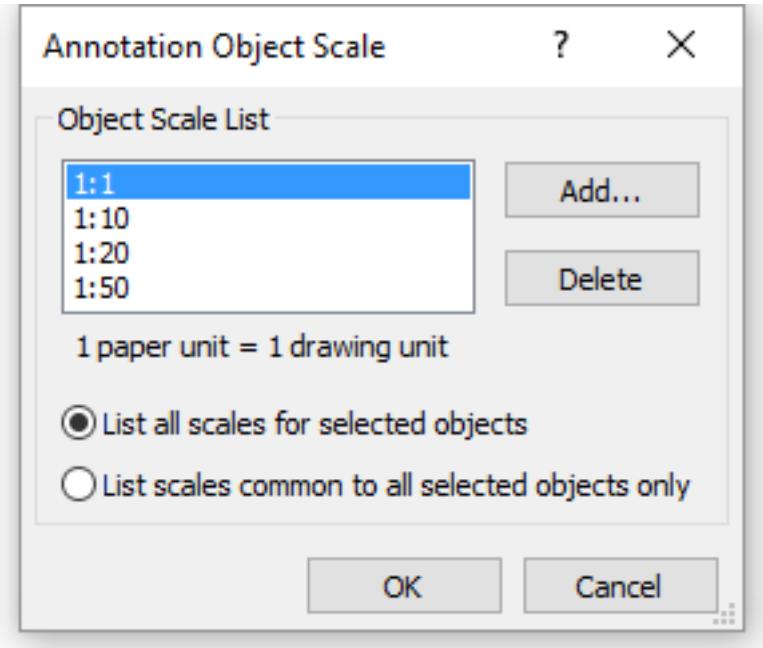
(6.2981 on page 6079) Adds or removes scale factors used with annotative entities through a dialog box. **Note:** Annotative scaling adjusts scale factors of annotative items, such as text and hatch patterns, to match the plot scale.

Figure 6.1727

Accessing the Command

command bar: **objectscale** ribbon: **Draw | Annotation Scaling | Add/Delete Scales** : **objectscale Prompts you in the command bar:** Select annotative entities: **(Select one or more entities)** Entities in set: 2 Select annotative entities: **(Select more entities, or else or press Enter to continue)** Displays a dialog box: (6.1728 on the next page)

Figure 6.1728



Command Options

Option	Description
Select annotative entities	Selects the entities whose annotative scales should be adjusted: • Select one or more items using any selection method. • Enter **all** to select all entities in the drawing; the program filters out ineligible entities automatically. • Press **Enter** to end entity selection.
Add	Adds annotation scale factors to the selected entities; displays a dialog box: (6.1729 on page 4961) 1. Select a scale factor from the list To select more than one, hold down the **Ctrl** key. 2. Click **OK** when done.
Delete	Removes annotation scales from the selected entities; this option does not work when there is just one scale factor attached to the entities. 1. Select one or more scale factors; hold down the Ctrl key to select more than one. 2. Click **Delete**. Choose **No** in the **Annotative** field on the Properties Bar (6.24.54) to remove the annotative property.

Scales to list	Specifies which scale factors are displayed by the dialog box; choose one: **List all scales for selected entities** - lists all the scale factors **List scales common to all selected entities only** - lists only the scale factor shared by the selected entities; this option is meaningless when only one entity is selected
OK	Closes the dialog box and applies the changes.

Related Commands

-ObjectScale (6.23.2) - adds or removes supported scales for annotative entities at the command line. ScaleListEdit (6.27.7) - edits the scale list of a drawing, used in **Plot Scale** section of the **Print** and **Page Setup** dialogs and the **Standard scale** property of a paper space viewport. Defines the available annotation scales for annotative entities.

Figure 6.1729

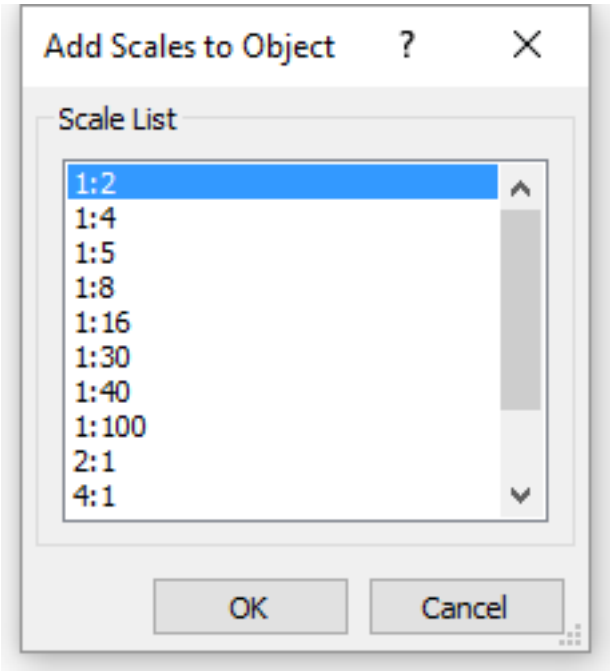


Figure 6.1730

6.23.2 -ObjectScale

(6.2981 on page 6079) Adds or removes scale factors used with annotative entities through the command line. **Note:** Annotative scaling adjusts scale factors of annotative items, such as text and hatch patterns, to match the plot scale.

Accessing the Command

command bar: **-objectscale** : **-objectscale Prompts you in the command bar.** Select annotative entities: **(Select entities)** Entities in set: 1 Select annotative entities: **(Select more entities, or else press Enter to continue)** Enter an option [Add/Delete/?] <Add>: **(Enter an option)**

Command Options

Option	Description
Select annotative entities	Selects the entities whose annotative scales should be adjusted: • Select one or more items using any selection method. • Enter **all** to select all entities in the drawing; the program filters out ineligible entities automatically. • Press **Enter** to end entity selection.
Add	Adds annotation scales to the selected annotative entities. When you enter a scale factor at the prompt, enter only the divisor. For instance, to add a scale of 1:5, type only the 5. 1. **Enter name scale to add or [? to list] <1:10> - type a scale, then press Enter x entities updated to support annotation scale '1:10'.** 2. **Enter name scale to add or [? to list] - type another scale or press Enter to stop** Enter **?** to list the annotative scale factors available, as listed below.
Delete	Deletes annotation scales from the selected annotative entities; prompts you: 1. **Enter name scale to delete or [?] <1:10> - type a scale factor, then press Enter x entities scale removed.** 2. **Enter name scale to delete or [?] - type another scale, or else press Enter to stop** Type **?** to display a list of all scales of the selected objects. Press **F2** to open the **Prompt History** window. (6.1731 on the facing page)

?	Displays a list of available annotation scales as defined in the scale list (see the ScaleListEdit (6.27.7) command). Press **F2** to open the Prompt History window. (6.1732 on the next page)

Related Commands

ObjectScale (6.23.1) - adds or removes supported scales for annotative entities through a dialog box. ScaleListEdit (6.27.7) - Edits the scale list of a drawing, used in **Plot Scale** section of the **Print** and **Page Setup** dialogs and the **Standard scale** property of a paper space viewport. Defines the available annotation scales for annotative entities.

Shape Classic Pro Platinum Mechanical BIM

6.23.3 Offset

(7.3 on page 6132) Creates parallel copies of 2D entities and 3D solid faces. (6.1740 on page 4969)

Accessing the Command

command bar: **offset** alias: **o** menu bar: **Modify | Offset** toolbar: **Modify |** ribbon: **Change | Modify | Offset** Quad: **2D Editing |** : **offset Prompts you in the command bar:** Enter offset distance or [Through point/Erase/Layer] <20.0>: **(Enter a distance, pick two points, press Enter for the default distance, or else select an option)** Select entity/subentity or [Exit] <Exit>: **(Choose a single entity, or press Enter to exit the command)** Select side for parallel copy or [Both sides/Multiple]: **(Pick a point to place the copy, or else choose an option)** Select entity/subentity or [Undo/Exit] <Exit>: **(Choose another entity, type U to undo the previous parallel copy, or press Enter to exit this command) Note:** When curved entities are offset, the command changes the radii of the copies: (6.1734) When polylines are being offset, the OFFSETGAPTYPE (6.23.3) variable determines how potential gaps between segments are treated: (6.1735 on the next page)

- **0** - gaps are closed, with segments extended to close them
- **1** - gaps are filleted, with the radius of the arc segments the size of the offset distance
- **2** - gaps are chamfered, with the distance equals to the offset distance

When faces of 3D models are offset, the SELECTIONMODES variable determines how potential conflicts are handled:

- **1** - edges are selected and offset
- **2** - faces are selected and offset (figure below, at left)
- **4** - boundaries are detected and offset (boundary is in blue in the figure below, at right)

(6.1736 on the following page) (6.1737 on the next page) Boundaries are also detected by the Offset command for 2D entities, such as these overlapping squares: (6.1738 on page 4967)

Figure 6.1734

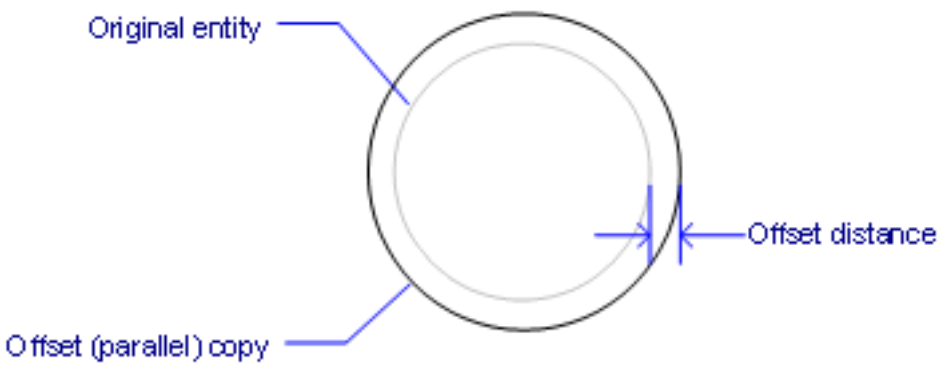

Figure 6.1735

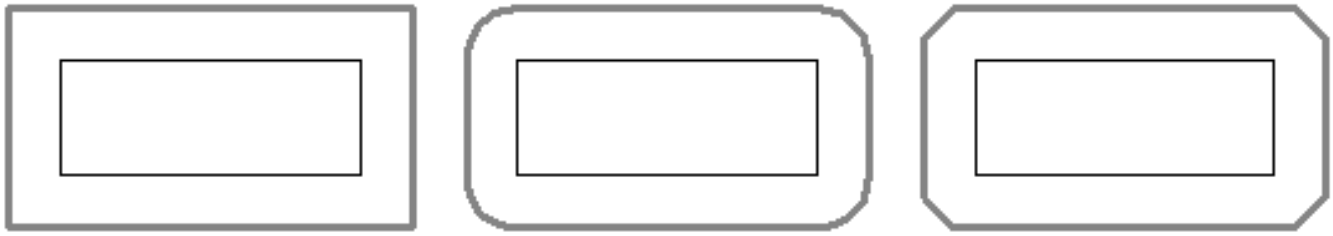

Figure 6.1736

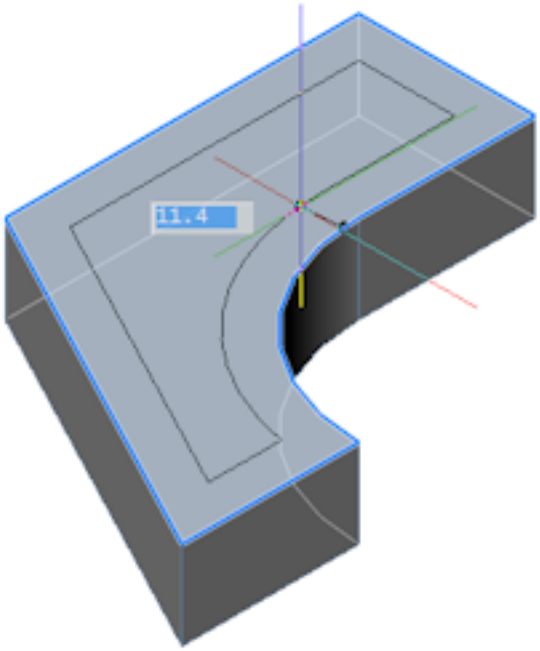

Figure 6.1737

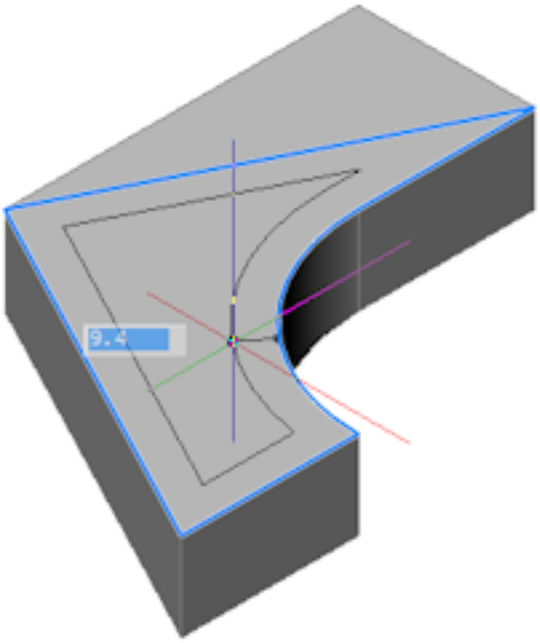

Figure 6.1738

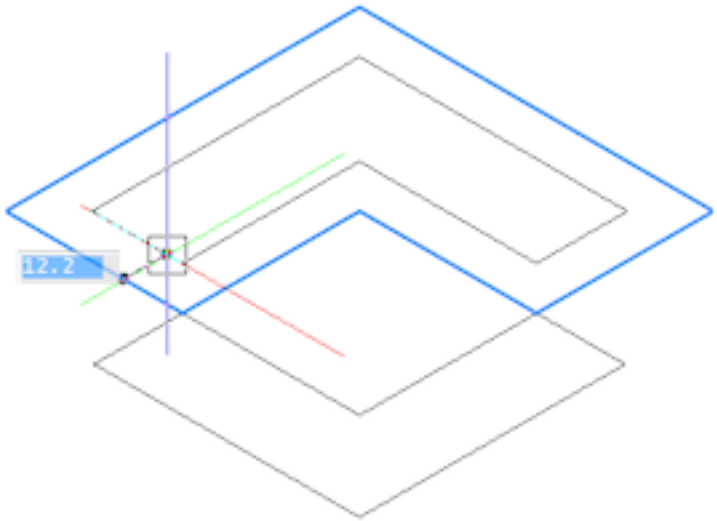

Command Options

Option	Description
Enter offset distance	Specifies the distance between the original entity and its parallel copy: • Press **Enter** to accept the default distance. • Type a value. • Specify two points in the drawing, such as along another entity. The offset distance is saved to the OFFSETDIST variable.
Through point	Specifies the offset distance by picking two points; prompts you: 1. **Select entity/subentity or [Exit] <Exit>** - enter an option: • **Select entity** - select a single entity • **Subentity** - select the face of a 3D solid • **Exit** - return to the previous prompt 2. **Select through point or [Multiple]** - enter an option: • **Select through point** - pick a point in the drawing • **Multiple** - repeats the 'Select next through point' prompt until you press Esc or Enter to return to the previous prompt; see below
Erase	Deletes the source entity following the offset operation. The status is saved to the OFFSETERASE variable with the drawing, but is then reset (turned off) with the next drawing.

Layer	Specifies the layer on which to place the copied entity; prompts you: **Select layer for offset entities? [Current/Source] <Source>** - enter an option: • **Current** - places the the offset entity on the current layer. • **Source** - places the offset on the same layer as that of the source entity.
Select entity/subentity	Selects the entity of which to make the parallel copy: • **Entity** - 2D entities that lay in a plane; this means you can offset lines, 2D polylines, and splines, but not helices or 3D polylines. • **Subentity** - flat 2D parts of 3D solid model; this means you can offset the base of a cone but not its curved surface. Only one entity can be selected for offsetting at a time; the command repeats automatically so that you can offset additional entities. Press **Enter** or **Esc** to exit the command.
Side for parallel copy	Specifies the side on which to make the offset (parallel) copy. (6.1740 on the next page) If the Through Point option was selected earlier, your pick point specifies the offset distance.
Both sides	Places offset copies on both sides of the entity. (6.1741 on the facing page)
Exit	Returns to the previous prompt of this command, or ends the command.
Undo	Undoes the previous offset operation.

Procedures

- Making a parallel copy at a specified distance (1.32.20)
- Making a parallel copy through a point (1.32.20)
- Making a parallel copy of a 3D solid edge (1.32.20)
- Making a parallel copy a 3D solid face (1.32.20)
- Making a parallel copy of a detected boundary (1.32.20)

Related Command

Copy (6.9.35) - makes copies of entities.

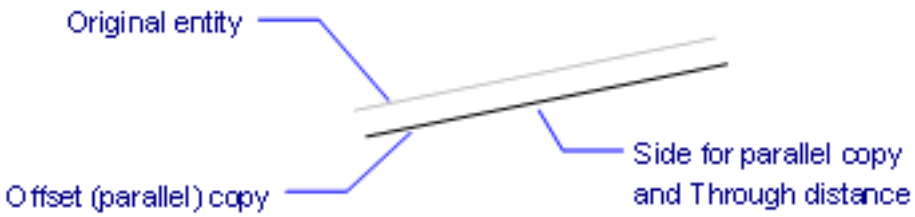

Figure 6.1741

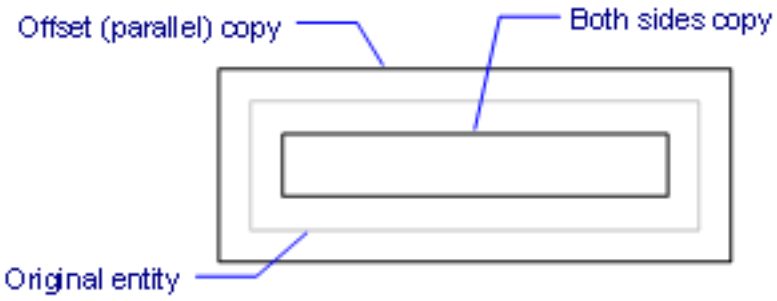

Figure 6.1742

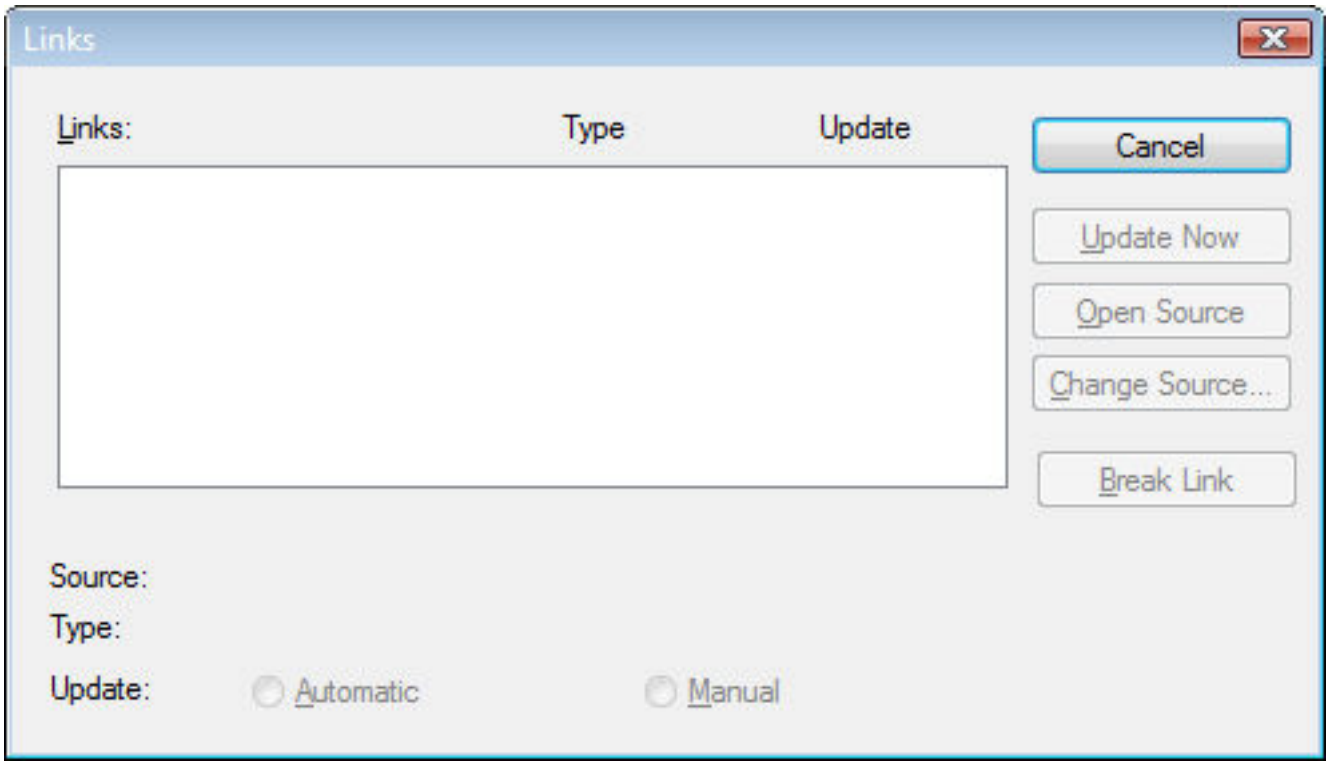
6.23.4 OleLinks

(6.2981 on page 6079) * Command only available on the Windows platform Edits the links of OLE entities that were embedded or linked to drawings (short for "object linking and embedding linking"). **Note:** Use the InsertObj (6.17.16) command to insert OLE objects in drawings.

Accessing the Command

command bar: **olelinks** menu bar: **Edit | Links** : **olelinks** Displays a dialog box: (6.1743 on the facing page) Change a setting for a link, and then click **Update Now**.

Figure 6.1743



Option	Description
Update Now	Updates linked OLE entities. When the source file changes, use this button to update the copy in the BricsCAD drawing.
Open Source	Opens the source file in the source application. This allows you to edit the source file. When done editing, choose **Update & Exit** from the File menu.
Change Source	Changes the source for the linked OLE entity.
Break Link	Breaks the link with the source file. When the link is broken, the OLE entity in the drawing no longer changes when the source file changes.
Source	Reports the path to the source file name.
Type	Reports the file type.
Update	Determines how the OLE entity in the drawing is updated, when the source changes: • **Automatic** - the OLE entity in the drawing changes whenever the source file changes. • **Manual** - the OLE entity in the drawing changes when you click the Update Now button.

Command Options

Related Commands

OleOpen (6.23.5) - opens linked and embedded objects in the appropriate application. PasteSpec (6.24.14) - pastes entities in several formats. InsertObj (6.17.16) - inserts foreign (non-BricsCAD) objects into drawings Insert (6.17.13) - inserts DWG files in drawings. ImageAttach (6.17.6) - attaches raster images to drawings. XAttach (6.34.1) - attaches DWG files to drawings.

Figure 6.1744

6.23.5 OleOpen

(6.2981 on page 6079) * Command only available on the Windows platform Opens the selected OLE object in the source application for editing. **Note:** Use the InsertObj (6.17.16) command to insert OLE objects in drawings.

Accessing the Command

command bar: **oleopen** : **oleopen** Prompts you: **Select OLE item to open: (Select an OLE object in the drawing)** The selected OLE object is opened.

Command Options

Option	Description
Select OLE item to open	Select an OLE object in the drawing. Alternatively, you can double-click the OLE object to open it in its source application. When you are finished editing the object in the source application, choose **File | Exit and Return to Drawing**. If the link between the drawing and the source application is broken, the OLE object cannot open.

Related Commands

OleLinks (6.23.4) - adjusts links of OLE entities embedded in or linked to drawings PasteSpec (6.24.14) - pastes entities in several formats. InsertObj (6.17.16) - inserts foreign (non-BricsCAD) objects into drawings

Figure 6.1745

6.23.6 OnWeb

(6.2981 on page 6079) Opens the Bricsys home page in your computer's default Web browser.

Accessing the Command

command bar: **onweb** : **onweb** Displays the Bricsys home page in a Web browser: (6.1746)

Command Options

No options.

Related Commands

Browser (6.6.19) - opens the default Web browser. Url (6.30.11) - opens the default Web browser. Mail (6.21.1) - attaches the current drawing to a message in the default email client.

Figure 6.1747

6.23.7 Oops

(7.3 on page 6132) Un-erases the last erased entity, including those erased by the **Block** command. **Note:** While the U command undoes the last action, this command returns the last entity erased, no matter how many commands earlier it occurred.

Accessing the Command

command bar: **oops** aliases: **undelete, unerase** : **oops** Does not prompt you in the command bar. If the drawing contains no erased entities, BricsCAD reports, "There is nothing to erase."

Command Options

No options.

Related Commands

U (6.30.3) - undoes the last command. Undo (6.30.5) - undoes one or more commands. Redo (6.26.8) - redoes the last undone command. Zoom (6.35.7) - utilizes the Previous option to show the previous view.

Figure 6.1748

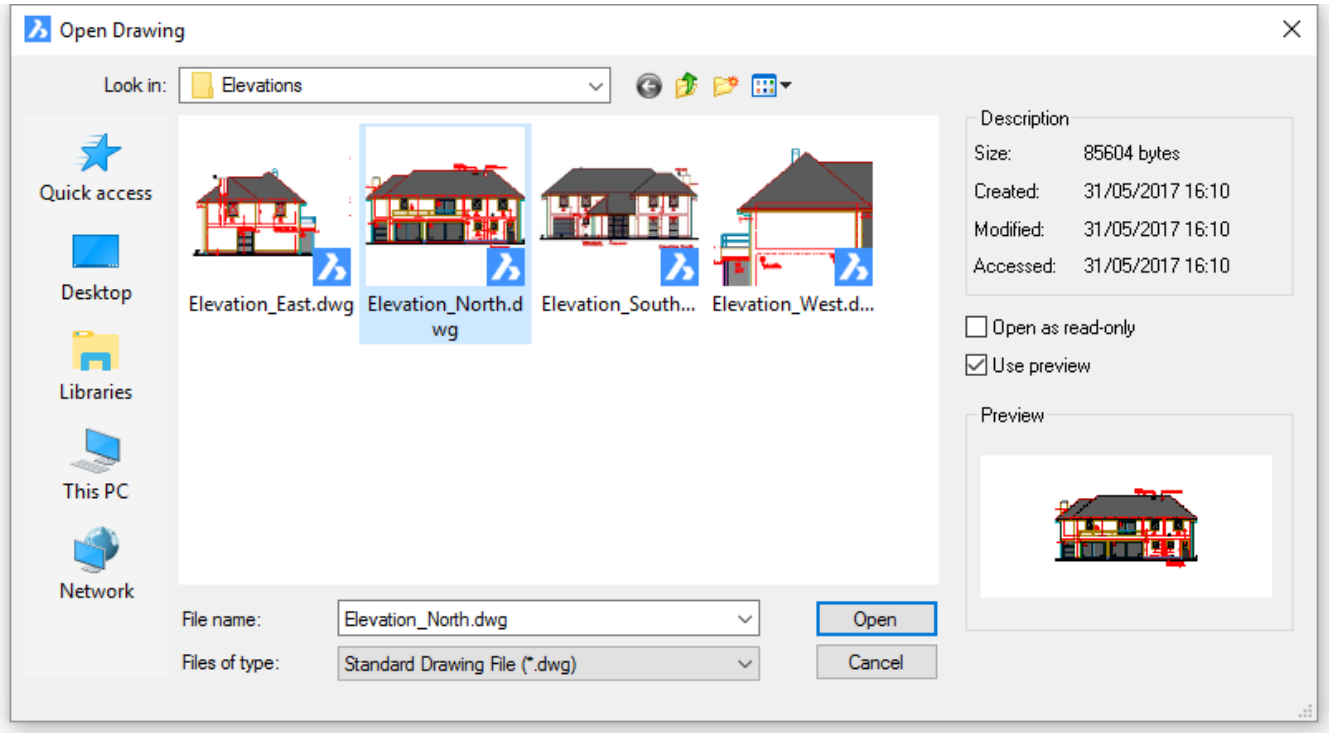
6.23.8 Open

(7.3 on page 6132) Opens drawing (DWG), template (DWT), and interchange (DXF) files in new document tabs. **Note:** To open a drawing in an existing drawing, use the Import (6.17.10) or Insert (6.13.13) commands.

Accessing the Command

command bar: **open** shortcut: **Ctrl+O** aliases: **op, im, import** menu bar: **File | Open** ribbon: **Home | File | Open** toolbar: **Standard |**  : **open** Displays a dialog box: (6.1749 on the facing page) Choose a file, and then click **Open**.

Figure 6.1749



Command Options

Option	Description
Look in	Selects the drive and folder.
File name	Specifies the name of the file.
Files of type	Selects the type of file: • **DWG** - CAD drawing file • **DWT** - drawing template file • **DXF** - drawing interchange file
Open	Opens the file in a new document tab.
Cancel	Closes the dialog box without opening a file.
Open as read-only	Toggles opening the drawing in read-only mode • **Yes** - opens the file in read-only mode, and displays [Read-Only] on the program's title bar • **No** - opens the drawing normally The drawing cannot be saved to the same file name, so to save changes to the drawing, use the SaveAs (6.27.3) command to save it by a different name.
Use Preview	Toggles the display of the the preview image: • **Yes** - displays a preview image in this dialog box • **No** - does not display the image

Procedures

- Working with document tabs (1.15.2)

Related Commands

Close (6.9.18) - closes the current drawing. Quit (6.25.8) - exits BricsCAD after closing open drawings. New (6.22.5) - starts new drawings. SecurityOptions (6.27.15) - sets a password to protect a drawing WhoHas (6.33.8) - reports the ownership of a drawing file. WorkSets (6.33.15) - creates and loads a set of drawing files. Allows to work with a named group of drawings.

Figure 6.1750

6.23.9 -OpenSheetSet

(6.2981 on page 6079) Opens an existing sheet set; prompts you in the command bar. **Note:** A sheet set is a collection of drawings used in projects that can be viewed, edited, and published (printed) as a set.

Accessing the Command

command bar: **-opensheetset** transparent: **-opensheetset** : **-opensheetset Prompts you in the command bar:** Enter sheet set file name: **(Type the path and file name of the .dst sheetset file)** The Sheets section of the Drawing Explorer dialog box displays; see the SheetSet (6.27.38) command.

Command Options

Option	Description
Enter sheet set file name	Type the path and file name of the .dst sheetset file, such as **C:\dwg\architectural\project.dst**

Related Commands

OpenSheetSet (6.23.10) - opens an existing sheet set; displays a file dialog box. NewSheetSet (6.22.4) - creates a new sheet set. SheetSet (6.27.38) - manages sheet sets. Opens the **Sheet Sets** panel.

Figure 6.1751

6.23.10 OpenSheetSet

(6.2981 on page 6079) Opens an existing sheet set through a file dialog box. **Note:** A sheet set is a collection of drawings used in projects that can be viewed, edited, and published (printed) as a set.

Accessing the Command

command bar: **opensheetset** ribbon: **Home | File | Open Sheetset** toolbar: **Drawing Explorer - Sheets |** 
: **opensheetset** Displays a dialog box: (6.1752 on the next page) Select a sheet set file (*.dst), and then click **Open**. The Sheet section of the Drawing Explorer dialog box opens; see the SheetSet (6.27.38) command.

6.23.12 Orthogonal

(7.3 on page 6132) Toggles orthographic (ortho) mode, which constrains drawing and editing to 90-degree angles. (6.1756)

Accessing the Command

command bar: **orthogonal** transparent: **'orthogonal** shortcut: **F8 Ctrl+L** keyboard shortcut: hold down **Shift** key while moving the cursor during editing and drawing aliases: **or ortho** menu bar: **Settings | Draw Orthogonal** ribbon: **Settings | Draw Orthongal** toolbar: **Settings |** status bar: **ORTHO** : **orthogonal Prompts you in the command bar:** ORTHOMODE is currently off: ON/Toggle/<Off>: **(Enter an option)**

Command Options

Option	Description
ON	Turns on orthogonal mode.
Toggle	Toggles orthogonal mode: • if on, turns it off • if off, turns it on
OFF	Turns off orthogonal mode.

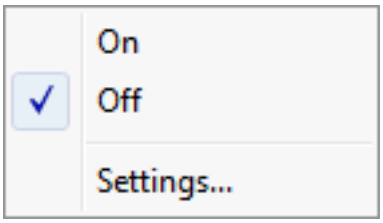
Status Bar Menu

Right-click ORTHO on the status bar for the shortcut menu: (6.2741 on page 5846) (6.2622 on page 5746)

Shortcut Menu	Description
On	Turns on orthographic mode.
Off	Turns off orthographic mode.
Settings	Opens the Coordinate Input section of the Settings dialog box. (6.1759 on the facing page)
Orthogonal mode	Toggles orthogonal mode: • **On** - turns on ortho mode • **Off** - turns off ortho mode

Figure 6.1757

Figure 6.1758



Related Commands

Snap (6.27.41) - sets the ortho angle. Settings (6.27.25) - sets the parameters for ortho mode.

6.23.13 -OSnap

(6.2981 on page 6079) Toggles entity snap modes at the command line (short for "object snap"). **Note:** Entity snap help you draw and edit precisely by snapping the cursor to the nearest geometric feature, as listed below. (6.2637 on page 5753)

Accessing the Command

command bar: **-osnap** transparent: **'-osnap** shortcut: **F3** aliases: **esnap -os** status bar: **ESNAP** mouse button: **middle** : **-osnap Prompts you in the command bar:** Snaps: NEArest/ENDpoint/MIDpoint/CENter/ GeometricCEnter/ PERpendicular/ TANgent/QUAdrant/INSertion/POInt/INTersection/APParent/ON/<OFF>: **(Enter an option, or press Enter to toggle all entity snaps on or off)** The following entity snaps work with the vertices and edges of 3D solid models:

- Endpoint
- Midpoint
- Nearest

Command Options

Option	Description
NEArest (6.22.2)	Toggles nearest entity snap mode. Snaps to the nearest point on any entity. (6.1795 on page 5007) Can also be toggled with the Nearest (6.22.2) command.
ENDpoint (6.13.7)	Toggles endpoint entity snap mode. Snaps to the endpoints of open entities, such as lines, arcs, open polylines, and open splines. (6.1786 on page 5005) Can also be toggled with the Endpoint (6.13.7) command.
MIDpoint (6.21.16)	Toggles midpoint entity snap mode. Snaps to the midpoint of open entities. (6.1787 on page 5005) Can also be toggled with the Midpoint (6.21.16) command.
CENter (6.9.3)	Toggles center entity snap mode. Snaps to the center of circular entities, such as circles, arcs, and polyarcs. (6.1788 on page 5005) Can also be toggled with the Center (6.9.3) command.
GeometricCEnter (6.15.5)	Toggles geometric center entity (GCenter) snap mode. Snaps to the centroid of any closed polylines and splines, planar 3d polylines, regions and planar faces of 3D solids. Can also be toggled with the GCenter (6.15.5) command.
PERpendicular (6.24.25)	Toggles perpendicular entity snap mode. Snaps to the perpendicular of one entity to another. (6.1888 on page 5085) Can also be toggled with the Perpendicular (6.24.25) command.
TANgent (6.29.10)	Toggles Tangent entity snap mode. Snaps to the tangencies of circular entities. (6.2637 on page 5753) Can also be toggled with the Tangent (6.29.10) command.
QUAdrant (6.25.7)	Toggles quadrant entity snap mode. Snaps to the quadrant points of circular entities, such as circles, arcs, and polyarcs. (6.2064 on page 5251) Can also be toggled with the Quadrant (6.25.7) command.

INSertion (6.17.18)	Toggles insertion entity snap mode. Snaps to the insertion point of blocks and text. (6.1792 on page 5006) Can also be toggled with the Insertion (6.17.18) command.
POInt (6.24.30) (Node)	Toggles node entity snap mode. Snaps to point entities. (6.1789 on page 5005) Can also be toggled with the Node (6.24.30) command.
INTersection (6.17.19)	Toggles intersection entity snap mode. Snaps to the intersection of any pair of entities. (6.1791 on page 5006) Can also be toggled with the Intersection (6.17.19) and 3dIntersection (6.3.7) commands.
APParent (6.4.16)	Toggles Apparent entity snap mode. Snaps to the apparent intersection of entities in 3D space. (6.1796 on page 5007) Can also be toggled with the Apparent (6.4.16) and 2dIntersection (6.2.1) commands.
EXTension (6.13.22)	Toggles extension entity snap mode. Snaps to the intersection of open entities, as if they were extended to the point of intersection. (6.1797 on page 5007) Can also be toggled with the Extension (6.13.22) command.
PARallel (6.24.5)	Toggles parallel entity snap mode. Snaps to the parallel point of entities. Allows to draw lines, polyline segments, xlines and rays parallel to another entity. (6.1798 on page 5008) Can aso be toggled with the Parallel (6.24.5) command.
ON	Turns all entity snap modes on.
OFF	Turns all entity snap modes off. Modes can also be turned off with the None (6.22.8) command.

Status Bar Menu

Right-click ESNAP on the status bar for the shortcut menu: (6.2741 on page 5846) (6.2622 on page 5746)

Shortcut Menu	Description
On	Turns on entity snaps.
Off	Turns off entity snaps.
Settings	Opens the Entity Snaps section of the Settings dialog box.

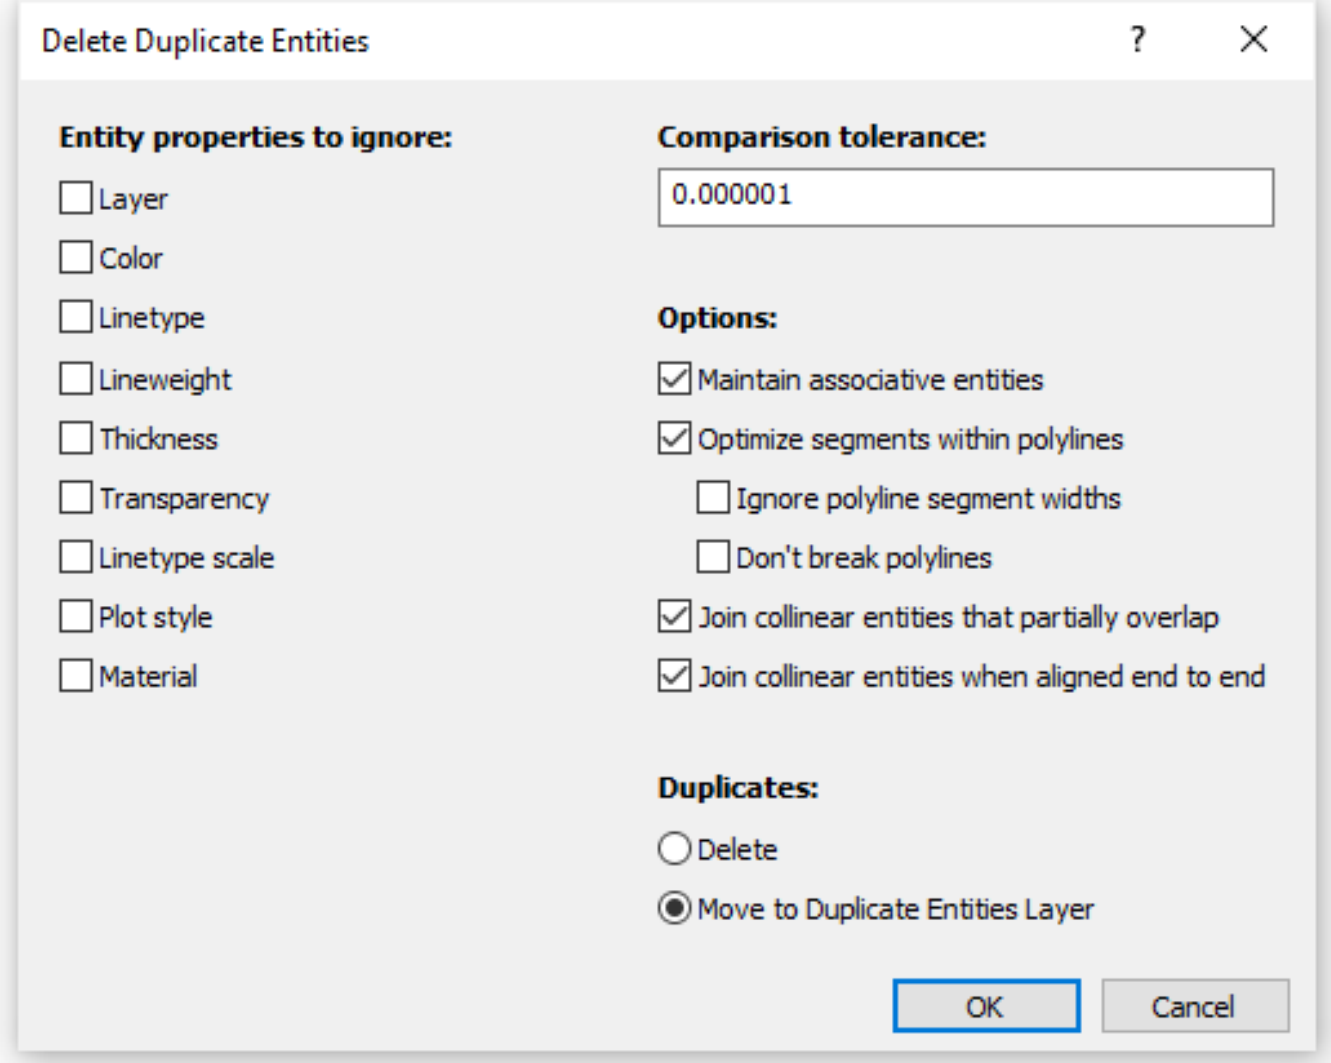
6.23.14 Overkill

(6.2981 on page 6079) Deletes duplicate entities and overlapping lines, arcs, and polylines, and unifies partly overlapping or contiguous ones; optionally moves duplicates to a dedicated layer. Combines duplicate blocks; optionally purges duplicate block definitions.

Accessing the Command

command bar: **overkill** transparent: **'overkill** menu: **Edit | Delete Duplicate Entities** : **overkill Prompts you in the command bar:** Select entities or [Combine duplicate blocks/selection options (?)]: **(Select entities to check or choose an option)** Select entities: [selection options (?)]: **(Select more entities to check, or press Enter to continue)** Displays a dialog box: (6.1778 on the next page)

Figure 6.1778



Command Options

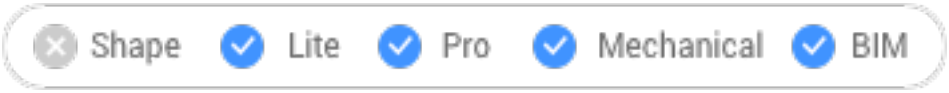
Option	Description
selection options (?)	Allows to choose between a variety of selection methods. See the SELECT (6.27.16) command.
Select entities	Select the entities to check for overlap: • Select one or more entities • Enter **all** to select all entities in the drawing • Press **Enter** to end entity selection The command opens the Delete Duplicate Entities dialog box, in which you specify which ones should be erased.
Entity properties to ignore	Selected properties are ignored when comparing duplicate or overlapping entities.
Comparison tolerance	Sets the tolerance for the comparison process. If set to 0 (zero), entities must match completely before being evaluated in the overkill process.
Options	Determines how special cases are handled: • **Maintain associative entities** - associative entities are not processed. • **Optimize segments within polylines** - segments of selected polylines are evaluated individually, duplicate vertices and segments are removed. When lines or arcs duplicate a polyline segment, one of them is deleted, which might break a polyline, unless the 'Don't break polylines option' is checked. • **Ignore polyline segment widths** - ignores the Width property of overlapping polyline segments • **Don't break polylines** - polyline entities are kept intact • **Join collinear entities that partially overlap** - partially overlapping entities are unified into a single entity • **Join collinear entities when aligned end to end** - collinear lines and polylines having coinciding endpoints are unified into a single entity or segment
Duplicates	Determines what to do with duplicates: • **Delete** • **Move to Duplicate Entities Layer** This layer is set by the OVERKILLLAYER system variable. Default = Duplicate Entities

Combine duplicate blocks	Searches the drawing for duplicate block definitions and replaces all such block instances by the most recent of these duplicates. Displays a dialog box. Do the following: • Check the **Block properties to ignore**. • Set the **Comparison tolerance**. • Optionally, select the **Purge duplicate blocks** option to delete duplicate block definitions.

Related Commands

-Overkill (6.23.17) - deletes duplicate entities and overlapping lines, arcs or polylines and unifies partly overlapping or contiguous ones; prompts you in the command bar. Break (6.6.21) - erases a portion of an entity. Erase (6.13.8) - erases entities from the drawing. Join (6.18.1) - joins lines, LW polylines, 2D polylines, 3D polylines, circular arcs, elliptical arcs, splines and helixes at their common endpoints. Oops (6.23.7) - returns erased entities. Purge (6.24.60) - removes unused named entities from drawings, such as unused layers and linetypes. Trim (6.29.35) - removes portions of entities. U (6.30.3) - unerases erased entities. Undo (6.30.5) - unerases erased entities.

Figure 6.1779



6.23.15 Optimize

(6.2947 on page 6049) Corrects inaccuracies in your drawings, such as small gaps between lines or near vertical, horizontal and diagonal lines.

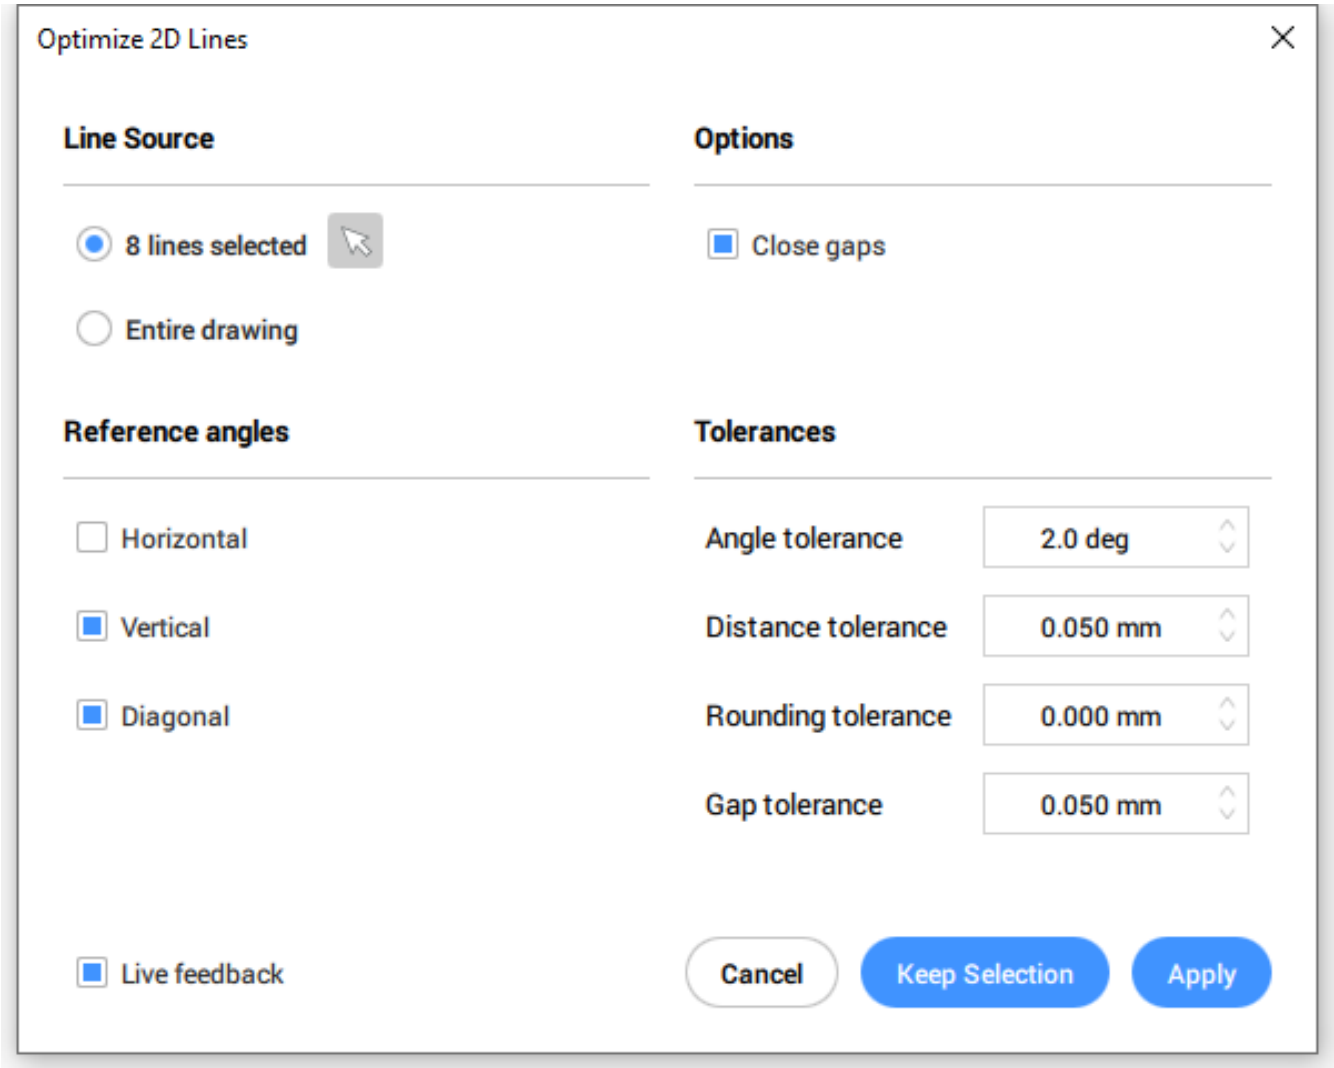
Accessing the Command

 Keyboard: **optimize** Ribbon Tab | Panel: **Manage | Drawing Optimizations : optimize** Displays a dialog box: (6.1780 on the next page) Do the following:

- Select the lines to be processed, optionally choose **Entire Drawing**.
- Select the desired options.
- Adjust the tolerances.
- Click the **Apply** button. or Click the **Keep Selection** button to leave the command without optimizing, but with keeping the highlighted lines selected. This option allows you to select suboptimal lines in a drawing.

BricsCAD reports XX lines optimized

Figure 6.1780



Command Options

Option	Description
Select lines in drawing	Click the arrow button to select entities in the drawing.
Entire drawing	Processes the entire drawing.
Close gaps	Closes gaps between collinear lines that are smaller than the gap tolerance.
Reference angles	
Horizontal	Corrects near horizontal lines according to the angle tolerance.
Vertical	Corrects near vertical lines according to the angle tolerance.
Diagonal	Corrects near 45° lines according to the angle tolerance.
Live feedback	Highlights the lines which match the selected options.
Tolerances	
Angle	Sets the angle tolerance in degrees, with respect to the World Coordinate System (WCS). Near horizontal, vertical or diagonal lines within this angle tolerance will be optimized.
Distance	Sets the distance tolerance.* Parallel Lines within this distance will be merged.
Rounding	Sets the rounding tolerance.* The calculated coordinates of the start- and endpoints will be rounded to the closest multiple of the rounding tolerance.
Gap	Sets the gap tolerance.* Gaps between collinear lines within the gap tolerance will be filled.

* Expressed in insertion units (see the INSUNITS system variable).

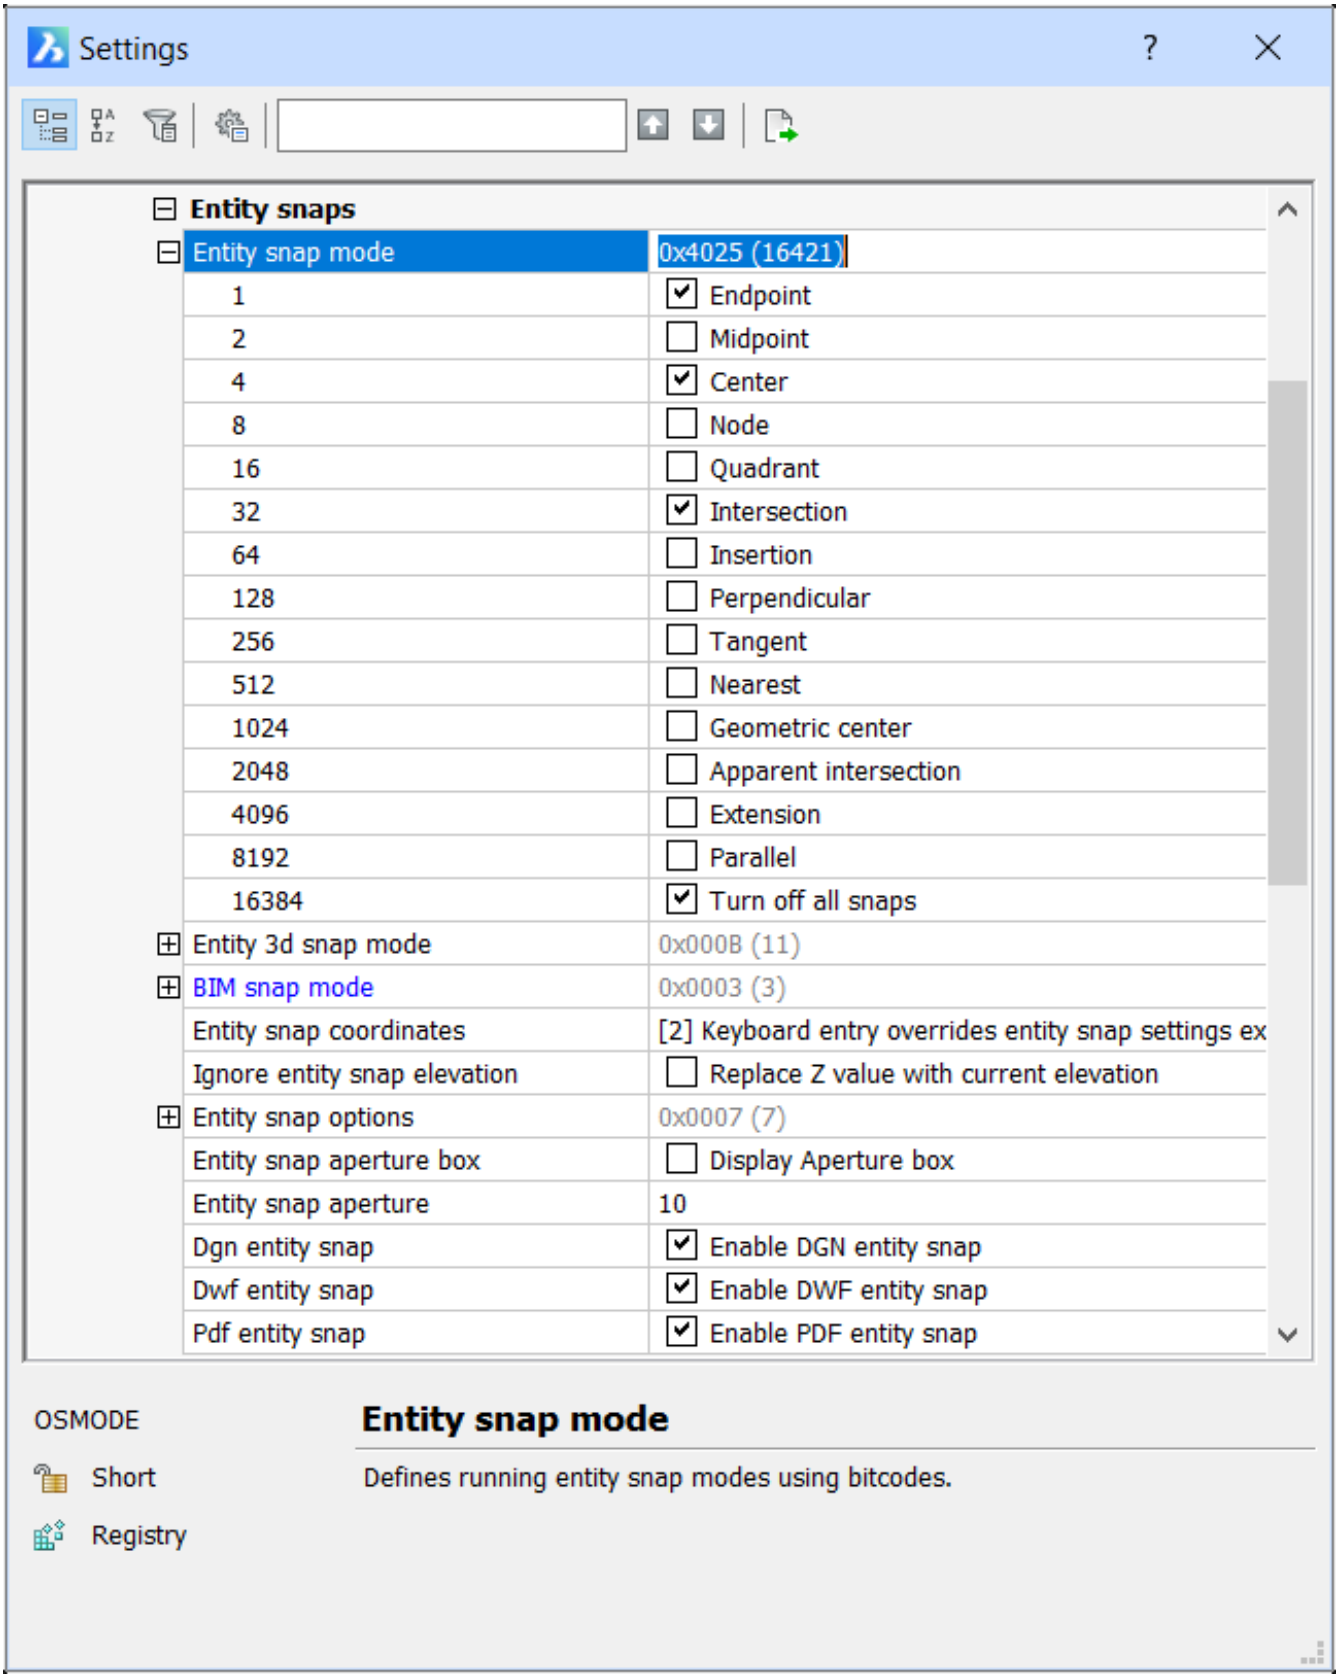
6.23.16 OSnap

(6.2981 on page 6079) Sets entity snaps through the Settings dialog box (short for "object snap"). **Note:** Entity snap help you draw and edit precisely by snapping the cursor to the nearest geometric feature, as listed below. (6.1787 on page 5005)

Accessing the Command

command bar: **osnap** transparent: **'osnap** shortcut: **F3** alias: **ddosnap ddesnap os setesnap** menu bar: **Settings | Entity Snap Settings** ribbon: **Settings | Entity Snap Settings** toolbar: **Settings |** status bar: **ESNAP** : **osnap** Displays the Entity Snaps section of the Settings dialog box: (6.1782 on the facing page) Change a setting, and then click **X**.

Figure 6.1782



Command Options

Option	Description
1 - Endpoint	Toggles endpoint entity snap mode. Snaps to the end points of open entities, such as lines,arcs, open polylines,and open splines. (6.1786 on page 5005) Can also be toggled with the Endpoint (6.13.7) command.
2 - Midpoint	Toggles midpoint entity snap mode. Snaps to the midpoint of open entities. (6.1787 on page 5005) Can also be toggled with the Midpoint (6.21.16) command.
4 - Center	Toggles center entity snap mode. Snaps to the center of circular entities, such as circles, arcs, and polyarcs. (6.1788 on page 5005) Can also be toggled with the Center (6.9.3) command.
8 - Node (Point)	Toggles node entity snap mode. Snaps to point entities. (6.1789 on page 5005) Can also be toggled with the Node (6.22.7) command.
16 - Quadrant	Toggles quadrant entity snap mode. Snaps to the quadrants points of circular entities, such as circles, arcs, and polyarcs. (6.2064 on page 5251) Can also be toggled with the Quadrant (6.25.7) command.
32 - Intersection	Toggles intersection entity snap mode. Snaps to the intersection of any pair of entities. (6.1791 on page 5006) Can also be toggled with the Intersection (6.17.19) command.
64 - Insertion	Toggles insertion entity snap mode. Snaps to the insertion point of blocks and text. (6.1792 on page 5006) Can also be toggled with the Insertion (6.17.18) command.
128 - Perpendicular	Toggles perpendicular entity snap mode. Snaps to the perpendicular of one entity to another. (6.1888 on page 5085) Can also be toggled with the Perpendicular (6.24.25) command.
256 - Tangent	Toggles Tangent entity snap mode. Snaps to the tangencies of circular entities. (6.2637 on page 5753) Can also be toggled with the Tangent (6.29.10) command.
512 - Nearest	Toggles nearest entity snap mode. Snaps to the nearest point on any entity. (6.1795 on page 5007) Can also be toggled with the Nearest (6.22.2) command.
1024 - Geometric Center	Toggles geometric center entity (GCenter) snap mode. Snaps to the centroid of any closed polylines and splines, planar 3d polylines, regions and planar faces of 3D solids. Can also be toggled with the GCenter (6.15.5) command.
2048 - Apparent Intersection	Toggles Apparent entity snap mode. Snaps to the apparent intersection of entities in 3D space. (6.1796 on page 5007) Can also be toggled with the Apparent (6.4.16) command.
4096 - Extension	Toggles extension entity snap mode. Snaps to the intersection of open entities, as if they were extended to the point of intersection. (6.1797 on page 5007) Can also be toggled with the Extension (6.13.22) command.
8192 - Parallel	Toggles parallel entity snap mode. Snaps to the parallel point of entities. Allows to draw lines, polyline segments, xlines and rays parallel to another entity. (6.1798 on page 5008) Can aso be toggled with the Parallel (6.24.5) command.

16384 - Toggle all snaps	Turns all entity snap modes off. Modes can also be turned off with the None (6.22.8) command.

Status Bar Menu

Right-click ESNAP on the status bar for the shortcut menu: (6.2741 on page 5846) (6.2622 on page 5746)

Shortcut Menu	Description
On	Turns on entity snaps.
Off	Turns off entity snaps.
Settings	Opens the Entity Snaps section of the Settings dialog box.

6.23.17 -Overkill

(6.2981 on page 6079) Deletes duplicate entities and overlapping lines, arcs, and polylines, and unifies partly overlapping or contiguous ones; displays options on the command line. Optionally moves duplicates to a dedicated layer. Combines duplicate blocks; optionally purges duplicate block definitions.

Accessing the Command

command bar: **-overkill** : **-overkill Prompts you in the command bar:** Select entities or [Combine duplicate blocks/selection options (?)]: **(Select entities to check, then press Enter or choose an option.)** Current settings: Tolerance=0.000001, Ignore=None, Optimize polylines=Yes, Combine partial overlap=Yes, Combine end-to-end=Yes, Delete or move duplicates=Delete Enter an option to change [Done/Ignore/tOlerance/optimize Plines/combine parTial overlap/combine Endtoend/Associativity/delete or Move duplicates] <Done>: **(Enter an option or press Enter to run the command)**

Command Options

Option	Description
Done	Executes the overkill procedure.
Ignore	Sets the properties to ignore; prompts you: **[None/All/Color/LAyer/Ltype/ltScale/LWeight/Thickness/TRanspa <None>** - **(enter an option)** • **None** - properties are taken into account to determine if overlapping entities should be combined • **All** - all properties are taken into account • **Color**, etc - the colors of overlapping entities are taken into account: if the colors match, then they are combined or deleted
tOlerance	Sets the tolerance for the comparison process; prompts you: **Specify tolerance for entity comparison precision: <0.000001>** - **(specify a number)** When set to 0 (zero), entities must match completely before being evaluated in the overkill process.

optimize Plines	Segments of selected polylines are evaluated individually, duplicate vertices and segments are removed. If lines or arcs duplicate a polyline segment, one of them is deleted, which might break a polyline, unless the **Don't break polylines** option is checked. Prompts you: **Optimize segments within plines [segment wiDth/Break polyline/Yes/No] <Yes>** - **(enter an option):** • **Segment width** - prompts you: **Ignore segment widths [Yes/No] <No>** - **(if Yes , ignores the Width property of polyline segments.)** • **Break polylne** - prompts you: **Break polylines [Yes/No] <Yes>** - **(if No, polyline entities are kept intact)** • **Yes** - optimizes polyline entities • **No** - polyline entities are not optimized
combine parTial overlap	Partially overlapping entities are unified into a single entity; prompts you: **Combine co-linear entities that partially overlap [Yes/No] <Yes>** - **(when yes, partially overlapping entities are unified into a single entity)**
Combine Endtoend	Collinear lines and polyline segments having coinciding endpoints are unified into a single entity or segment; prompts you: **Combine co-linear entities when aligned end to end [Yes/No] <Yes>** - **(when yes, collinear lines and polylines having coinciding endpoints are unified into a single entity or segment)**
Associativity	Associative entities are not processed; prompts you: **Maintain associative entities [Yes/No] <Yes>** - **(when yes, associative entities are not processed and so keep their associativity)**
delete or Move duplicates	Determines what to do with duplicate entities; prompts you: **Delete duplicates or move to Overkill layer [Delete/Move] <Delete>**: • **Delete** • **Move to Overkill layer** This layer is set by the OVERKILLLAYER system variable. Default = Duplicate Entities
Combine duplicate blocks	Searches the drawing for duplicate block definitions and replaces all such block instances by the most recent of these duplicates. prompts you: Current settings: Tolerance=0.000001, Ignore=None, Purge duplicate blocks=No **Enter an option to change [Done/Ignore/tOlerance/Purge duplicate blocks] <Done>:** Do the following: • Choose the Block properties to ignore. • Set the Comparison tolerance. • Optionally set the **Purge duplicate blocks** option to delete duplicate block definitions.

Related Commands

6.24.2 PageSetup

(6.2981 on page 6079) Creates and edits page setups for presetting plotting options in the Drawing Explorer.

Accessing the Command

command bar: **pagesetup** menu bar: **File | Page Setup** toolbar: **Layout |** : **PageSetup** Displays the Page Setups section of the Drawing Explorer dialog box: (6.1802 on the next page) Do one of the following:

- Click the **New** icon () to create a new page setup.
- Double click the icon () of a ***Layout*** or ***Model*** to edit the page setup of a layout or the model space.
- Select one or more layouts () then click the **Delete** button () to remove layouts.
- Double click the icon () of a model space page setup to edit the definition.
- Double click the icon () of a paper space page setup to edit the definition.

When creating a new page setup, choose between **Model space** or **Paper Space**, and then click the **Create** button. (6.1806 on page 5019) The Page Setup dialog box displays: (6.1804 on page 5016) Yes, this looks very similar to the Print dialog box, but there are some differences. Changes options in it, and then click **OK**. You are returned to the Page Setups dialog box.

Figure 6.1802

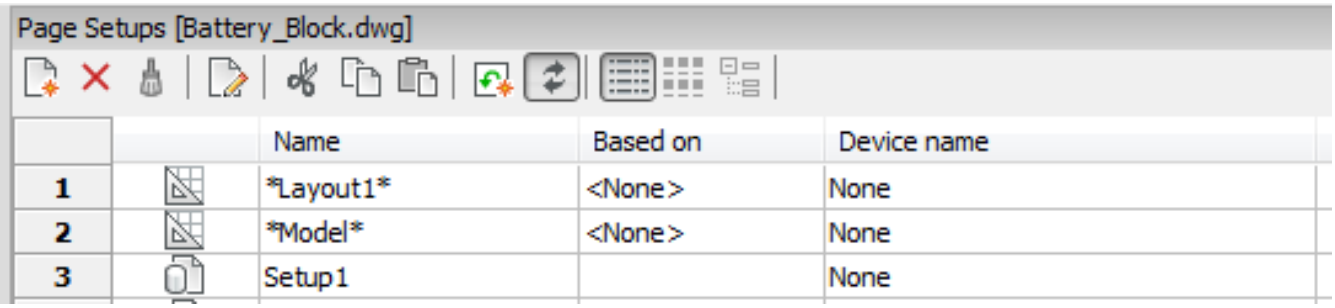
Command Options for Page Setups

(6.1805)

Page Setups Options	Description
New	Creates a new page setup; see Command Options for New Page Setup dialog box below
Delete	Removes the page setup from this drawing; displays a warning dialog box when you try to delete page setups with asterisks, such as *Layout1*
Edit	Edit the selected page setup; displays the Page Setup dialog box; see below
Cut / Copy / Paste	Cuts or copies the selected page setup for pasting into another drawing

Figure 6.1805

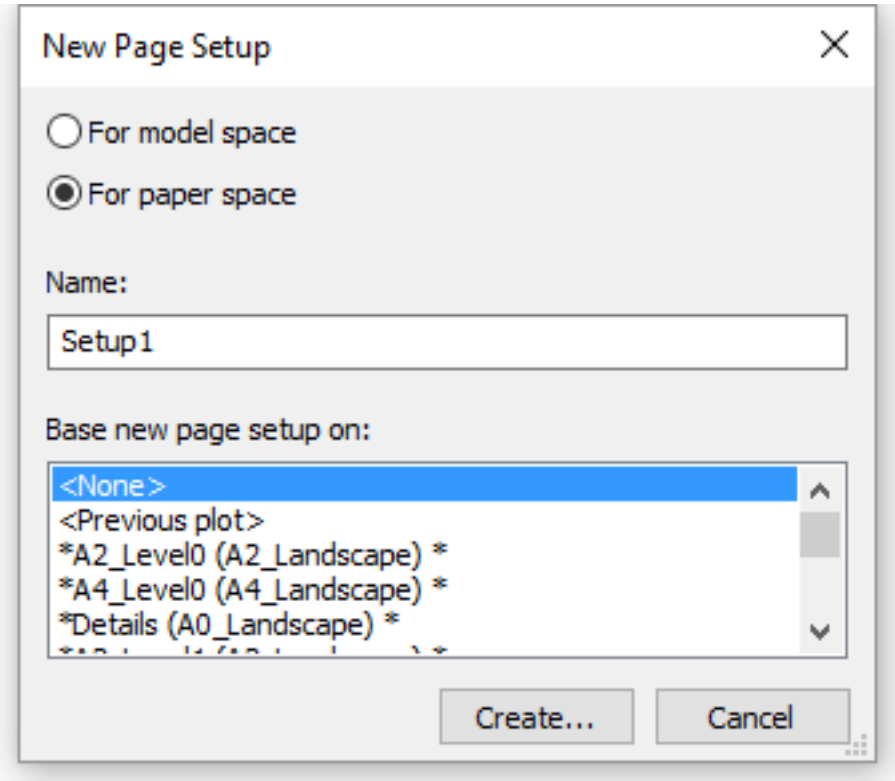


Command Options for New Page Setup Dialog Box

This dialog box appears when you click **New** in Page Setups: (6.1806 on the next page)

New Page Setup Options	Description
For Model Space	Lists model space setups in the list
For Paper Space	Lists paper space setups in the list
Name	Specifies the name for this new setup
Base New Page Setup On	Lists available page setups in this drawing; choose one: • **<None>** - creates a fresh page setup • **<Previous Plot>** - uses the settings from the last time the Print command was used • **Name** - bases the new setup on the settings in a named setup
Create	Moves on to the Page Setup dialog box; see below.
Cancel	Returns to the Page Setups section of the Drawing Explorer without creating the new setup

Figure 6.1806



Command Options for Page Setup Dialog Box

This dialog box appears when you click **Create** in New Page Setup:

Page Setup Option	Description
Printer/Plotter Configuration	Selects the printer or plotter. (6.1807 on page 5023) The program works with any output device installed on the system, including networked printers, print to file, faxes, and PostScript devices -- as well as predefined printer parameters stored in PC3 files.
Edit plotter configuration	Opens the printer's Properties dialog box for customizing the printer's parameters and creating PC3 files; see the PlotterManager (6.24.32) command.
Paper Size	Specifies the size of paper. You can select standard sizes listed by the droplist; these are sizes supported by the printer. (6.1808 on page 5023) While printer may appear to support many different sizes, you should select only the size of paper that is actually in the printer. If User Defined appears in the list, the paper's dimensions are specified by the printer's Properties dialog box. The image indicates the size, position and orientation of the current plot area on the selected paper size. • **Inches** - uses imperial units for measurements involving printing • **Millimeters** - uses metric units for measurements involving printing **Manage Custom Sizes** - (PDF output only.) Manages custom paper sizes when Print as PDF.pc3 is selected in the Printer/Plotter Configuration list; displays a dialog box: (6.1964 on page 5172)

Plot Area

Specifies which area of the drawing to print: (6.1810 on page 5024)

- **View** - prints the current view or a named view. Choose a view from the droplist; use the View (6.31.2) command to create named views.
- **Extents** - prints the extents of the drawing, which ensures every visible entity is printed. Entities on frozen layers are not taken into account when calculating the extents.
- **Limits** - prints the limits of the drawing, as specified by the Limits command.
- **Window** - prints a rectangular area of the drawing. You define the rectangular area by entering x,y coordinates or by clicking the **Select Area to be Printed**  button:

1. Click the button; you are prompted:
2. **Select first corner of window** - **(specify one corner of the rectangle by picking points or entering x,y coordinates.)**
3. **Select second corner of window** - **(specify the other corner.)**

The Print dialog box returns, with the pair of x,y coordinates added to the Windows Plot Area boxes; you can edit the values: (6.1811 on page 5024)

Plot Scale

Scales the drawing to fit it to the paper: **Fit print area to the size of paper** - scale is calculated automatically by the program, taking into account the print area of the drawing. When this option is turned on, you cannot specify the scale factor.:

- **Printable area** is the size of the paper, minus the margins.
- **Margins** are the strips along the four edges that the printer uses for handling the paper.

Scale - allows you to specify the scale factor to use for plotting; choose a scale factor from the droplist, or choose **Custom**. The scale factor shown can be edited with the ScaleListEdit (6.27.7) command. (6.1812 on page 5025)

- For scale factors like 1:5, the drawing is printed smaller.
- For scale factors like 5:1, the drawing is printed larger.

Custom - lets you enter in your own scale factors: (6.1968 on page 5173) (6.1969 on page 5173) **Scale lineweights** - when on, lineweights are scaled with respect to the plot scale.

Plot Style Table (Pen Assignment)	Specifies the plot style table to use for the printed output, which assigns properties to "pens," colors, and entities. (6.1815 on page 5025) • When the drawing does not use plot styles, then only CTB (color-based table) files are listed. • When the drawing uses plot styles, then only STB (style-based table) files are listed. **Display plot styles?** - **(enter an option)**: • **Yes** - displays plot styles at plot time • **No** - does not.
 Edit Plot Style	Opens the Plot Style Table editor dialog box; see the PlotStyle (6.24.28) command. This button is available only when the drawing uses STB plot styles.
 Create New Plot Style	Creates new plot styles; runs the Add Plot Style Table wizard; see the StylesManager (6.27.57) command. • When the drawing does not use named plot styles, then the wizard creates new color-dependent tables (CTB files). • If the drawing uses named plot styles, then the wizard creates new named plot style tables (STB files).
Drawing Orientation	Specifies the orientation of the drawing on rectangular paper: (6.1816 on page 5026) • **Portrait** - The drawing or layout x-axis is aligned with the shortest edge of the selected paper size. • **Landscape** - The drawing or layout x-axis is aligned with the longest edge of the selected paper size. • **Print upside down** - Prints the drawing upside-down. This is useful when paper with a drawing border is loaded backwards in the printer.

Plot Offset	Specifies the offset distance for the print. **Center On Page** - centers the print on the page, taking into account margins. Together with **Fit Print Area to Size of Page**, this option is excellent for prints where scale is unimportant. **X** and **Y** - **(enter positive or negative distances to move the drawing in the x and/or y distances)**: (6.1817 on page 5026) • **Positive values** - moves the drawing up and to the right. • **Negative values** - moves the drawing down and to the left. The lower left corner of the drawing is moved by the specified distance. This is useful when the paper has a title block area that might interfere with the drawing.
Plot Options	**Plot entity lineweights** - toggles the use the lineweights; this option is unavailable when Plot with Plot Styles is turned on\: • **On** - mimics lineweights assigned to the drawing in the print. • **Off** - ignores lineweights. **Plot with Plot Styles** - toggles the use of plot styles • **On** - uses plot styles to determine the look of the printed drawing, and overrides lineweight settings. • **Off** - does not use plot styles. **Plot Transparencies** - plots entities who have been assigned the the Transparency (1.25.9) property, either by-entity or by layer. **Plot Paperspace Last** - specifies the printing order; this option is available only when printing layouts, and so is unavailable in model tab: • **On** - prints model space entities, followed by paper space entities. • **Off** - prints paper space entities first, followed by entities in model space. **Hide Paperspace Entities** - when on, removes hidden lines from 3D entities in paper space. This option is disabled when printing model space.
Shaded Viewport Options	Override the visual style of the current view when printing model space: (6.1973 on page 5174) **Shade Plot** - **(choose a shade style plot the drawing with.)** This option is disabled when printing a paper space layout. The Shade Plot mode of a paper space viewport is defined in the Shade Plot property of the viewport. The quality of the Rendered option is defined through the current render preset; see the RenderPresets (6.26.27) command.
OK	Saves the changes, and then returns to the Page Setup dialog box.
Cancel	Returns to the Page Setup dialog box without printing the drawing.

Figure 6.1807

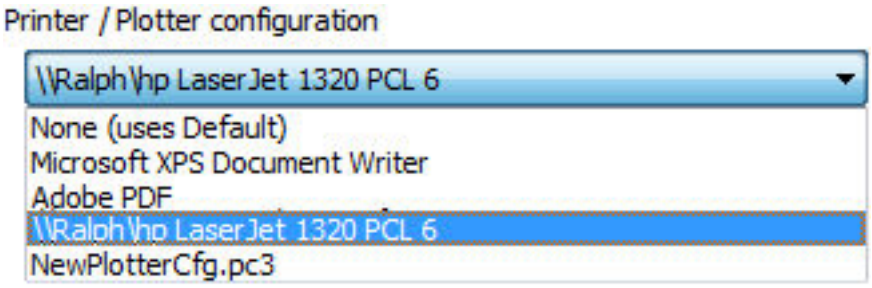


Figure 6.1808

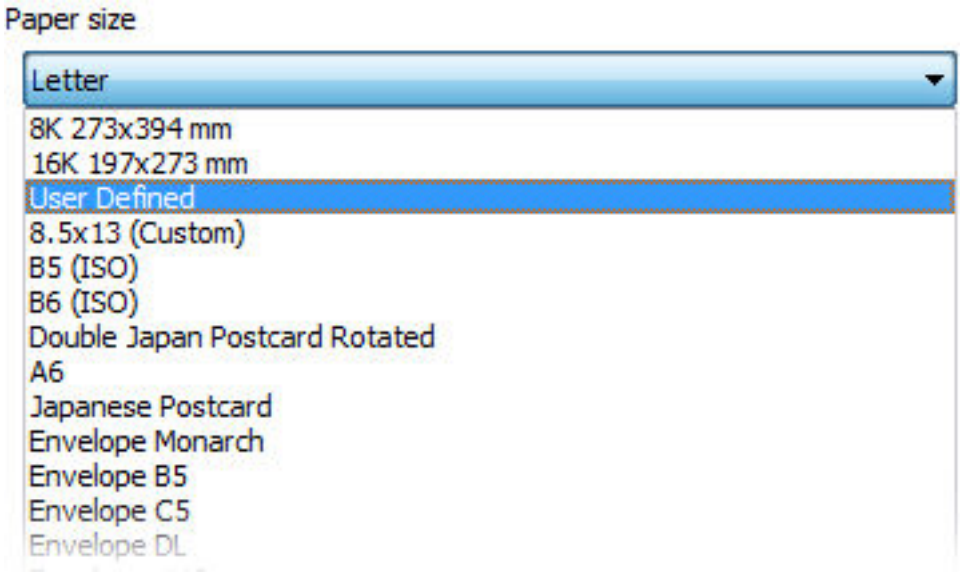

Related Commands

CPageSetup (6.9.54) - edits the page setup of the current layout or model space in a dialog box. ConvertCtb (6.9.28) - converts CTB plot style files to STB files. ConvertPStyles (6.9.38) - converts drawings from CTB to STB plot styles. ExportPdf (6.13.20) - exports layouts in a drawing to a pdf docucment. PsetupIn (6.24.57) - Imports page setup definitions from another drawing through a dialog box. -PsetupIn (6.24.58) - imports page setup definitions from another drawing through the command bar. PlotStyle (6.24.28) - sets the current plot style. Print (6.24.51) - plots drawings with plot styles. Properties (6.24.54) - changes plot styles assigned to entities. Publish (6.24.68) - allows to print a sheet list (= a list of model space or paper space layouts). Saves a sheet list to a file. -Publish (6.24.62) - prints a saved sheet list (= a list of model space or paper space layouts). ScaleListEdit (6.27.7) - edits the scale list of a drawing, used in **Plot Scale** section of the **Print** and **Page Setup** dialogs and the **Standard scale** property of a paper space viewport. Explorer (6.13.15) - Opens the **Drawing Explorer** dialog box.

6.24.3 Pan

(7.3 on page 6132) Moves the entire drawing in real-tme within the current viewport. **Note:** "Real-time" means that the drawing pans as you move the mouse.

Accessing the Command

 command bar: **pan** transparent: **'pan** alias: **p** menu bar: **View | Zoom| Pan** toolbar: **View | Zoom |** 
mouse button: hold down **middle** key and move the mouse
: **Pan** »Press ENTER or Esc to complete, or right-click to display context menu... **(Hold down the left mouse key and then move the mouse to pan the drawing; press Esc when done)**

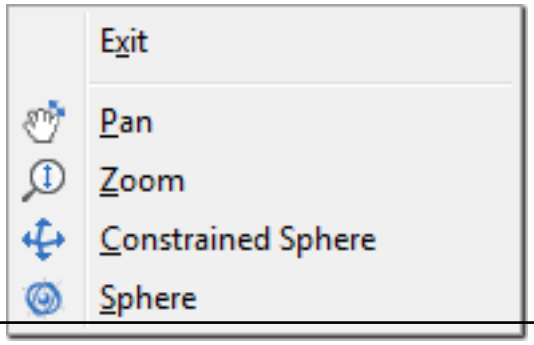
Command Options

Option	Description
Press ENTER or Esc to complete, or right-click to display context menu	Pans the drawing, notice that the cursor changes to a hand icon: 1. Hold down the left mouse key and then move the mouse to pan the drawing 2. Right-click to display a menu that lets you change modes; see below 3. Press **Esc** when done.

Note: You can also pan the drawing with the scroll bars; turn them on with the ScrollBar command. During the Pan command, right-click to see this menu that changes the viewing mode: (6.2177 on page 5361)

Menu Option	Description
Exit	Exits the command
Pan	Switches back to panning mode; see the RtPan (6.26.36) command
Zoom	Switches to real-time zoom mode; see the RtZoom (6.26.42) command
Constrained Sphere	Switches to real-time 3D orbiting mode; see the RtRot (6.26.37) command
Sphere	Switches to real-time 3D orbiting mode; see the RtRotf (6.26.39) command

Figure 6.1820



Related Commands

-Pan (6.24.4) - moves the drawing within the current viewport. RtPan (6.26.36) - pan the drawing in realtime. RtRot (6.26.37) - rotates 3D drawings in real-time (short for "real time rotation"). RtRotf (6.26.39) - rotates 3D drawings in real-time (short for "real time rotation"). RtZoom (6.26.42) - performs real-time zooming of the drawing. Zoom (6.35.7) - increases and decreases the size of the drawing within the current viewport.

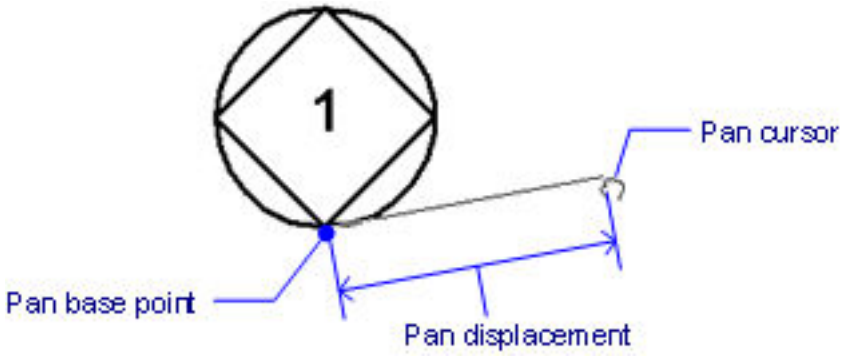
Figure 6.1822



6.24.4 -Pan

(7.3 on page 6132) Moves the entire drawing within the current viewport. (6.1822)

Accessing the Command

command bar: -**pan** transparent: **'-pan** alias: **-p** shortcuts: **PgUp PgDn** : **-Pan Prompts you in the command bar:** Left/Right/Up/Down/PGLeft/PGRight/PGUp/PGDown/<Pan base point>: **(Pick a point, or else enter an option)** Pan displacement point: **(Pick another point)**

Command Options

Option	Description
Pan base point	Specifies the pan distance's starting point.
Pan displacement point	Specifies the ending point.
Left	Pans the drawing 5% to the right. The drawing is panned by 5% of the width of the current viewport.
Right	Pans the drawing 5% to the left.
Up	Pans the drawing 5% downwards.
Down	Pans the drawing 5% upwards.
PaGe Left	Pans the drawing 100% to the right. You can also press the **Shift+Left** cursor key.
PaGe Right	Pans the drawing 100% to the left. You can also press the **Shift+Right** cursor key.
PaGe Up	Pans the drawing 100% upwards. You can also press the **Shift+Up** cursor key.
PaGe Down	Pans the drawing 100% downwards. You can also press the **Shift+Down** cursor key.

Related Commands

Pan (6.24.3) **-** moves the drawing within the current viewport. RtPan (6.26.36) - pan the drawing in realtime. Zoom (6.35.7) - increases and decreases the size of the drawing within the current viewport. RtZoom (6.26.42) - performs real-time zooming of the drawing.

6.24.5 Parallel

(6.2981 on page 6079) Toggles parallel entity snap; draws lines, polyline segments, xlines, and rays parallel to another entity. (6.1824)

Accessing the Command

command bar: **parallel** transparent: **par** toolbar: **Entity Snaps |**
: **Parallel Displays no prompts in the command bar.** When drawing a line, polyline segment, xline or ray:

1. Hover the cursor over the entity tow which you want to draw parallel
2. The parallel snap marker is displayed on the entity, but wait until a small cross indicates the entity is identified
3. The program displays a tracking line when the entity you are drawing is parallel to the selected entity

Command Options

Option	Description
Parallel	Entering this command toggles Parallel entity snap. It draw lines parallel to another entity. This command can be entered transparently during commands, but must be entered without the apostrophe prefix (').

Related Commands

OSnap (6.23.16) - toggles entity snap modes in the Settings dialog box. -OSnap (6.23.13) - toggles entity snap modes in the command bar. Aperture (6.4.14) - sizes the aperture cursor for entity snaps. 2dIntersection (6.2.1) - toggles apparent intersection snap mode. 3dIntersection (6.3.7) - toggles intersection snap mode. Apparent (6.4.16) - toggles apparent intersection snap mode. Center (6.9.3) - toggles center snap mode. Endpoint (6.13.7) - toggles endpoint snap mode. Extension (6.13.22) - toggles extension snap mode. From (6.14.13) - allows to enter relative coordinates with respect to a reference point. GCenter (6.15.5) - toggles Geometric Center (GCenter) entity snap. Insertion (6.17.18) - toggles insertion snap mode. Intersection (6.17.19) - toggles intersection snap mode. Midpoint (6.21.16) - toggles midpoint snap mode. Mtp (6.21.35) - allows to specify a point as the midpoint between two points. Nearest (6.22.2) - toggles nearest snap mode. Node (6.22.7) - toggles node (point) snap mode. None (6.22.8) - turns off all entity snap modes. Perpendicular (6.24.25) - toggles perpendicular snap mode. Quadrant (6.25.7) - toggles quadrant snap mode. Tangent (6.29.10) - toggles tangent snap mode.

Figure 6.1825

6.24.6 -Parameters

(6.2981 on page 6079) Manages dimensional constraint parameters through the command line.

NOTE	Use the ParametersPanelOpen (6.24.10) command to manage parameters through the Parameters panel.

Accessing the Command

command bar: **-parameters** : **-Parameters Prompts you in the command bar:** Enter parameter option [New/Edit/Rename/Dele
<?>: **(Enter an option, or else press Enter to display a list of the parameters defined in the current drawing)**

Command Options

Option	Description
New	Creates a user variable; prompts you: 1. **Enter name for new user parameter** - **(type a name for the new user variable. such as PipeLength.)** 2. **Enter expression** - **(enter a valid mathematical expression or a fixed value, such as 20.)**
Edit	Edits the expression for the dimensional constraint or user variable; prompts you: 1. **Enter parameter name** - **(type the name of a dimensional constraint parameter or a user variable, such as PipeRadius.) Old Expression = OutsideDiameter/2.0, Value = 30.15** 2. **Enter expression** - **(type a new mathematical or string expression or press Enter to confirm the current expression.)**
Rename	Renames a dimensional constraint or user variable. Prompts you: 1. **Enter old parameter name** - **(type the name of an existing dimensional constraint or user variable, such as PipeRadius.) Old Expression = OutsideDiameter/2.0, Value = 30.15** 2. **Enter new parameter name** - **(type a new name for the dimensional constraint or user variable.)**
Delete	Deletes a dimensional constraint or user variable. Prompts you: **Enter parameter name to delete** - **(type the name of an existing dimensional constraint or user variable.)** The parameter is erased with no warning.
?	Lists all dimensional constraints and user variables in the current drawing, showing the name, expression and current value of each dimensional constraint or user variable, such as:

Related Commands

CleanUnusedVariables (6.9.15) - purges variables not used in constraint expressions and not linked to dimensions. -BmParameters (6.8.25) - allows to list and edit the parameters of inserted components. -DesignTableEdit (6.10.27) - allows to edit designtables. Parametrize (6.24.7) - adds constraints and parameters to pure geometric models. DcAligned (6.10.6) - constrains the distance between two points. DcAngular (6.10.7) - constrains the angle between two lines or linear polyline segments; the total angle of an arc or an arc polyline segment; or the angle between three points on entities. DcConvert (6.10.18) - converts an associative dimension to a dimensional constraint. DcDiameter (6.10.8) - constrains the diameter of a circle or an arc. DcHorizontal (6.10.10) - constrains the horizontal distance (X-distance) between two points with respect to the current coordinate system. DcLinear (6.10.12) - constrains the horizontal distance (X-distance) or vertical distance (Y-distance) between two points with respect to the current coordinate system. DcRadius (6.10.11) - constrains the radius of a circle or an arc. DcVertical (6.10.15) - constrains the vertical distance (Y-distance) between two points with respect to the current coordinate system.

DcVertical (6.10.15) - constrains the vertical distance (Y-distance) between two points with respect to the current coordinate system. Delconstraint (6.10.26) - removes all dimensional and geometrical constraints from an entity. -DesignTableEdit (6.10.27) - allows to edit designtables. Dimconstraint (6.10.30) - applies a dimensional constraint to an entity or between constraint points on entities; converts associative dimensions to dynamic dimensions. Geomconstraint (6.15.17) - applies geometric relationships between entities and/or valid constraint points on entities. MechanicalBrowseOpen (6.8.32) - opens the Mechanical Browser panel. ParametersPanelOpen (6.24.10) - opens the Parameters panel. -Parameters (6.24.6) - Manages dimensional constraint parameters in the current drawing. ParametricBlockify (6.24.9) - automatically replaces equally shaped sets of solids, matching a selected parametric block or a set of parametrized solids in a model, by parametric block references.

Figure 6.1827

6.24.8 ParametersPanelClose

(6.2673 on page 5786) Closes the Parameters panel.

Accessing the Command

Keyboard: **parameterspanelclose ：ParametersPanelClose Displays no prompts.**

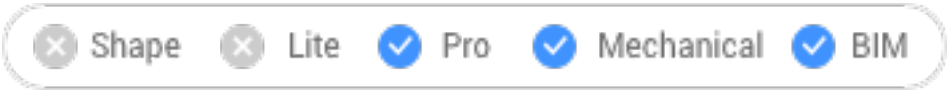
Command Options

No command options.

Related Commands

ParametersPanelOpen (6.24.10) - Opens the Parameters Panel. -ToolPanel (6.29.37) - Allows to control the display of tool panels, such as the Properties Bar, the Ribbon or the Sheet Sets panel from the command line.

Figure 6.1828



6.24.9 ParametricBlockify

(6.1951 on page 5150) Automatically replaces equally shaped sets of solids, matching a selected parametric block or a set of parametrized solids in a model, by parametric block references.

Accessing the Command

Keyboard: **parametricblockify** Menu: **Tools** Ribbon Tab | Panel: **Inserts | Blocks : parametricblockify** **Prompts you:** Select input parametric block or parametrized entities or [check Library/Settings/selection options (?)]: **(Select parametrized entities* or a single parametric block.)** Entities in set: 1 Select input parametric block or parametrized entities or [check Library/Settings/selection options (?)]: **(Select more parametrized entities* or press Enter.)** Select parametric block insertion point or [use Default point] <use Default point>: **(Specify a point.)** Select search space or [Entire drawing/selection options (?)] <Entire drawing>: **(Compose a selection set or press Enter.)** Finding candidates: x.xxxx sec Specify parametric block name or <ENTER to use default name>: **(Type a name for the new block.)** Creating parametric blocks: x.xxxx sec * Selected parametrized entities must not have Fix constraints (6.12.15).

Command Options

Option	Description
check Library	Searches the components library for parametric blocks. The current drawing is then search for matching geometry, which is then replaced by inserts of the block(s) in the library. The library search path is: <Install_Folder>/UserDataCache/Support/<Language>/BIM/Compon
Settings	Displays the BLOCKIFYMODE system variable in the Settings dialog box (see below).
use Default point	A default insertion point is used.
Entire drawing	Searches the entire drawing for matching geometry.
Use default name	Uses the default block name. (Param_Block, Param_Block 1, Param_Block 2, ...)

Settings

The BLOCKIFYMODE system variable defines the behavior of the BLOCKIFY and PARAMETRICBLOCKIFY commands. Depending on the value of the system variable, some prompts or options are not available: **Select insertion point:** available only if **Use default block insertion point** is not checked. **Select search space:** available only if **Use entire drawing as search space** is not checked. **Specify block name:** available only if **Use default block name** is not checked. (6.1829)

Bitcode	Option	Description

Figure 6.1829

Blockify settings	0x002F (47)
1	☑ Use entire drawing as search space
2	☑ Use default block insertion point
4	☑ Use default block name
8	☑ Replace patterns by arrays (BLOCKIFY only)
16	☐ Use block references as array base elements (BLOCKIFY only)
32	☑ Compare geometry only

BLOCKIFYMODE	**Blockify settings**
	Defines the behavior of the BLOCKIFY and PARAMETRICBLOCKIFY commands

1	Use entire drawing as search space	Controls whether you are prompted to select the part of the drawing to be searched. • **OFF**: You are prompted to select the part of the drawing to be searched. • **ON**: The entire drawing is searched. Suppresses the **Select search space** prompt.
2	Use default block insertion point	Controls whether you are prompted to define the block insertion point. • **OFF**: You are prompted to define the block insertion point. • **ON**: The default insertion point is used. Suppresses the **Select insertion point** prompt.
4	Use default block name	Controls whether you are prompted to specify the block name. • **OFF**: You are prompted for the block name. • **ON**: The default block name is used. Suppresses the **Specify block name** prompt.
8	Replace patterns by arrays	Applies to the BLOCKIFY command only. Controls whether patterns are replaced by arrays. • **OFF**: No arrays are created. • **ON**: Patterns of created blocks are replaced by arrays.
16	Use block references as array base elements	Applies to the BLOCKIFY command only. Controls whether the base element of the array is a block or the source entities. • **OFF**: The source entities are the base element of arrays. • **ON**: The created block is the base element of arrays.

32	Compare geometry only	Controls whether entity properties are compared or not. • **OFF**: Matching entities must have the same properties such as color, layer, etc. • **ON**: Entity properties are ignored.

Related Commands

Blockify (6.6.13) - automatically detects equally shaped solids in a model and replaces them by block references. Searches the drawing for an identical set of entities (2D and 3D) and replaces them by block references. Optionally replaces block patterns by arrays. Parametrize (6.24.7) - adds constraints and parameters to pure geometric models.

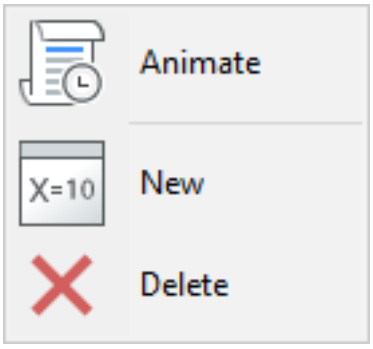
Command Options

Option	Description
Context menu	Right-click on any parameter: (6.1833 on the following page) • **Animate** : Allows to check the correctness of assigned parameter and see corresponding geometry modifications dynamically. (6.1834 on page 5043) • **New** : Create a new parameter. A new parameter using default values is added at the bottom of the list. • **Delete** : Deletes a dimensional constraint or user parameter.
	Click to create a new parameter. A new parameter using default values is added at the bottom of the list.
	Deletes the selected parameter(s). To select multiple parameters: • Click the first parameter of a series, then hold down the Shift key and select the last parameter. • Hold down the Ctrl key to add parameters to the selection.
	Shows the parameter(s) driven by the selected parameter. Select a parameter, then click the Show Driven Parameters button. Click the button again to display the complete list. (6.1835 on page 5044)
	Shows the driving parameter(s) of the selected parameter. Select a parameter, then click the Show Driving Parameters button. Click the button again to display the complete list. (6.1836 on page 5045)
	Filters the parameters list as you type. Only parameters which contain the character string display.
Name Expression Value	Column headings allow to sort the parameters list: 1. Click the column heading. A small triangle displays. The list is sorted alphabetically or small to large. 2. Click again to sort in reverse order. 3. Click again to sort in creation order. The small triangle disappears.

Figure 6.1833



Procedures

Editing the parameters and constraints in the parameters panel (2.5.21)

Related Commands

CleanUnusedVariables (6.9.15) - purges variables not used in constraint expressions and not linked to dimensions. -BmParameters (6.8.25) - allows to list and edit the parameters of inserted components. -Parameters (6.24.6) - manages 2D dimensional constraint parameters and user variables in the current drawing. -DesignTableEdit (6.10.27) - allows to edit designtables. MechanicalBrowserOpen (6.24.10) - opens the Mechanical Browser panel.

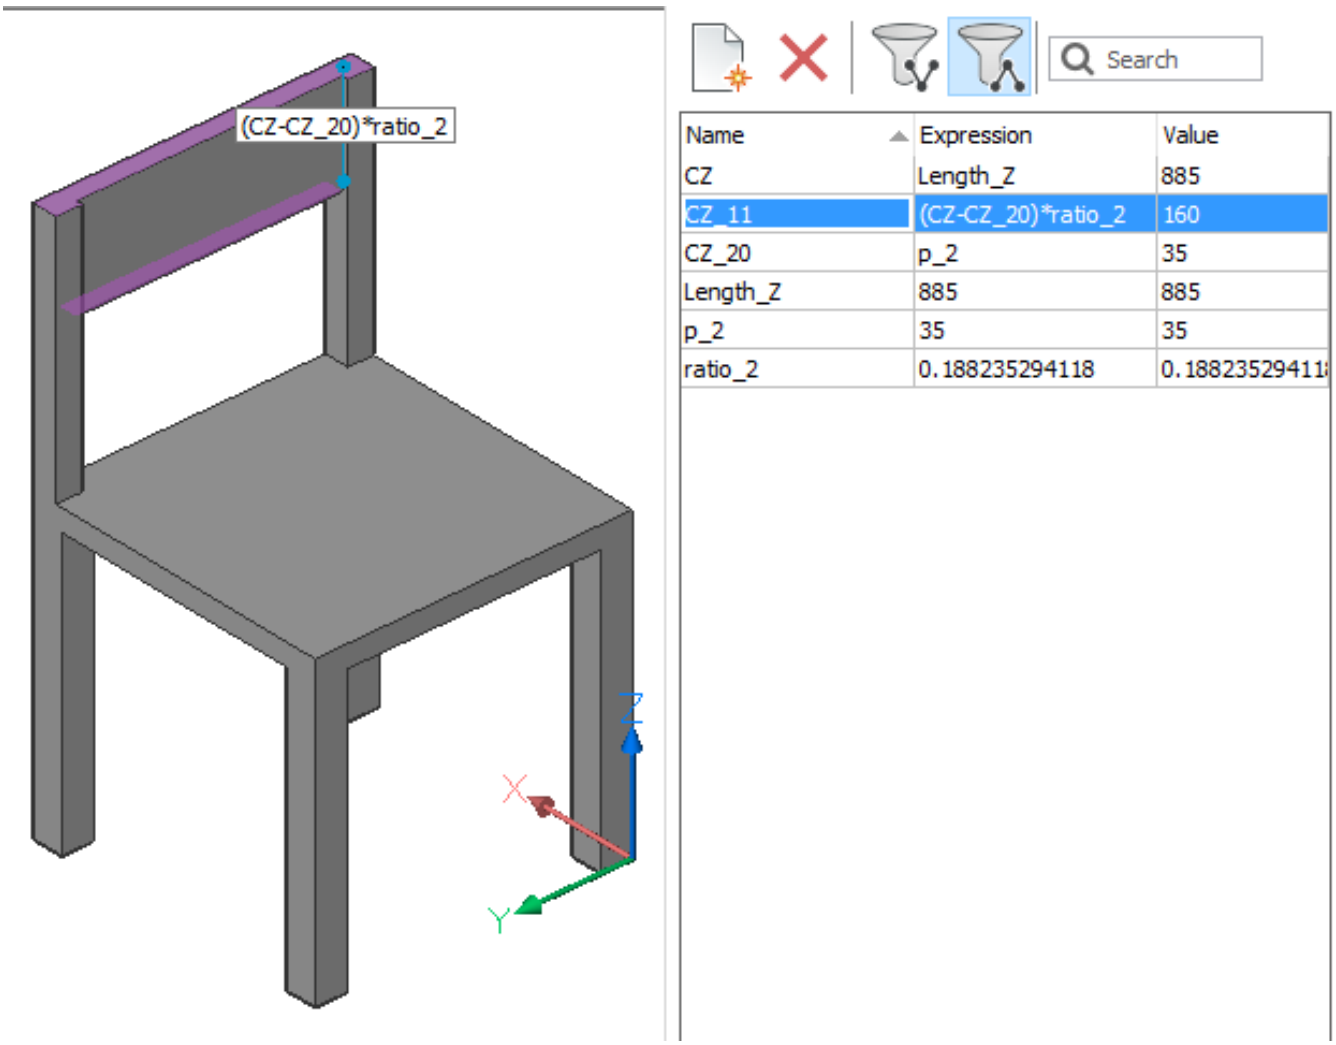

Figure 6.1837

6.24.11 PasteBlock

(7.3 on page 6132) Pastes CAD entities from the Clipboard as a block. **Note:** Before you can use this command, first use the the CopyClip (6.9.36) or CopyBase (6.9.58) commands to copy entities from the current drawing, another drawing, or even from another CAD program.

Accessing the Command

command bar: **pasteblock** shortcut: **Ctrl+Shift+V** menu: **Edit | Paste as Block** ribbon: **Home | Edit | Paste | Base As Block**
: **PasteBlock** When the Clipboard contains entities copied with the CopyClip (6.9.36) command, **you are prompted in the command bar:** Select insertion point: **(Pick a point, or enter x,y coordinates)** When the Clipboard contains entities copied with CopyBase (6.9.58), entities are pasted at their base point, and so you are not prompted in the command bar. This command can only paste CAD entities into the drawing as entities; other Clipboard content may be pasted as OLE entities.

Command Options

Option	Description
Select insertion point	Specifies the insertion point for the entities pasted from the Clipboard: • Pick a point • Enter x,y coordinates

Procedures

- To paste a selection set as a block (1.32.18)
- Paste a selection as a block in the target drawing (1.32.18)
- Move a selection as a block (1.32.11)

Related Commands

CopyBase (6.9.58)- copies selected entities to the Clipboard with a base point. CopyClip (6.9.36) - copies selected entities to the Clipboard. CopyHist (6.9.59) - copies all text from the Text window to the Clipboard. CutClip (6.9.48) - cuts (moves) selected entities to the Clipboard. PasteClip (6.24.13) - pastes entities from the Clipboard into the current drawing. PasteOrig (6.24.12) - pastes entities from the Clipboard at the original coordinates. PasteSpec (6.24.14) - displays the Paste Special dialog box for controlling the format of pasted entities.

Figure 6.1838

6.24.12 PasteOrig

(7.3 on page 6132) Pastes CAD entities from the Clipboard into a different drawing using the coordinates of the entities in the source drawing (short for "paste at original coordinates"). **Note:** Before you can use this command, first use the the CopyClip (6.9.36) or CopyBase (6.9.58) commands to copy entities from the current drawing.

Accessing the Command

 command bar: **pasteorig** menu bar: **Edit | Paste to original coordinates** |ribbon: **Home | Edit | Paste | Paste to Original Coordinates** Switch to another drawing before using the command: : **PasteOrig** There is no prompt. The program pastes the CAD content from the Clipboard into the target drawing using the entities' coordinates. For instance, a circle with center at 2,3 is pasted into the target drawing with its center at 2,3. This command does not paste entities back into the source drawing.

Command Options

None.

Procedures

- Using Copy and Pasteorig to copy entities between drawings (1.32.18)

Related Commands

CopyBase (6.9.58)- copies selected entities to the Clipboard with a base point. CopyClip (6.9.36) - copies selected entities to the Clipboard. CopyHist (6.9.59) - copies all text from the Text window to the Clipboard. CutClip (6.9.48) - cuts (moves) selected entities to the Clipboard. PasteBlock (6.24.11) - pasted entities from the Clipboard as a block at an insertion point. PasteSpec (6.24.14) - displays the Paste Special dialog box for controlling the format of pasted entities.

Figure 6.1839

6.24.13 PasteClip

(7.3 on page 6132) Pastes entities from the Clipboard into the drawing (short for "paste clipboard"). **Note:** Before you can use this command, first use the the CopyClip (6.9.36) or CopyBase (6.9.58) commands to copy entities from the current drawing, another drawing, or even from another CAD program.

Accessing the Command

 command bar: **pasteclip** shortcut: **Ctrl+V** menu bar: **Edit | Paste** ribbon: **Home | Edit | Paste** toolbar: **Standard |** 
: **PasteClip** When the Clipboard contains BricsCAD entities (including BricsCAD text), **this command prompts you in the command bar:** Select insertion point: **(Pick a point in the drawing, or specify x,y coordinates)** When the Clipboard contains non BricsCAD entities

- Non-BricsCAD text (including LISP and Diesel code) is pasted in the command bar, and the program execute the text as commands
- Non-BricsCAD entities, such as raster images, are pasted as OLE entities in the upper-left corner of the viewport

Command Options

Option	Description
Select insertion point	Specifies the insertion point for the entity: • Pick a point • Enter x,y coordinates

Procedures

- Using Copy and Paste to copy entities between drawings (1.32.18)
- Using Copybase and Paste to copy entities between drawings (1.32.18)

Related Commands

ChSpace (6.9.13) - moves entities from paper space to model space and vice versa. CopyBase (6.9.58)- copies selected entities to the Clipboard with a base point. CopyClip (6.9.36) - copies selected entities to the Clipboard. CopyHist (6.9.59) - copies all text from the Text window to the Clipboard. CutClip (6.9.48) - cuts (moves) selected entities to the Clipboard. PasteBlock (6.24.11) - pastes entities from the Clipboard as a block at an insertion point. PasteOrig (6.24.12) - pastes entities from the Clipboard at the original coordinates. PasteSpec (6.24.14) - displays the Paste Special dialog box for controlling the format of pasted entities.

Figure 6.1840

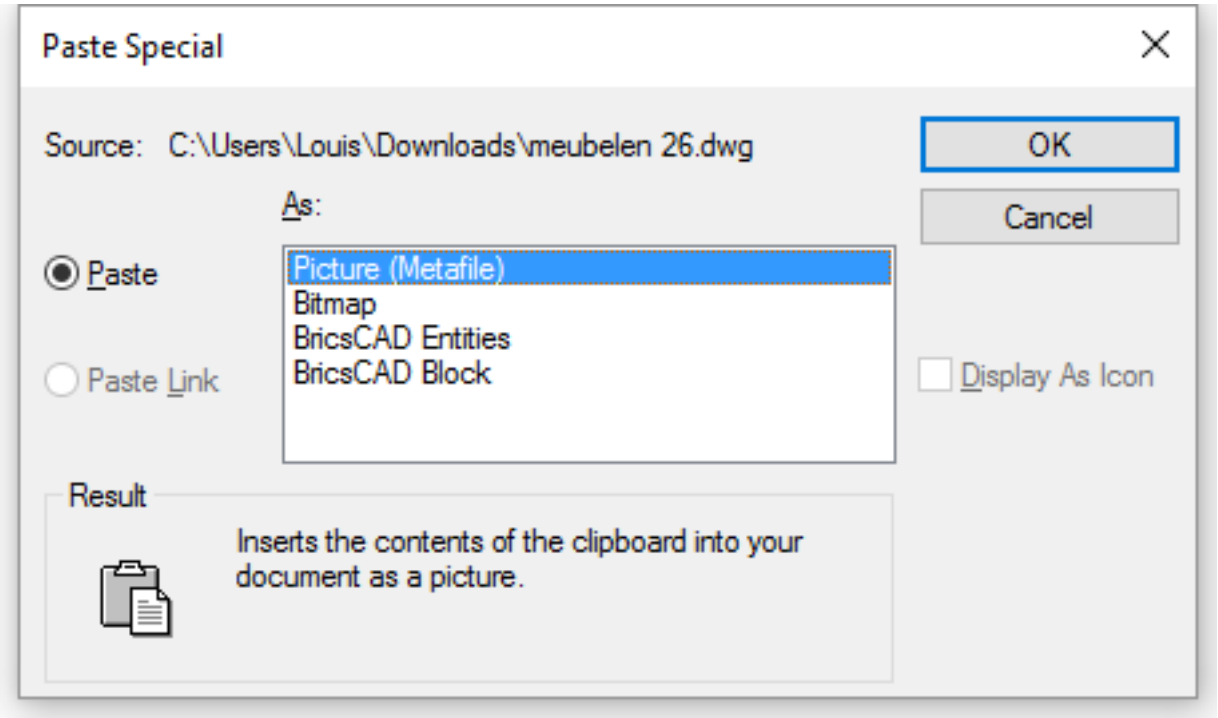
6.24.14 PasteSpec

(7.3 on page 6132) This command is available on Windows only. Gives you the choice of the type of object to paste from the Clipboard into the drawing (short for "paste special"). **Note:** Before you can use this command, first copy content from a drawing or other document to Clipboard using **Edit | Copy**.

Accessing the Command

 command bar: **pastespec** alias: **pa** shortcut: **Ctrl+Alt+V** menu bar: **Edit | Paste Special**
: **PasteSpec** When Clipboard contains CAD data, displays a dialog box that looks like this: (6.1841 on the following page) Choose a format under As, and then click **OK**.

Figure 6.1841



Command Options

Option	Description
As	Chooses the format in which to paste the entities. This list varies, depending on the content of the Clipboard. When the Clipboard contains data copied from a BricsCAD drawing, then the following formats are available: • **Picture Metafile** - entities are converted to a WMF-format image and then pasted as an OLE image • **Bitmap** - entities are converted to a BMP-format image and then pasted as an OLE image • **BricsCAD Entities** - pasted as individual entities; see below • **BricsCAD Block** - the entities in the Clipboard are pasted as a block; see below Here is the same dialog box, but with entities copied from an Excel spreadsheet: (6.1842 on page 5052)

Paste As BricsCAD Entities	Pastes CAD entities into the drawing as BricsCAD entities; prompts you: **Select insertion point or [Rotate/Scale/Mirror]** - **(enter an option)**: 1. **Select insertion point** - **(specify a point in the drawing by picking a point or entering x,y coordinates.)** 2. **Rotate** - prompts you: **Specify rotation angle** - **(enter an angle by which to rotate the entities.)** 3. **Scale** - prompts you: **Specify scale factor for XYZ axes** - **(enter a scale factor.)** 4. **Mirror** - prompts you: **Select mirroring control point** - **(pick a second point for the mirror line.)** The insertion point is the first point for the mirror line. When you enter 0,0 for the insertion point, the entities are pasted to their original coordinates.
Paste As BricsCAD Block	Pastes the CAD entities into the drawing as a block: 1. Starts the Insert command and then displays the Insert Block dialog box. 2. Fill out the properties and then click **OK**. 3. The program gives a block a generated name, such as A$C5C4F59B9, and inserts it into the drawing.
Paste Link	(This option is not available for CAD entities.) Pastes the entities in the drawing as an OLE object, and then creates a link to the originating application.
Display as icon	(This option is not available for CAD entities.) Displays the pasted entities as an icon identifying their source application.

Related Commands

CopyBase (6.9.58)- copies selected entities to the Clipboard with a base point. CopyClip (6.9.36) - copies selected entities to the Clipboard. CopyHist (6.9.59) - copies all text from the Text window to the Clipboard. CutClip (6.9.48) - cuts (moves) selected entities to the Clipboard. PasteBlock (6.24.11) - pasted entities from the Clipboard as a block at an insertion point. PasteClip (6.24.13) - pastes entities from the Clipboard into the current drawing. PasteOrig (6.24.12) - pastes entities from the Clipboard at the original coordinates. Table (6.29.2) - creates a table entity in the drawing through a dialog box.

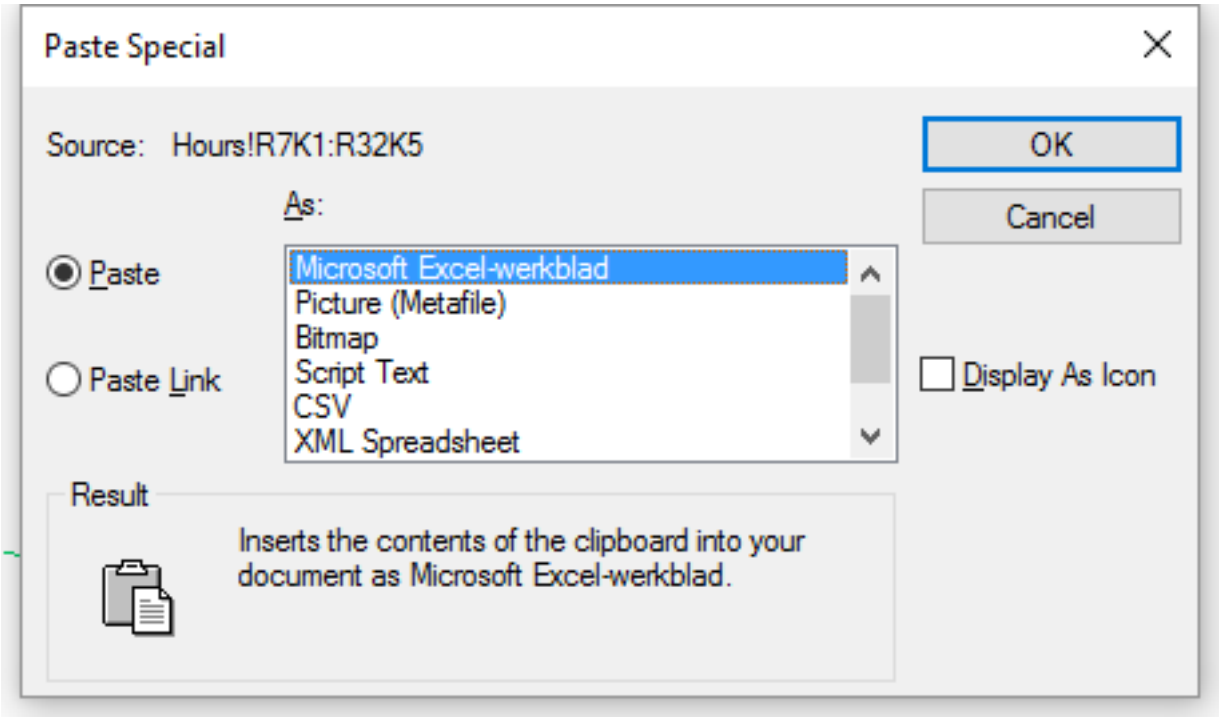

Figure 6.1843

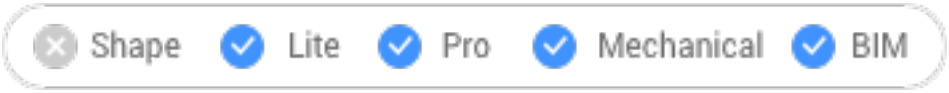

6.24.15 Pdf

(6.2947 on page 6049) Opens the Attachments panel. See the ATTACHMENTSPANELOPEN (6.4.30) command.

Figure 6.1844

6.24.16 Pdfattach

(6.2981 on page 6079) Attaches a PDF file as an underlay into the current drawing through dialog boxes. **Note:** To import PDF files as drawing entities, use the PdfImport (6.24.29) command.

Accessing the Command

 command bar: **pdfattach** transparent: **'pdfattach** menu bar: **Insert | Attach Pdf** ribbon: **Insert | PDF | Attach PDF** toolbar: **Insert |**  **: Pdfattach** Displays a dialog box: (6.1845 on the facing page) Select a PDF file, then click **Open**. The program displays a dialog box: (6.1846 on the next page) Specify parameters, and then click **OK**. The program attaches the PDF file to the drawing as an underlay.

Figure 6.1845

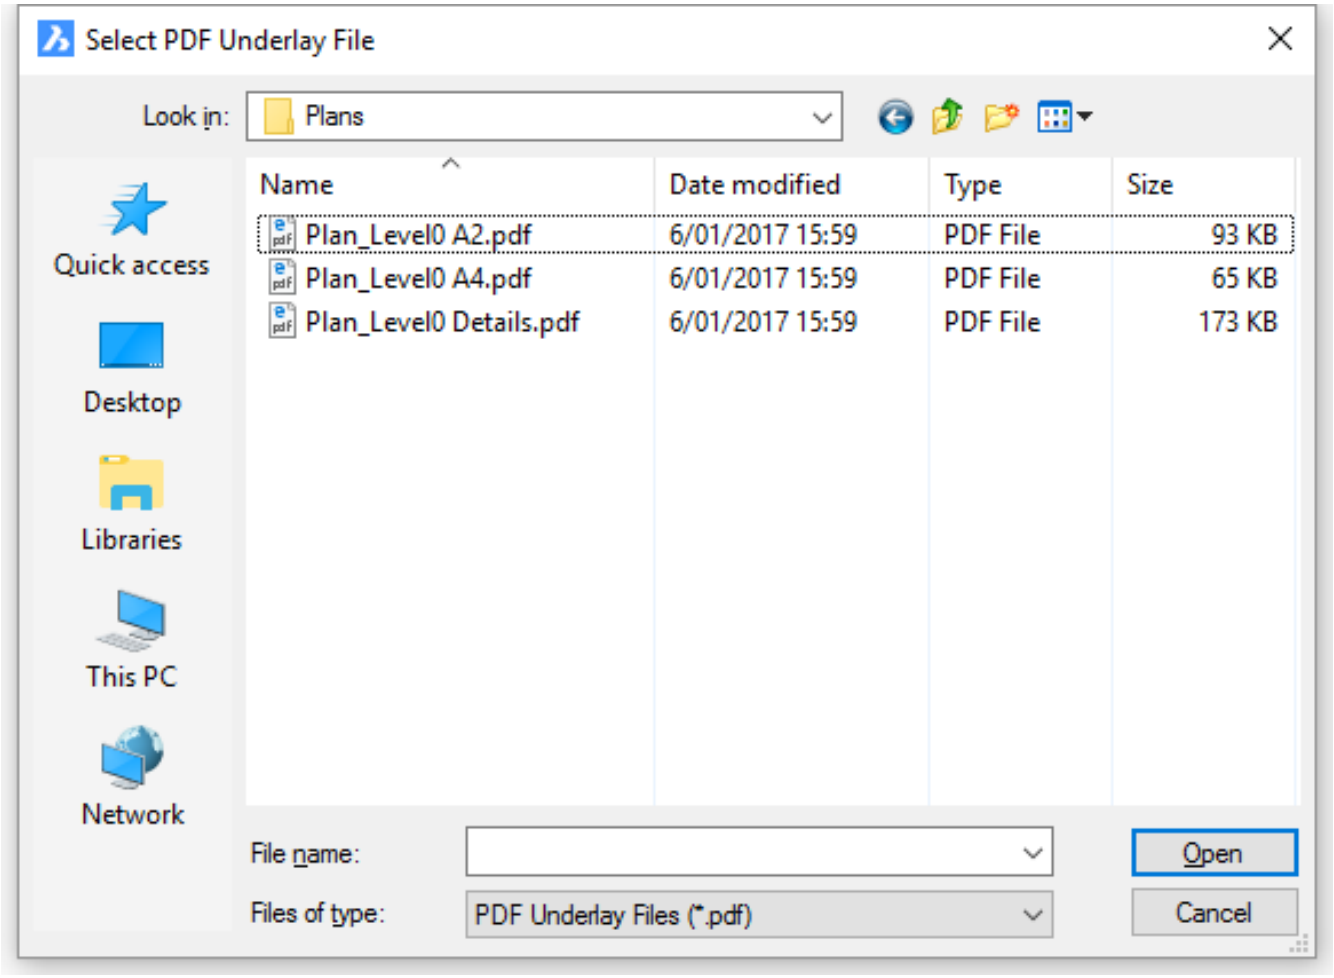

Figure 6.1846

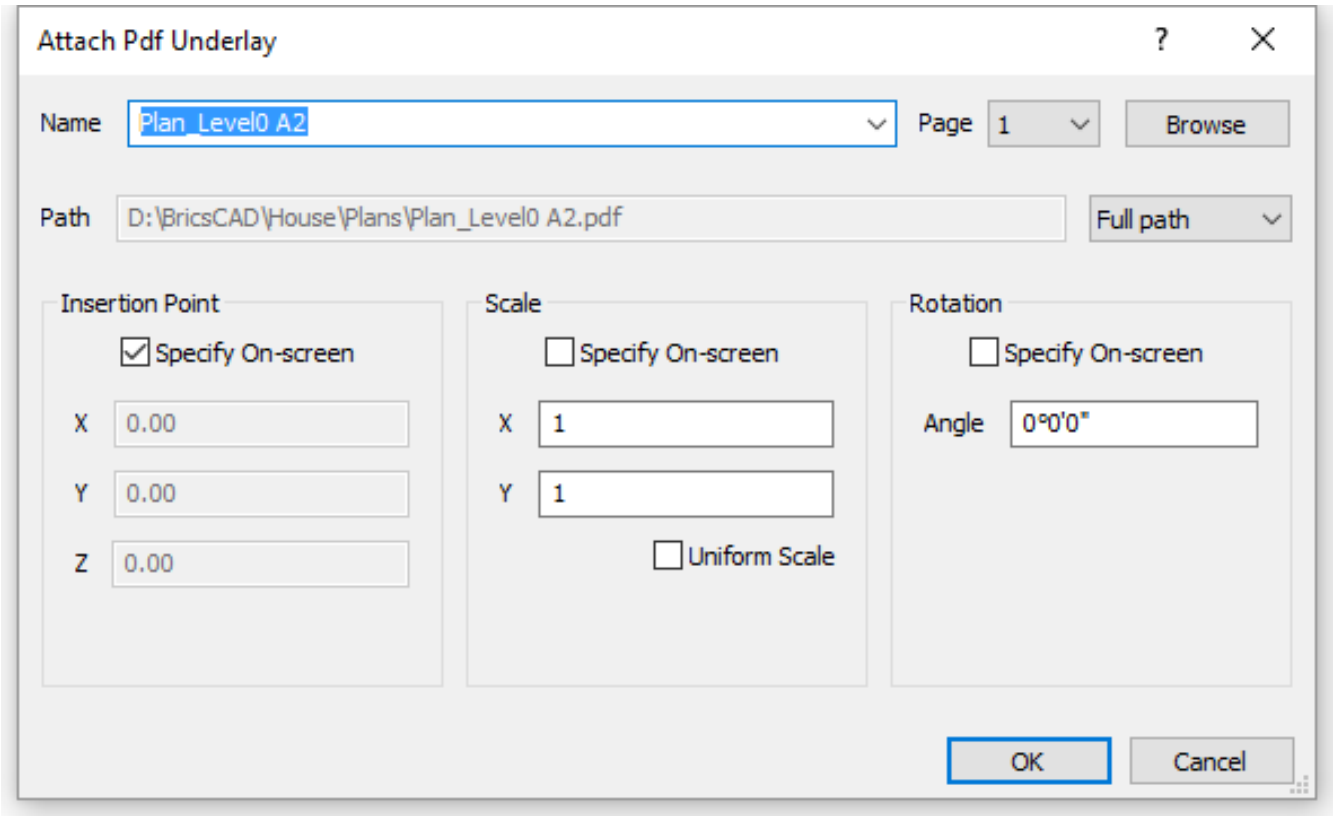


Command Options

Attach PDF Option	Description
Name	Specifies the name of the attached PDF file. When more than one PDF file has been attached to the drawing, their names are listed by the droplist.
Browse	Selects a different PDF file from your computer's disk drive or network: 1. In the Select PDF Underlay dialog box, choose a PDF file. 2. Click **Open**.
Path	Chooses the way the program remembers the path to the PDF file: (6.1848 on page 5058) 1. Click the **Path** droplist. 2. Choose an option: • **Full path** - stores the drive and folder(s) name to the PDF file as an absolute reference, such as: c:\cad\PDF\filename.pdf • **Relative path** - stores the part of the path to PDF file's folder, such as ..\filename.pdf . This option does not work until the drawing has been saved at least once. (..\ means one folder higher.) • **No path** - strips the drive and folder names, leaving just the PDF file name, such as filename.pdf.
Insertion Point	Specifies the location of the underlay's lower-left corner: **Specify On-screen** - determines how the insertion point is specified: • **On** - specify the insertion point in the drawing after the dialog box is closed; you will be prompted: **Insertion point for block** - **(pick a point or enter x,y,z coordinates.)** • **Off** - specify the insertion point in the dialog box, using the X, Y, and Z fields: **X**, **Y**, **Z** - specifies the x,y,z coordinates for the PDF underlay's insertion point; use 0,0,0 to insert the underlay at the drawing's origin.

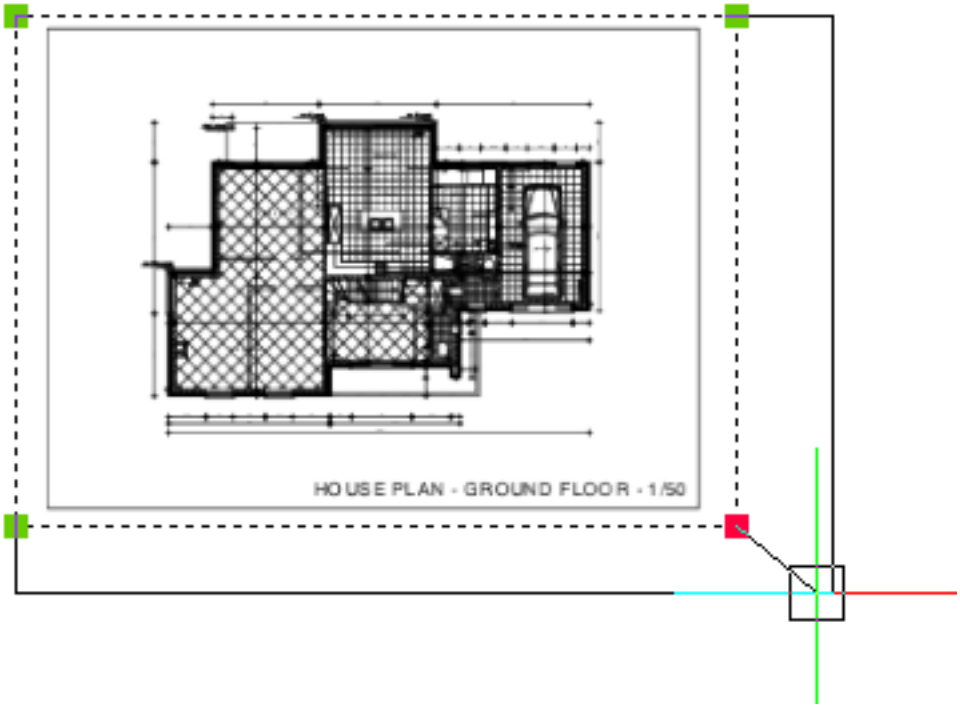
Scale	Specifies the size of the PDF underlay: **Specify On-screen** - determines how the scale factors are specified: • **On** - specify the scale factor in the drawing after the dialog box is closed; you will be prompted: **Scale factor <1.00>** - **(type a value or specify a point.)** • **Off** - specify the scale factor in the dialog box using the X, Y, and Z fields: **X**, **Y**, **Z** - specifies the scale factors of the underlay in the x, y, and z directions; use 1,1,1 to keep the underlay at its original size
Rotation	Specifies the rotation angle of the PDF underlay: **Specify On-screen** - determines how the rotation angle is specified: • **On** - specify the rotation angle in the drawing after the dialog box is closed; you will be prompted: **Rotation angle <0.00>** - **(pick two points or enter an angle.)** • **Off** - specify the rotation angle in the dialog box, using the X, Y, and Z fields: **Angle** - specifies the rotation angle about the insertion point. Positive angles rotate the underlay counterclockwise. Use 0 to keep the underlay at it original orientation.
OK	Attaches the PDF as an underlay.

Grips Editing

The scaling of a PDF underlay can be edited directly through grips.

1. Select the PDF underlay. It has four grips.
2. Drag a grip to adjust the scaling of the PDF underlay. (6.1847 on the next page)

Figure 6.1847



Procedures

- To control the PDF underlay caching (1.30.23)
- To attach a PDF underlay (1.30.23)
- To insert a PDF underlay (1.30.23)
- To control the display of a PDF underlay (1.30.23)
- To set the layer display in a PDF underlay (1.30.23)
- To clip a PDF underlay (1.30.23)

Related Commands

PdfAdjust (6.24.17) - Allows to adjust the fade, contrast and monochrome settings of a PDF-underlay in the command bar. -PdfAttach (6.24.18) - inserts a PDF file as an underlay into the current drawing; displays prompts in the command bar. Pdfclip (6.24.19) - allows clipping of PDF underlays. Pdflayers (6.24.22) - allows to control the display of layers in a PDF underlay. XRef (6.13.23) - attaches and controls externally referenced drawings through the Drawing Explorer. -XRef (6.34.8) - attaches and controls xrefs through the command bar. XClip (6.34.2) - clips externally-referenced drawings. Insert (6.17.13) - inserts drawings as blocks. -Insert (6.17.14) - inserts blocks, by prompting in the command bar and prompts for attribute values through the command bar or a dialog box.

Figure 6.1848

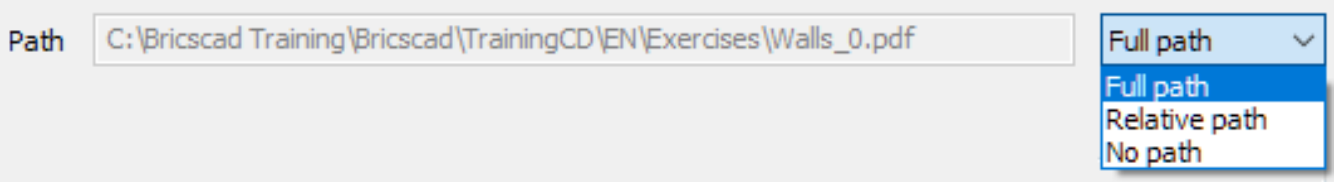


Figure 6.1849

Figure 6.1850

Underlay Adjust	
Contrast	100
Fade	0
Monochrome	Yes
Adjust colors for background	Yes

6.24.17 PdfAdjust

(6.2981 on page 6079) Adjusts the fade, contrast and monochrome level of one or more PDF underlays attached to the current drawing. **Note:** You may find it easier to use the Properties (6.24.54) panel's Underlay Adjust section to change these parameters. (6.1850)

Accessing the Command

command bar: **pdfadjust** transparent: **'pdfadjust** menu: **Modify | PDF Underlay | Adjust PDF**
: **PdfAdjust Prompts you in the command bar:** Select PDF underlay: **(Select one or more PDF underlays)** Entities in set: 1 Select PDF underlay: **(Select more PDF underlays, or else press Enter to continue)** Enter PDF underlay option [Fade/Contrast/Monochrome] <Fade>: **(Enter an option)**

Command Options

Option	Description
Fade	Sets the fade setting of the PDF underlay(s); prompts you: **Enter fade value [0-100] <0>** - **(type a value)**: • **0** - minimum fade: PDF underlay is fully displayed • **100** - maximum fade: PDF is barely visible
Contrast	Sets the contrast setting of the PDF underlay(s); prompts you: **Enter contrast value [0-100] <100>** - **(type a value.)** • **0** - minimum contrast: both light and dark elements are medium gray • **100** - maximum contrast: dark elements are dark, light elements light
Monochrome	Toggles the monochrome setting of the PDf underlay(s); prompts you: **Monochrome? <Yes>/No** - **(enter an option)**: • **Yes** - turns colors into shades of gray • **No** - keeps PDF as-is

Procedures

- To adjust the display settings of a PDF underlay (1.30.23)

Related Commands

Pdf (6.13.14) - attaches PDF files to the current drawing through the Drawing Explorer. Pdfattach (6.24.16) -

Figure 6.1851

6.24.18 -PdfAttach

(6.2981 on page 6079) Attaches a PDF file as an underlay into the current drawing through the command bar. **Note:** To import PDF files as drawing entities, use the PdfImport (6.24.29) command.

Accessing the Command

command bar: **-pdfattach** transparent: **'-pdfattach** : **-Pdfattach** PDF Underlay file: **(Type the path and name of the PDF document, or else press ~ to display the file dialog box)** PDF Underlay page number <1>: **(Type the page number, or else press Enter to accept the current page number)** Insertion point: **(Specify the insertion point in the drawing)** Scale [Size/XY scales] <1.00>: **(Type a value in the command bar, pick a point in the drawing, or else enter an option)** Rotation angle <0.00>: **(Type a value, or else pick a point in the drawing)**

Command Options

Option	Description
PDF Underlay file	Specifies the file name of the PDF file to attach: • Type the path and name of the PDF file • Press ~ to display the file dialog box
PDF Underlay page number	(This prompt does not appear when the PDF file has just one page.) Specifies the page number of a multi-page PDF file to insert: • Type the page number • Press **Enter** to accept the current page number
Insertion point	Specifies the insertion point in the drawing: • Pick a point in the drawing • Enter x,y coordinates for the lower left corner of the PDF attachment
Scale	Specifies the size of the PDF underlay: • Enter a scale factor: Larger than 1.0 increases the size of the underlay Smaller than 1.0 makes the underlay smaller • Move the cursor to dynamically size the underlay
Size	Sets the size of the insert dynamically; prompts you: **Specify opposite corner** - **(pick a point.)** The first point is the insertion point. As you move the cursor, the program ghosts the size and position of the underlay relative to the insertion point.

XY Scale factors	Scales the underlay separately in X- and Y direction differently; prompts you: 1. **Specify X scale factor <1.00>** - **(type a value or pick a point.)** 2. **Specify Y scale factor < Equal to X scale factor <1.00>** - **(enter an option)**: • Press **Enter** to set the Y scale factor equal to the X scale factor • Pick a point in the drawing • Type a value
Rotation angle	Specifies the angle of the underlay: • Enter an angle: Positive numbers rotate the underlay counter clockwise from the x-axis Negative numbers rotate it clockwise • Move the cursor to dynamically rotate the underlay

Related Commands

PdfAdjust (6.24.17) - Allows to adjust the fade, contrast and monochrome settings of a PDF-underlay in the command bar. Pdfclip (6.24.19) - allows clipping of PDF underlays. Pdflayers (6.24.22) - allows to control the display of layers in a PDF underlay. XRef (6.13.23) - attaches and controls externally referenced drawings through the Drawing Explorer. -XRef (6.34.8) - attaches and controls xrefs through the command bar. XClip (6.34.2) - clips externally-referenced drawings. Insert (6.17.13) - inserts drawings as blocks. -Insert (6.17.14) - inserts blocks, by prompting in the command bar and prompts for attribute values through the command bar or a dialog box.

Figure 6.1852

6.24.19 Pdfclip

(6.2981 on page 6079) Clips a PDF underlay with a rectangular or polygonal boundary, and inverts the boundary.

Accessing the Command

 command bar: **pdfclip** command bar: **'pdfclip** ribbon: **Insert | PDF | Clip PDF**
: Pdfclip Select PDF underlay: **(Choose a pdf underlay)** Enter PDF clipping option [ON/OFF/Delete/New] <New>: **(Enter an option, or else press Enter to execute the default option)**

Command Options

Option	Description
Select PDF underlay	Selects the PDF underlay to clip: click the frame of the PDF underlay, not the body of the PDF itself.
ON	Turns the clipping boundary on; the area outside the clipping boundary is hidden from view.
OFF	Turns the clipping boundary off; all of the PDF underlay is again visible. The clipping boundary is saved.
Delete	Deletes an existing clipping boundary.
Invert	Inverts the clipping boundary. Initially, the PDF underlay outside of the clipping boundary is hidden. Use this option to invert it, so that the portion of the PDF inside the boundary is hidden, and that outside is visible. You may find it more convenient to use the Misc section of the Properties (6.24.54) panel to turn the clipping on and off, and to invert it.
New	Draws a new clipping boundary: When no boundary exists, you are prompted: **Enter PDF clipping type [Polygonal/Rectangular] <Rectangular>** - **(type P or R)**: • **Polygonal** - draws multi-sided clipping boundary; see below • **Rectangular** - draws rectangular clipping boundary; see below When a boundary already exists you are first prompted: **Delete old boundary? [Yes/No]** - **(type Y or N)**: • **Yes** - replaces the existing clipping boundary, and then proceeds to prompts you for the new one • **No** - the program exits the command

Polygonal	Draws multi-sided clipping boundaries; prompts you: 1. **Start of polyline - (pick a point in the drawing, or specify x,y coordinates.)** 2. **N ext point - (pick another point in the drawing, or specify x,y coordinates.)** 3. **Undo/next point - (pick another point in the drawing, specify x,y coordinates, or press Enter to complete the polygon.)** As you pick points, the program ghosts the polygon. Type **U** to undo the previous point.
Rectangular	Draws rectangular clipping boundary; prompts you: • **Specify first corner - (pick a point in the drawing, or specify x,y coordinates.)** • **Specify opposite corner - (pick another point in the drawing, or specify x,y coordinates.)** The program draws the rectangle.

Procedures

- To clip a PDF underlay (1.30.23)
- To toggle the display of the clipped part of a PDF underlay (1.30.23)
- To delete a clipping boundary (1.30.23)

Related Commands

ImageClip (6.17.7) - clips images. PdfAdjust (6.24.17) - Allows to adjust the fade, contrast and monochrome settings of a PDF-underlay in the command bar. pdfattach (6.24.16) - inserts a PDF file as an underlay into the current drawing. -PdfAttach (6.24.18) - inserts a PDF file as an underlay into the current drawing; displays prompts in the command bar. Pdflayers (6.24.22) - allows to control the display of layers in a PDF underlay. VpClip (6.31.18) - clips viewports. XClip (6.34.2) - clips externally-referenced drawings.

Figure 6.1853

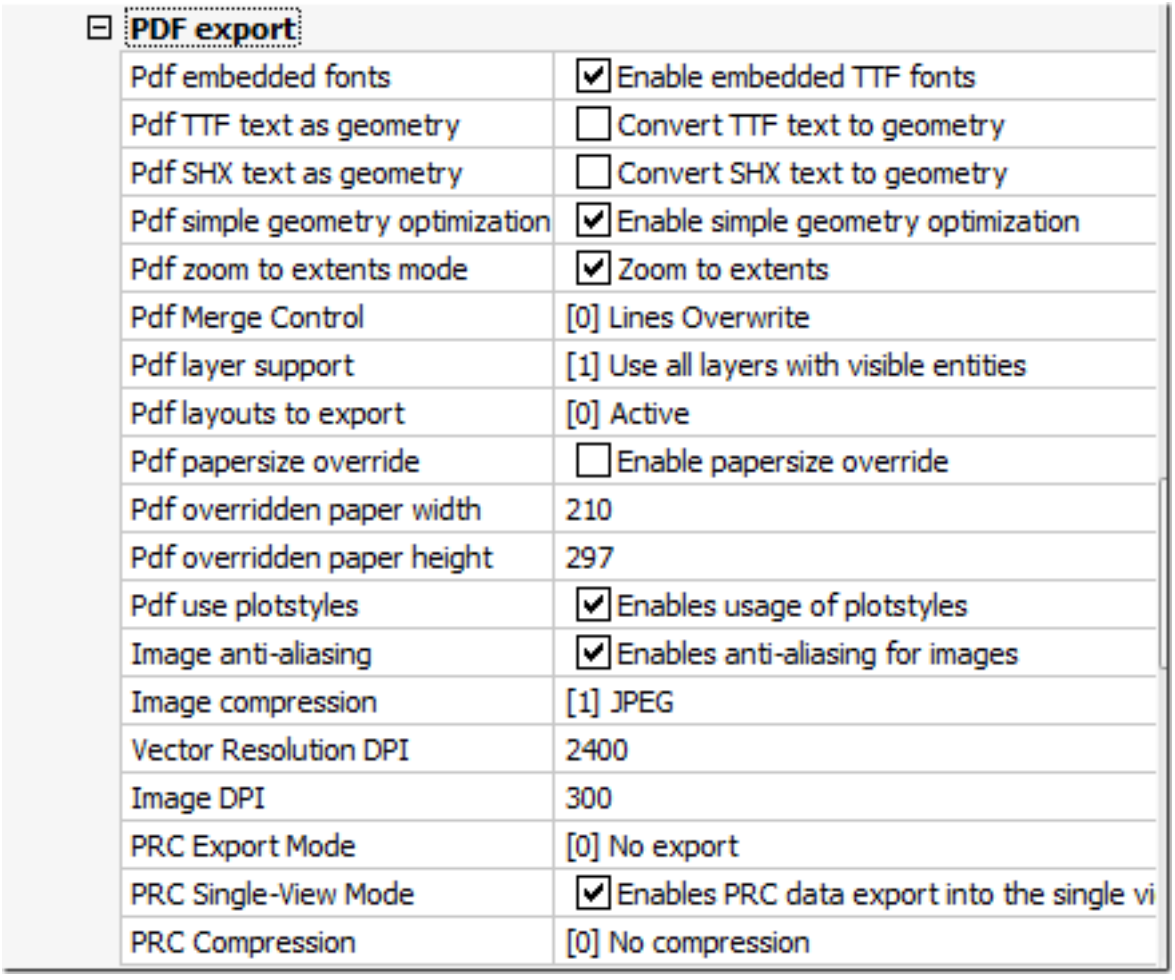
6.24.20 PdfOptions

(6.2981 on page 6079) Determines how drawings are exported in format through the Settings dialog box. **Note:** To export drawings in PDF format, use the ExportPdf (6.13.20) command.

Accessing the Command

command bar: **pdfoptions** transparent: **'pdfoptions** menu bar: **File | PDF Export Options** : **PdfOptions** Displays the PDF Export section of the Settings dialog box: (6.1854 on the next page) Change options, and then click the **X** to exit the dialog box.

Figure 6.1854



PDF export	
Pdf embedded fonts	☑ Enable embedded TTF fonts
Pdf TTF text as geometry	☐ Convert TTF text to geometry
Pdf SHX text as geometry	☐ Convert SHX text to geometry
Pdf simple geometry optimization	☑ Enable simple geometry optimization
Pdf zoom to extents mode	☑ Zoom to extents
Pdf Merge Control	[0] Lines Overwrite
Pdf layer support	[1] Use all layers with visible entities
Pdf layouts to export	[0] Active
Pdf papersize override	☐ Enable papersize override
Pdf overridden paper width	210
Pdf overridden paper height	297
Pdf use plotstyles	☑ Enables usage of plotstyles
Image anti-aliasing	☑ Enables anti-aliasing for images
Image compression	[1] JPEG
Vector Resolution DPI	2400
Image DPI	300
PRC Export Mode	[0] No export
PRC Single-View Mode	☑ Enables PRC data export into the single vi
PRC Compression	[0] No compression

Command Options

Option	Description
Pdf embedded fonts	Determines whether TTF font files are embedded in the PDF file: • **Yes** - includes fonts, which may violate the copyright on some fonts. • **No** - does not include fonts, which may result in missing fonts if the receiving computer does not have the required SHX or TTF files.
Pdf TTF text as geometry	Determines whether TTF (true type fonts) are exported as geometry: • **Yes** - explodes fonts into lines and arcs. • **No** - does not explode fonts.
Pdf SHX text as geometry	Determines whether SHX (shapes compiled) are exported as geometry: • **Yes** - explodes font into lines and arcs. • **No** - does not explode fonts.
Pdf simple geometry optimization	Determines if the geometry is simplified to reduce file size: • **Yes** - optimizes geometry, such as turning multiple segments into a single polyline. • **No** - does not optimize geometry.
Pdf zoom to extents mode	Determines if the drawing is zoomed to extents: • **Yes** - zooms drawing to extents, which ensures the drawing matches the paper size. • **No** - does not zoom the drawing, which ensures the drawing is exported as-is.
Pdf Merge Control	Controls the appearance of crossing lines. • **Lines Overwrite** - the lines on top overwrite the lines below. See the Publish (6.24.68) dialog: (6.2045 on page 5232) • **Lines Merge** - the colors of crossing lines are blended into a new color. See the Publish (6.24.68) dialog: (6.2046 on page 5232)
Pdf layer support	Determines how layers are exported: • **Don't use layers** - removes all layer information. • **Use layers/Don't include OFF-layers** - excludes layers that are turned off. • **Use layers/Include OFF-layers** - exports all layers. See Layer (6.13.17) command.

Pdf layouts to export	Determines which layouts to export: • **Active** - exports the current layout. • **All** - exports all layouts. Each layout is plotted to a separate page in the PDF file.
Pdf papersize override	Determines whether page size is specified: • **Yes** - uses the custom page size specified below • **No** - does not use specified page size
Pdf overridden paper width	Specifies the width of the page, in drawing units
Pdf overridden paper height	Specifies the height of the page, in drawing units
Pdf use plotstyles	Toggles the use of plot styles when exporting to PDF: • **Yes** - uses plot styles defined in the drawing for greater control over individual entities • **No** - does not use plot styles
Image Antialiasing	Toggles anti-aliasing for images that require upscaling when exporting: • **Yes** - use anti-aliasing to smooth images • **No** - does not use anti-aliasing
Image Compression	Toggles the use of compression for exported images: • **0** - no compression • **1** - compress the images using JPEG format
Vector Resolution DPI	Sets the resolution for vector graphics when exporting; values between 72 and 40000 are accepted.
Image DPI	Controls the minimum resolution for exported raster images. The value cannot exceed the value set for Vector Resolution DPI.
PRC Export Mode	Determines whether 3D models are exported in PRC format: • **0** - do export 3D models as 3D • **1** - export 3D models in b-rep (boundary representation) format • **2** - export 3D models in mesh format PRC options work only when the optional Communicator add-on is installed.
PRC Single-view Mode	Toggles whether the 3D model is exported in a single viewport: • **Yes** - yes • **No** - no
PRC Compression	Toggles the use of compression for 3D models: • **0** - use no compression • **1** - use medium compression • 2 - use high compression

Related Commands

Export (6.13.18) - exports drawings in PDF format. Plot (6.24.42) and Print (6.24.51) - export drawings to PDF files if the **Print As PDF.pc3** printer configuration is selected. Publish (6.24.68) - allows to print a sheet list (= a list of model space or paper space layouts). Saves a sheet list to a file.

Figure 6.1857

6.24.21 PeditExt

(7.3 on page 6132) Edits vertices and segments of a polyline interactively, without first selecting the polyline. **Note:** This command was meant for use with the Quad cursor.

Accessing the Command

command bar: **peditext** Quad cursor menu: **2D Editing |** 
: **PeditExt Prompts you in the command bar:** Select option [Add vertex/add vertex at End/adjust Bulge/Remove segment/Stretch segment/stretch Vertex]: (S**elect an option)**

Command Options

Option	Description - command line
Add vertex	Adds a vertex to the selected segment; prompts you: 1. **Select the polyline segment to add a vertex to** - **(select a polyline segment. The new vertex displays dynamically)**: (6.1858 on page 5071) 2. **Select a point** - **(specify the location of the new vertex.)**  Quad icon  adds a vertex to the segment under the cursor.
add vertex at End	Adds a new vertex at the end of the polyline; prompts you: • **Select the polyline near the end you wish to add a vertex** - **(click a polyline near the end point. The new vertex displays dynamically)**: (6.1859 on page 5071) • **Select a point** - **(specify the location of the new vertex.)**  Quad icon ads a new vertex at the end of the polyline under the cursor.

adjust Bulge	Modifies the bulge factor of the selected segment; prompts you: 1. **Select the polyline segment to adjust bulge - (select a polyline segment.)** The bulge of the selected segment changes dynamically. (6.1860 on the next page) 2. **Select a point - (specify a point to set the new bulge.)** Quad icon  modifies the bulge factor of the segment under the cursor. Bulge factor (1.32.35) defines the shape of a polyline segment: • Straight bulge = 0 • Counter-clockwise arc bulge > 0 • Clockwise arc bulge bulge < 0
Remove segment	Deletes the selected segment; prompts you: **Select the polyline segment to remove - (select a polyline segment.)** Quad icon  deletes the segment under the cursor.
Stretch segment	Moves the selected segment; prompts you: 1. **Select the polyline segment to stretch - (select a polyline segment. The selected segment moves dynamically; the adjacent segments are stretched)**: (6.1861 on the facing page) 2. **Select a point - (specify the location of the segment.)** Quad icon  moves the segment under the cursor.
stretch Vertex	Moves the selected vertex; prompts you: 1. **Select the polyline vertex to stretch - (select a polyline vertex. The selected vertex moves dynamically)**: (6.1862 on the next page) 2. **Select a point - (specify the location of the vertex.)** Quad icon  moves the vertex under the cursor.

Procedures

- Editing a polyline using the Quad (1.32.33)

Related Commands

PEdit (6.24.24) - edits polylines, 3D polylines, and 3D meshes.

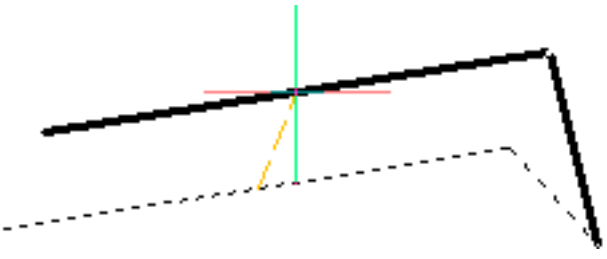

Figure 6.1862

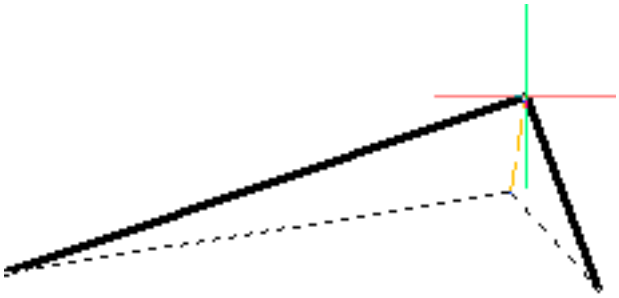

Figure 6.1863

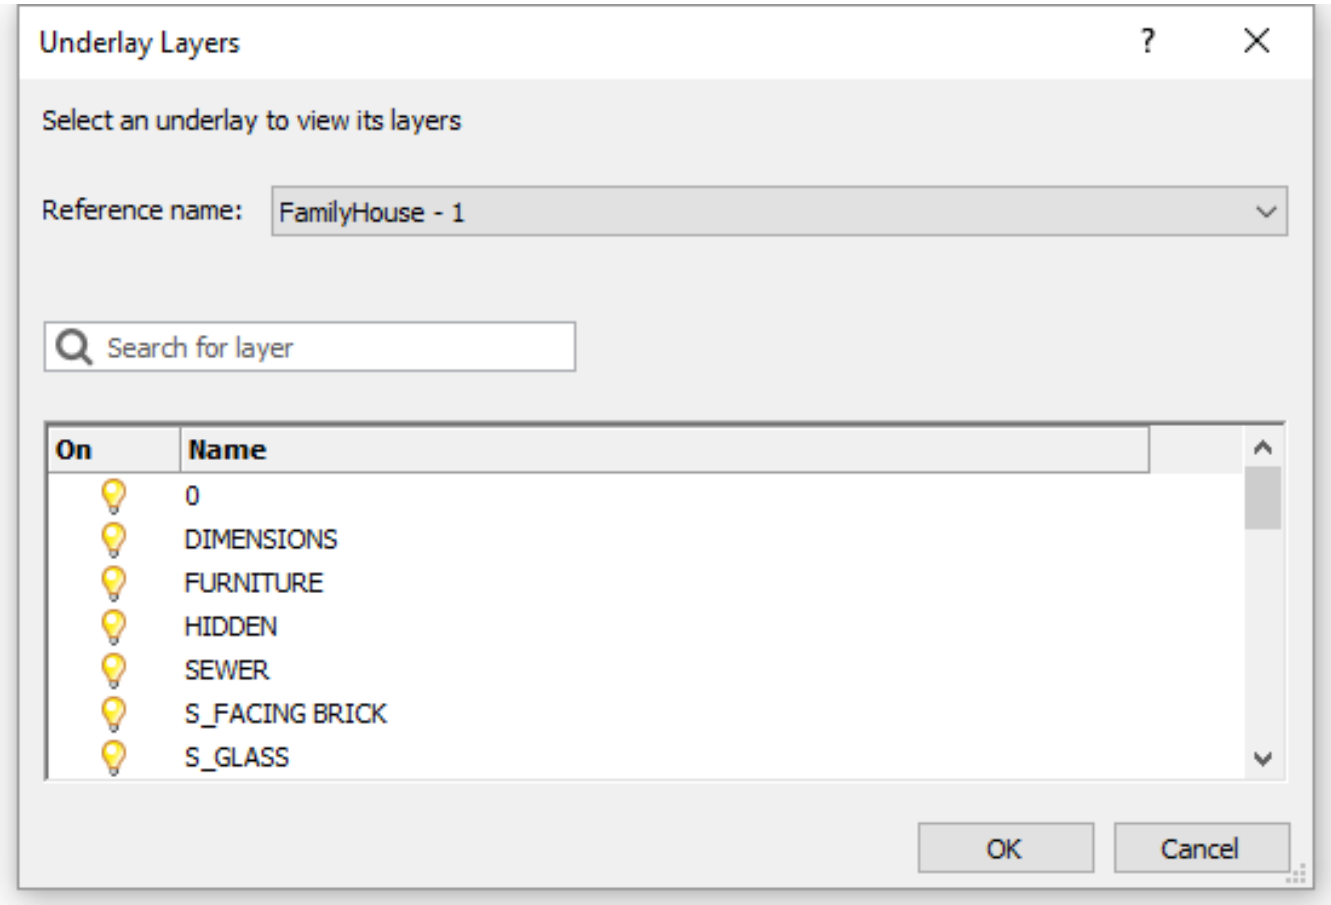
6.24.22 Pdflayers

(6.2981 on page 6079) Toggles the display of layers in PDF underlays.

Accessing the Command

command bar: **pdflayers** transparent: **'pdflayers**
: **Pdflayers Prompts you in the command bar:** Select PDF underlay: **(Click the frame of a PDF underlay)** Displays a dialog box: (6.1864 on the next page)

Figure 6.1864



Command Options

Option	Description
Reference name	Selects a different PDF underlay that is in the current drawing.
Search for layer	Type a search string in the search field. Only layers of which part of the layer name matches the search string are listed. You can use wildcards (? or *) in the search field.
On	Click the column title to sort the layer list by display.
or	Click the icon to turn the display of a layer on/off.
Name	Click the column title to sort the layer list by name.

Procedures

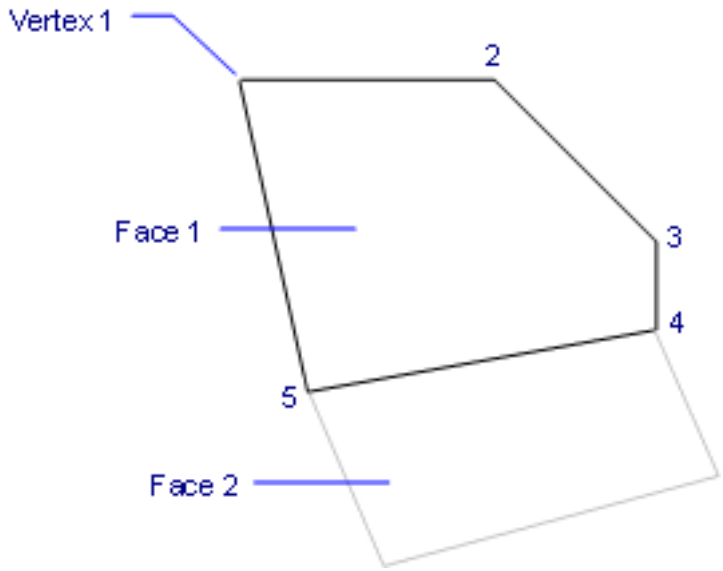
- To set the layer display in a PDF underlay (1.30.23)

Related Commands

PdfAdjust (6.24.17) - Allows to adjust the fade, contrast and monochrome settings of a PDF-underlay in the command bar. pdfattach (6.24.16) - inserts a PDF file as an underlay into the current drawing. -PdfAttach (6.24.18) - inserts a PDF file as an underlay into the current drawing; displays prompts in the command bar. pdfclip (6.24.19) - clips a PDF underlay.

Figure 6.1865

Figure 6.1866



6.24.23 PFace

(6.2981 on page 6079) Draws 3D multi-sided meshes (short for "polyface mesh"). (6.1866)

Accessing the Command

command bar: **pface** menu: **Model | Meshes | Polyface Mesh** ribbon: **Model | Meshes | Polyface Mesh** toolbar: **Meshes | 3D Faces |** 
: **PFace Prompts you in the command bar:** Position of mesh vertex 1: **(Pick a point, or enter x,y,z coordinates.)** Position of mesh vertex 2/<Enter to define faces>: **(Pick a point, or enter x,y,z coordinates.)** Position of mesh vertex 3/<Enter to define faces>: **(Pick a point, enter x,y,z coordinates, or press Enter to stop placing vertices.)** Face 1, Vertex 1: Color/Layer/<Exit>: **(Enter a number or an option)** Face 1, Vertex 2: Color/Layer/<Exit>: **(Enter a number or an option.)** The prompt continue until all faces and vertices are dealt with.

Command Options

Option	Description
Position of mesh vertex 1:	Specifies the first vertex of the face. A face can have up to 256 sides.
Position of mesh vertex n	Specifies the next vertex of the face.
Color	Specifies the color of the edge; see Color (6.9.19) command.
Layer	Specifies the layer of the edge; see Layer (6.13.17) command.
Face n , vertex n	Specifies the face and vertex number. Enter a negative number to make the edge invisible.

Related Commands

3dFace (6.3.6) - draws 3D 4-edged faces with optional invisible edges. 3dMesh (6.3.9) - draws 3D surface meshes of size m x n. PEdit (6.24.24) - edits 3D meshes.

Figure 6.1867

6.24.24 PEdit

(7.3 on page 6132) Edits polylines, 3D polylines, and 3D meshes (short for "polyline edit"); converts 2D entities into polylines (6.1869 on page 5081) **Note:** This prompts of this command change, depending on the entity you are editing

- Single or multiple 2D polylines
- Single 3D polyline
- 3D mesh
- Single or multiple lines, arcs, circles, splines, or helixes

Accessing the Command

 command bar: **pedit** aliases: **editpline pe** menu: **Modify | Edit Polyline** toolbar: **Modify |**  mouse: Double-click a polyline : **PEdit Prompts you in the command bar:** Select polyline to edit [Multiple]: **(Choose one polyline or polyface mesh, or else press M to select multiple polylines)**

- When a 2D polyline is selected, **you are prompted:**

Edit polyline [Edit vertices/Close/Decurve/Fit/Join/Linetype mode/Reverse direction/Spline/Taper/Width/Undo] <eXit>: **(Enter an option, or press Enter to exit the command)**

- When a 3D polyline is selected, **you are prompted:**

Edit polyline [Edit vertices/Close/Decurve/Join/Reverse/Spline/Undo]<eXit>: **(Enter an option, or press Enter to exit the command)**

- When a 3D mesh is selected, **you are prompted:**

Edit polyline: [Edit vertices/Desmooth/Mopen/Nclose/Undo]<eXit>: **(Enter an option, or press Enter to exit the command)**

- When a line, arc, circle or spline is selected, **you are prompted:**

The selected entity is not a polyline. Turn it into one? [Yes-turn into polyline/No-leave as is] <Yes-Turn into polyline>: **(Press Enter to turn the selected entity into a 2D polyline)** Edit polyline [Edit vertices/Close/Decurve/Fit/Join/Linetype mode/Reverse direction/Spline/Taper/Width/Undo] <eXit>: **(Enter an option, or press Enter to exit the command)**

- When the Multiple option is chosen, **you are prompted:**

Select entities: (**Select lines, polylines, arcs, circles, helixes, and/or splines)**

- When one or more lines, arcs, circles or spline are selected, **you are prompted:**

The selected entity is not a polyline. Turn it into one? [Yes-turn into polyline/No-leave as is] <Yes-Turn into polyline>: (**Press Enter to turn the selected entity into a 2D polyline)** Edit polyline [Edit vertices/Close/Decurve/Fit/Join/Linetype mode/Reverse direction/Spline/Taper/Width/Undo] <eXit>: **(Enter an option, or press Enter to exit the command)**

Command Options for 2D Polylines

2D Polyline Option	Description

Edit vertices

Edit vertices; prompts you: **Edit vertices: Next/ Previous/ Angle/ Break/ Insert/ Move/ Regen/ SElect/ Straighten/ Width/eXit/ <Next>** - **(enter an option.)** BricsCAD displays a triangle marker at the start of the polyline, and an X marker at the current vertex. (6.1869 on page 5081)

- Enter **Next** or **Previous** to move the marker from vertex to vertex
- Enter the **SElect** option to select the vertex directly

Note: It is much easier to edit the vertices of a polyline with grips editing.

Next

Moves the X marker to the next vertex. When the marker reaches the last vertex of a closed polyline, it does not move to the "next" (first) vertex.

Previous

Moves the X marker to the previous vertex.

Angle

Changes the angle of the current segment; prompts you: **Included angle for segment (>0 is ccw, 0 is straight, <0 is cw) <0>** - **(enter an angle)**:

- If it is an arc segment, then the angle (curvature) of the arc is changed
- If it is a line segment, it is turned into an arc
- Press **0** (zero degrees) to convert the arc segment into a line segment

(6.1870 on page 5081)

Break

Removes segments from the polyline between the two vertices marked with X markers. This action turns:

- Closed polylines into open polylines
- Open polylines into two polylines, with a gap between them

This action cannot be undone. Prompts you: (6.1871 on page 5081)
Next/Previous/Select/Go/eXit/<Next> - **(enter an option to move the X marker along the polyline)**:

- **Next** - choose the next vertex
- **Previous** - choose the previous vertex
- **Select** - moves second X marker directly to another vertex; prompts you: **Select point along segment move to** - **(pick a point on the polyline. The program places the second X marker on the vertex nearest to the pick point; this option is faster than using Next and Previous.)**
- **Go** - break the polyline between the first and second marked vertices

(6.1872 on page 5081)

- **eXit** - return to the previous prompt

Note: It is much easier to use the Break (6.6.21) or Trim (6.29.35) commands to remove part of a polyline.

Insert	Inserts a vertex. A drag line previews the location of the new vertex; prompts you: (6.1873 on page 5081) **Location of vertex** - pick a point for the new vertex. The program adds a vertex and a segment: (6.1874 on page 5082)
Move	Moves the current vertex. Ahe drag line previews the new location of the vertex. (6.1875 on page 5082) Prompts you: **New location for vertex** - **(pick point to move the vertex. The program moves the vertex and associated segments.)** (6.1876 on page 5082) **Note:** It is much easier to move the vertices of a polyline with grips editing.
Regen	Regenerates the polyline to show changes made by the editing actions of this command.
SElect	Moves the X marker directly to another vertex; prompts you: **Select point along segment to edit** - **(pick a point on the polyline; the program places the X marker on the vertex nearest to the pick point. This option is faster than using the Next and Previous options.)**
Straighten	Removes all segments between two vertices. When you select the start and end points of an multi-segment polyline, the entire polyline is straightened, becoming a single segment; this also applies to closed polylines. Prompts you: **Straighten: Next/Previous/Select/Go/eXit** - **(enter an option.)** • **Next** - moves the second X marker to the next vertex • **Previous** - moves the second X marker to the previous vertex • **Select** - moves second X marker directly to another vertex; prompts you: **Select point along segment move to** - pick a point on the polyline • **Go** - replaces the segments between the two marked vertices with a single segment: (6.1877 on page 5083) This action cannot be undone. • **eXit** - exits this sub-sub-option; returns to the previous prompt
Width	Changes the width of the current segment; prompts you: 1. **Enter new starting width** - **(specifies the width at the starting end of the polyline.)** 2. **Enter new ending width** - **(specifies the width at the polyline's end.)** The "current" segment lays between the X-marked vertex and the next vertex.
eXit	Exits this sub-option; returns to the previous prompt
Close	Closes the polyline by adding a segment between the start and endpoints. (6.1878 on page 5083) When the polyline is closed, this option reads **Open**.

Open
Opens closed polylines by removing the last segment drawn to close the polyline. When the polyline is open, this option reads **Close**.

Decurve
Reverses the effects the Fit and Spline options.

Fit
Fits a curve to the polyline. (6.1879 on page 5083) To unfit the polyline, use the **Decurve** option.

Join
Adds open entities to the selected polyline; prompts you: **Select entities to join** - **(choose an entity)**:

- Line
- Arc
- Polyline segment and arc
- Helix

This option works only with open and with cojoined entities. **Cojoined** means that the endpoints of entities meet, such as when drawn with ENDpoint object snap or with the Last point option. The joined entities take on the source polyline's properties, such as color, width, and layer. When editing multiple polylines, prompts you: **Enter fuzz distance or [Jointype]** - **(do one of the following)**:

- Press **Enter** to create one or more polylines with cojoined lines, polylines, and arcs in the selection set.
- Enter a so-called 'fuzz distance' then press **Enter** to create one or more polylines from the entities in the selection set. When endpoints are within the fuzz distance, the entities are extended or trimmed.
- Type **J** to specify the type of joining; prompts you: **Specify type of joining: [Extend/Add/Both]** - **(enter an option to specify what happens when entities lie within the fuzz distance)**: **Extend** - extends or trims segments to the nearest endpoints **Add** - adds linear segments between the nearest endpoints **Both** - extends or trims if possible, otherwise adds linear segments

The program then reports the number of polylines created.

Linetype-mode
Determines how linetype appear on polylines; prompts you: **Linetype continuous along polyline: ON/OFF <OFF>** - **(enter an option)**:

- **ON** - linetypes start and stop at the polyline's start and endpoints
- **OFF** - linetypes start and stop at each vertex

This option is stored in the PLineGen variable.

Reverse
Reverses the direction of the polyline: the starting point is now its end point, and vice versa. The polyline does not change its look with this operation, except that the triangle marker moves to the other end of open polylines. This option affects operations that depend on the direction of a polyline, such as vertex editing.

Spline
Converts the polyline into a spline. (6.1880 on page 5083) All width information is lost; use the **Width** option to reapply width. The spline is a Bezier-spline whose smoothing is defined by the SplineType system variable.

Taper	Tapers the width of the entire polyline from one end to the other; prompts you: • **Enter new starting polyline width - (specify the width at the starting end of the polyline.)** • **Enter new ending polyline width - (specify the width at the polyline's end.)** (6.1881 on page 5083)
Width	Changes the width of all segments; prompts you: **Enter new width for all segments - (specify a width.)** This option overrides tapered widths. (6.1882 on page 5083)
Undo	Undoes the last action.
eXit	Exits the command.

Command Options for 3D Polylines

3D Polyline Option	Description
Edit vertices	Edit vertices; prompts you: **Edit vertices: Next/ Previous/ Break/ Insert/ Move/ Regen/ SElect/ Straighten/ eXit/<Next> - (see the options for 2D polylines, above.)** The Angle and Width options are missing from the prompt, because 3D polylines cannot contain arc segments and cannot have width.

Command Options for 3D Polyface Meshes

3D Polyface Mesh Option	Description
Edit vertices	Moves vertices; prompts you: **Edit vertex (0,0): Select/Next/Previous/Left/RIght/Up/Down/Move/REgen/eXit - (enter an option. BricsCAD displays a triangle marker on the home vertex (0,0) and an X marker on the current vertex.)** (6.1883 on page 5084) It is easier to move vertices using grips.
Select	Moves X marker directly to another vertex; prompts you: **Select point along segment to edit - (pick a point on the mesh.)** The program places the X marker on the vertex nearest to the pick point. This option is faster than using the **Next** and **Previous** options.
Next	Moves the X marker to the next vertex. When the marker reaches the last vertex, it does not move to the "next' (first) vertex.
Previous	Moves the X marker to the previous vertex.
Left	Moves the X marker to the vertex on the left.
RIght	Moves the X marker to the vertex on the right.
Up	Moves the X marker to the higher-numbered vertex.
Down	Moves the X marker to the lower-numbered vertex.
Move	Moves the current vertex; prompts you: **New location for vertex - (pick a point to move the vertex. The drag line previews the new location of the vertex.)** (6.1884 on page 5084) BricsCAD moves the vertex and associated faces.
REgen	Regenerates the polyline to show changes made by the editing actions of this command.
eXit	Exits this sub-option; returns to the previous prompt line.
Desmooth	Removes the Bezier-spline smoothing of 3D meshes.

Mclose	Closes the 3D mesh in the m direction: (6.1885 on page 5084) When the mesh is closed, this option reads MOpen.
Mopen	Opens the 3D mesh in the m direction. When the mesh is closed, this option reads MClose.
Nclose	Closes the 3D mesh in the n direction: (6.1886 on page 5084) When the mesh is closed, this option reads NOpen.
Nopen	Open the 3D mesh in the n direction. When the mesh is closed, this option reads NClose.
Undo	Undoes the last action.
eXit	Exits the command.

Procedures

- Converting an entity into a polyline (1.32.29)
- To fit a curve to a polyline (1.32.40)
- Convert a straight polyline segment into an arc (1.32.33)
- Break a polyline into two separate polylines (1.32.33)
- Insert a new vertex in a polyline (1.32.33)
- Move a vertex in a polyline (1.32.33)
- Delete vertices in a polyline (1.32.33)
- Change the width of a polyline segment (1.32.33)
- To apply a uniform width to a polyline (1.32.34)
- To taper a polyline uniformly along its length (1.32.34)
- To join an arc, line, or polyline to an existing polyline (1.32.31)
- Opening and closing polylines (1.32.30)
- Setting the Linetype generation mode (1.32.39)

Related Commands

3dPoly (6.3.10) - draws 3D polylines. 3dFace (6.3.6) - draws 3D 4-edged faces with optional invisible edges. 3dMesh (6.3.9) - draws 3D surface meshes of size m x n. ConvertPoly (6.9.31) - converts lightweight polylines to classic polylines (2D polylines) and vice versa. Join (6.18.1) - joins lines, LW polylines, 2D polylines, 3D polylines, circular arcs, elliptical arcs, splines and helixes at their common endpoints. PeditExt (6.24.21) - Edits vertices and segments of a polyline. PFace (6.24.23) - draws 3D multi-sided meshes. PLine (6.24.27) - draws polylines. Splinedit (6.27.46) - modifies the properties of a spline or converses a spline to a polyline.

6.24.25 Perpendicular

(6.2981 on page 6079) Toggles perpendicular entity snap mode. (6.1888)

Accessing the Command

 command bar: **perpendicular** transparent: **per** ribbon: **Home | Entity Snaps | Snap to Perpendicular** toolbar: **Entity Snaps |** 
: **Perpendicular Displays no prompt in the command bar.** When perpendicular entity snap is on, the cursor snaps to points of perpendicularity to entities.

Command Options

Option	Description
Perpendicular	Entering this command toggles Perpendicular entity snap. It snaps to points of perpendicularity. This command can be entered transparently during commands, but must be entered without the apostrophe prefix (').

Related Commands

OSnap (6.23.16) - toggles entity snap modes in the Settings dialog box. -OSnap (6.23.13) - toggles entity snap modes in the command bar. Aperture (6.4.14) - sizes the aperture cursor for entity snaps. 2dIntersection (6.2.1) - toggles apparent intersection snap mode. 3dIntersection (6.3.7) - toggles intersection snap mode. Apparent (6.4.16) - toggles apparent intersection snap mode. Center (6.9.3) - toggles center snap mode. Endpoint (6.13.7) - toggles endpoint snap mode. Extension (6.13.22) - toggles extension snap mode. From (6.14.13) - allows to enter relative coordinates with respect to a reference point. GCenter (6.15.5) - toggles Geometric Center (GCenter) entity snap. Insertion (6.17.18) - toggles insertion snap mode. Intersection (6.17.19) - toggles intersection snap mode. Midpoint (6.21.16) - toggles midpoint snap mode. Mtp (6.21.35) - allows to specify a point as the midpoint between two points. Nearest (6.22.2) - toggles nearest snap mode. Node (6.22.7) - toggles node (point) snap mode. None (6.22.8) - turns off all entity snap modes. Parallel (6.24.5) - toggles parallel snap mode. Quadrant (6.25.7) - toggles quadrant snap mode. Tangent (6.29.10) - toggles tangent snap mode. Zperpendicular (6.35.8) - toggles the 3D perpendicular entity snap. Snaps to a point perpendicular to a face.

6.24.26 Plan

Displays the plan viewpoint of drawings, which looks straight down on the x,y-plane.

Accessing the Command

 command bar: **plan** menu bar: **View | Plan View** ribbon: **View | View | Viewpoint | Plan View** toolbar: **View |**

: **Plan Prompts you in the command bar:** Plan view of [Current/Ucs/World] <Current UCS>: **(Enter an option, or else press Enter)** Left: 3D model in 3D viewpoint; right: 3D model in plan view. (6.1889 on the facing page) (6.1890 on the next page)

Figure 6.1889

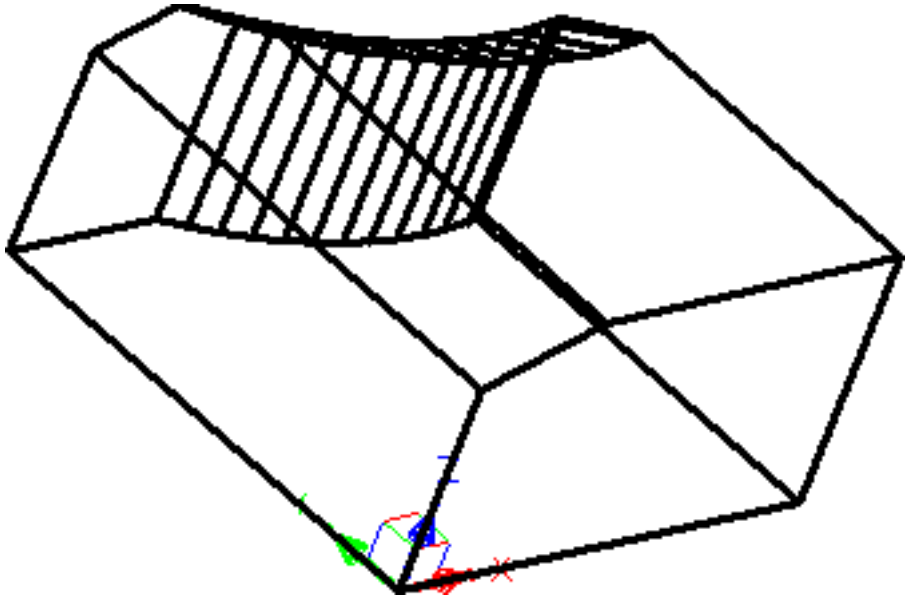

Figure 6.1890

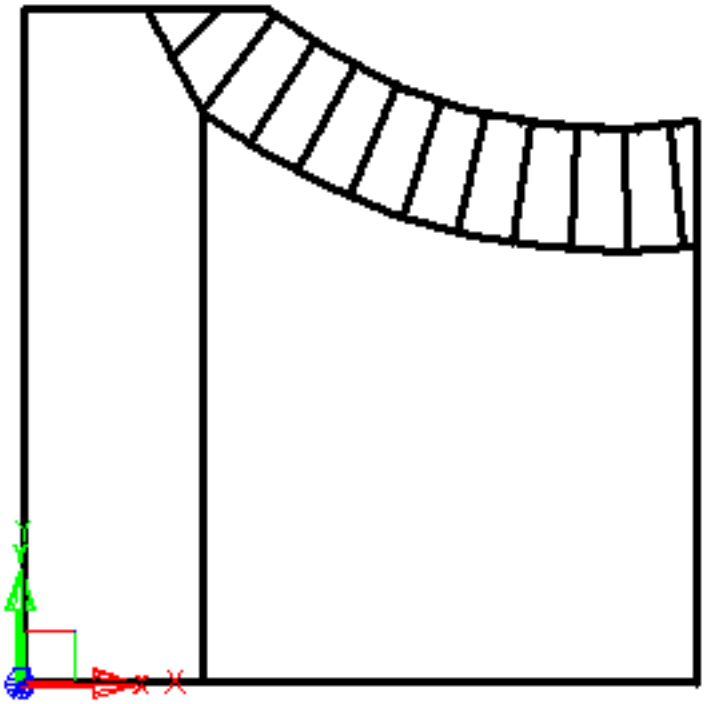


Command Options

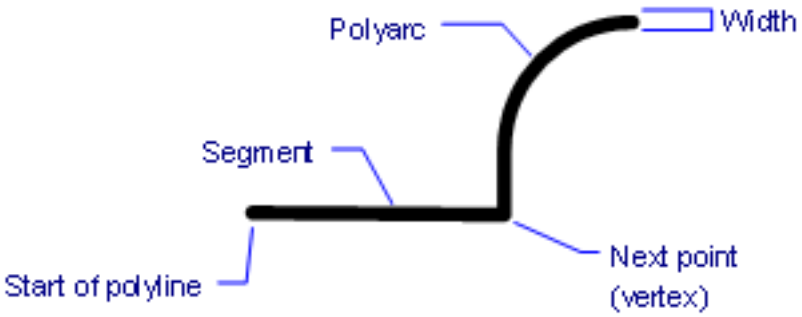
Option	Description
UCS	Displays the plan view of a named UCS (6.13.24) or a Dynamic UCS (1.21.20) (DUCS). Prompts you: **? to list/<Name of UCS>:** Do one of the following: • Type the name of a UCS. • If DUCS is ON, place the cursor over a 3D solid face, a surface or a region, then click when it highlights and press Enter.
?	Lists the names of UCSs in the current drawing
World	Displays the plan view of the World Coordinate System.
Current	Displays the plan view of the current UCS.

Related Commands

SetUcs (6.27.26) - sets the UCS to a specified viewpoint. UcsIcon (6.30.2) - controls the appearance of the UCS icon. Ucs (6.30.1) - creates and modifies user-defined coordinate systems. DdVPoint (6.10.23) - changes the 3D viewpoint of the drawing through a dialog box. VPoint (6.31.21) - changes the 3D viewpoint of the drawing through the command bar. Settings (6.27.25) - sets parameters of UCSs

Figure 6.1891

Figure 6.1892



6.24.27 PLine

(7.3 on page 6132) Draws polylines (short for "polyline"). **Note:** A polyline is a multi-segment entity that can contain lines, arcs, and have segments of variable width, as well as be edited to have curves and splines. (6.1893)

Accessing the Command

command bar: **pline** aliases: **pl polyline** menu bar: **Draw | Polyline** ribbon: **Draw | Draw | Polylines** toolbar: **Draw |**  : **PLine**

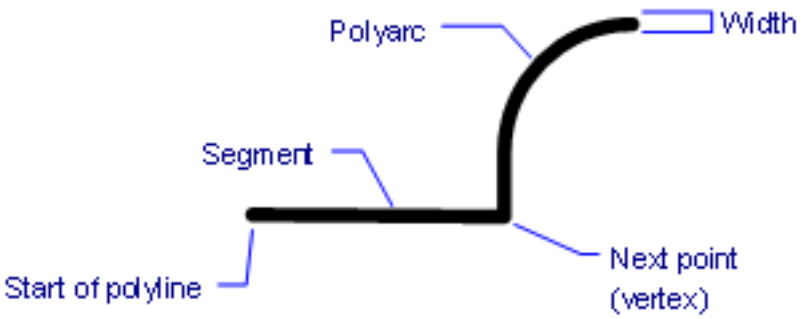
- The first time the command is used in a drawing, **prompts you in the command bar:**

Start of polyline: **(Pick a point)**

- **Subsequent times the the first prompt changes to**

Select start of polyline or [Follow] <Last point>: **(Pick a point or enter an option)** Set next point or [draw Arcs/Distance/Follow/H **(Pick a point, or enter an option)** Set next point or [draw Arcs/Distance/Follow/Halfwidth/Width/Undo]: **(Pick a point, enter an option, or press Enter to exi.)** Set next point or [draw Arcs/Close/Distance/Follow/Halfwidth/Width/Undo]: **(Pick a point, enter an option, or press Enter to exit)** (6.1893)

Figure 6.1893



Command Options

Option	Description
Start of polyline	Specifies the start point of the polyline's first segment: • Enter x,y,z coordinates • Pick a point in the drawing
Last point	Starts the polyline at the last point picked in the drawing, which is useful for continuing from an existing polyline.
Next point	Specifies the next point (endpoint for the current segment); each next-point becomes a vertex in the polyline.
Arc	Switches to arc-drawing mode; draws arc segments; prompts you: **Set end of arc or [draw Lines/ Angle/ CEnter/ CLose/ Direction/ Halfwidth/ Radius/Second point/Width/Undo]** - **(pick a point or choose an option.)** • **draw Lines** - switches to line-drawing mode; draws line segments. • **Angle** - sets the included angle of the arc segment; prompts you: **Included angle for segment (+ for ccw, - for cw)** - **(enter an angle.) Set end of arc or [Center/Radius]** - **(pick point or choose an option.)** • **CEnter** - sets the center of the arc segment; prompts you: **Center point** - **(pick a point.) Set end of arc or [Angle/Length of chord]** - **(pick a point or choose an option.)** • **CLose** - closes the arc and then returns to the previous prompt • **Direction** - defines the direction of the tangent line in the start point of the arc; prompts you: **Direction from start** - **(pick a point to define the direction of the tangent line.) End of arc** - **(pick a point.)** • **Halfwidth** - specifies the halfwidth of the arc, the distance from the centerline to the edge of the wide arc; prompts you: **Starting half-width <0>** - **(enter a width for the start of the arc segment.) Ending half-width <175.96>** - **(enter a width for the end of the arc segment.)** • **Radius** - specifies the radius of the arc; prompts you: **Radius of arc** - **(specify a radius.) Set end of arc or [included Angle]** - **(pick a point to end the arc.)** • **Second point** - prompts you to define the second point and endpoint of a 3-point arc; prompts you: **Second point** - **(pick a point along the arc.) End of arc** - **(pick a point to determine the end of the arc.)** See the Arc (6.4.21) command.

Close	Closes the polyline; the program automatically draws a segment from the current next-point to the starting point. (6.1900 on page 5094)
Distance	Specifies the length and angle of the next segment; prompts you: 1. **Distance for segment - (specify the length of the segment.)** 2. **Angle of segment - (specify the angle of the segment.)** (6.1901 on page 5095) Distances are measured from the last vertex. Angles are measured counterclockwise from the positive x-axis.
Follow	Draws the next segment at the same angle; move the mouse to indicate the length. (6.1902 on page 5095)
Halfwidth	Specifies the halfwidth for the current segment, as well as all segments that follow -- until you change the width or halfwidth. (6.1903 on page 5095) You can specify different starting and ending halfwidths, which creates tapered segments; prompts you: 1. **Starting half-width - (specify the width at the start end of the segment; enter a value, or pick two points in the drawing.)** 2. **Ending half-width - (specify the width at the start end of the segment; enter a value, or pick two points in the drawing.)**
Width	Specifies the width for the current segment, as well as all segments that follow -- until you change the width or halfwidth. (6.1904 on page 5095) You can specify different starting and ending widths, which creates tapered segments; prompts you: 1. **Starting width - (specify the width at the start end of the segment; enter a value, or pick two points in the drawing.)** 2. **Ending width - (specify the width at the start end of the segment; enter a value, or pick two points in the drawing.)** When you specify 0 as the width, the polyline is drawn to look like a line.
Undo	Undoes (undraws) the last segment.

Grips Editing

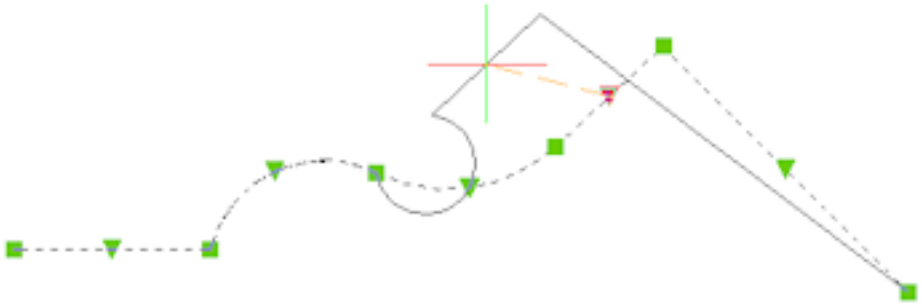
Depending on the value of the GRIPS (6.10.25) system variable polylines have grips on its endpoints and vertices and/or at the midpoint of each segment. The value of GRIPS can be 0, 1 or 2

Value	Grips display
0	No grips
1	Endpoint grips only
2	Endpoint and midpoints grips

Polylines can be edited directly through grips: 1. Select the polyline. Notice that it has a square grip at each vertex (1) and a triangular grip at the midpoint of each segment (2). (6.1894 on the following page) 2. Do one of the following:

Figure 6.1894

Figure 6.1895



- Drag the midpoint grip of a line segment to move the segment. (6.1895)
- Drag the midpoint grip of an arc segment to modify its radius. (6.1896)
- Drag a vertex grip to move the selected vertex. (6.1897 on the next page)
- Splined polylines have a grip at each control point, which can be stretched:

(6.1898 on the facing page) **Cubic** or **Quadratic** splined polyline. (6.1899 on the next page) **Curve fit** splined polyline.

Figure 6.1896

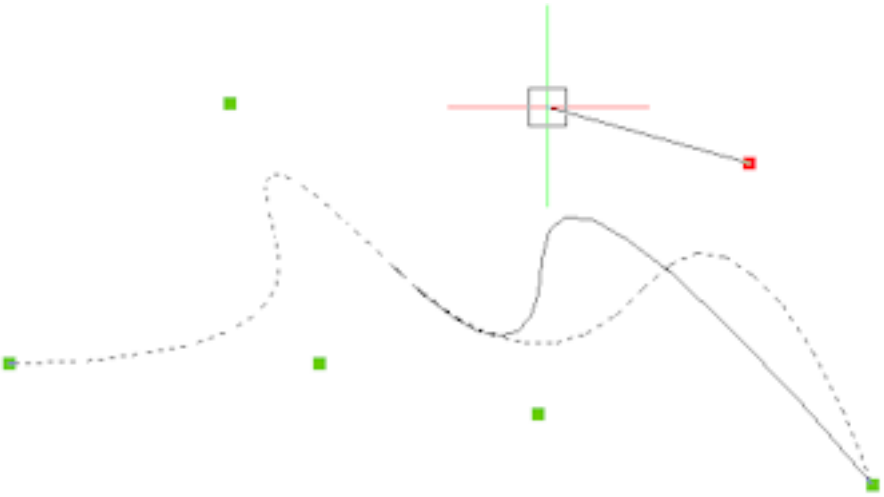

Figure 6.1899

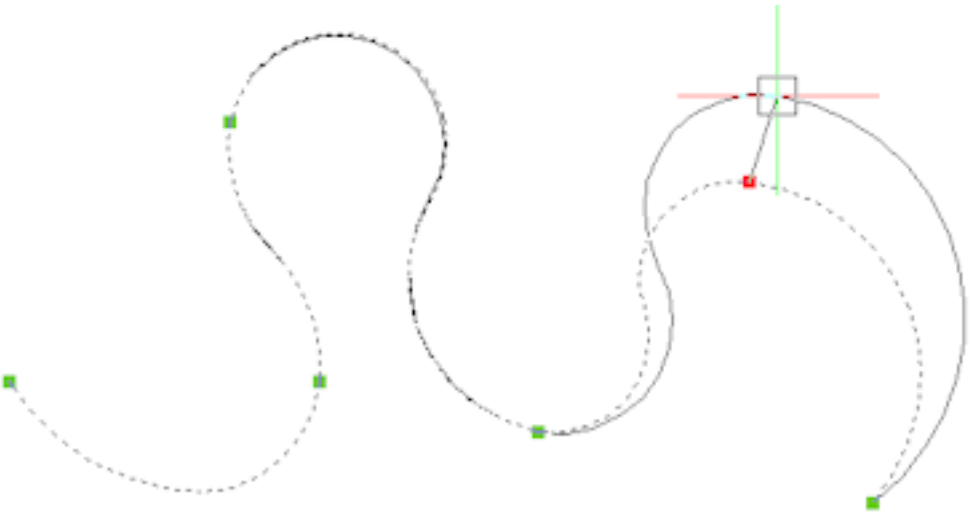

Procedures

- Drawing polylines (1.25.12)
- Creating boundary polylines (1.25.12)

Related Commands

3dPoly (6.3.10) - draws polylines with x,y,z coordinates. Boundary (6.6.15) - creates a polyline that forms a boundary inside a closed area through a dialog box -Boundary (6.6.16) - creates a polyline boundary inside closed areas through the command bar. ConvertPoly (6.9.31) - converts lightweight polylines to classic polylines (2D polylines) and vice versa. Helix (6.16.7) - creates a 2D spiral or a 3D helix. MLine (6.21.33) - draws multilines. PEdit (6.24.24) - edits polylines. Donut (6.10.37) - draws fat circles out of polylines. Polygon (6.24.61) - draws regular polygons out of polylines. Rectang (6.26.6) - draws rectangles out of polylines. Solid (6.27.45) - draws solid-filled entities with 3 and 4 sides. Trace (6.29.32) - draws wide lines.

Figure 6.1905

6.24.28 PlotStyle

(6.2981 on page 6079) Sets the current plot style. **Note:** This command operates only when plot styles are enabled in drawings.

Accessing the Command

command bar: **plotstyle** : **PlotStyle** Displays a dialog box: (6.1906 on the next page) Choose a plot style name, and then click **OK**. When drawings are not set up for plot styles, this command displays the dialog box: (6.1907 on the facing page) Click **OK**.

Figure 6.1906

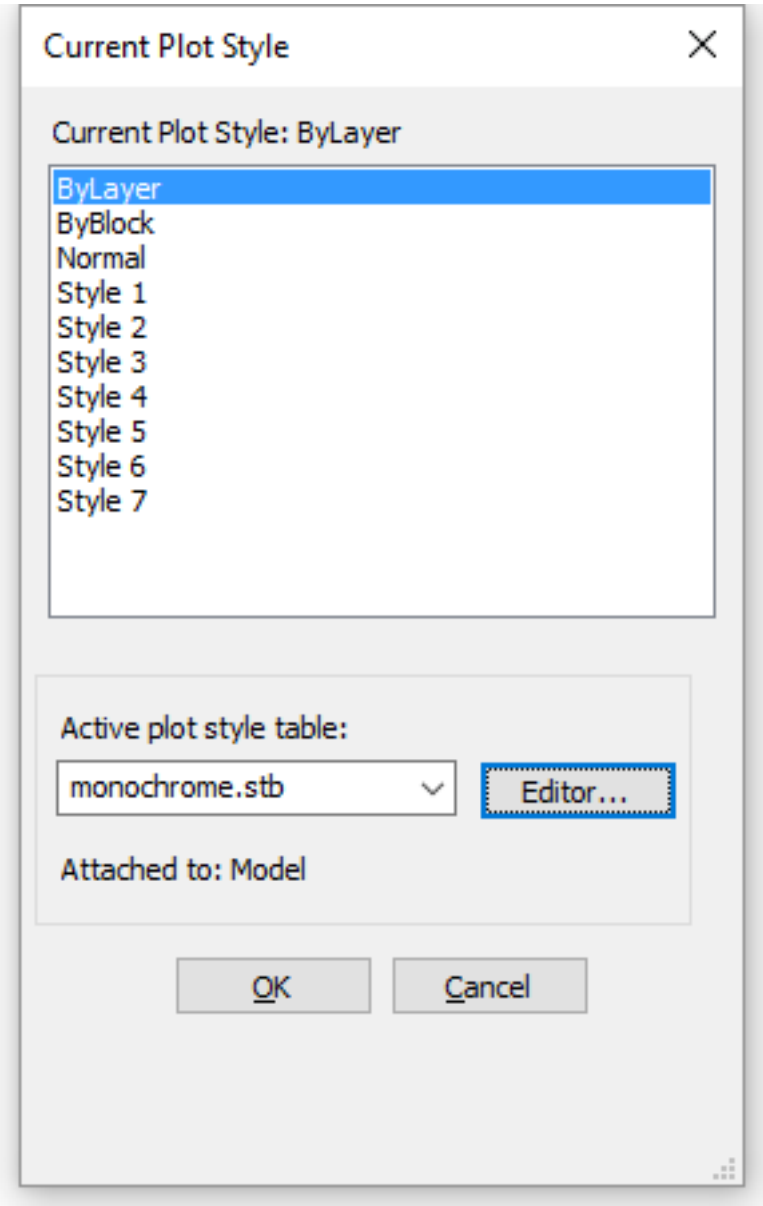

Figure 6.1907

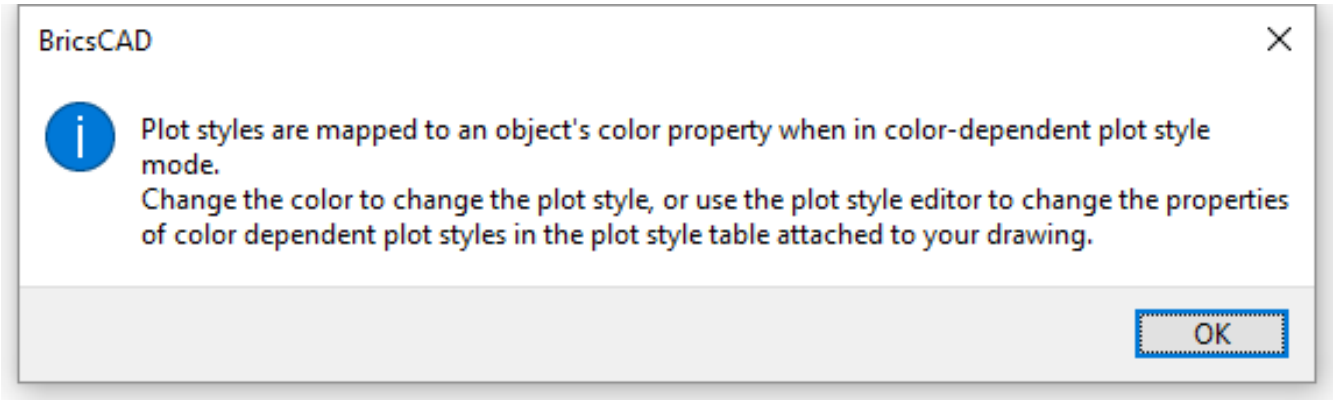


Command Options

Option	Description
Active plot style table	Lists the names of STB files (short for "style table").
Editor	Displays the PlotStyle Table Editor dialog box; see the StylesManager (6.27.57) command.

Related Commands

ConvertCtb (6.9.28) - converts CTB plot style files to STB files. ConvertPStyles (6.9.38) - converts drawings from CTB to STB plot styles. Layer (6.13.17) - assigns plot styles to layers. PageSetup (6.24.2) - assigns plot style to drawings. Print (6.24.51) - plots drawings with plot styles. Properties (6.24.54) - changes plot styles assigned to entities. StylesManager (6.27.57) - creates and attaches plot styles to drawings.

Figure 6.1908

6.24.29 PdfImport

(6.2981 on page 6079) Imports a PDF and converts its content to simple CAD entities; also converts a PDF underlay already attached to the drawing to CAD entities. **Note:** This command performs the following conversions:

PDF Entity	CAD Entity
Straight and curved lines	Polylines or splines
SHX text	Polylines
TrueType text	MText
Solid-filled areas and wide lines	Hatches (solid color) with 50% transparency
Raster images	Raster images
Layers	Layers
Lines with linetypes	Polyline segments

Accessing the Command

Command bar: **PdfImport** Ribbon: **Insert | PDF | PDF Import : PdfImport Prompts you:** Select pdf underlay or [File] <File>: **(Select a PDF underlay in the drawing, or else enter F to access the file dialog box)** When you select an underlay already in the drawing, the program prompts you: Specify first corner of area to import or [Polygonal/All/Settings] <All>: **(Pick a point, or enter an option)** Specify the opposite corner: **(Pick another point to specify the size of the PDF)** Keep, Detach or Unload PDF underlay? [Keep/Detach/Unload] <Unload>: **(Enter an option) When you select a PDF file, the program prompts you:** Specify page number to import or list pages [?/Settings] <1>: **(Enter a page number, or else enter an option)** Specify insertion point <0, 0>: **(Pick a point, or else enter x,y,z coordinates)** Specify scale <1.>: **(Specify a scale factor)** Specify rotation <0.>: **(Specify a rotation angle)**

Command Options

When you want to convert an attached PDF underlay to CAD entities:

Underlay Option	Description
Specify first corner of area to import	Picks the first of two points to convert a rectangular area of an underlay to CAD entities: 1. Pick a point in the drawing or specify x,y coordinates 2. Prompts you: **Specify the opposite corner - (pick the other point to form a rectangular area.)**
Polygonal	Picks three or more points to convert a polygonal area of an underlay to CAD entities: 1. **Specify first point - (pick a point on the PDF or else or specify x,y coordinates.)** 2. **Specify next point or [Undo] - (pick another point, or enter U to undo the last segment.)** 3. **Specify next point or [Undo] - (pick another point, or else press Enter to continue.)** When you pick points that are not on the PDF, the program ignores your pick points, and you have to pick more.
All	Selects the entire PDF underlay for conversion to CAD entities.
Settings	Displays the PDF Import Settings section of the

Detach	Detaches the PDF underlay so that it is not longer a part of the drawing
Unload	Unloads the PDF underlay so that it is no longer seen in the drawing, but is still attached to the drawing.

When you want to convert a PDF file to CAD entities:

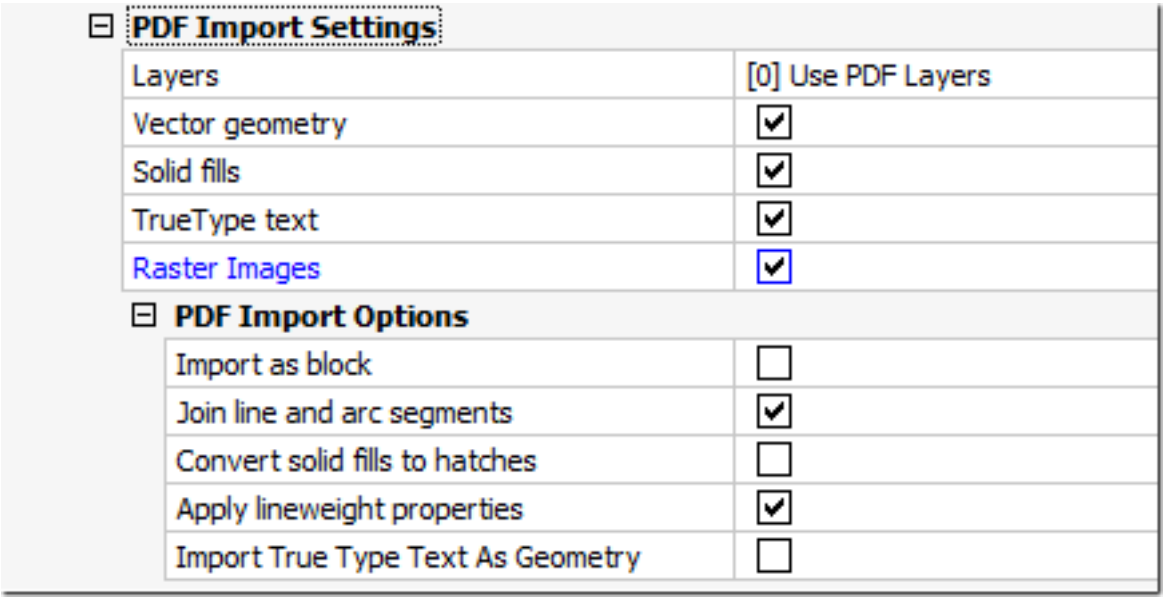
Import Option	Description
Specify page number to import	Imports a specific page from the PDF file: • Press **Enter** to import page 1, especially useful when the PDF file contains just one page • Press **?** (question mark) to list the page numbers in the PDF document; see below • Specify the page number, such as 3.
?	Lists the page numbers in the PDF document; prompts you: • **Page(s) to list <* for all> [*] - (press Enter, and then press F2 key to see the list in the Prompt History (6.29.16) window, such as this): 1 2 3 4** To view the content of the pages before importing them, use File Manager's preview window or a PDF viewing program like Acrobat.
Settings	Displays the PDF Import Settings section of the Settings (1.17.10) dialog box; see below.
Specify insertion point	Specifies the insertion point in the drawing: • Press **Enter** to accept the default of 0,0 • Pick a point in the drawing • Enter x,y coordinates for the lower left corner of the imported file
Specify scale	Specifies the scaling factor for the inserted geometry: • Press **Enter** to accept the default of 1 • Enter a scale value You cannot pick points in the drawing to show the size
Specify rotation	Specifies the rotation angle: • Press **Enter** to accept the default of 0 degrees • Enter an angle You cannot pick points in the drawing to show the angle

When you select the **Settings** option, the program displays the PDF Import Settings section of the Settings (1.17.10) dialog box: (6.1909 on page 5102)

Settings Option	Description

Layers	Determines how PDF layers are handled: • **0** - use the layers in the PDF files; incoming layer names are prefixed with 'PDF-', such as PDF_A-ANNO-DIM PDF_A-STAIR PDF_DOOR • **1** - segregate entities on separate layers, such as PDF_Geometry PDF_Images PDF_Text PDF_Solid Fills • **2** - place entire PDF on the current layer
Vector Geometry	Determines if vector geometry is imported: • **Yes** - imports and converts vector geometry • **No** - does not import vector geometry
Solids Fills	Determines if filled areas are imported: • **Yes** - imports and converts solid fills, such as filled areas and wide lines into hatches • **No** - does not import solid fills Hatched areas are given 50% transparency,
TrueType Text	Determines if TrueType text is imported: • **Yes** - imports TrueType text and assigns them style names based on the font name, such as: PDF Arial PDF Arial Bold PDF Times New Roman Bold • **No** - does not import text SHX text is converted to polylines
Raster Images	Determines if raster images are imported: • **Yes** - attaches raster images • **No** - does not import raster images Raster images are saved as PNG files in a folder.
Import as Block	Imports the PDF and inserts it as a block.
Join Line and Arc Segments	Attempts to join lines and polylines into a single segment, when possible.
Convert Solids Fills to Hatches	Converts solid fills into hatched areas
Apply Lineweight Properties	Gives imported lines with weight (width) a lineweight
Import TrueType Text as Geometry	Imports TrueType text as geometry, as is done with SHX text. The benefit here is if you do not have matching fonts.

Figure 6.1909



Related Commands

Pdfattach (6.24.16) - inserts a PDF file as an underlay into the current drawing; displays dialog boxes. -PdfAttach (6.24.18) - inserts a PDF file as an underlay into the current drawing; displays prompts in the command bar.

Figure 6.1910

6.24.30 Point

(6.2981 on page 6079) Draws point entities.

Accessing the Command

command bar: **point** alias: **po** menu bar: **Draw | Point** ribbon: **Draw | Draw | Points | Point** toolbar: **Draw |**

: **Point Prompts you in the command bar:** Location of point or [point Settings.../Multiple points]: **(Pick a point, enter x,y,z coordinates, or enter an option)**

Command Options

Option	Description
Location of point	Specifies the location of the point in the drawing. • Pick a point • Enter x,y,z coordinates
Point settings	Displays the Points section of the **Settings** dialog box: (6.1911 on the following page) • **Point display mode** - specifies the look of points. (6.1912 on the next page) • **Point display size** - specifies the size of points.
Multiple points	Repeats the command to draw multiple points; keeps prompting you: **Location of point or [point Settings...]** - **(specify a point or press Enter to stop.)**

Grips Editing

Points can be edited directly through grips:

1. Select the point. Notice that it has one grip.
2. Drag the grip to move the point.

Procedures

- Defining the point display settings (1.25.33)
- Drawing points (1.25.33)

Related Commands

Divide (6.10.20) - defines the size and shape of points. Divide (6.10.39) - places evenly-spaced points along entities. Measure (6.21.11) - places equi-distant points along entities.

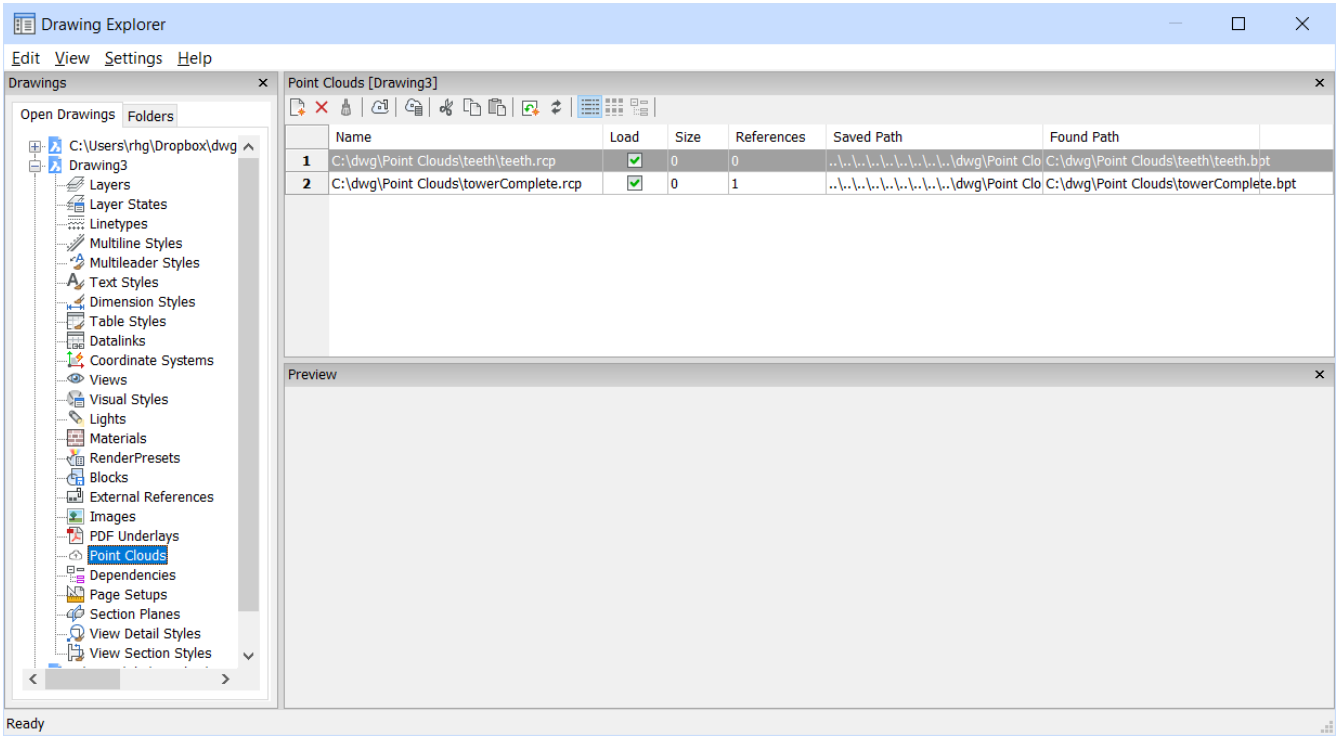
6.24.31 PointCloud

(6.2880 on page 5977) Displays the Point Cloud section of the Drawing Explorer.

Accessing the Command

Keyboard: **pointcloud**：**PointCloud** Displays the Drawing Explorer with the Point Cloud node selected: (6.1914 on the next page)

Figure 6.1914



Command Options

Option	Description
New	Attaches a point cloud file to the current drawing, like the PointCloudAttach (6.24.35) command. Preprocess option, shown below.
Delete	Removes the selected point cloud from the current drawing.
Insert	Inserts additional copies of the existing point cloud files into the drawing; displays the Attach Point Cloud dialog box, like the PointCloudAttach (6.24.35) command.
Preprocess	Converts LAS, PTS, and PTX point cloud files into the BricsCAD BPT point cloud format; displays the Point CLoud Data File dialog box, like the PointCloudPreprocess (6.24.63) command.
Load	Toggles the display of the point cloud.

Related Commands

AttachmentsPanelOpen (6.4.30) - displays the Attachments panel from which point clouds and other attachments can be loaded and controlled. PointCloud2dVsDisplay (6.24.33) - controls whether a bounding box and a warning message display when trying to view a point cloud in the 2D Wireframe visual style. PointCloudAlign (6.24.67) - rotates the point cloud to optimally align it with the X and Y axes. PointCloudAttach (6.24.35) - attaches point cloud files (that were previously converted to BricsCAD's BPT format) to the current drawing. PointCloudBoundary (6.24.36) - sets the display of the bounding box of point clouds. PointCloudColorMap (6.24.37) - colorizes the points based on Intensity, Elevation, and Classification of the point cloud. PointCloudCrop (6.24.41) - crops a point cloud entity, displaying only the part of the point cloud inside or outside a prismatic or cylindrical volume. PointCloudDeleteItem (6.24.38) - deletes point cloud files from the cache folder through a dialog box. PointCloudExport (6.24.39) - exports a cropped selection of a point cloud to a .pts file. PointCloudImport (6.24.40) - imports a VRM file into the current point cloud cache location through a dialog box. PointCloudPointMax (6.24.49) - defines the maximum amount of points shown per point cloud. PointCloudPointSize (6.24.55) - specifies the size of points. PointCloudPointSize_Minus (6.24.43) - decreases the size of points. PointCloudPointSize_Plus (6.24.48) - increases the size of points. PointCloudReference (6.24.45) - attaches point cloud files from the cache folder to the current drawing through a dialog box. PointCloudUncrop (6.24.46) - removes all croppings from a point cloud.

Figure 6.1915

6.24.32 PlotterManager

(6.2981 on page 6079) Creates and edits customized parameter PC3 files for printers and other output devices.

Accessing the Command

command bar: **plottermanager** transparent: **'plottermanager** menu bar: **File | Plotter Manager** : **PlotterManager** Displays a window: (6.1916)

- To edit a plotter configuration:

1. Choose a PC3 file. (PC3 is short for "plotter configuration version 3".)
2. Double-click it to edit it. The program displays a dialog box: (6.1917 on the following page)
3. Edit the settings.
4. Click **OK**.

- To create a new plotter configuration file:

1. Double-click the **Create a Plotter Configuration** shortcut. The Plotter Configuration Editor dialog displays.
2. Select a printer from the **Printer Name** droplist. (6.1919 on page 5111)
3. Edit the settings.
4. Click **OK**.
5. Enter a name to save the new plotter configuration file
6. Click **OK**.

The new PC3 file is added to the **C:\Users\<loginname>\AppData\Roaming\Bricsys\BricsCAD\V...\en_US\plotconfig** folder.

Figure 6.1916

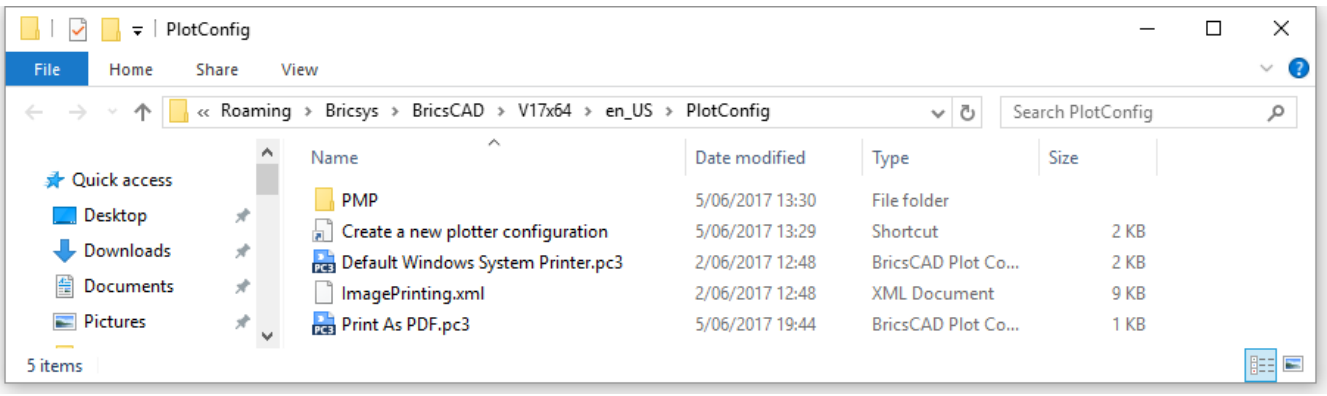


Figure 6.1917

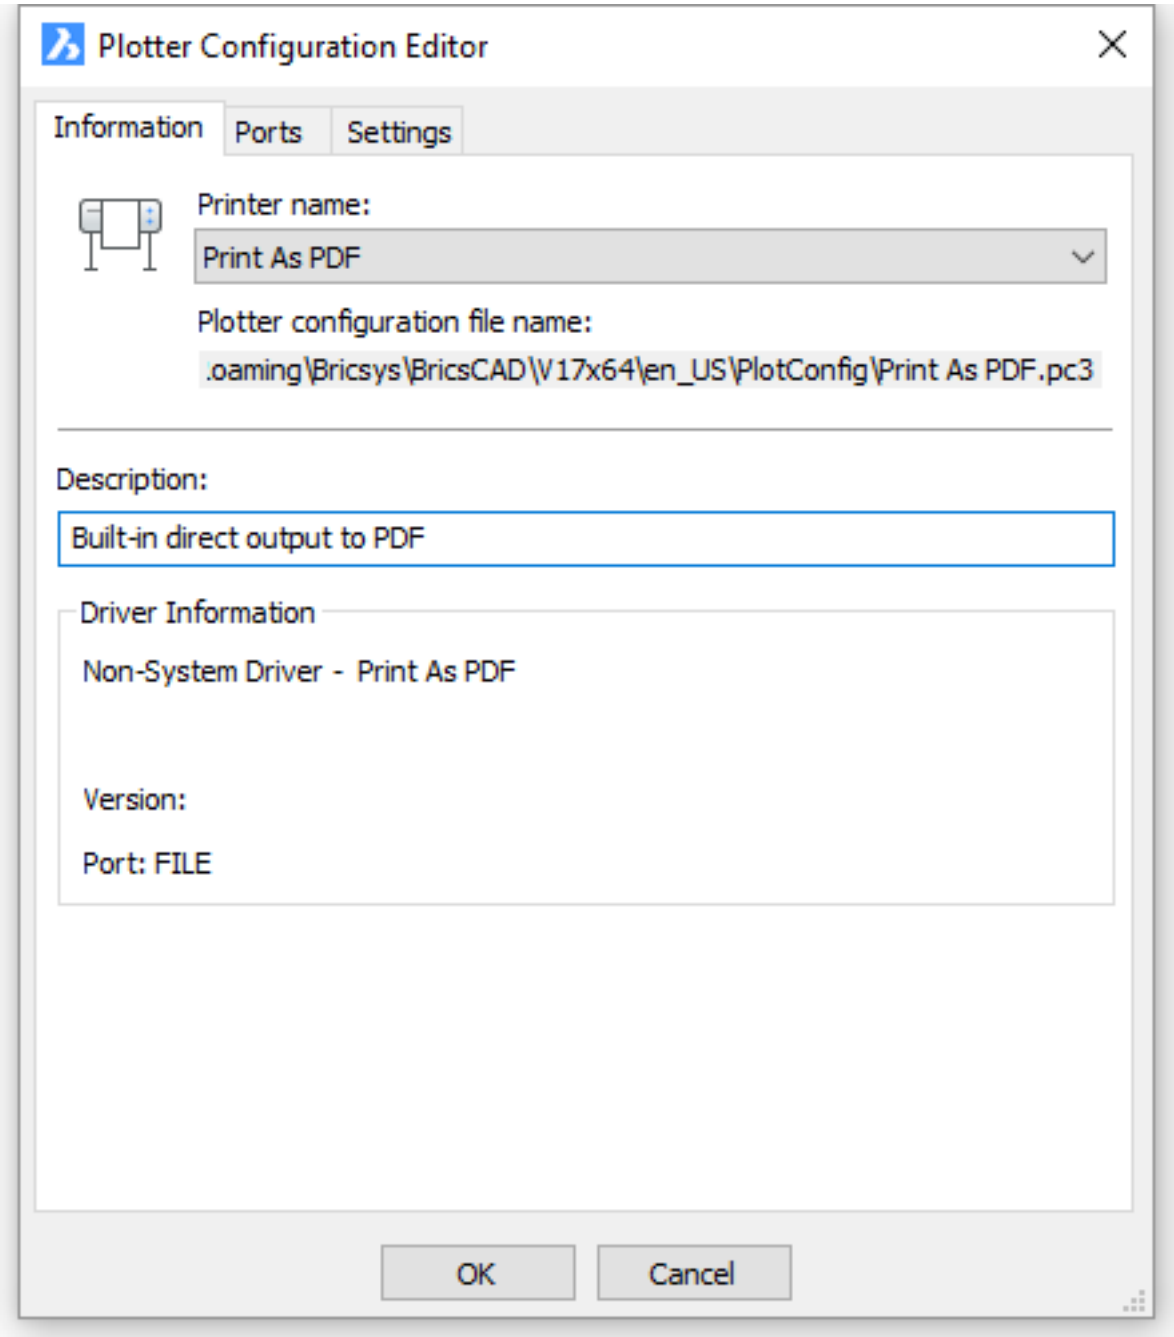

Figure 6.1918

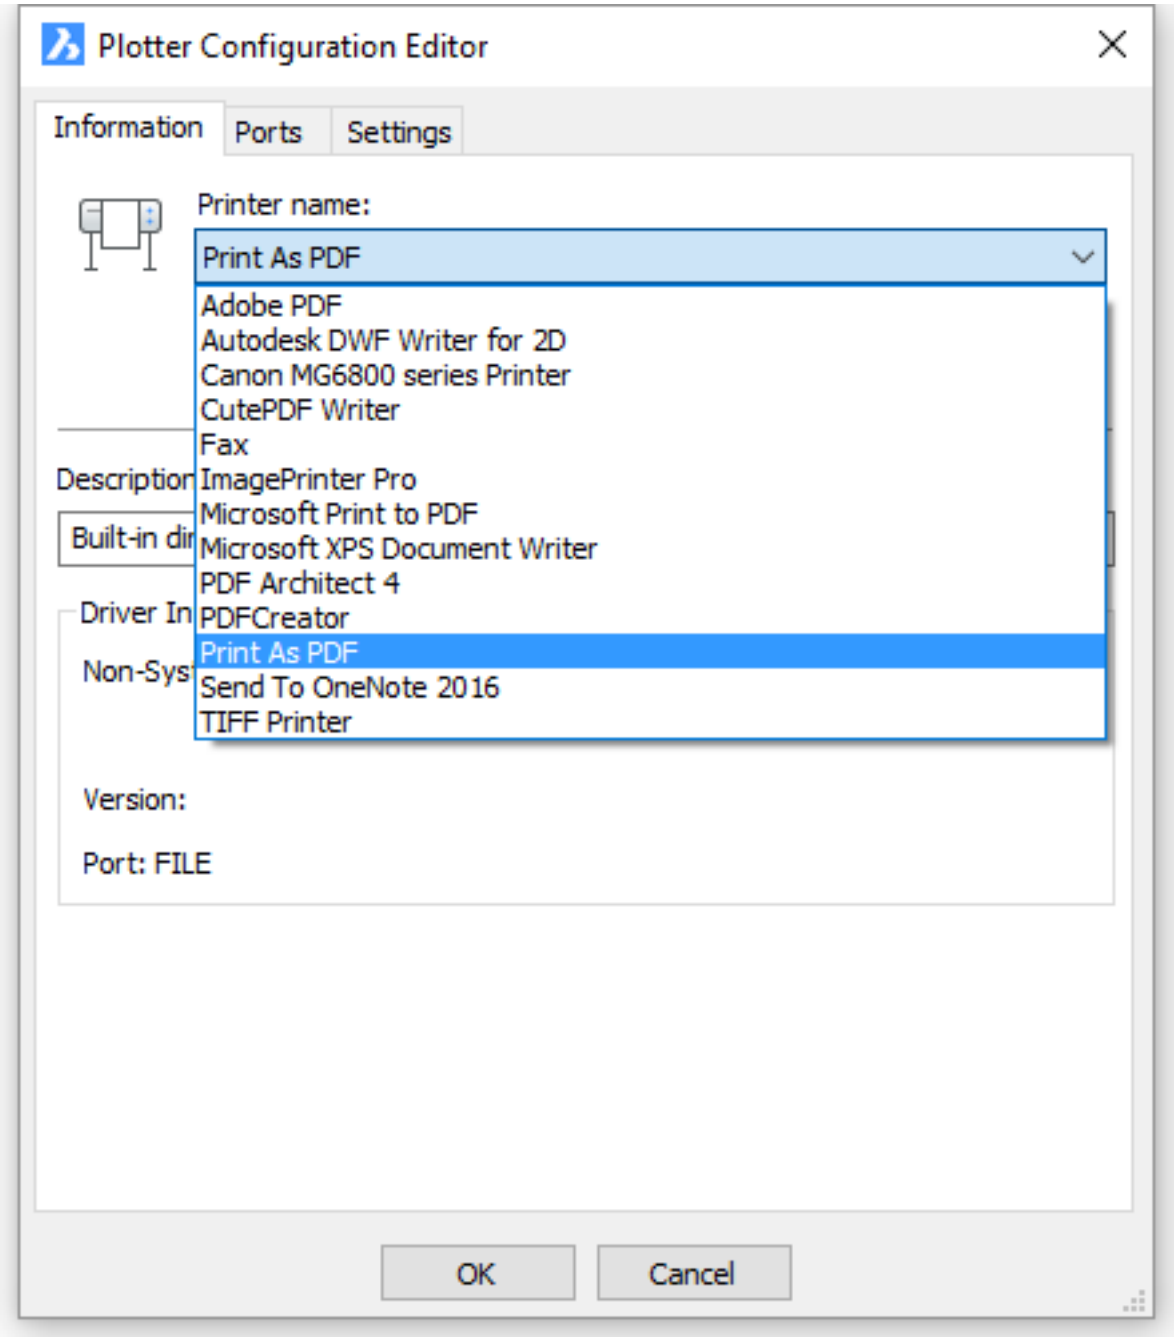
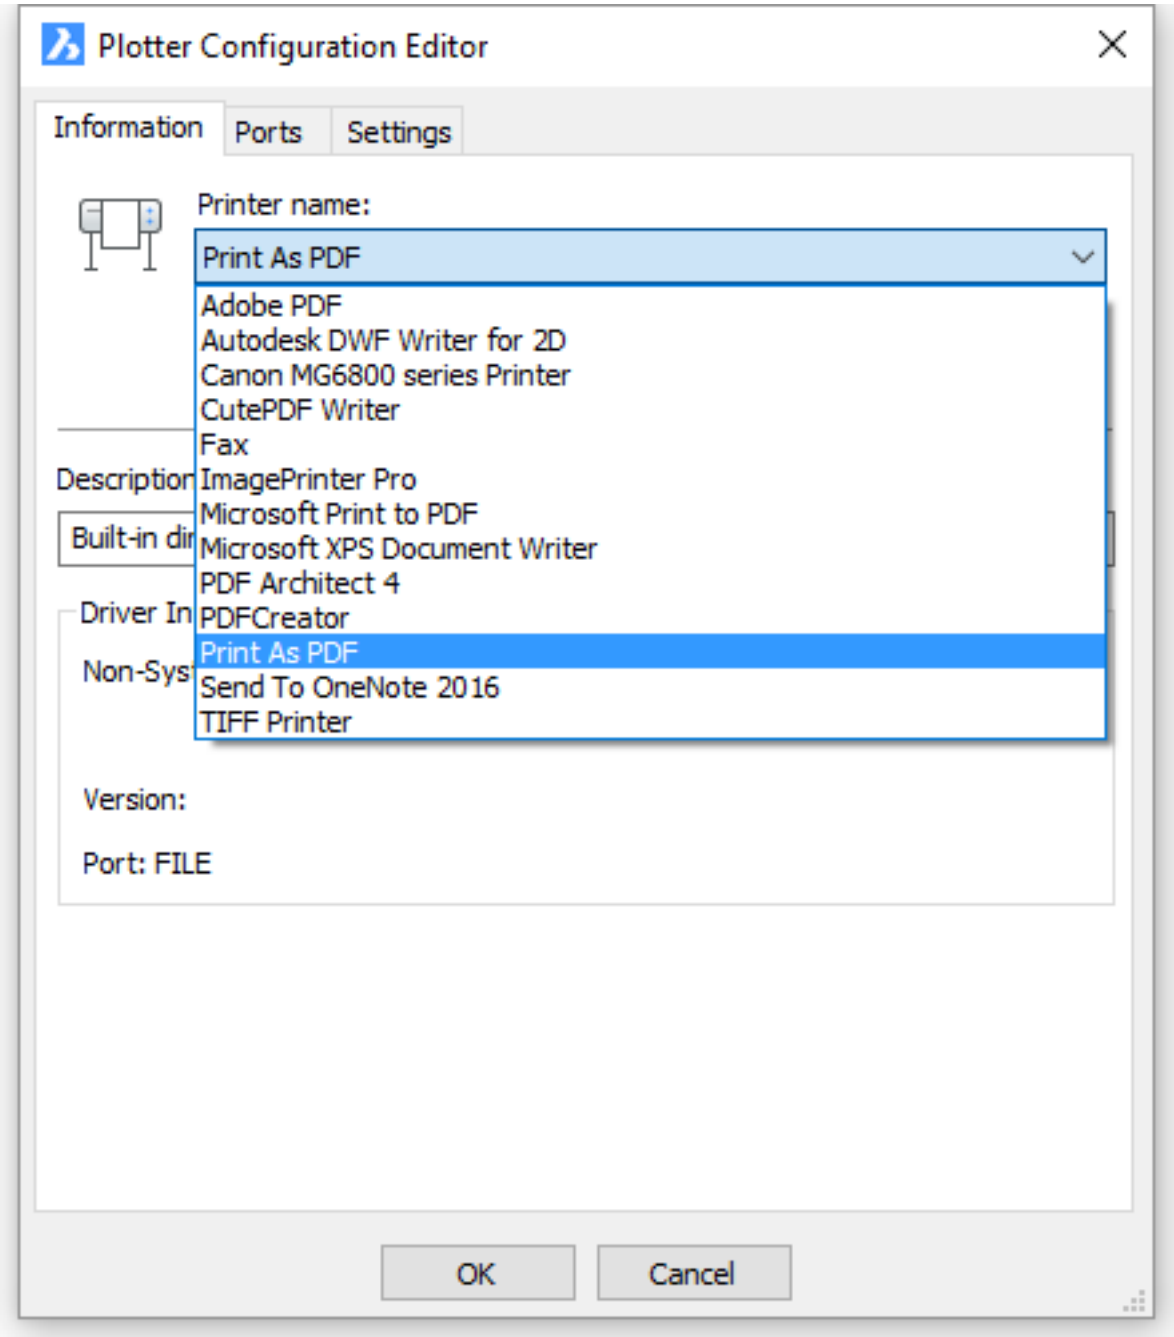


Information Tab Options

Click the Information tab: (6.1919 on the facing page)

Information Tab Option	Description
Printer Name	Lists the names of printers supported by the the operating system.
Description	(Optional) Describes the plotter configuration, and is displayed by tooltips.
OK	Closes the dialog box and saves the changes.
Cancel	Ignores the changes and closes the dialog box,

Figure 6.1919

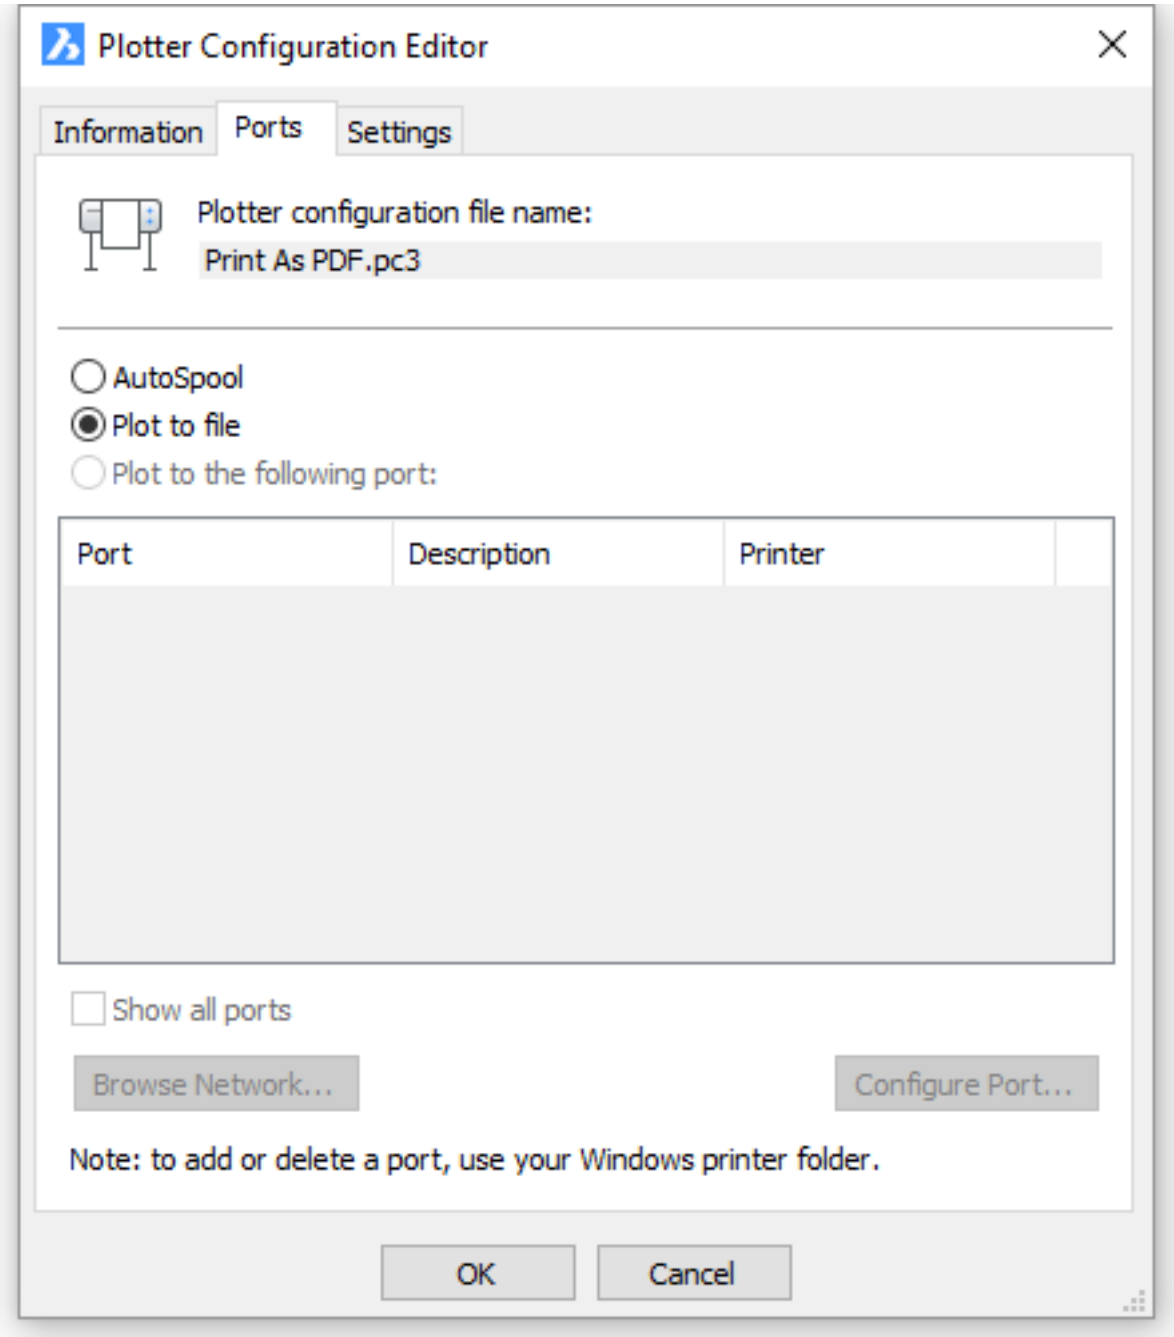


Ports Tab Options

Click the Ports tab: (6.1920 on the next page)

Ports Tab Options	Description
AutoSpool	Sends drawings to the spooler software, which records the plot file and then sends it to the printer. The spooler software must be set up separately, although generally no longer necessary as the operating system usually includes spooling.
Plot to file	Plots drawings to PLT files. These plot files can be read by other software programs.
Plot to the following port	Plots drawings to the printer attached to the specified port.
Show all ports	Displays the names of all local and network ports on the current computer.
Browse Network	Opens the Browse Network window so that you to locate printers attached to the network.
Configure Port	Opens the Configure Port dialog box to configure the selected port.

Figure 6.1920



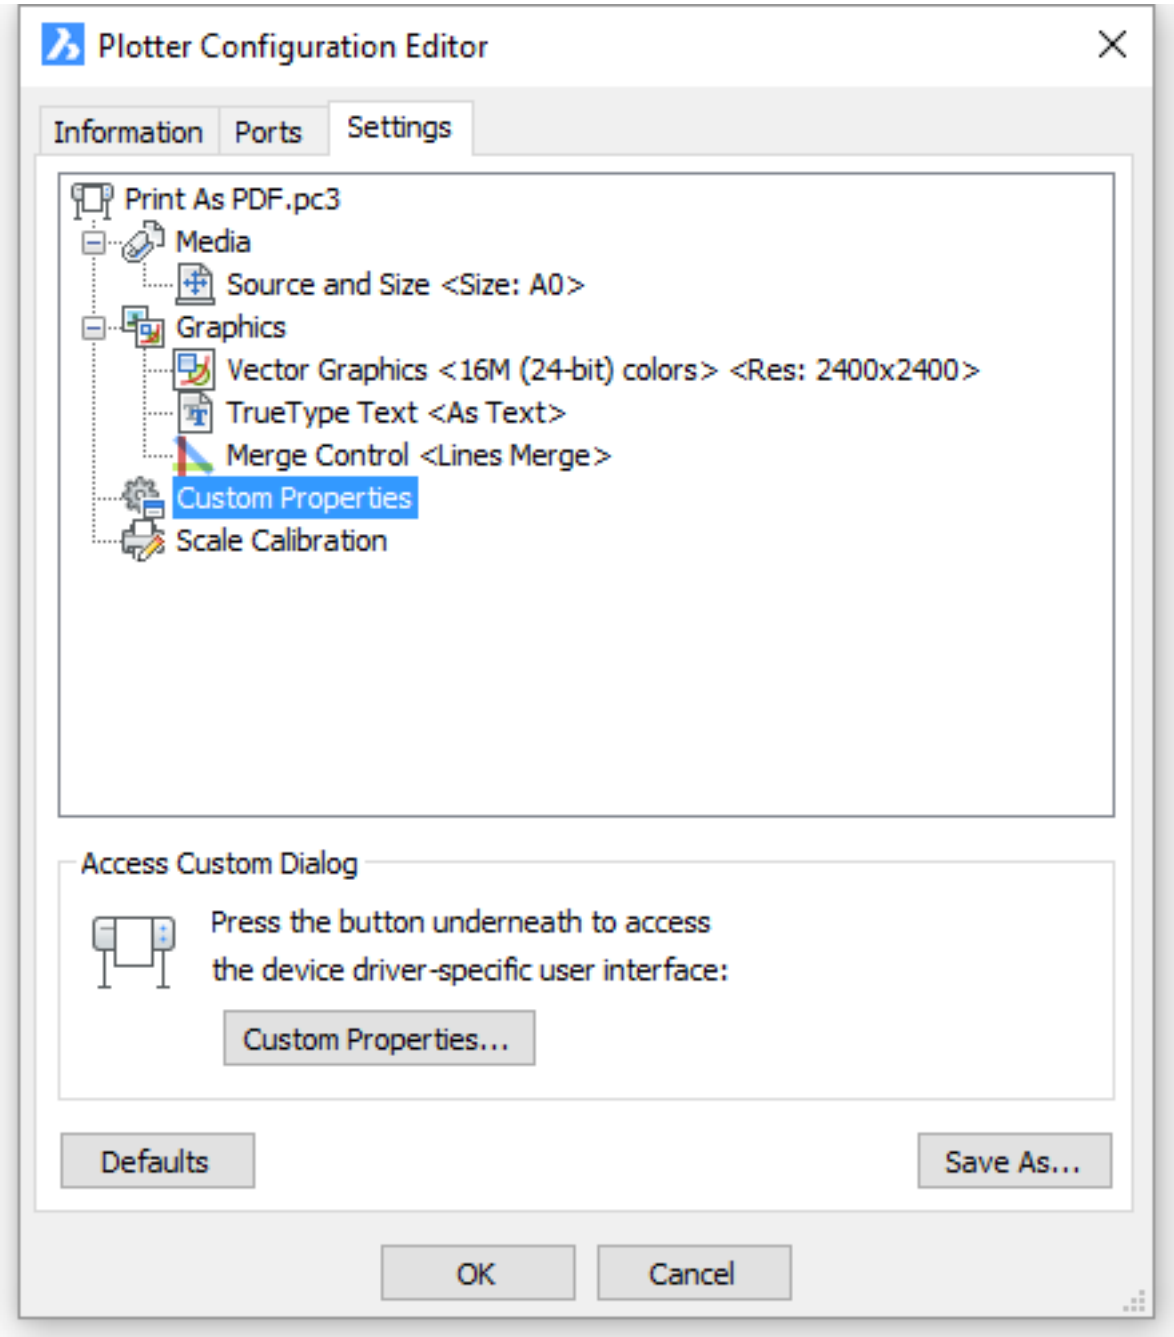
Settings Tab Options

Click the Settings tab: (6.1921 on page 5116) The settings available depend on the capabilities of the printer selected. The ones shown below are common to all printers and output devices.

Settings Tab Options	Description
Media	Specifies settings for the media (paper).
Collating	Specifies how to collate pages: • **None** - does not collate; drawings are printed normally • **Regular** - prints layouts of each drawing together This option is useful when printing multiple copies of drawings with multiple layouts.
Graphics	Specifies how the three types of graphics are handled by the printer: Vector Graphics options: • **Color depth** - specifies the number of colors to use • **Color** - outputs the drawing in color. • **Monochrome** - outputs the drawing in monochrome (black or shades or gray) • **Resolution** - adjusts the resolution; a lower resolution is coarser, but prints more quickly • **Dithering** - specifies the type of dithering, which simulates more colors at the cost of lower resolution Raster Graphics options: • **Raster** - adjusts how raster images are handled • **OLE** - adjust how OLE objects are printed; ranges from **None** (does not print OLE entities, faster) to **Best** (prints OLE entities at highest quality) • **Trade-off** - specifies how the program should handle drawings with very large raster images that take up much memory: (6.1922 on page 5117) **Lower Resolution** - prints images with lower resolution but full colors; suitable for photographs **Balance** - prints images with as many colors and as much resolution as possible **Fewer Colors** - prints images with fewer colors but full resolution; suitable for grayscale images TrueType text options: • **TrueType as text** - prints text as text; preferred when the printer holds the needed fonts. • **TrueType as graphics** - prints text as graphics; preferred when drawings are printed to files.

Merge Control	Specifies how overlapping lines are merged: • **Lines Overwrite** - specifies that entities with higher draw order overwrite other entities. • **Lines Merge** - specifies that entities are blended to merge their colors; allows entities with lower draw order to be seen.
Custom Properties	Accesses the Custom Properties dialog box, which lists properties unique to the selected output device. The content varies according the capabilities of the device. Custom properties are not supported on the Linux platform.
Scale Calibration	Calibrates the plotter;displays the Calibrate Plotter wizard. This option was necessary in the days of pen plotters, which could go out of alignment; today's inkjet and laser printers not to have the problem.
Save As	Displays the Save As dialog box to save settings as PC3 files. 1. Enter a file name. 2. Click **Save**. PC3 is short for "plotter configuration version 3"; these files store parameters for specific plotters. You can have multiple PC3 files for each printer and output device.
Defaults	Resets all options to their default values; prompts you: **Do you want to set everything to defaults? - (type Y or N.)**

Figure 6.1921



Procedures

- To create a plotter configuration file (1.33.2)
- To edit a plotter configuration (1.33.2)
- To assign a plotter configuration (1.33.2)

6.24.34 PlaceView

(6.2981 on page 6079) Places named views from a source drawing into a paper space layout of the current drawing. **Notes:**

- This command works only in paper space, and is meant for use with sheet sets.
- It is not allowed to place a named view in a layout of the source drawing.

Accessing the Command

command bar: **placeview** mouse: drag a model view from the Content Browser (6.9.32) panel onto a paper space layout
: PlaceView

- When you start the command in model place, **the program reports:**

Command only valid in Paper Space.

- When you start the command in paper space, **the command prompts you:**

Enter file name: **(Type the drawing name, including the full path)** Enter view name to place or [?]: **(Type the name of the model view, or enter ? for a list of view names)** Enter view origin point: **(Specify a point)** The drawing is attached as an external reference and a paper space viewport is placed in the layout showing the named view.

Command Options

Option	Description
Enter file name	Names the file from which the views will be place.
Enter view name to place	Names the view to place.
?	Prints a list of the named views in the Prompt History (6.29.16) window, such as: Start of Road Hairpin Curve End of Road
Enter view origin point	Specify the location of the lower left corner: • Pick a point • Enter x,y coordinates

Related Commands

ContentBrowserOpen (6.9.32) - opens the Content Browser panel. XAttach (6.34.1) - attaches externally-referenced drawings through a dialog box. XRef (6.13.23) - attaches DWG files to the current drawing through the Drawing Explorer .

Figure 6.1926

6.24.35 PointCloudAttach

(6.2880 on page 5977) Attaches point cloud files (that were previously converted to BricsCAD's BPT format) to the current drawing.

Accessing the Command

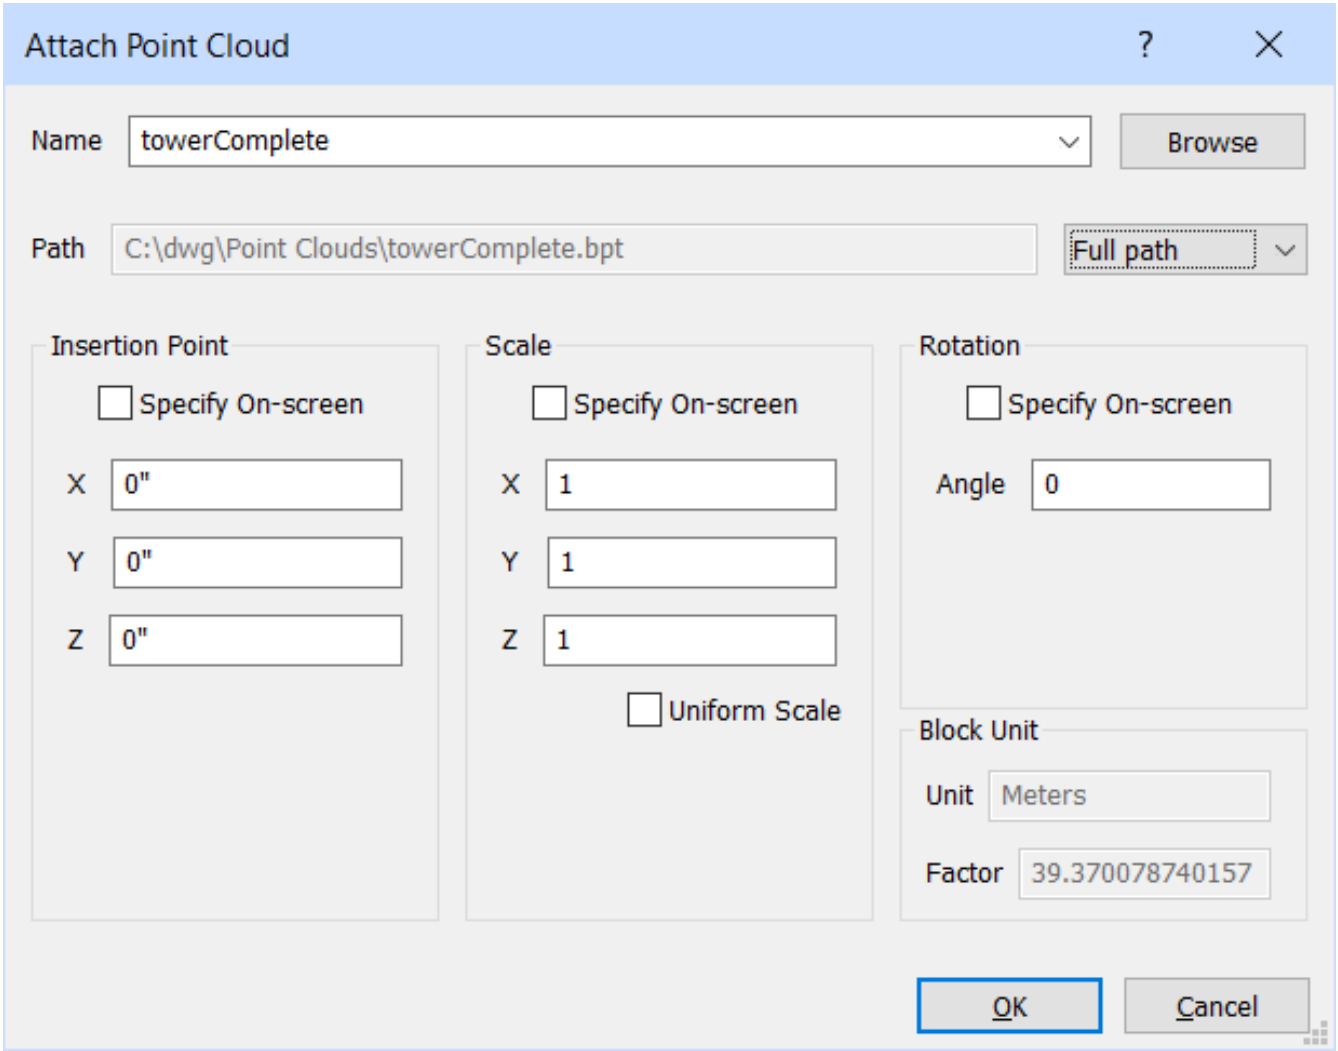
Keyboard: **pointcloudattach** Toolbar: **Point Cloud :PointCloudAttach** Displays the Pre-process point cloud data file(s) dialog box.

Command Options

Option	Description
File name	Specifies the name of the point cloud file to attach. You can select from the following file types: E57, LAS, PTS, PTX, RCP, RCS, BPT.
Open	Opens the point cloud file, then displays the Attach Point Cloud dialog box; see below.
Cancel	Cancels the attachment process.

After you click **Open**, the program displays a dialog box: (6.1927 on the following page)

Figure 6.1927



Command Options

Option	Description
Name	Specifies a name for the point cloud to be attached. You can use the name of the file, or give it another name.
Path	Specifies the path to the folder holding the point cloud. The droplist lets you choose whether to • **Full path** - keep the full path • **Relative path** - relative to the folder of the current drawing • **No path** - at all
Insertion Point	Specifies where the lower left corner of the point cloud should be located in the drawing • **Specify on-screen** - prompts you for the insertion point after you close the dialog box • **X, Y, Z** - specifies the x, y, and z coordinates for the insertion point
Scale	Specifies the size of the point cloud: • **Specify on-screen** - prompts you for the scale factor after you close the dialog box • **X, Y, Z** - specifies the scale factor for each of the three directions • **Uniform Scale** - forces all three scale factors to be the same The point cloud is scaled relative to the insertion point.
Rotation	Specifies the angle at which to position the cloud: • **Specify on-screen** - prompts you for the rotation angle after you close the dialog box • **Angle** - specifies the angle The point cloud is rotated relative to the insertion point.
OK	Attaches the point cloud into the current drawing.
Cancel	Cancels the attachment process.

PointCloud2dVsDisplay (6.24.33) - controls whether a bounding box and a warning message display when trying to view a point cloud in the 2D Wireframe visual style. PointCloud (6.24.31) - opens the Drawing Explorer to the Point Cloud section; converts, loads, and unloads point cloud file attachments. PointCloudAlign (6.24.67) - rotates the point cloud to optimally align it with the X and Y axes. PointCloudAttach (6.24.35) - attaches point cloud files (that were previously converted to BricsCAD's BPT format) to the current drawing. PointCloudColorMap (6.24.37) - colorizes the points based on Intensity, Elevation, and Classification of the point cloud. PointCloudCrop (6.24.41) - crops a point cloud entity, displaying only the part of the point cloud inside or outside a prismatic or cylindrical volume. PointCloudDeleteItem (6.24.38) - deletes point cloud files from the cache folder through a dialog box. PointCloudExport (6.24.39) - exports a cropped selection of a point cloud to a .pts file. PointCloudImport (6.24.40) - imports a VRM file into the current point cloud cache location through a dialog box. PointCloudPointMax (6.24.49) - defines the maximum amount of points shown per point cloud. PointCloudPointSize (6.24.55) - specifies the size of points. PointCloudPointSize_Minus (6.24.43) - decreases the size of points. PointCloudPointSize_Plus (6.24.48) - increases the size of points. PointCloudReference (6.24.45) - attaches point cloud files from the cache folder to the current drawing through a dialog box. PointCloudUncrop (6.24.46) - removes all croppings from a point cloud.

AttachmentsPanelOpen (6.4.30) - displays the Attachments panel from which point clouds and other attachments can be loaded and controlled. PointCloud2dVsDisplay (6.24.33) - controls whether a bounding box and a warning message display when trying to view a point cloud in the 2D Wireframe visual style. PointCloud (6.24.31) - opens the Drawing Explorer to the Point Cloud section; converts, loads, and unloads point cloud file attachments. PointCloudAlign (6.24.67) - rotates the point cloud to optimally align it with the X and Y axes. PointCloudAttach (6.24.35) - attaches point cloud files (that were previously converted to BricsCAD's BPT format) to the current drawing. PointCloudColorMap (6.24.37) - colorizes the points based on Intensity, Elevation, and Classification of the point cloud. PointCloudCrop (6.24.41) - crops a point cloud entity, displaying only the part of the point cloud inside or outside a prismatic or cylindrical volume. PointCloudDeleteItem (6.24.38) - deletes point cloud files from the cache folder through a dialog box. PointCloudExport (6.24.39) - exports a cropped selection of a point cloud to a .pts file. PointCloudImport (6.24.40) - imports a VRM file into the current point cloud cache location through a dialog box. PointCloudPointMax (6.24.49) - defines the maximum amount of points shown per point cloud. PointCloudPointSize (6.24.55) - specifies the size of points. PointCloudPointSize_Minus (6.24.43) - decreases the size of points. PointCloudPointSize_Plus (6.24.48) - increases the size of points. PointCloudReference (6.24.45) - attaches point cloud files from the cache folder to the current drawing through a dialog box. PointCloudUncrop (6.24.46) - removes all croppings from a point cloud.

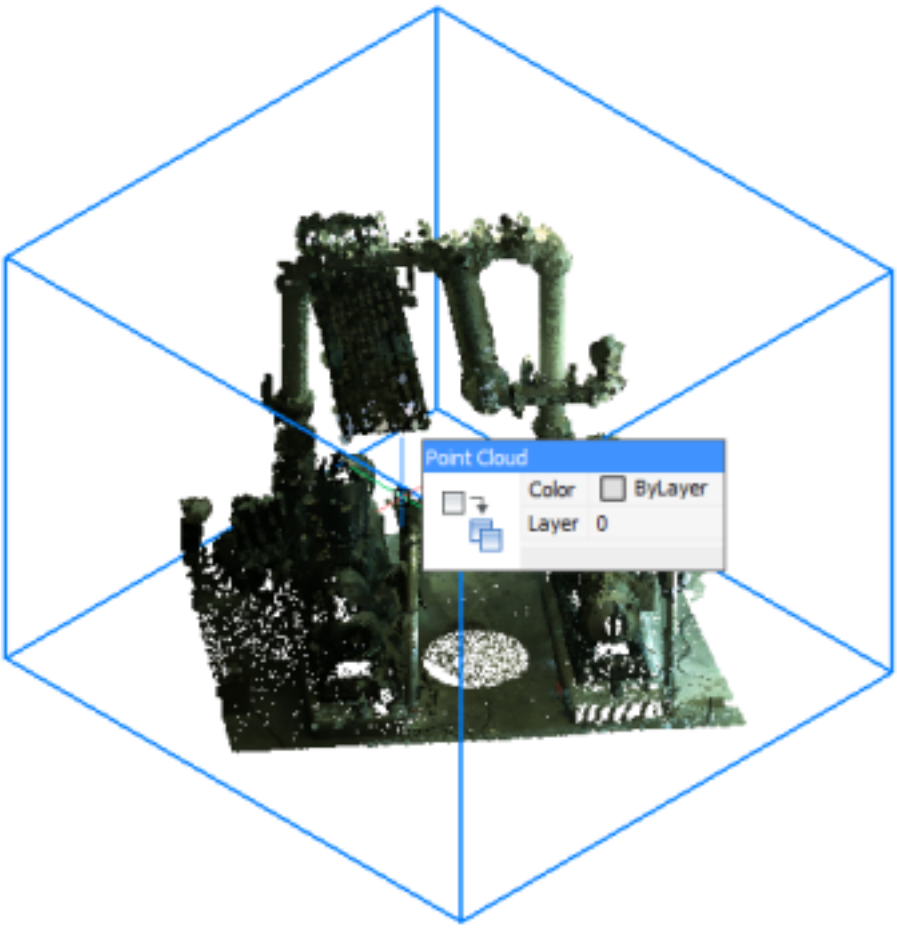

Figure 6.1931

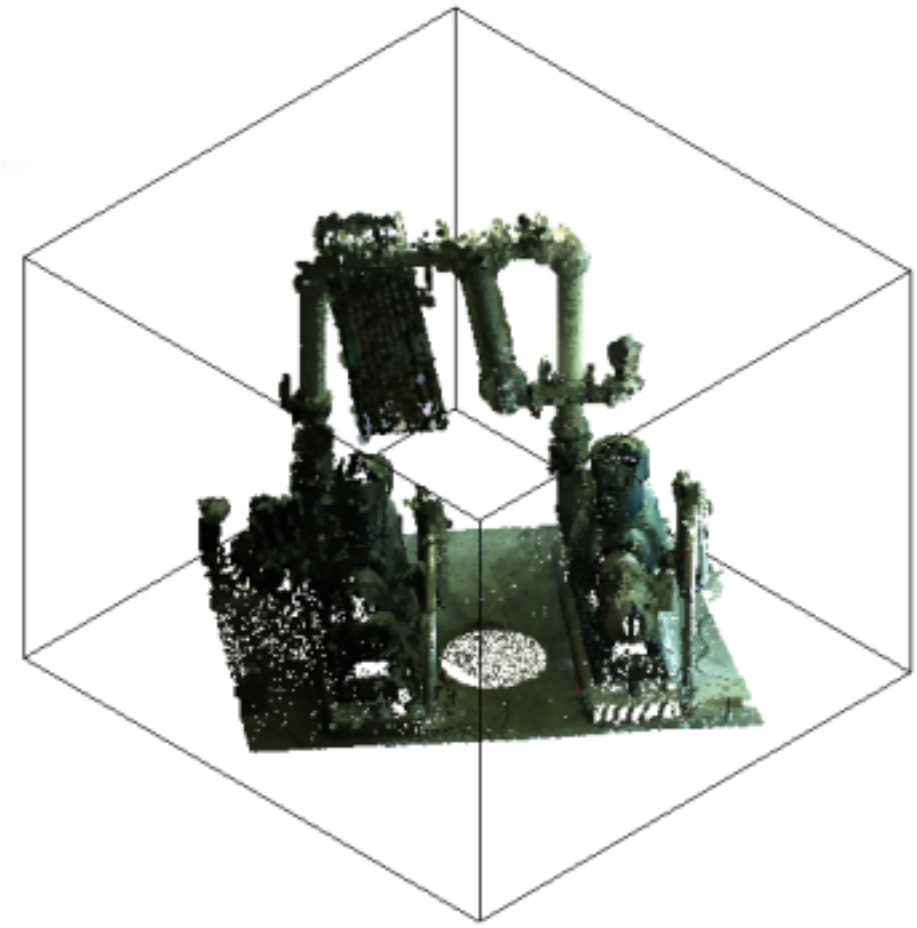

Figure 6.1932

6.24.37 PointCloudColorMap

(6.2880 on page 5977) Colorizes the point cloud.

Accessing the Command

Keyboard: **pointcloudcolormap** Toolbar: **Point Cloud :PointCloudColorMap Prompts you:** Role [Scan/Elevation/Intens <Elevation>:

Command Options

Option	Description
Scan	Assigns colors according to color data collected by the scan.
Elevation	Colors assigned by the elevation of the points according to the specified color map.
Intensity	Colors assigned according to their intensity value according to the specified color map. When the point cloud file contains no intensity data, then the colors are assigned by height, regardless of which option you select.
Color map	Specifies the range of colors to assign points: • **Scan** - assigns colors according to color data collected by the scan. • **Spectrum** - assigns a range of colors across the color spectrum. • **Earth** - assigns a range of colors from light brown to dark brown. • **Hydro** - assigns a range of colors from light to dark blue. • **grAy**- assigns a range of colors from light gray to dark gray. • **Reds** - assigns a range of colors from light to dark red • **Greens** - assigns a range of colors from light to dark green • **Blues** - assigns a range of colors from light to dark blue

When the command ends, the program colorizes the point cloud, such as the "Hydro" one illustrated below. (6.1933 on the facing page)

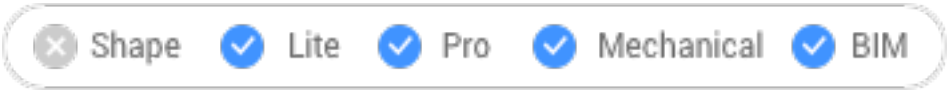
PointCloud (6.24.31) - opens the Drawing Explorer to the Point Cloud section; converts, loads, and unloads point cloud file attachments. PointCloudAlign (6.24.67) - rotates the point cloud to optimally align it with the X and Y axes. PointCloudAttach (6.24.35) - attaches point cloud files (that were previously converted to BricsCAD's BPT format) to the current drawing. PointCloudBoundary (6.24.36) - sets the display of the bounding box of point clouds. PointCloudCrop (6.24.41) - crops a point cloud entity, displaying only the part of the point cloud inside or outside a prismatic or cylindrical volume. PointCloudDeleteItem (6.24.38) - deletes point cloud files from the cache folder through a dialog box. PointCloudExport (6.24.39) - exports a cropped selection of a point cloud to a .pts file. PointCloudImport (6.24.40) - imports a VRM file into the current point cloud cache location through a dialog box. PointCloudPointMax (6.24.49) - defines the maximum amount of points shown per point cloud. PointCloudPointSize (6.24.55) - specifies the size of points. PointCloudPointSize_Minus (6.24.43) - decreases the size of points. PointCloudPointSize_Plus (6.24.48) - increases the size of points. PointCloudReference (6.24.45) - attaches point cloud files from the cache folder to the current drawing through a dialog box. PointCloudUncrop (6.24.46) - removes all croppings from a point cloud.

Figure 6.1934



6.24.38 PointCloudDeleteItem

(6.2947 on page 6049) Deletes point cloud files from the cache folder through a dialog box.

Accessing the Command

Keyboard: **pointclouddeleteitem** Toolbar: **Pointclouds : pointclouddeleteitem** Displays a dialog box: (6.1935 on the facing page)

1. **Cache used**: Specifies the total amount of used cache.
2. **Available**: Specifies the total amount of available cache. The available cache is controlled by the POINTCLOUDCACHESIZE system variable.
3. **Dataset**: Displays a list of cached point cloud files including their names and locations. You can select point cloud files from the list to delete them from the cache.
4. **Size**: Displays the amount of cache used for each point cloud file.
5. **OK**: Displays the Confirm deleting selected cache items dialog box where you can review the list of point clouds to be deleted.
6. **Cancel**: Closes the dialog box without deleting point cloud files from the cache.

The Confirm Deleting Selected Cache Items dialog box enables you to review a list of cached point cloud files that were selected to be deleted. This gives you a final opportunity to cancel the operation before permanently removing them from the cache. (6.1936 on the next page)

1. **Dataset**: Selected datasets to deleted.
2. **Size**: Size of the selected datasets.
3. **OK**: Click to confirm the deletion.
4. **Cancel**: Closes the dialog box without deleting point cloud files from the cache.

Figure 6.1940

6.24.41 PointCloudCrop

(6.2981 on page 6079) Crops a point cloud entity, displaying only the part of the point cloud inside or outside a prismatic or cylindrical volume.

Accessing the Command

Keyboard: **pointcloudcrop : pointcloudcrop Prompts you:** Select point cloud entity: **(Select a point cloud.)** Crop option [Rectangular/Circular/Polygonal/Invert/showToggle/removeLast/removeAll] <Rectangular>: **(Choose an option or press Enter to create a rectangular cropping.)**

(6.1941 on the facing page)	(6.1942 on the next page)	(6.1943 on page 5138)
uncropped point cloud	rectangular cropping inside	rectangular cropping outside

Note: Multiple cropping volumes can be combined.

Command Options

Option	Description
Rectangular	Creates a rectangular prismatic cropping. Prompts you: **First corner point - (specify a point.) Specify opposite corner - (specify a point.) Inside? [Inside/Outside] <Inside> - (choose an option.)** • **Inside**: displays the part of the point cloud inside the rectangular prismatic volume only. • **Outside**: displays the part of the point cloud outside the rectangular prismatic volume only.
Circular	Creates a cylindrical cropping. Prompts you: **Circle center point - (specify a point.) Point on circle circumference - (specify a point.) Inside? [Inside/Outside] <Inside> - (choose an option.)** • **Inside**: displays the part of the point cloud inside the cylindrical volume only. • **Outside**: displays the part of the point cloud outside the cylindrical volume only.
Polygonal	Creates a polygonal prismatic cropping. Prompts you: **Specify first point - (specify a point.) Specify next point - (specify a point.) Specify next point - (specify a point.) Specify next point - (specify more points or press Enter to stop.) Inside? [Inside/Outside] <Inside> - (choose an option.)** • **Inside**: displays the part of the point cloud inside the polygonal prismatic volume only. • **Outside**: displays the part of the point cloud outside the polygonal prismatic volume only.
Invert	Inverts the current cropping; toggles the cropping inside/outside and vice versa.
Show Toggle	Toggles the current cropping on/off.
Remove Last	Removes the most recently added cropping volume.
Remove All	Removes all cropping.

Figure 6.1943

Figure 6.1944

6.24.42 -Plot

(6.2981 on page 6079) Plots drawings to printers and to files, through prompts at the command bar; this command is meant for scripts and routines. **Note:** To print drawings through a dialog box, use the Print (6.24.51) command.

Accessing the Command

command bar: **-plot** alias: **-plot** : **-plot Prompts you in the command bar:** Detailed plot configuration [Yes/No] <No>: **(Type Y or N)**

- When you don't want detailed plot configuration, **you are prompted:**

Enter a layout name or ? <Model>: **(Enter a name, type ? for a list of layout names, or press Enter to accept the default)** Enter a page setup name <>: **(Enter a name, press Enter for none, or type _previous plot or <previous plot>)** Enter an output device name or ? <default.pc3>: **(Enter a name, type ? for a list of device names, or press Enter to accept the default)** Write the plot to a file [Yes/No] <No>: **(Type Y or N)** Save changes to model tab [Yes/No] <No>: **(Type Y or N)** Proceed with Plot [Yes/No] <No>: **(Type Y or N)**

- When you want detailed plot configuration, **you are prompted:**

Enter a layout name or ? <Model>: **(Enter a name, type ? for a list of layout names, or press Enter to accept the default)** Enter an output device name or ? <dfault.pc3>: **(Enter a name, type ? for a list of device names, or press Enter to accept the default)** Enter paper size or ? <Letter>: **(Enter a name, type ? for a list of size names, or press Enter to accept the default)** Enter paper units [Inches/Millimeters] <Millimeters>: **(Type I or M)** Enter drawing orientation [Portrait/Landscape] <Portrait>: **(Type P or L)** Plot upside down [Yes/No] <No>: **(Type Y or N)** Enter plot area [Display/Extents/Limits/View/Window] <Display>: **(Enter an option)** Enter plot scale (Plotted millimeters = Drawing Units) or [Fit] <Fit>: **(Enter a scale factor or type F)** Enter plot offset (x,y) or <0.0000,0.0000>: **(Enter a x,y offset distance, or press Enter to accept the default)** Plot with plot styles [Yes/No] <Yes>: **(Type Y or N)** Enter plot style table name (enter . for none) or ? <bricscad.stb>: **(Enter a name, type ? for a list of style names, or press Enter to accept the default).** Plot with lineweights [Yes/No] <Yes>: **(Type Y or N)** Remove hidden lines [Yes/No] <Yes>: **(Type Y or N)** Write the plot to a file [Yes/No] <Yes>: **(Type Y or N)** Save changes to model tab [Yes/No] <Yes>: **(Type Y or N)** Proceed with Plot [Yes/No] <Yes>: **(Type Y or N)**

Command Options

Option	Description
Detailed plot configuration	Toggles detailed plot configuration: • **Yes** - prompts you with 16 options; see below • **No** - prompts you with six options
Enter a layout name	Specifies the name of the layout to plot. • Enter the name of a layout, such as layout1 • **?** - lists the names of layouts in the drawing. • **Model** - plots the model tab only.
Enter a page setup name	Specifies the name of a page setup: • Enter a name • Press **Enter** for none See the PageSetup (6.24.2) command.

Enter an output device name	Specifies the name of the output device (plotter or file): • Enter a name of a PC3 file • **?** - lists the names of devices available on this computer, such as: "Adobe PDF" "Default Windows System Printer.pc3" "Print As PDF.pc3" When the default is None, you must specify a name.
Write the plot to a file	Determines whether the plot is sent to a file: • **Yes** - plots the drawing to a PLT file; the program displays the Create Plot File dialog box: (6.1946 on page 5144)Specify a file name, and then click **Save**. • **No** - plots the drawing to a printer or other output device.
Save changes to model tab or Save changes to layout-name	Toggles saving the plot parameters to the model or layout tab: • **Yes** - saves the plot parameters, which can be used for the next plot • **No** - does not save plot parameters
Proceed with Plot	Toggles plotting of the drawing: • **Yes** - plots the drawing • **No** - does not plot the drawing; exits the command

Detailed Configuration Option	**Description**
Enter a layout name	Specifies the name of the layout to plot. • Enter the name of a layout, such as layout1 • **?** - lists the names of layouts in the drawing. • **Model** - plots the model tab only. model tab only.
Enter an output device name	Specifies the name of the output device (plotter or file): • Enter a name of a PC3 file • **?** - lists the names of devices available on this computer, such as: "Adobe PDF" "Default Windows System Printer.pc3" "Print As PDF.pc3" When the default is None, you must specify a name.
Enter paper size	Specifies the name of the paper size: • Enter the name of a paper size • **?** - lists the names of paper sizes available for the plotter, such as: Available media sizes. "Letter" "Legal" "Executive" "A3" The available paper sizes vary according to the printer selected.

Enter paper units

Specifies the units used for paper sizes:

- **Inches** - shows paper sizes in inches
- **Millimeters** - shows paper sizes in millimeters

Enter drawing orientation

Determines how the drawing is plotted on the paper:

- **Portrait** - prints the drawing so that the tall edge is upright
- **Landscape** - prints the drawing so that the short edge is upright

Plot upside down

Toggles upside-down plotting:

- **Yes** - prints drawing upside-down
- **No** - prints drawing normally

Enter plot area

Specifies the area of the drawing to plot:

- **Display** - plots the area shown in the current viewport.
- **Extents** - plots the extents of the drawing, ensuring all non-frozen entities are plotted.
- **Limits** - plots the limits of the drawing, as defined by the Limits command.
- **View** - plots the current view, or a named view. See View command; prompts you: **Enter view name** - **(specify the name of a view.)**
- **Window** - plots a rectangular area defined by the user; prompts you:

1. **Select first corner of window** - **(specify one corner of the rectangle.)**
2. **Select second corner of window** - **(specify the other corner.)**

Enter plot scale

Specifies the plot scale factor:

- **Plotted Inches (or Millimeters)** - specifies the inches (or millimeters) on the paper.
- **Drawing Units** - specifies the number of drawing units (inches, meters, etc).
- **F** - fits the drawing to the paper; BricsCAD calculates the scale factor automatically.

Enter plot offset

Specifies the offset distance for the print; enter positive or negative distances to move the drawing in the x and/or y distances:

- **Positive values** - moves the drawing up and to the right
- **Negative values -** moves the drawing down and to the left

The lower left corner of the drawing is moved by the specified distance. This is useful when the paper has a title block area that might interfere with the drawing.

Plot with plot styles	Toggles the use of plot styles: • **On** - uses plot styles to determine the look of the printed drawing. • **Off** - does not use plot styles. Plot styles override lineweight settings.
Enter plot style table name	Specifies the plot style table to use, which assigns properties to "pens," colors, and entities. • Enter a STB file name • **?** - lists the names of plot styles available in the drawing. • **.** - specifies no plot style.
Plot with lineweights	(This option is unavailable when Plot with Plot Styles is turned on.) Toggles the use the lineweights: • **On** - mimics lineweights assigned to the drawing in the print • **Off** - ignores lineweights
Remove hidden lines	Toggles removal of hidden lines for 3D drawings: • **Yes** - removes hidden lines • **No** - does not remove hidden lines
Write the plot to a file	Determines whether the plot is sent to a file: • **Yes** - plots the drawing to a PLT file; the program displays the Create Plot File dialog box: (6.1946 on page 5144)Specify a file name, and then click **Save**. • **No** - plots the drawing to a printer or other output device.
Save changes to model tab or Save changes to layout-name	Toggles saving the plot parameters to the model or layout tab: • **Yes** - saves the plot parameters, which can be used for the next plot • **No** - does not save plot parameters
Proceed with Plot	Toggles plotting of the drawing: • **Yes** - plots the drawing • **No** - does not plot the drawing; exits the command

6.24.43 PointCloudPointSize_Minus

(6.2981 on page 6079) Decreases the size of points in point clouds.

Accessing the Command

Keyboard: **pointcloudpointsize_minus** Toolbar: **Point Cloud :PointCloudpointsize_minus**

Command Options

None. This command reduces the size of each point in the cloud by one size.

Related Commands

AttachmentsPanelOpen (6.4.30) - displays the Attachments panel from which point clouds and other attachments can be loaded and controlled. PointCloud2dVsDisplay (6.24.33) - controls whether a bounding box and a warning message display when trying to view a point cloud in the 2D Wireframe visual style. PointCloud (6.24.31) - opens the Drawing Explorer to the Point Cloud section; converts, loads, and unloads point cloud file attachments. PointCloudAlign (6.24.67) - rotates the point cloud to optimally align it with the X and Y axes. PointCloudAttach (6.24.35) - attaches point cloud files (that were previously converted to BricsCAD's BPT format) to the current drawing. PointCloudBoundary (6.24.36) - sets the display of the bounding box of point clouds. PointCloudColorMap (6.24.37) - colorizes the points based on Intensity, Elevation, and Classification of the point cloud. PointCloudCrop (6.24.41) - crops a point cloud entity, displaying only the part of the point cloud inside or outside a prismatic or cylindrical volume. PointCloudDeleteItem (6.24.38) - deletes point cloud files from the cache folder through a dialog box. PointCloudExport (6.24.39) - exports a cropped selection of a point cloud to a .pts file. PointCloudImport (6.24.40) - imports a VRM file into the current point cloud cache location through a dialog box. PointCloudPointMax (6.24.49) - defines the maximum amount of points shown per point cloud. PointCloudPointSize (6.24.55) - specifies the size of points. PointCloudPointSize_Plus (6.24.48) - increases the size of points. PointCloudReference (6.24.45) - attaches point cloud files from the cache folder to the current drawing through a dialog box. PointCloudUncrop (6.24.46) - removes all croppings from a point cloud.

Figure 6.1948

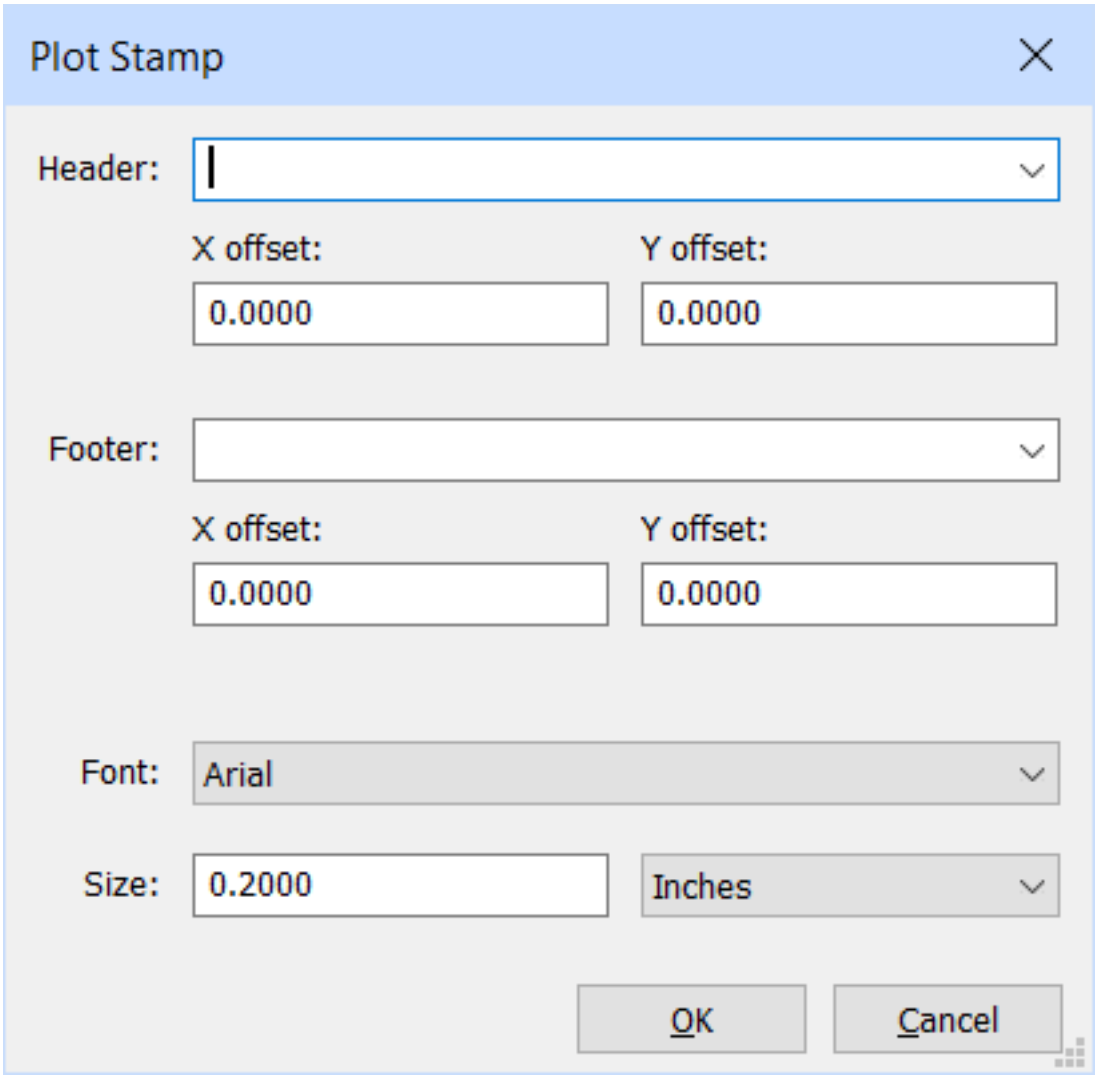
6.24.44 PlotStamp

(6.2981 on page 6079) Adds information about drawings and prints to the edge of the plotted drawing.

Accessing the Command

command bar: **plotstamp** : **PlotStamp** Displays a dialog box: (6.1949 on the facing page) Enter options, and then click **OK**. Use the **Preview (6.24.50)** command to check that the plot stamp appears correctly.

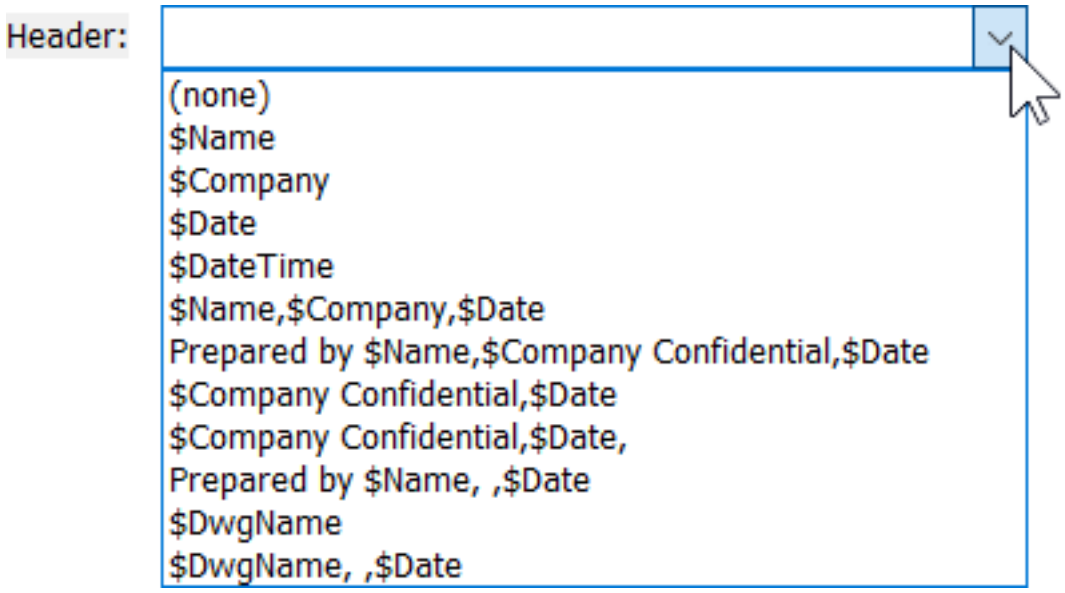
Figure 6.1949



Command Options

Option	Description
Header Options	The header appears at the top of the plot. Enter the following: 1. **Header** - click the droplist to choose a meta-phrase for the header, or else enter your own text (6.1950 on the next page) After you select a meta-phrase (one that starts with the $), it is not filled in until you run the Preview or Print commands. Data such as $Name and $Company are extracted from properties defined by the **DwgProps (6.10.46)** command. If you leave properties blank, the program substitutes generic information, such as "YourName" and "YourCompany." The $Date and $DateTime fields report the date and time the drawing is plotted, not when the drawing was created or last edited. 2. **X offset** - specify the distance from the left margin; some data, like the drawing name and the date, are centered 3. **Y offset** - specify the distance from the top margin of the drawing; enter a positive number to move the plotstamp downward
Footer Options	The footer appears at the bottom of the plot. Enter the following: 1. **Header** - click the droplist to choose preset wording for the header, or else enter your own text. 2. **X offset** - specify the distance from the left margin; some data, like the drawing name and the date, are centered 3. **Y offset** - specify the distance from the bottom margin of the plot; enter a positive number to move the plotstamp upwards
Font Options	Specify the font used for the plotstamp: 1. **Font** - click the droplist, and then choose one of the TTF and SHX font names from among those provided by your computer 2. **Size** - specify the height of the text; the initial units are the current drawing units, such as 0.2 being 0.2 inches tall 3. **Inches** - click the droplist to choose a different set of units, either inches or millimeters
OK	Applies the changes to the plot stamp, which will appear the next time you use the Preview or Print commands.

Figure 6.1950



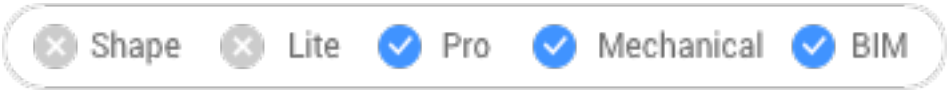
Procedures

To define the plot stamp (1.33.1)

Related Commands

Print (6.24.51) - prints drawings through a dialog box Plot (6.24.42) - plots drawings through the command bar. QPrint (6.25.2) - plots drawings using the current settings. Preview (6.24.50) - previews drawings before they are plotted. DwgProps (6.10.46) - provides data used by the PlotStamp command Publish (6.24.68) - allows to print a sheet list (= a list of model space or paper space layouts). Saves a sheet list to a file.

Figure 6.1951



6.24.45 PointCloudReference

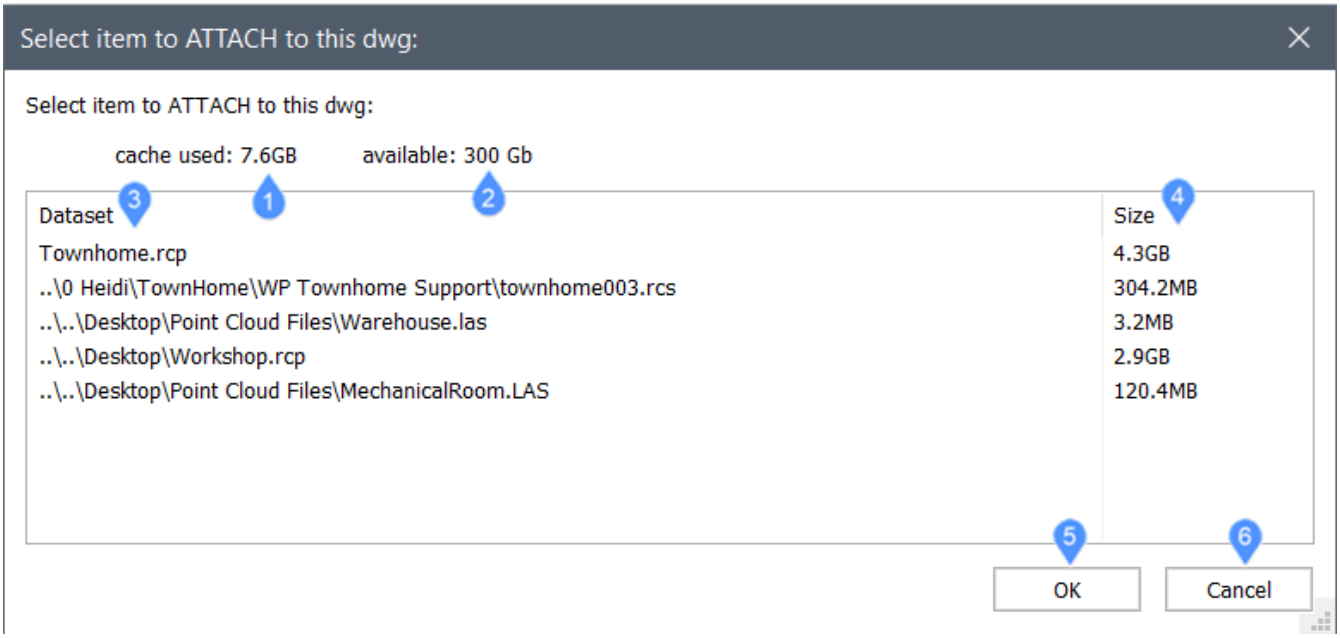
(6.1951) Attaches point cloud files from the cache folder to the current drawing through a dialog box.

Accessing the Command

Keyboard: **pointcloudreference** Toolbar: **Pointclouds : pointcloudreference** Displays a dialog box: (6.1952 on the next page)

1. **Cache used**: Specifies the total amount of used cache.
2. **Available**: Specifies the total amount of available cache. The available cache is controlled by the POINTCLOUDCACHESIZE system variable.
3. **Dataset**: Displays a list of cached point cloud files including their names and locations. You can select a cached file from the list to attach to the current drawing.
4. **Size**: Displays the amount of cache used for each point cloud file.
5. **OK**: Displays the **Attach Point Cloud** dialog box where you can specify how to attach the selected point cloud file to the current drawing.
6. **Cancel**: Closes the dialog box without attaching a point cloud file.

Figure 6.1952



Command Options

No command options.

Related Commands

AttachmentsPanelOpen (6.4.30) - displays the Attachments panel from which point clouds and other attachments can be loaded and controlled. PointCloud2dVsDisplay (6.24.33) - controls whether a bounding box and a warning message display when trying to view a point cloud in the 2D Wireframe visual style. PointCloud (6.24.31) - opens the Drawing Explorer to the Point Cloud section; converts, loads, and unloads point cloud file attachments. PointCloudAlign (6.24.67) - rotates the point cloud to optimally align it with the X and Y axes. PointCloudAttach (6.24.35) - attaches point cloud files (that were previously converted to BricsCAD's BPT format) to the current drawing. PointCloudBoundary (6.24.36) - sets the display of the bounding box of point clouds. PointCloudColorMap (6.24.37) - colorizes the points based on Intensity, Elevation, and Classification of the point cloud. PointCloudCrop (6.24.41) - crops a point cloud entity, displaying only the part of the point cloud inside or outside a prismatic or cylindrical volume. PointCloudDeleteItem (6.24.38) - deletes point cloud files from the cache folder through a dialog box. PointCloudExport (6.24.39) - exports a cropped selection of a point cloud to a .pts file. PointCloudImport (6.24.40) - imports a VRM file into the current point cloud cache location through a dialog box. PointCloudPointMax (6.24.49) - defines the maximum amount of points shown per point cloud. PointCloudPointSize (6.24.55) - specifies the size of points. PointCloudPointSize_Minus (6.24.43) - decreases the size of points. PointCloudPointSize_Plus (6.24.48) - increases the size of points. PointCloudUncrop (6.24.46) - removes all croppings from a point cloud.

Figure 6.1953

6.24.46 PointCloudUncrop

(6.2981 on page 6079) Removes all croppings from a point cloud.

Accessing the Command

Keyboard: **pointclouduncrop : pointclouduncrop Prompts you:** Select point cloud entity: (Select the point cloud.) All croppings of the selected point cloud are removed right away.

Command Options

No command options.

Related Commands

PointCloudPointMax (6.24.49) - defines the maximum amount of points shown per point cloud. PointCloudPointSize (6.24.55) - specifies the size of points. PointCloudPointSize_Minus (6.24.43) - decreases the size of points. PointCloudPointSize_Plus (6.24.48) - increases the size of points. PointCloudReference (6.24.45) - attaches point cloud files from the cache folder to the current drawing through a dialog box. PointCloudUncrop (6.24.46) - removes all croppings from a point cloud.

Figure 6.1954

6.24.47 Pointlight

(7.3 on page 6132) Creates a point light for use in renderings, placing this glyph in the drawing: **Note:** A point light spreads illumination in all directions, like a bare lightbulb, and so has no target.

Accessing the Command

command bar: **pointlight** menu bar: **View | Rendering | Lights | New point light** ribbon: **View | Lights | Create | New Point Light** toolbar: **Lights |**  : **Pointlight Prompts you in the command bar:** Specify source position <0,0,0>: **(Specify the position of the light)**

- When the LIGHTINGUNITS (1.34.6) system variable is 0 (no lighting units), the following prompt displays:

Enter an option to change [Name/Intensity/Status/shadoW/Attenuation/Color/eXit] <eXit>: **(Enter an option,or press Enter to end the command)**

- If the LIGHTINGUNITS (1.34.6) system variable is 1 (American lighting units) or 2 (international lighting units), the following prompt displays:

Enter an option to change [Name/Intensity factor/ Status/ Photometry/ shadoW/ Attenuation /filterColor/ eXit] <eXit>: **(Enter an option,or press Enter to end the command)**

Command Options

Option	Description
Specify source position	Specifies the position of the light: • Pick a point • Enter x,y,z coordinates • Press **Enter** to accept the default location
Name	Specifies a name for the light so that it can be identified by the LightList command; prompts you: **Enter light name <Pointlight1>** - **(enter an option)**: • Enter a name • Press **Enter** to accept the default name
Intensity Factor Intensity	Specifies the intensity of the light; prompts you: **Enter intensity (0.00 - max float) <1.0>** - **(enter an option)**: • Enter an intensity values between 0.00 and the maximum value supported by your system • Press **Enter** to accept the default value

Status	Toggles the use of this light; prompts you: **Enter status [ON/OFf] <ON>** - **(enter an option)**: • **ON** - light is included when calculating renderings • **OFf** - light is excluded
Photometry	Specifies the photometric properties of the light; prompts you: **Enter a photometric option to change [Intensity/Color/eXit] <Intensity>** - **(enter an option)**: • **Enter intensity (Cd) or enter an option [Flux/Illuminance] <1500.0>**: - **(enter the intensity expressed in candela or an option)**: **Enter Flux (Lm)** - **(enter the luminous flux expressed in lumens.) Enter Illuminance (Lx or Fc) or enter an option [Distance] <9424.8>** - **(enter the illuminance expressed in lux or foot-candles.) Enter Distance** - **(Enter a distance expressed in drawing units.)** • **Enter color name or enter an option [?/Kelvin] <D65>** - **(enter a color name.) ?** - lists the names of available colors, such as: D65 Fluorescent Coolwhite Whitefluorescent daylightfluorescenT Incandescent Xenon Halogen Quartz Metalhalide mErcury Phosphormercury highpressureSodium Lowpressuresodium **Enter Kelvin temperature <3600.0>** - **(enter a color temperature expressed in degrees Kelvin.)**

Shadow	Specifies the look of shadows cast by this light; prompts you: **Enter shadow settings [Off/Sharp/soFt mapped/soft sAmpled] <Sharp>** - **(enter an option)**: • **Off** - disables the calculation of shadows for the light. • **Sharp** - displays shadows with sharp edges. Use this option to increase performance. • **Soft mapped** - displays realistic shadows with soft edges. Prompts you: Enter map size [64/128/256/512/1024/2048/4096] <256>: • **Soft sampled** : Displays realistic shadows with softer shadows based on extended light sources; prompts you: **Enter an option to change Shape/sAmples/Visible/<eXit>** - **(enter an option)**: **Enter shape [Disk/Rect] <Disk>** - **(type D or R) Enter radius <0.0>** - enter the radius of the disk **Enter Width <0.0>** - enter width of the rectangle **Enter Length <0.0>** - enter length of the rectangle • **Enter Shadow Sample <16>** - **(specify the sampling size of the shadow; larger numbers are more accurate but take longer to render.)** • **Enter Shape Visibility [Yes/No] <No>** - **(type Y or N to cast a shadow that represents shapes (more accurate) or is rectangular (faster to render).)**

Attenuation	Specifies how the illumination falls off with distance from the light: **Enter an option to change [attenuation Type/Use limits/attenuation start Limit/attenuation End limit/eXit] <eXit>** - **(enter an option)**: • **Enter attenuation type [None/Inverse linear/inverse Squared] <None>** - specifies the type of attenuation: **None** - No attenuation so that the distance to the light source has no influence **Inverse linear** - attenuation is the inverse of the linear distance from the light: at a distance of 2 units from the light source, light is half as strong; at a distance of 4 units, light is one quarter as strong **Inverse squared** - attenuation is the inverse of the square of the distance from the light: at a distance of 2 units, light is one quarter as strong; at a distance of 4 units, light is one sixteenth as strong • **Use limits** - toggles whether the extent of the illumination is limited; prompts you: **Limits [OFf/ON]** - **(enter an option)**: **ON** - limit the extent **OFf** - do not limit it • **attenuation start Limit** - defines the point where the light starts to shine, measured from the center of the light; prompts you: **Specify start limit offset <1.0>** - **(enter a distance.)** • **attenuation End limit** - defines the point where the light stops to shine, measured from the center of the light; prompts you: **Specify end limit offset <10.0>** - **(enter a distance.)**
colorFilter	Specifies the color of the light; prompts you: **Enter true color (R,G,B) or enter an option [Index color/Hsl]:<255,255,255>** - **(enter an option)**: • **Enter true color** - the RGB color model is an additive color model in which red, green, and blue light are added together in various ways to reproduce a broad array of colors. The name of the model comes from the initials of the three additive primary colors, red, green, and blue. The component values are stored as integer numbers in the range 0 to 255, the range that a single 8-bit byte can offer (by encoding 256 distinct values). • **Index color** - specifies an AutoCAD Color Index color. • **Hsl** - specifies the color using three parameters Hue, Saturation and Lightness
eXit	Concludes the command and creates the light.

Definitions

Candela The candela (symbol: cd) is the SI base unit of luminous intensity; that is, power emitted by a light source in a particular direction, weighted by the luminosity function (a standardized model of the sensitivity of the human eye to different wavelengths, also known as the luminous efficiency function). A common candle emits light with a luminous intensity of roughly one candela. **Lumen** The lumen (symbol: Lm) is the SI unit of luminous flux, a measure of the power of light perceived by the human eye. Luminous flux differs from radiant flux in that luminous flux measurements (such as lumens) are intended to reflect the varying sensitivity of the human eye to different wavelengths of light, while radiant flux measurements (such as watts) indicate the total power of light emitted. The lumen is defined in relation to the candela as: 1 lm = 1 cd·sr As a full sphere has a solid angle of 4·pi steradians, a light source that uniformly radiates one candela in all directions has a total luminous flux of 1 cd·4pi sr = 4pi ≈ 12.57 lumens. For example, if a candle emits light with a luminous intensity of about 1 candela, the total light emitted is about 12.6 lumens. **Illuminance** In photometry, illuminance is the total luminous flux incident on a surface, per unit area. It is a measure of the intensity of the incident light, wavelength-weighted by the luminosity function to correlate with human brightness perception. **LIGHTINGUNITS**=2 International lighting units uses SI units derived units illuminance is measured in lux (lx) or lumens per square metre. **LIGHTINGUNITS**=1 American lighting units use the foot-candle (Fc) is a non-metric unit of illuminance that is used in photography. The unit is defined as the amount of illumination the inside surface of a 1-foot radius sphere would be receiving if there were a uniform point source of one candela in the exact center of the sphere. Alternatively, it can be defined as the illuminance on a 1-square foot surface of which there is a uniformly distributed flux of one lumen. This can be thought of as the amount of light that actually falls on a given surface. The foot-candle is equal to one lumen per square foot. One foot-candle is equal to approximately 10.764 lux, although in the lighting industry, typically this is approximated as 1 foot-candle being equal to 10 lux. **Kelvin Temperature** Color temperature is a characteristic of visible light that has important applications in lighting, photography, videography, publishing, manufacturing, astrophysics, and other fields. The color temperature of a light source is the temperature of an ideal black-body radiator that radiates light of comparable hue to that light source. The temperature is conventionally stated in units of absolute temperature: degrees kelvin (K). Higher color temperatures (5,000 K or more) are called cool colors (blueish white); lower color temperatures (2,700 – 3,000 K) are called warm colors (yellowish white through red).

Related Commands

Distantlight (6.10.34) - creates a distant light. Light (6.20.30) - creates a new light in the drawing. Lightlist (6.20.36) - displays the Drawing Explorer - Lights dialog window. Render (6.26.21) - calculates a photorealistic image of the 3D model. Spotlight (6.27.47) - creates a spot light. Sunproperties (6.27.70) - displays the Sun Properties of the Active Viewport editor in the Drawing Explorer - Lights dialog. Weblight (6.33.4) - creates a web light.

Figure 6.1955

6.24.48 PointCloudPointSize_Plus

(6.2981 on page 6079) Increases the size of points in point clouds.

Accessing the Command

Keyboard: **pointcloudpointsize_plus** Toolbar: **Point Cloud :PointCloudpointsize_plus**

Command Options

None. The program increases the size of points in cloud by one.

Related Commands

AttachmentsPanelOpen (6.4.30) - displays the Attachments panel from which point clouds and other attachments can be loaded and controlled. PointCloud2dVsDisplay (6.24.33) - controls whether a bounding box and a warning message display when trying to view a point cloud in the 2D Wireframe visual style. PointCloud (6.24.31) - opens the Drawing Explorer to the Point Cloud section; converts, loads, and unloads point cloud file attachments. PointCloudAlign (6.24.67) - rotates the point cloud to optimally align it with the X and Y axes. PointCloudAttach (6.24.35) - attaches point cloud files (that were previously converted to BricsCAD's BPT format) to the current drawing. PointCloudBoundary (6.24.36) - sets the display of the bounding box of point clouds. PointCloudColorMap (6.24.37) - colorizes the points based on Intensity, Elevation, and Classification of the point cloud. PointCloudCrop (6.24.41) - crops a point cloud entity, displaying only the part of the point cloud inside or outside a prismatic or cylindrical volume. PointCloudDeleteItem (6.24.38) - deletes point cloud files from the cache folder through a dialog box. PointCloudExport (6.24.39) - exports a cropped selection of a point cloud to a .pts file. PointCloudImport (6.24.40) - imports a VRM file into the current point cloud cache location through a dialog box. PointCloudPointMax (6.24.49) - defines the maximum amount of points shown per point cloud. PointCloudPointSize (6.24.55) - specifies the size of points. PointCloudPointSize_Minus (6.24.43) - decreases the size of points. PointCloudReference (6.24.45) - attaches point cloud files from the cache folder to the current drawing through a dialog box. PointCloudUncrop (6.24.46) - removes all croppings from a point cloud.

Figure 6.1956

6.24.49 PointCloudPointMax

(6.2981 on page 6079) This command sets the maximum amount of points shown on screen per point cloud. Since a screen only contains a few million pixels, it makes no sense to display more points at a given moment. Lowering this value results in displaying less detail but faster response. This does not mean that the actual point cloud cannot contain more points!! That latest number can be typically several hundred millions and even larger, and is not affected by this setting.

Accessing the Command

Keyboard: **pointcloudpointmax : pointcloudpointmax Prompts you:** Enter new value for POINTCLOUDPOINTMAX <1000000>: **(Type a value or press Enter to accept the current value.)**

Command Options

No command options.

Settings

Name	Title	Description
PointCloudPointMax	Point cloud max points	Maximum number of points displayed per point cloud. Values between 100 000 and 20 000 000 are accepted.

Related Commands

AttachmentsPanelOpen (6.4.30) - displays the Attachments panel from which point clouds and other attachments can be loaded and controlled. PointCloud2dVsDisplay (6.24.33) - controls whether a bounding box and a warning message display when trying to view a point cloud in the 2D Wireframe visual style. PointCloud (6.24.31) - opens the Drawing Explorer to the Point Cloud section; converts, loads, and unloads point cloud file attachments. PointCloudAlign (6.24.67) - rotates the point cloud to optimally align it with the X and Y axes. PointCloudAttach (6.24.35) - attaches point cloud files (that were previously converted to BricsCAD's BPT format) to the current drawing. PointCloudBoundary (6.24.36) - sets the display of the bounding box of point clouds. PointCloudColorMap (6.24.37) - colorizes the points based on Intensity, Elevation, and Classification of the point cloud. PointCloudPointSize_Minus (6.24.43) - decreases the size of points. PointCloudPointSize_Plus (6.24.48) - increases the size of points. PointCloudReference (6.24.45) - attaches point cloud files from the cache folder to the current drawing through a dialog box. PointCloudUncrop (6.24.46) - removes all croppings from a point cloud.

Figure 6.1957

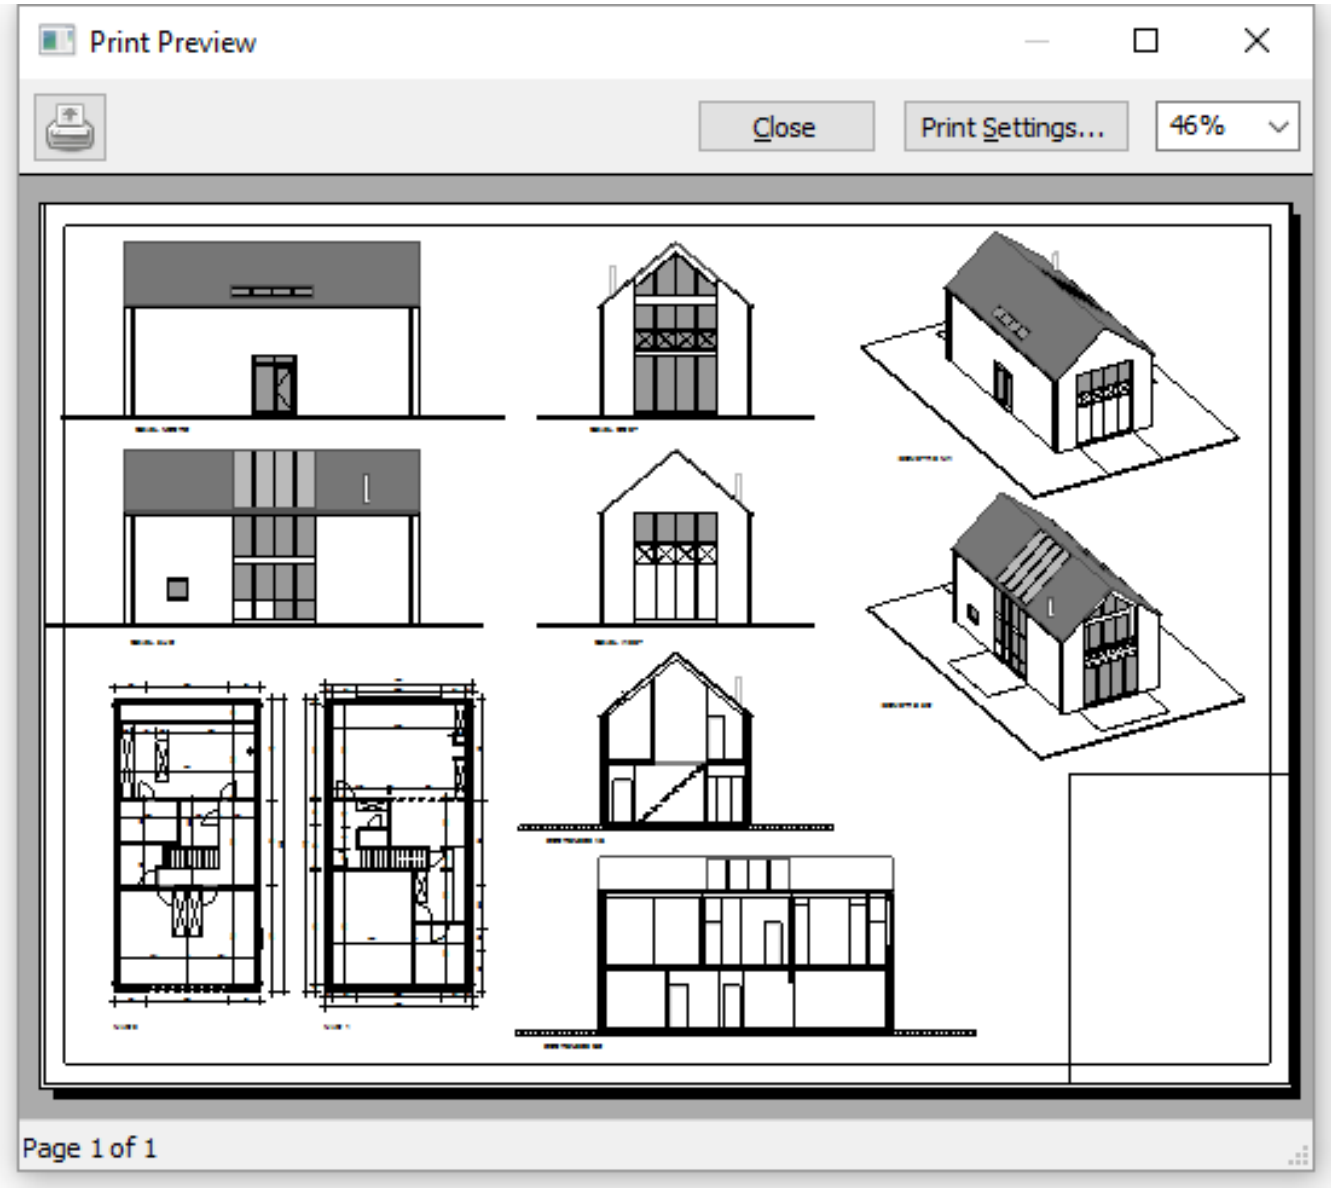
6.24.50 Preview

(7.3 on page 6132) Displays the Preview window so that you can check how the drawing looks before you plot it. **Note:** This command does not work with the "None" printer; use the Print (6.24.51) or PageSetup (6.24.2) command to first specify a printer.

Accessing the Command

 command bar: **preview** aliases: **ppreview** **pre** menu bar: **File | Print Preview** ribbon: **Home | Print/Plot | Preview** toolbar: **Standard |**  : **Preview** Displays a window: (6.1958 on the next page) Use the mouse scroll wheel to zoom, and use the scroll bars to pan. Click **Print** to plot the drawing, or click **Close** to return to BricsCAD.

Figure 6.1958



Command Options

Option	Description
Print	Prints the drawing; does not display the Print dialog box. See Print (6.24.51) command.
Close	Closes the preview window and returns to the BricsCAD drawing window.
Print Settings	Displays the Print Settings dialog box. See PageSetup (6.24.2) command.
Zoom	Changes the size of the preview; use the scroll bars to pan.

Related Commands

Print (6.24.51) - prints drawings through a dialog box. Plot (6.24.42) - plots drawings through the command bar.

Figure 6.1959

6.24.51 Print

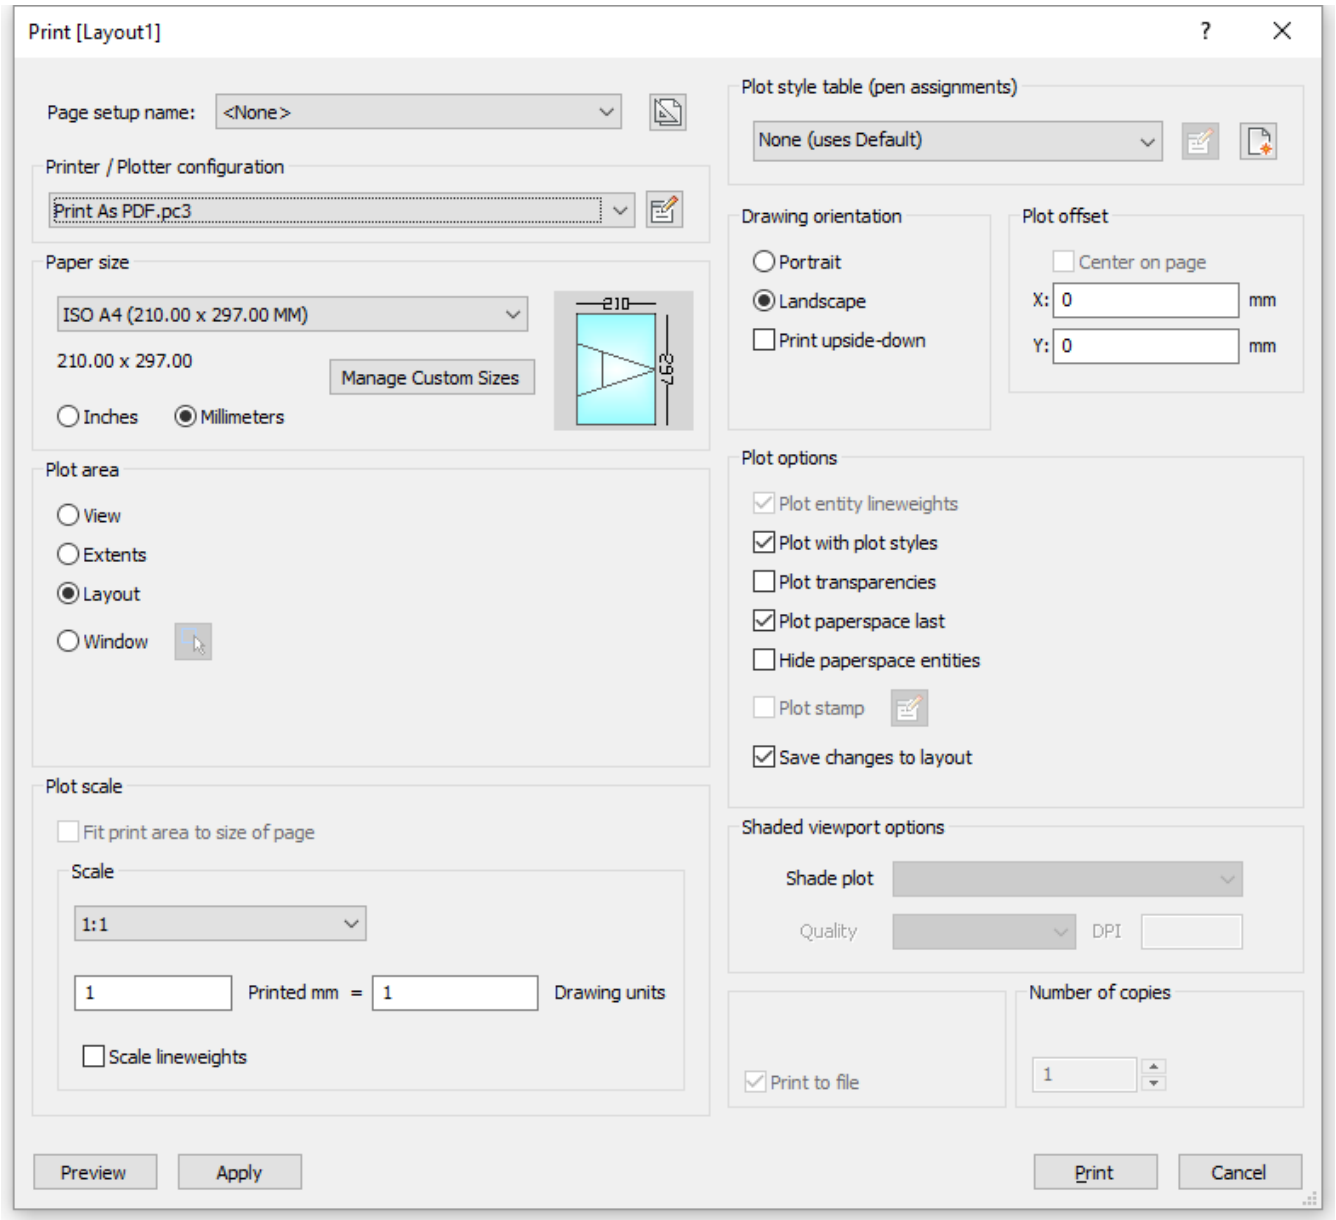
(6.2981 on page 6079) Prints and previews drawings to plotters and files through a dialog box. **Note:** When a selection set is active upon starting this command, the selection set is printed.

Accessing the Command

command bar: **print** shortcut: **Ctrl+P** menu bar: **File | Print** ribbon: **Home | Print/Plot | Print** toolbar: **Standard | Print** : **Print** Displays a dialog box: (6.1960 on the next page)

1. Choose options.
2. Click **Preview** to preview the plot on simulated paper.
3. Click **Apply** to apply the changes.
4. Click **Print** to print the drawing, or click **Cancel** to close the Print dialog box.

Figure 6.1960



Command Options

Option	Description
Page Setup Name	Recalls plot settings used previously: (6.1961 on page 5170) • **<None>** - uses options saved in the current layout or model space • **<Previous Plot>** - uses options that were saved from the last time this dialog box was used • Names of other page setups stored in the drawing
 Save current settings to page setup	Create new page setups; see the PageSetup (6.24.2) command.
Printer/Plotter Configuration Mac and Linux versions: see important note below.	Selects the printer or plotter. (6.1962 on page 5171) The program works with any output device installed on the system, including networked printers, print to file, faxes, and PostScript devices -- as well as predefined printer parameters stored in PC3 files.
 Edit plotter configuration	Opens the printer's Properties dialog box for customizing the printer's parameters and creating PC3 files; see the PlotterManager (6.24.32) command.
Paper Size	Specifies the size of paper. You can select standard sizes listed by the drop-down list; these are sizes supported by the printer. (6.1963 on page 5171) While printer may appear to support many different sizes, you should select only the size of paper that is actually in the printer. If User Defined appears in the list, the paper's dimensions are specified by the printer's Properties dialog box. The image indicates the size, position and orientation of the current plot area on the selected paper size. • **Inches** - uses imperial units for measurements involving printing • **Millimeters** - uses metric units for measurements involving printing **Manage Custom Sizes** - (PDF output only.) Manages custom paper sizes when Print as PDF.pc3 is selected in the Printer/Plotter Configuration list; displays a dialog box: (6.1964 on page 5172)

Plot Area

Specifies which area of the drawing to print: (6.1965 on page 5172)

- **View** - prints the current view or a named view. Choose a view from the drop-down list; use the View (6.31.2) command to create named views.
- **Extents** - prints the extents of the drawing, which ensures every visible entity is printed. Entities on frozen layers are not taken into account when calculating the extents.
- **Limits** - prints the limits of the drawing, as specified by the Limits command.
- **Window** - prints a rectangular area of the drawing. You define the rectangular area by entering x,y coordinates or by clicking the **Select Area to be Printed** button:

1. Click the button; you are prompted:
2. **Select first corner of window** - **(specify one corner of the rectangle by picking points or entering x,y coordinates.)**
3. **Select second corner of window** - **(specify the other corner.)**

The Print dialog box returns, with the pair of x,y coordinates added to the Windows Plot Area boxes; you can edit the values: (6.1966 on page 5172)

Plot Scale

Scales the drawing to fit it to the paper: **Fit print area to the size of paper** - scale is calculated automatically by the program, taking into account the print area of the drawing. When this option is turned on, you cannot specify the scale factor.:

- **Printable area** is the size of the paper, minus the margins.
- **Margins** are the strips along the four edges that the printer uses for handling the paper.

Scale - allows you to specify the scale factor to use for plotting; choose a scale factor from the drop-down list, or choose **Custom**. The scale factor shown can be edited with the ScaleListEdit (6.27.7) command. (6.1967 on page 5173)

- For scale factors like 1:5, the drawing is printed smaller.
- For scale factors like 5:1, the drawing is printed larger.

Custom - lets you enter in your own scale factors: (6.1968 on page 5173) (6.1969 on page 5173) **Scale lineweights** - when on, lineweights are scaled with respect to the plot scale.

Plot Style Table (Pen Assignment)

Specifies the plot style table to use for the printed output, which assigns properties to "pens," colors, and entities. (6.1970 on page 5174)

- When the drawing does not use plot styles, then only CTB (color-based table) files are listed.
- When the drawing uses plot styles, then only STB (style-based table) files are listed.

When you switch from **None** to a named plot style, BricsCAD prompts you: **Assign plot style table to all layouts?** - **(enter an option)**:

- **Yes** - assigns the CTB or STB plot style file to all layouts.
- **No** - assigns the plot style file to the current layout only.

 Edit Plot Style

Opens the Plot Style Table editor dialog box; see the PlotStyle (6.24.28) command. This button is available only when the drawing uses STB plot styles.

 Create New Plot Style

Creates new plot styles; runs the Add Plot Style Table wizard; see the StylesManager (6.27.57) command.

- When the drawing does not use named plot styles, then the wizard creates new color-dependent tables (CTB files).
- If the drawing uses named plot styles, then the wizard creates new named plot style tables (STB files).

Drawing Orientation

Specifies the orientation of the drawing on rectangular paper: (6.1971 on page 5174)

- **Portrait** - The drawing or layout x-axis is aligned with the shortest edge of the selected paper size.
- **Landscape** - The drawing or layout x-axis is aligned with the longest edge of the selected paper size.
- **Print upside down** - Prints the drawing upside-down. This is useful when paper with a drawing border is loaded backwards in the printer.

Plot Offset	Specifies the offset distance for the print. **Center On Page** - centers the print on the page, taking into account margins. Together with **Fit Print Area to Size of Page**, this option is excellent for prints where scale is unimportant. **X** and **Y** - enter positive or negative distances to move the drawing in the x and/or y distances: (6.1972 on page 5174) • **Positive values** - moves the drawing up and to the right. • **Negative values** - moves the drawing down and to the left. The lower left corner of the drawing is moved by the specified distance. This is useful when the paper has a title block area that might interfere with the drawing.

Plot Options	**Plot entity lineweights** - toggles the use the lineweights; this option is unavailable when Plot with Plot Styles is turned on: • **On** - mimics lineweights assigned to the drawing in the print. • **Off** - ignores lineweights. **Plot with Plot Styles** - toggles the use of plot styles • **On** - uses plot styles to determine the look of the printed drawing, and overrides lineweight settings. • **Off** - does not use plot styles. **Plot Transparencies** - plots entities who have been assigned the the Transparency (1.25.9) property, either by-entity or by layer. **Plot Paperspace Last** - specifies the printing order; this option is available only when printing layouts, and so is unavailable in model tab: • **On** - prints model space entities, followed by paper space entities. • **Off** - prints paper space entities first, followed by entities in model space. **Hide Paperspace Entities** - when on, removes hidden lines from 3D entities in paper space. This option is disabled when printing model space. **Plot Stamp** - toggles use of the plot stamp; click the  **Edit Plot Stamp** button to change plot stamp data. See the PlotStamp (6.24.44) command • **On** - applies plot stamp data to the print. • **Off** - does not apply plot stamps. **Save Changes to Layout** - determines if the options you changed in this dialog box are saved; the next time you use this dialog box, you can select "Layout" from the Use Plot Settings From drop-down list. • **On** - saves changes made to this dialog box with the layout. • **Off** - does not save changes.
Shaded Viewport Options	Override the visual style of the current view when printing model space: (6.1973 on page 5174) **Shade Plot** - choose a shade style plot the drawing with. This option is disabled when printing a paper space layout. The Shade Plot mode of a paper space viewport is defined in the Shade Plot property of the viewport. The quality of the Rendered option is defined through the current render preset; see the RenderPresets (6.26.27) command.
Print to File	When checked, redirects the print output to a *.plt file, which can be processed by certain types of software.
Number of Copies	Specifies the number of copies to print. Enter a number or click the buttons to change the value.

Preview	Displays a preview of the print. In the preview window, click Print Settings button to return to this dialog box. See the Preview (6.24.50) command.
Apply	Applies the changes you made to this dialog box. The changes are remembered the next time you use this command. This is like using the PageSetup (6.24.2) command.
Print	Prints the drawing, and then returns to the drawing editor.
Cancel	Returns to the drawing editor without printing the drawing.

Note: On Mac or Linux, printing will always print to PDF. So a PDF document will be generated that then still needs to be sent to the printer for physical printing. On MAC and Linux there is a relevant PAGESETUP (6.24.2) command.

Procedures

- General procedure for printing (1.33.1)
- To open the Print dialog (1.33.1)
- To choose the paper size (1.33.1)
- To choose the paper units (1.33.1)
- To choose the drawing orientation (1.33.1)
- To define the plot offset (1.33.1)
- To specify the area to plot (1.33.1)
- To define the plot scale (1.33.1)
- To set the plot options (1.33.1)
- To define the plot stamp (1.33.1)
- To specify the number of copies (1.33.1)
- To see a preview of the plot output (1.33.1)

Related Commands

-Plot (6.24.42) - plots drawings through the command bar. Plot (6.24.1) - prints and previews drawings to plotters and files through a dialog box. QPrint (6.25.2) - plots drawings using the current settings. Preview (6.24.50) - previews drawings before they are plotted. ConvertCtb (6.9.28) - converts CTB plot style files to STB files. ConvertPStyles (6.9.38) - converts drawings from CTB to STB plot styles. ExportPdf (6.13.20) - exports layouts in a drawing to a pdf document. Layer (6.13.17) - assigns plot styles to layers. PageSetup (6.24.2) - assigns plot style to drawings. PlotStyle (6.24.28) - sets the current plot style. Properties (6.24.54) - changes plot styles assigned to entities. StylesManager (6.27.57) - creates and attaches plot styles to drawings. ScaleListEdit (6.27.7) - edits the scale list of a drawing, used in Plot Scale section of the Print and Page Setup dialogs and the Standard scale property of a paper space viewport. Publish (6.24.68) - allows to print a sheet list (= a list of model space or paper space layouts). Saves a sheet list to a file. -Publish (6.24.62) - prints a saved sheet list (= a list of model space or paper space layouts).

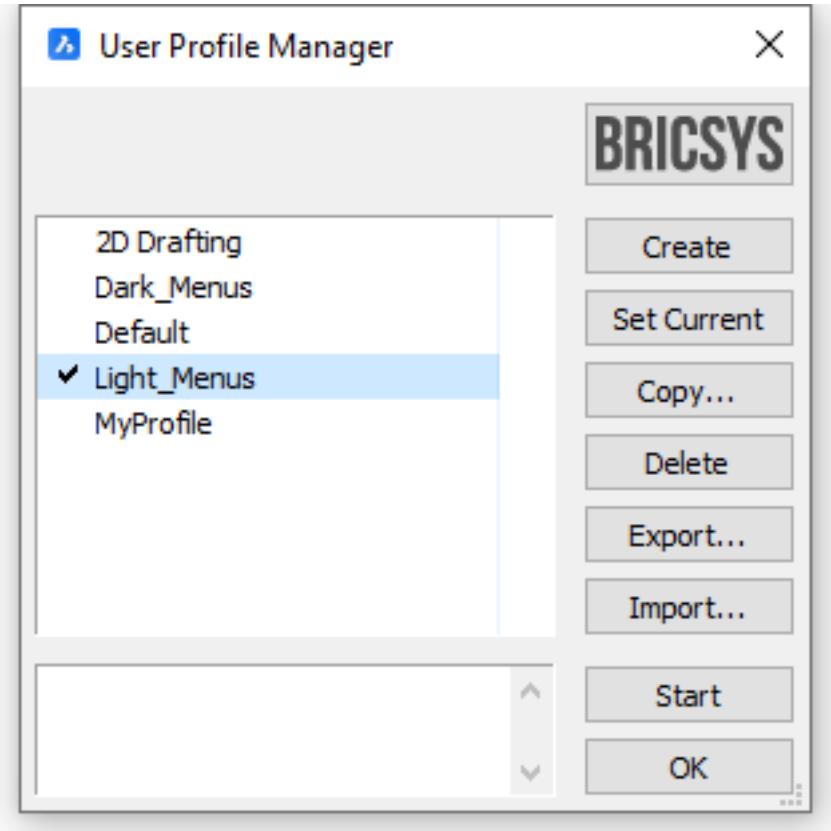
6.24.52 ProfileManager

(6.2981 on page 6079) Sets the current user profile; also creates, copies, deletes, imports, and exports profiles through a dialog box.

Accessing the Command

command bar: **profilemanager** transparent: **'profilemanager** menu bar: **Tools | User Profile Manager** Without BricsCAD running: launch **profilemanager_app.exe** in the BricsCAD installation folder.
: **ProfileManager** Displays a dialog box: (6.1975 on the following page)

Figure 6.1975



Command Options

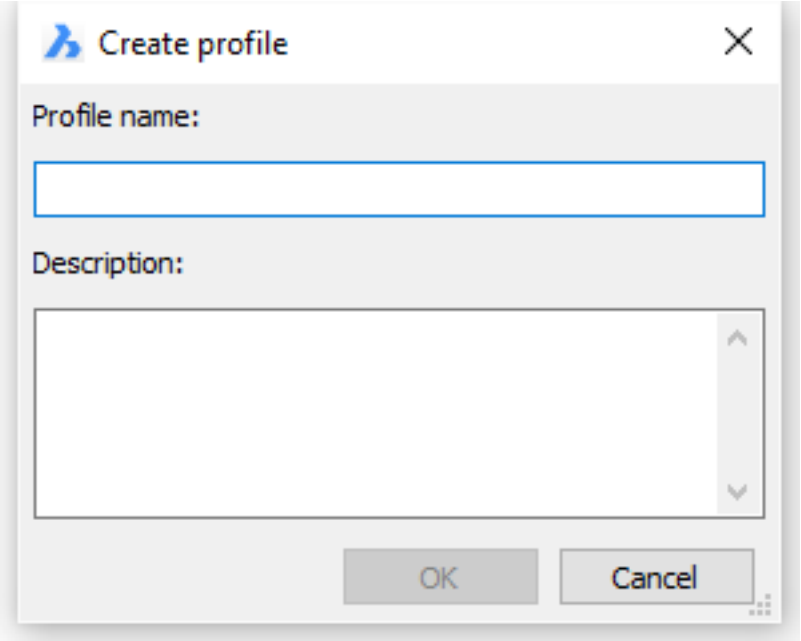
Option	Description
Create	Creates a new fresh profile, using built-in default settings; displays a dialog box: (6.1976 on page 5178) 1. **Profile name** - type a name for the new profile 2. **Description** - (optional) type a description for the new profile 3. Click **OK** to close and return to the previous dialog box
Set Current	Loads the selected profile: • Double click the profile in the list • Select the profile, and then click the **Set Current** button. The current profile is marked in the list with a check mark.

Copy	Creates a new profile as a copy of an existing profile: 1. Choose a profile name 2. Click **Copy**; displays a dialog box: (6.1977 on page 5179) 3. **Profile name** - type a name for the copied profile 4. **Description** - (optional) type a description for the copied profile 5. Click **OK** to close and return to the previous dialog box
Delete	Deletes profiles: • Select a profile in the list • Click **Delete** to delete the profile Deleting the current profile is not possible. When trying to do so, a dialog box displays, which allows to reset all settings to factory defaults.
Export	Exports profiles: 1. Select a profile in the list 2. Click **Export** button 3. Specify the export folder and ARG file name 4. Click **Save** Exporting, then importing, a profile allows you to migrate user preferences from one computer to another.
Import	Imports saved profiles: 1. Click **Import** button 2. In the Import Profile dialog box, select an ARG file 3. Click **Open**
Start	This option is available only when the command is launched using **profilemanager_app.exe** in the BricsCAD installation folder. Starts another BricsCAD session using the selected profile: Do one of the following: • Double click the profile in the list • Select the profile, and then click the **Start** button. If the SingletonMode user preference is set to Yes it is not possible to have multiple BricsCAD sessions open simultaneously.
OK	Closes the User Profile Manager dialog box.

Procedures

- Starting BricsCAD with a specific user profile (1.17.8)
- To import a user profile from another user (1.17.8)

Figure 6.1976



Related Commands

Customize (6.9.47) - customizes the user interface of BricsCAD: menus, toolbars, keyboard shortcuts, aliases, and shell commands.

6.24.53 ProjectGeometry

(7.3 on page 6132) Projects 2D geometry onto regions, surfaces, or 3D solids to create additional edges (line work). (6.1979)

Accessing the Command

 command bar: **projectgeometry** menu bar: **Draw | Project Geometry** toolbar: **Draw |**  : **ProjectGeometry Prompts you in the command bar**: Select 2d entities to be projected or specify [PROjection direction]: **(Select a 2D entity, #1 in the figure below, or choose an option)** Entities in set: 1 Select 2d entities to be projected or specify [PROjection direction]: **(Select more 2D entities or press Enter)** Select a region, surface or 3d solid to project onto: **(Select a region, surface, or 3D solid, #2 in the figure)** 1 object(s) projected successfully. The program draws entities where the 2D entity projects onto the 3D solid, surface, or region and placed on the current layer. (1) 2D entity; (2) 3D solid; blue line = projection direction; pink tube = projection; yellow curves = new edges (6.1980 on the next page) (6.1981 on the facing page) (6.1982 on page 5182)

Figure 6.1980

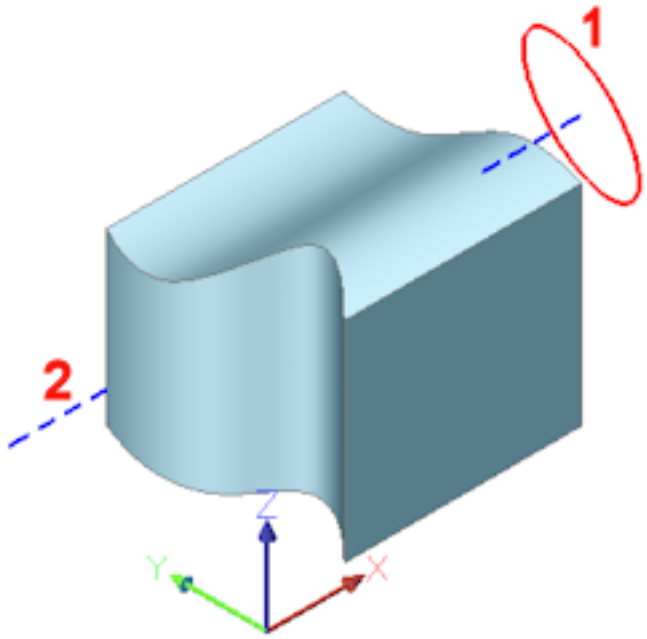

Figure 6.1981

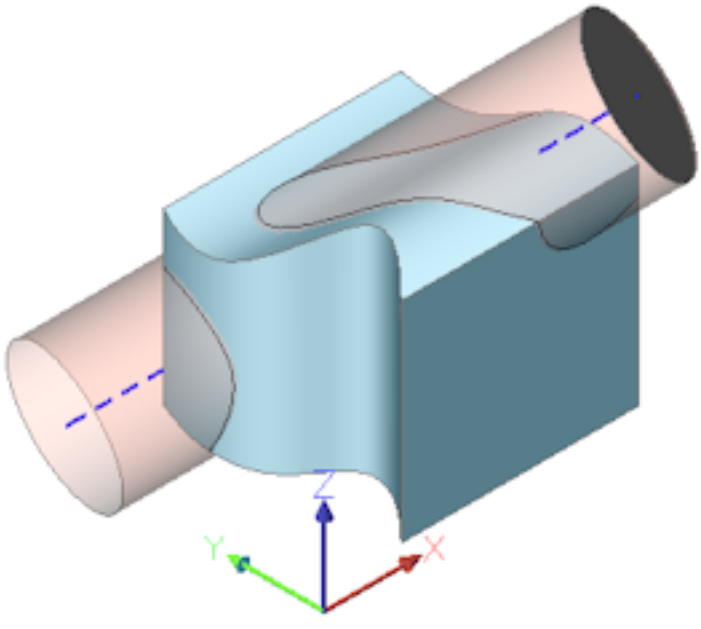

Figure 6.1982

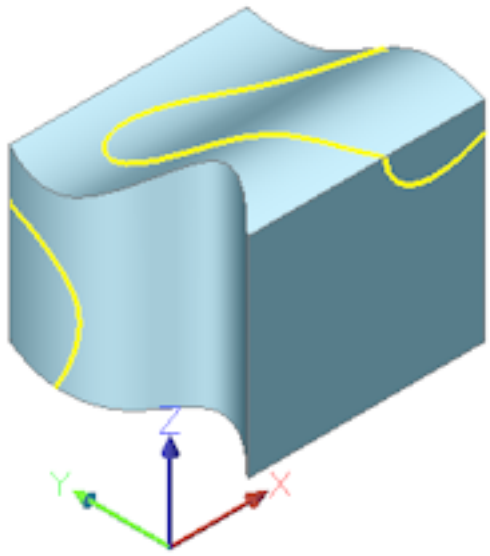

Command Options

Option	Description
Select 2d entities to be projected	Select one or more entities; the entity can be any open or cloesd 2D entities, such as line, circle, ellipse, and open or closed spline.
Select a region, surface or 3d solid to project onto	Select a region, surface or 3D solid onto which to project the 2D entities.
Projection direction	Defines the projection direction. By default 2D geometry is projected orthogonally onto the receiving entity. Prompts you: **Specify the direction [View/Ucs/Points] <View>** - **(enter an option):** • **View** - sets the projection direction perpendicular to the current view orientation. • **UCS** - uses the Z-axis of the current UCS. • **Points** - prompts you to specify the start and end point of the projection direction

Procedures

- Use "PROJECTGEOMETRY (1.18.33)" to markout your models.
- Using Project Geometry (1.18.30) to create a corrugate Iron roof profile.

Related Commands

Imprint (6.17.12) - imprints 2D entities onto planar faces of 3D solids and surfaces for additional edges on planar faces. XEdges (6.34.4) - creates 2D linear entities (lines, arcs, circles, ellipses, elliptical arcs and splines) from the edges of 3D solids, 3D solid faces, surfaces, etc. and regions.

Figure 6.1983

6.24.54 Properties

(6.2981 on page 6079) Displays the Properties panel with either the default properties or the properties of selected entities.

Accessing the Command

command bar: **properties** aliases: **ch pr props mo ddchprop ddmodify** keystrokes: **Ctrl+1 Ctrl+Shift+P** menu bar: **View | Properties Modify | Properties** toolbar: **Standard |** : **properties** Displays a palette with varying content:

- When no entities are selected, displays the following content:
  General - reports the current entity property settings
  View - reports the current view settings and visual style
  Misc - reports the current annotation scale and default lighting status

(6.1984 on the next page)

- When a single entity is selected, displays the following content:
  General - reports the properties of the entity
  3D Visualization - reports the entity's material
  Geometry - reports the geometry of the entity (6.1985 on page 5185)
- When two or more entities are selected, reports the shared properties of the selected entities; where properties are different, the panel reports *varies*.

(6.1986 on page 5186)

Figure 6.1984

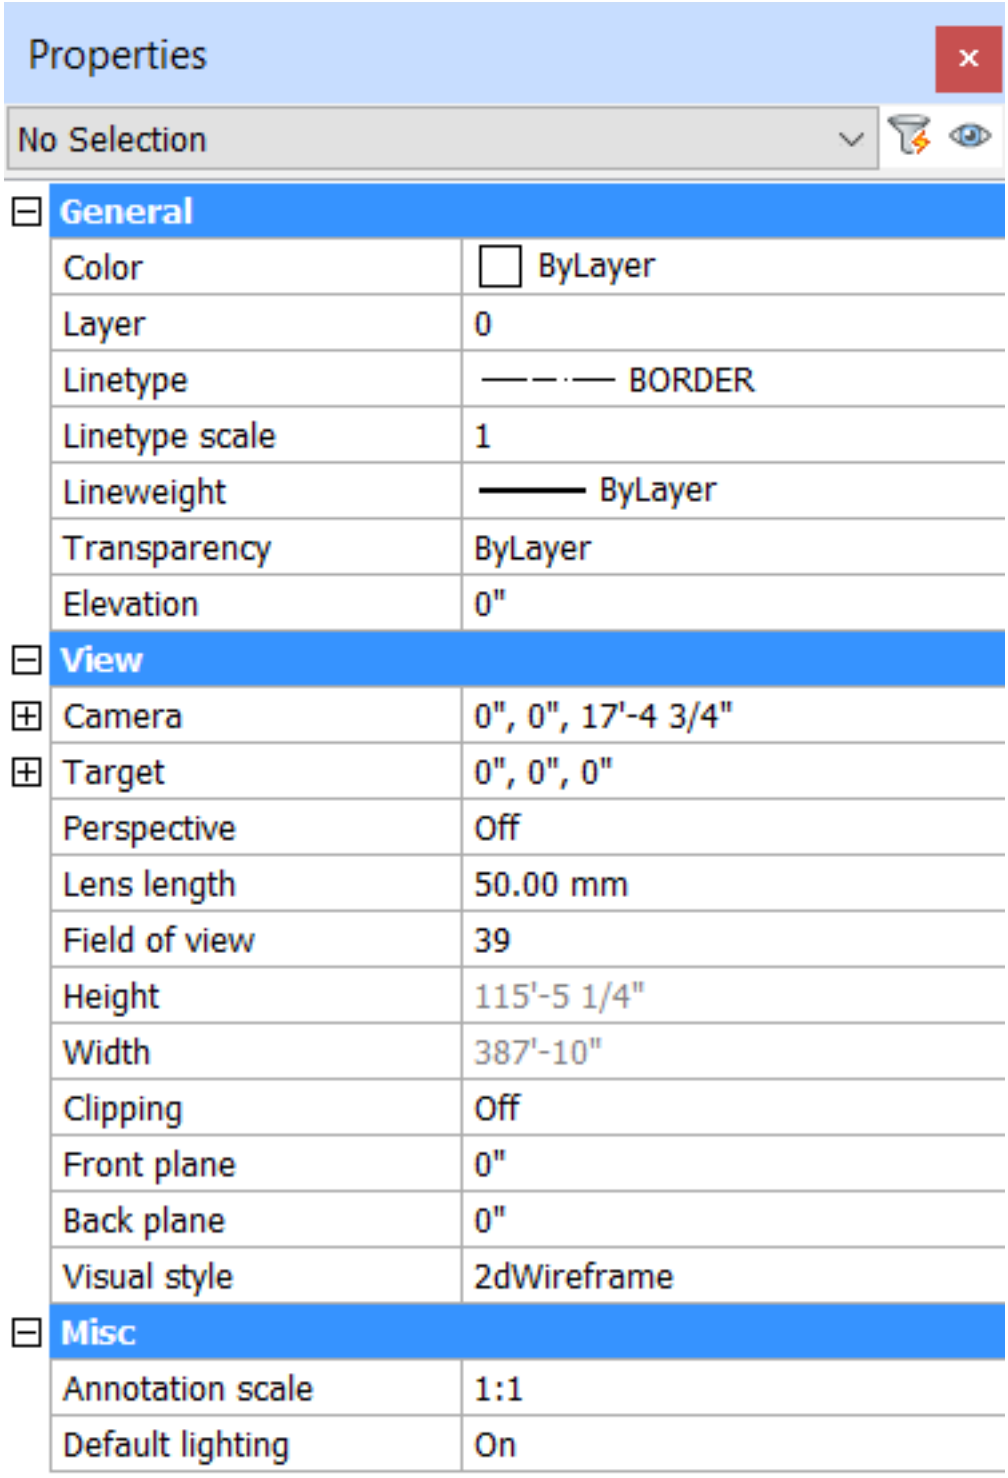

Figure 6.1985

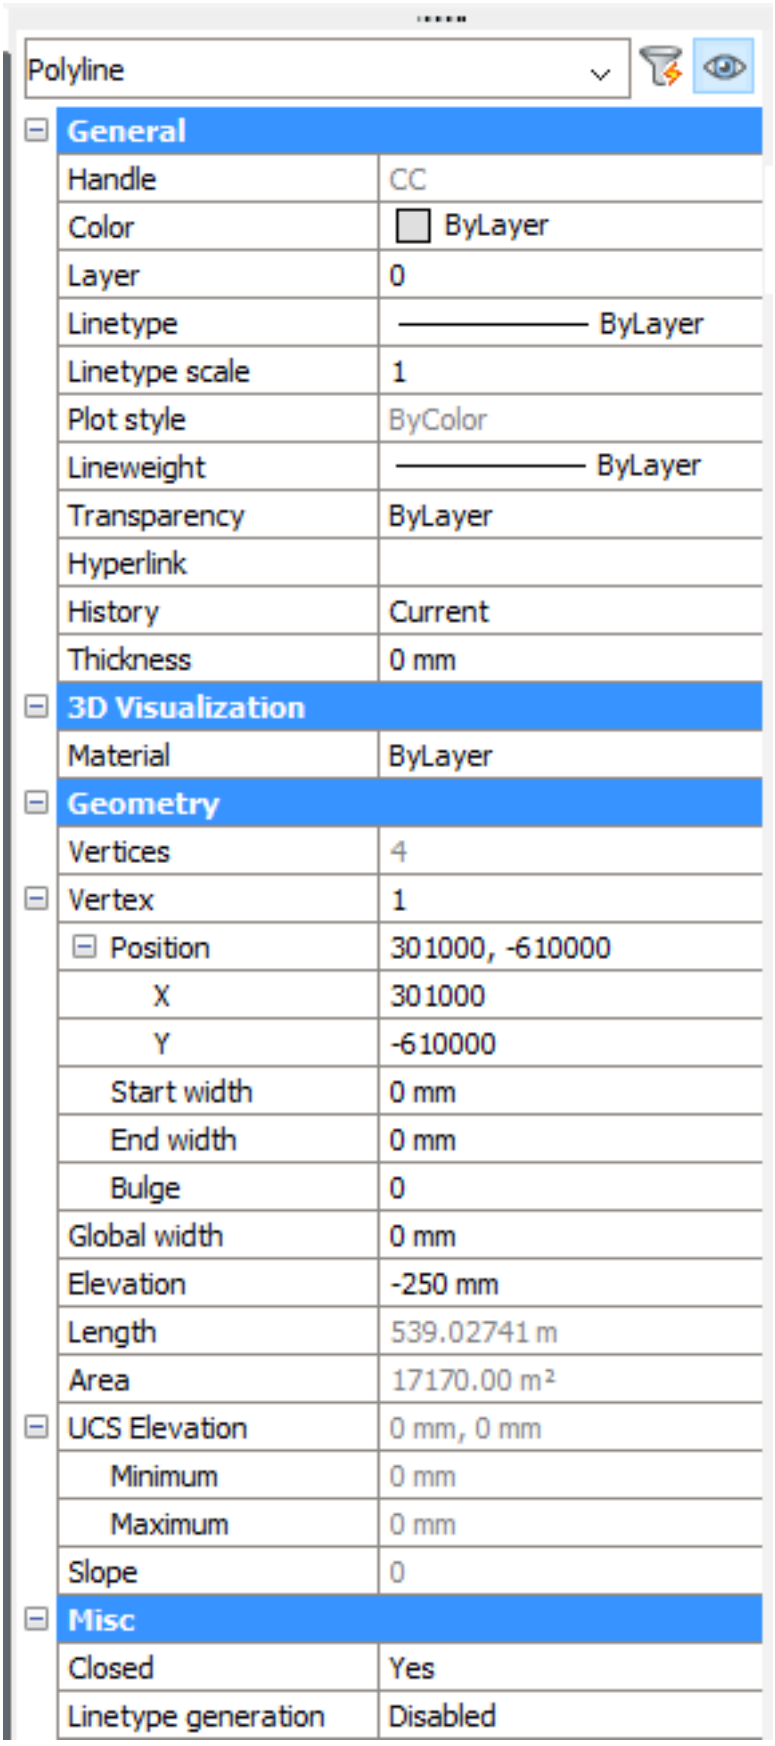

Figure 6.1986

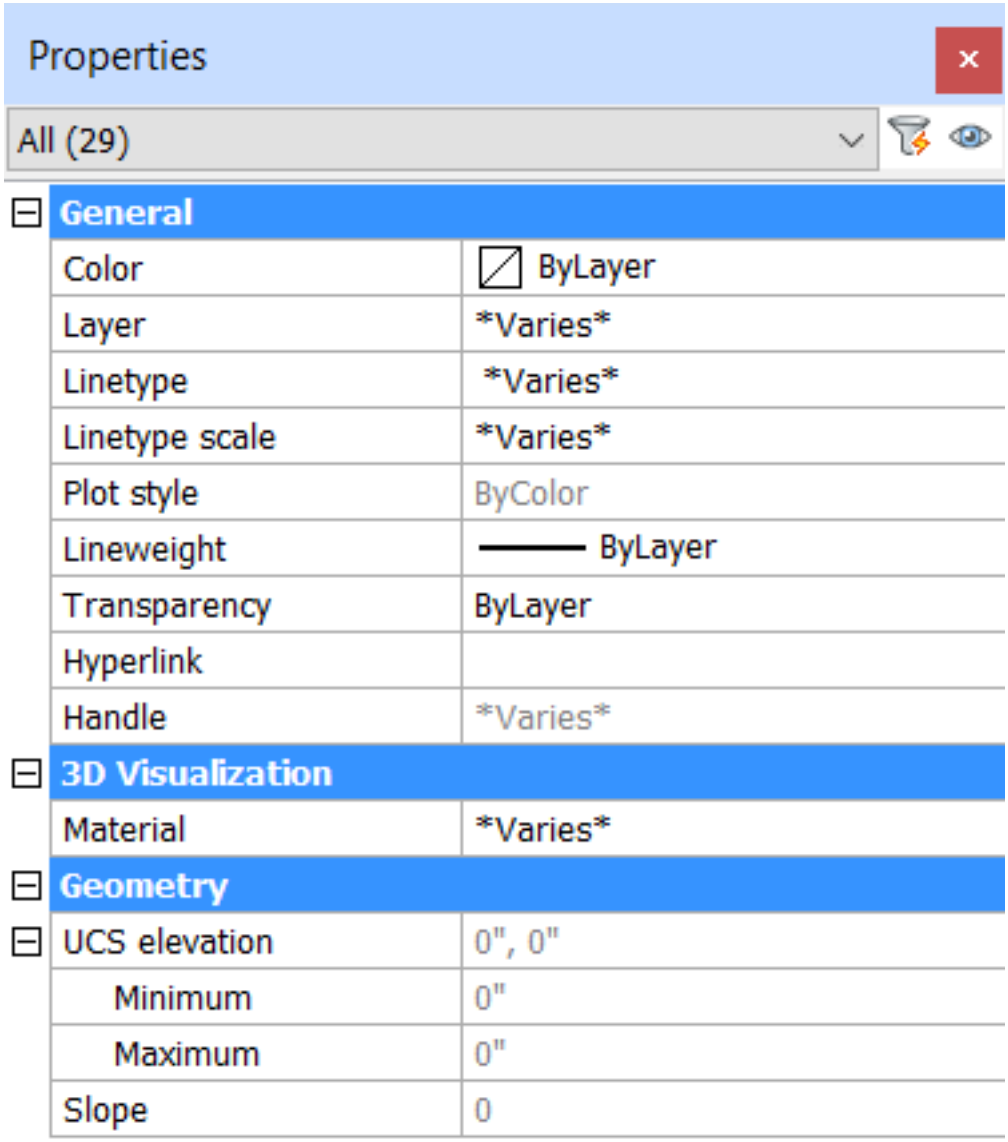

Command Options

Options	Description
(6.1987 on page 5189)	Reports the number of selected entities. Click to see the number of each entity type in the current selection set: (6.1988 on page 5190) Select an entity type in the list to see the shared properties of all entities of this type in the current selection set.
Quick Select	Switches between **Properties** and **Quick Select** mode (See also the Qselect (6.25.6) command).
Property Preview	When on, the Properties panel previews values when you hover the cursor over a property.
General	
Color	Reports the current color, and allows you to change the color of selected entities: • Click the droplist, and then choose another color. • Choose **Select Color** to access the Colors dialog box. (6.1989 on page 5190) See the Color (6.9.19) command.
Layer	Reports the current layer name. To change the layer of selected entities: 1. Click the droplist, and then choose another name. (6.1990 on page 5190) See the Layer (6.13.17) command.
Linetype	Reports the current linetype. To change the linetype of selected entities: 1. Click the droplist, and then choose another name. (6.1991 on page 5191) 2. Or, choose **Load** to access the Load Linetypes dialog box. See the Linetype (6.20.32) command.
Linetype Scale	Reports the current linetype scale factor. (6.1992 on page 5191) To change the linetype scale, enter a new value. See LTSCALE system variable,
Plot Style	Reports the current plot style. To change the plot style of selected entities, click the droplist and then choose another name. (6.1993 on page 5191) This property is only available when plot styles are enabled for the drawing. See PlotStyle (6.24.28) command.
Lineweight	Reports the current lineweight. To change the lineweight of selected entities, click the droplist and then choose another width. (6.1994 on page 5191) See LWeight (6.20.42) command.

Transparency	Reports the current level of transparency. To change transparency, click the droplist, and then choose a settings: (6.1995 on page 5192) • Select ByLayer or ByBlock • Select a preset value, such as 10 or 90 • Enter a value between 0 (opaque) and 90 (nearly transparent)
Hyperlink	Reports the current hyperlink. To change the hyperlink of selected entities: (6.1996 on page 5192) • Or else click the  button to access the Edit Hyperlinks dialog box. See Hyperlink (6.16.11) command.
History	Allows to see the history of the selected entity and restore a previous state. Click the field to see the history list. (6.1997 on page 5192) • Hover over a step, to see the state of the entity in that step. • Click to restore the selected step.
Thickness	Reports the current entity thickness. To change the thickness of selected entities, enter a new value. (6.1998 on page 5192) See Elev (6.13.4) command.
Handle	Reports the hexadecimal value by which the entity is known in the DWG database; read-only, and so you cannot change it.
3D Visualization	
Material	Reports the current material definition of the selected entity. To change, click the field, then select a material from the drop-down list. (6.1999 on page 5192) See the Materials (6.21.10) command to manage material definitions.
View	
Camera	Reports and edits the current position of the camera's position. See the Camera (6.9.1) command.
Target	Reports and edits the current position of the camera's target position. See the Target command.
Perspective	Reports the current value of the PERSPECTIVE system variable; switches perspective view mode on and off.
Lens Length	Reports the current value of the LENSLENGTH system variable; edits the value of the LENSLENGTH system variable.
Field of View	Reports the current view angle; edits the camera view angle. Editing this value changes the value of the LENSLENGTH system variable.
Height, Width	Reports the dimensions of the current view in drawing units; cannot be edited. These values are changed when the Field of View property is modified.
Clipping	Toggles view clipping on and off; when clipping is on, parts of the view before the front clipping plane and behind the back clipping plane become invisible.
Front, Back Plane	Specifies the locations of the front and back clipping planes; available only when the Clipping property is on.
Visual Style	Reports the current visual style, and selects a different one. (6.2000 on page 5193) See the VisualStyles (6.31.15) command to edit and create visual styles.

Misc (Miscellaneous)	
Annotation Scale	Reports the current value of the CANNOSCALE system variable, and allows you to choose another one from the list defined in the drawing are available (see the ScaleListEdit (6.27.7) and -ScaleListEdit (6.27.20) commands).
Default Lighting	Toggles default lighting status on and off: • **On** - the program uses default lighting, which substitutes when no lights are defined in the scene • **Off** - the program uses lights defined in the scene

Other properties may appear depending on the entity selected.

Procedures

- To open or close a panel (1.15.7)
- To dock a panel (1.15.7)
- To dock a panel with respect to another docked panel (1.15.7)
- To stack panels in a tabbed panel (1.15.7)

Related Commands

Area (6.4.18) - reports the area, circumference, and perimeter of entities. AttEdit (6.4.34) - edits attribute values and properties. AttRedef (6.4.36) - redefines a block and updates associated attributes. AttSync (6.4.37) - synchronizes attribute definitions in all block references of a specified block definition. BattMan (6.6.1) - manages the attributes of a block definition. Dist (6.10.36) - reports the 2D and 3D distances between two points. EAttEdit (6.13.1) - edits attribute values and most properties. Id (6.17.4) - reports the x,y,z coordinates of picked points. Layer (6.13.17) - assigns properties to layers. List (6.20.34) - lists the area and other parameters of entities in the command bar. MassProp (6.21.2) - reports the properties of solid models and regions. PropertiesClose (6.24.56) - closes the Properties panel. SetByLayer (6.27.34) - sets the property overrides of selected entities to ByLayer. -SetByLaye (6.27.24)r - sets the property overrides of selected entities to ByLayer. -ToolPanel (6.29.37) - controls the display of tool panels, such as the Properties panel, Ribbon and the Sheet Sets panel from the command line.

6.24.55 PointCloudPointSize

(6.2981 on page 6079) Sets the size of points in point clouds.

Accessing the Command

Keyboard: **pointcloudpointsize :PointCloudPointSize Prompts you:** Set point size: **(Enter a number)**

Command Options

Set point size	Specify a number between 1 and 10. The larger the number, the larger each point. Very large numbers can overwhelm the display so that you can no longer see details in the point cloud.

When the command ends, the program displays all points in the new size. You may need to zoom in to see the change.

Related Commands

AttachmentsPanelOpen (6.4.30) - displays the Attachments panel from which point clouds and other attachments can be loaded and controlled. PointCloud2dVsDisplay (6.24.33) - controls whether a bounding box and a warning message display when trying to view a point cloud in the 2D Wireframe visual style. PointCloud (6.24.31) - opens the Drawing Explorer to the Point Cloud section; converts, loads, and unloads point cloud file attachments. PointCloudAlign (6.24.67) - rotates the point cloud to optimally align it with the X and Y axes. PointCloudAttach (6.24.35) - attaches point cloud files (that were previously converted to BricsCAD's BPT format) to the current drawing. PointCloudBoundary (6.24.36) - sets the display of the bounding box of point clouds. PointCloudColorMap (6.24.37) - colorizes the points based on Intensity, Elevation, and Classification of the point cloud. PointCloudCrop (6.24.41) - crops a point cloud entity, displaying only the part of the point cloud inside or outside a prismatic or cylindrical volume. PointCloudDeleteItem (6.24.38) - deletes point cloud files from the cache folder through a dialog box. PointCloudExport (6.24.39) - exports a cropped selection of a point cloud to a .pts file. PointCloudImport (6.24.40) - imports a VRM file into the current point cloud cache location through a dialog box. PointCloudPointMax (6.24.49) - defines the maximum amount of points shown per point cloud. PointCloudPointSize_Minus (6.24.43) - decreases the size of points. PointCloudPointSize_Plus (6.24.48) - increases the size of points. PointCloudReference (6.24.45) - attaches point cloud files from the cache folder to the current drawing through a dialog box. PointCloudUncrop (6.24.46) - removes all croppings from a point cloud.

Figure 6.2002

6.24.56 PropertiesClose

(6.2981 on page 6079) Closes the Properties panel.

Accessing the Command

command bar: **propertiesclose** alias: **prc** keystrokes: **Ctrl+1 Ctrl+Shift+P** menu: **View | Properties** : **propertiesclose** Closes the Properties panel. To open the Properties palette, use the Properties (6.24.54) command.

Command Options

No options.

Related Command

Properties (6.24.54) - opens the Properties panel. -ToolPanel (6.29.37) - allows to control the display of tool panels, such as the Properties Bar, the Ribbon or the Sheet Sets panel from the command line.

Figure 6.2003

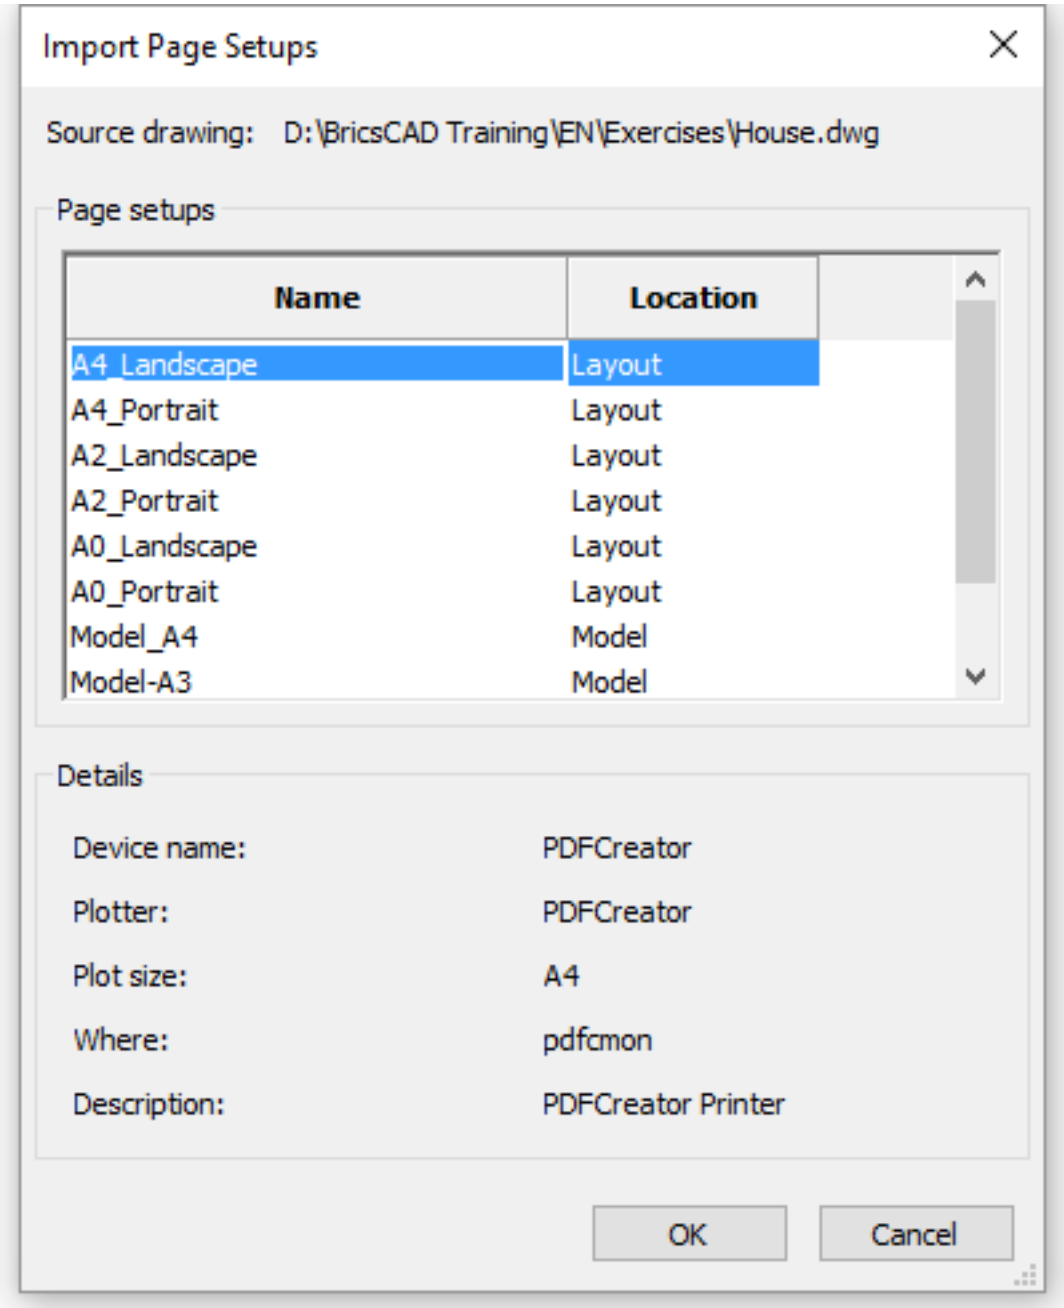
6.24.57 PSetupIn

(6.2981 on page 6079) Imports page setup definitions from other drawings through a dialog box. **Note:** Page setups define how a drawing is printed, and are used by the Print (6.24.51) and Publish (6.24.68) commands.

Accessing the Command

command bar: **psetupin** : **psetupin** Displays a file dialog: select the drawing from which you want to import page setups, and then click **Open**. Displays a dialog: (6.2004 on the next page) Select one or more page setups in the list. Hold down the **Ctrl** key to select multiple page setups, then click **OK** to import the selection into the current drawing.

Figure 6.2004



Command Options

Option	Description
Name	Specifies the names of page setups in the drawing; click the Name header to short the names alphabetically. When the drawing contains no page setups, then the dialog box is blank.
Location	Specifies the layout and model locations of page setups; click the Location header to short them alphabetically
OK	Imports the page setups into the drawing
Cancel	Cancels the command and does not import anything

Related Commands

-PsetupIn (6.24.58) - imports page setup definitions from another drawing through the command bar. PageSetup (6.24.2) - creates and edits page setups for plotting drawings in the Drawing Explorer. Layout (6.20.14) - creates, copies, renames, and deletes layouts.

Figure 6.2005

6.24.58 -PSetupIn

(6.2981 on page 6079) Imports page setup definitions from another drawing through the command bar. **Note:** Page setups define how a drawing is printed, and are used by the Print (6.24.51) and Publish (6.24.68) commands.

Accessing the Command

command bar: **-psetupin** : **-psetupin** Displays a file dialog: select the drawing from which you want to import page setups, and then click **Open**. **Prompts you in the command bar:** Enter user defined page setup(s) to import or [?]: **(Type the name(s) of the page setup(s) you want to import or type ? to list the available page setups)**

Command Options

Option	Description
Enter user defined page setup(s) to import	Type the name(s) of the page setup(s) you want to import; separate setup names by commas
?	Lists the names of page setups in the drawing

Related Commands

PsetupIn (6.24.57) - Imports page setup definitions from another drawing through a dialog box. PageSetup (6.24.2) - creates and edits page setups for plotting drawings in the Drawing Explorer.

Figure 6.2006

6.24.59 PSpace

(6.2981 on page 6079) Switches from model to paper space in a layout tab (short for "paper space"). **Note:** This command operates only in a layout tab.

Accessing the Command

command bar: **pspace** shortcut: in a layout tab, double-click outside a viewport border alias: **ps** status bar: **M:Layout** : **pspace** Displays no prompts in the command bar.

Command Options

No options.

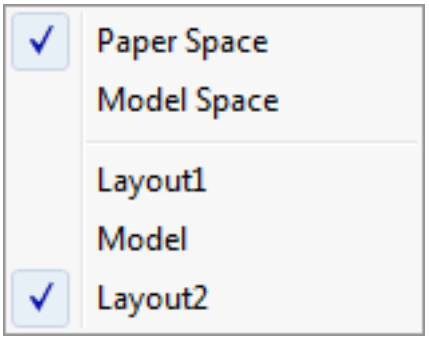
Status Bar Menu

Right-click P:Layout on the status bar for the shortcut menu: (6.2007) (6.2008 on the next page)

Shortcut Menu	Description
Paper Space	Switches to paper space in the current layout.
Model Space	Switches to model space in the current layout.
Layout1	Switches the drawing editor to Layout1.
Model	Switches the drawing editor to Model.
Layout2	Switches the drawing editor to Layout2. When the drawing contains other layouts, they are also listed in the shortcut menu.

Figure 6.2007

Figure 6.2008



Related Commands

ChSpace (6.9.13) - Moves entities from paper space to model space and vice versa. MSpace (6.21.32) - switches to model space. MView (6.21.37) - creates viewports in paper space. VpClip (6.31.18) - clips viewports. VPorts (6.31.26) - creates viewports in model space. Zoom (6.35.7) - utilizes the XP option to specify the zoom factor in paper space relative to model space.

Figure 6.2009

6.24.60 Purge

(7.3 on page 6132) Removes unused named entities from drawings, such as unused layers and linetypes.

Accessing the Command

 command bar: **purge** alias: **pu, -purge** menu bar: **File | Purge** ribbon: **Home | File | Purge** : **purge Prompts you in the command bar:** Purge [BAtch all/purge All/Blocks/DEtail view styles/Dimension styles/Groups/LAyers/LineTypes/M styles/MUltileader styles/Plot styles/Regapps/SEction view styles/SHapes/Table styles/text STyles/Visual styles/Zero-length geometry/Empty text entities/Orphaned data]: **(Enter an option)**

Command Options

Option	Description
BAtch all	Purges all unused named entities from the drawing without prompts.
purge All	Purges all unused named entities from the drawing with the following prompt: **Enter name(s) to purge <*>: (Enter an entity name, or press Enter to have the program check all named entities) Verify each name to be purged? [Yes/No] <Yes>:** • **Yes** - purges each unused named entity after you confirm • **No** - purges all unused named entities without confirmation
Blocks	Removes unused block definitions from the current drawing; prompts you: **Enter name(s) to purge <*> - (enter the names of block definitions to purge, or press Enter to purge all unused ones.)**
DEtail view styles	Removes used detail view styles used by the ViewBase and related commands: **Enter name(s) to purge <*> - (enter the names of styles to remove, or else press Enter to purge all unused ones.)**
Dimension styles	Removes unused dimension styles from the current drawing; prompts you: **Enter name(s) to purge <*> - (enter the names of dimension styles to purge, or press Enter to purge all unused ones. The "Standard" dimension styles cannot be purged.)**
Groups	Removes unused named groupss from the current drawing; prompts you: **Enter name(s) to purge <*> - (enter the names of groups styles to purge, or press Enter to purge all unused ones.)**
LAyers	Removes unused layers from the current drawing; prompts you: **Enter name(s) to purge <*> - (enter the names of layers to purge, or press Enter to purge all unused ones. Layer "0" cannot be purged.)**
LineTypes	Removes unused linetypes from the current drawing; prompts you: **Enter name(s) to purge <*> - (enter the names of linetypes to purge, or press Enter to purge all unused ones. Linetype "Continuous" cannot be purged.)**

MAterials	Removes unused materials from the current drawing; prompts you: **Enter name(s) to purge <*>** - **(enter the names of materials to purge, or press Enter to purge all unused ones. The "Global" material cannot be purged.)**
MLine styles	Removes unused multiline styles from the current drawing; prompts you: **Enter name(s) to purge <*>** - **(enter the names of multiline styles to purge, or press Enter to purge all unused ones. Multiline style "Standard" cannot be purged.)**
MUltileader styles	Removes unused multileader styles from the current drawing; prompts you: **Enter name(s) to purge <*>** - **(enter the names of mleader styles to purge, or press Enter to purge all unused ones. MLeader style "Standard" cannot be purged.)**
Plot styles	Removes unused plot styles from the current drawing; prompts you: **Enter name(s) to purge <*>** - **(enter the names of plot styles to purge, or press Enter to purge all unused ones.)**
Regapps	Removes unused regapp keys (1) from the current drawing; prompts you: **Enter name(s) to purge <*>** - **(enter the names registered application keys to purge, or press Enter to purge all unused ones.)** Regapp (registered application) keys are used to attach additional information to entities in drawings by third-party applications. The keys are saved with the drawing, and unused ones can be purged by this command.
SEction view styles	Removes unused section view styles (used by the ViewBase and related commands) from the current drawing; prompts you: **Enter name(s) to purge <*>** - **(enter the names of section view styles to purge, or press Enter to purge all unused ones.)**
Shapes	Removes unused shapes (loaded into the drawing with the Load command) from from the current drawing; prompts you: **Enter name(s) to purge <*>** - **(enter the names of shapes to purge, or press Enter to purge all unused ones)**
Table styles	Removes unused table styles from the current drawing; prompts you: **Enter name(s) to purge <*>** - **(enter the names of table styles to purge, or press Enter to purge all unused ones. Table style "Standard" cannot be purged.)**
text STyles	Removes unused text styles from the current drawing; prompts you: **Enter name(s) to purge <*>** - **(enter the names of styles to purge, or press Enter to purge all unused ones. Text style "Standard" cannot be purged.)**
Visual styles	Removes unused user-defined visual styles from the current drawing; prompts you: **Enter name(s) to purge <*>** - **(enter the names of visual styles to purge, or press Enter to purge all unused ones.)** Only user defined visual styles can be purged; hard-coded visual styles cannot be purged.
Zero-length geometry	Removes geometry with no length, without a prompt.
Empty text entities	Removes empty text entities from the current drawing, such as those from imported DGN design files. No prompt is displayed.
Orphaned data	Performs a drawing scan and removes obsolete DGN linestyle data. No prompt is displayed.

Related Command

Explorer (6.13.15) - purges unused entity names through the Drawing Explorer.

Figure 6.2010

6.24.61 Polygon

(7.3 on page 6132) Draws regular polygons, from 3 to 1,024 sides. **Note:** This command draws regular polygons, where each side is the same length, and are made of polylines. To draw irregular polygons, use the Rectang (6.26.6) or PLine (6.24.27) commands. (6.2016 on page 5209)

Accessing the Command

 command bar: **polygon** alias: **pol** menu bar: **Draw | Polygon** ribbon: **Draw | Draw | Polygons | Polygon** toolbar: **Draw | Polygon |**  : **Polygon Prompts you in the command bar:** Polygon: Set number of sides or [Width of line/Multiple polygons] <4>: **(Specify the number of sides, press Enter for the default number of sides, or else enter an option)** This command draws polygons by several different methods:

- Location of center point and the midpoint of a side; **prompts you**:

Specify by: Set center of polygon or [specify by Edge]: **(Pick a point for the center)** Specify by: Select midpoint of side or [specify by Vertex]: **(Pick a point at the midpoint of one side)** (6.2011)

- Length of one edge by entering the **E** option:

First endpoint of edge: **(Pick a point)** Second endpoint of edge: **(Pick another point)** (6.2012 on the following page)

- Location of center point and one vertex:

Specify by: Select midpoint of side or [specify by Vertex]: **(Type V)** Specify by: Select vertex point or [specify by Side]: **(Pick a point at what should be one of the vertices)** (6.2013 on the next page)

Figure 6.2011

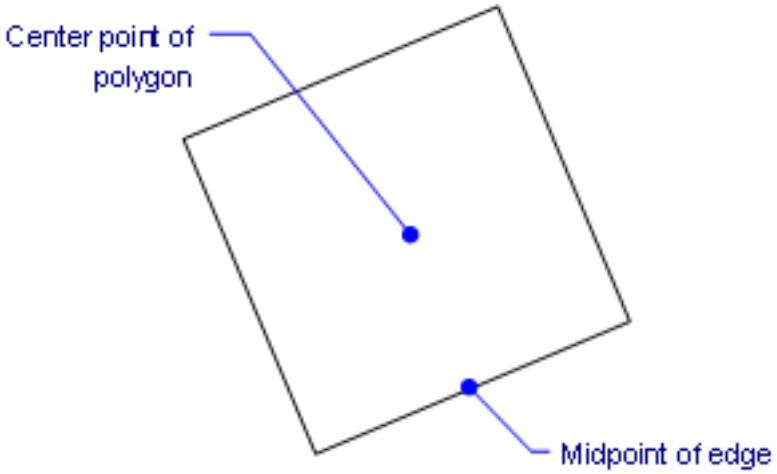


Figure 6.2012

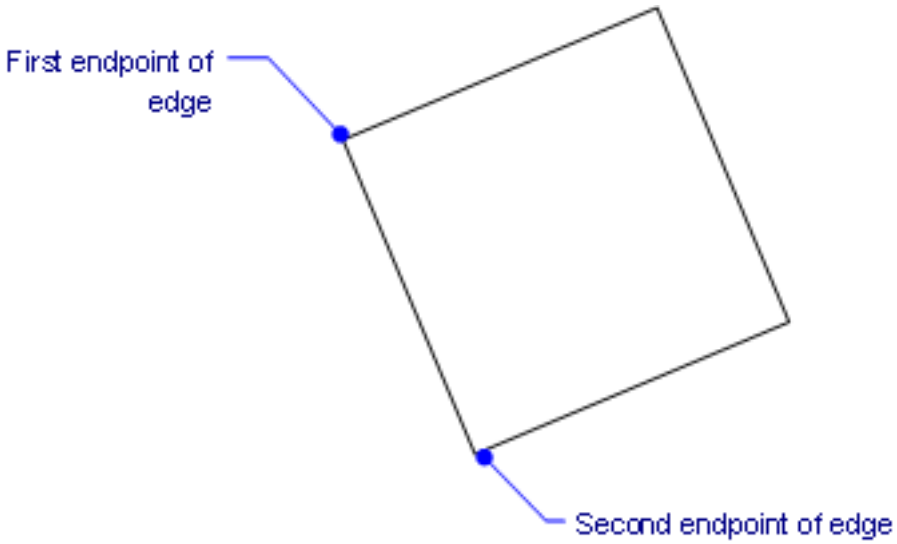

Figure 6.2013

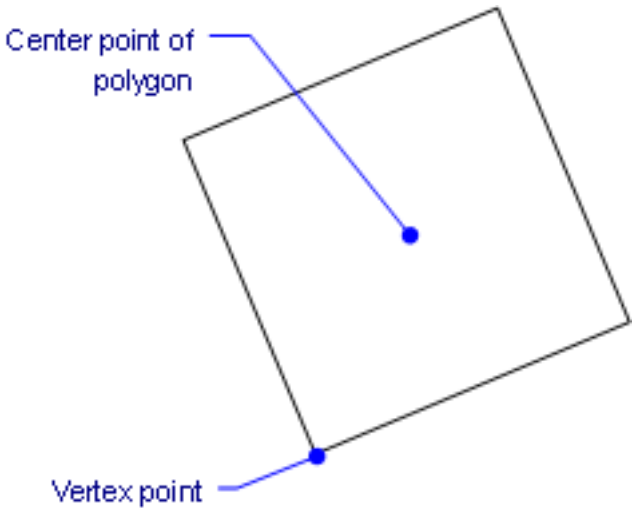


Command Options

Option	Description
Number of sides	Specifies the number of sides; enter a number between 3 and 1024.
Multiple polygons	Repeats the command to draw additional polygons.
Width of line	Specifies the width of the edge lines.
Center of polygon	Specifies the center point of the polygon.
Midpoint of side	Specifies the midpoint of one of the sides: (6.2016 on page 5209) The midpoint of the side determines the size and angle of the polygon.
Edge	Specifies the length of an edge; prompts you: 1. **First endpoint of edge** - **(specify the edge's start point.)** 2. **Second endpoint of edge** - **(specify the edge's endpoint.)** (6.2017 on page 5209) The length of the side determines the size and angle of the polygon.
Vertex	Specifies a vertex (corner of the polygon); prompts you: **Select vertex point** - **(specify the vertex.)** (6.2018 on page 5209) The location of the vertex determines the size and angle of the polygon.

Procedures

Drawing polygons

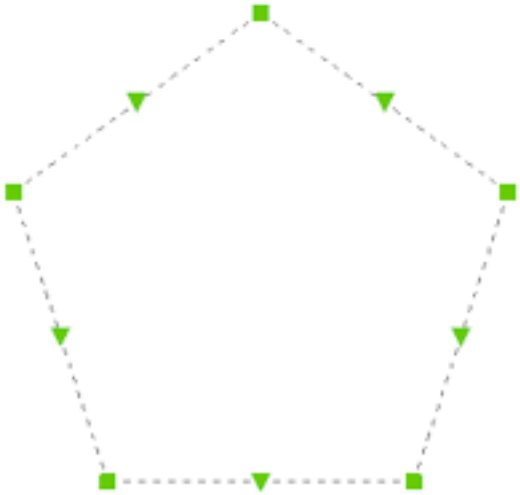
Grips Editing

Polygons can be edited directly through grips:

1. Select the polygon. Notice that it has a square grip at each vertex and a triangular grip at the midpoint of each segment. (6.2014 on the next page)
2. Drag a square grip to move a vertex.
3. Drag a triangular grip to move a segment.

Notice that the polygon is no longer regular.

Figure 6.2014



Related Commands

Rectang (6.26.6) - draws rectangles and squares. PEdit (6.24.24) - edits polygons.

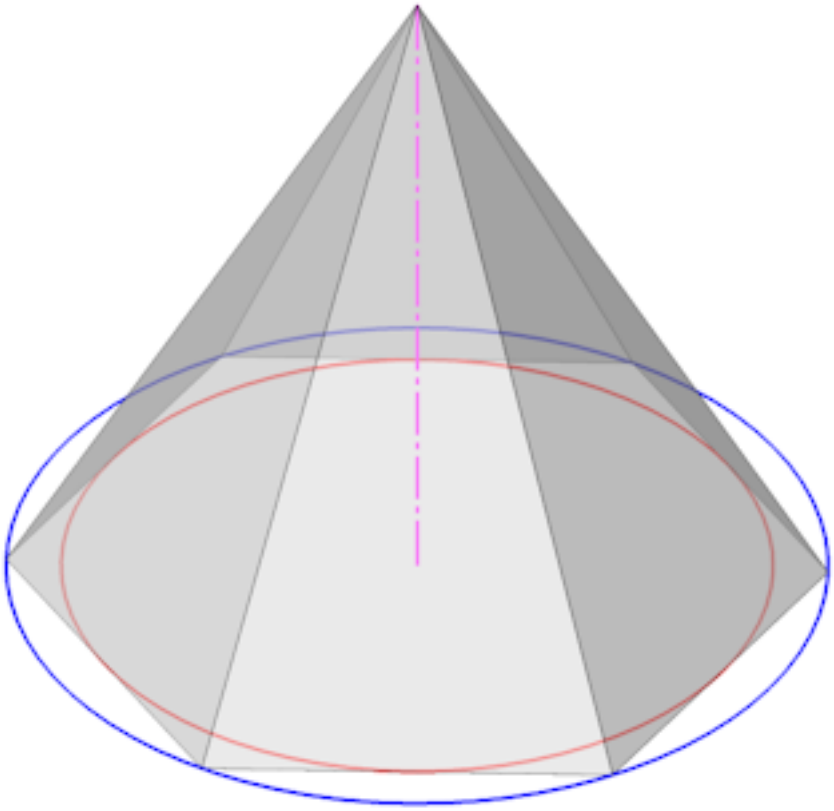
(6.2981 on page 6079) This command is obsolete. See PointCloudAttach (6.24.35).

Figure 6.2022

Figure 6.2023



6.24.64 Pyramid

(7.3 on page 6132) Draws 3D pyramids:

- Classic: pyramid is drawn from a 3D polyface mesh.
- Other license levels: pyramid is drawn as a 3D solid.

(6.2023)

Accessing the Command

 command bar: **pyramid** alias: **pyr** menu bar: **Model | 3D Solids | Pyramid** ribbon: **Solid | Create | Primitive | Pyramid** toolbar: **3D Solids |** : **pyramid**

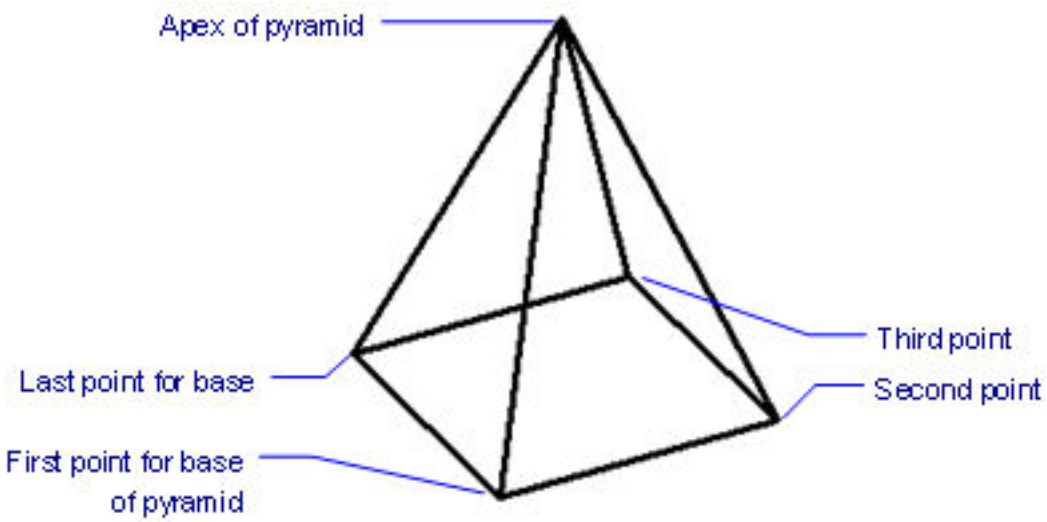
- Command sequence in Pro and Platinum:

You are prompted: Specify center point or [Edge/Sides]: **(Pick a point, enter coordinates, or choose an option)** Specify base radius or [Inscribed]: **(Type a value, pick a point, or choose an option)** Specify height or [2Point/Axis endpoint/Top radius]: **(Type a value, pick a point, or choose an option)**

- Command sequence in Classic:

You are prompted: First point for base of pyramid: **(Pick a point, or enter coordinates)** Second point: **(Pick another point, or enter coordinates)** Third point: **(Pick a third point, or enter coordinates)** Tetrahedron/<Last point for base>: **(Pick the last point, enter coordinates, or type T)** Set apex of pyramid or [Ridge/Top surface]: **(Enter an option, pick a point, or enter coordinates)** (6.2024 on the next page)

Figure 6.2024



Command Options in Pro and Platinum

Pro and Platinum Option	Description
Specify center point	**Specifies the center of the pyramid's base: (pick a point or enter x,y,z coordinates.)**
Sides	Specifies the number of sides (or vertices of the base); prompts you: **Enter number of sides <4>** - **(Type a number, or press Enter to accept the default)**
Edge	Specifies the length of the edges of the base face; prompts you: 1. **Specify first endpoint of edge - (specify a point)** 2. **Specify second point of edge** - **(specify a point)** As you move the cursor for the second point, the program ghosts an image of the pyramid.
Specify base radius	Specifies the radius of a circle inscribed by the base of the pyramid; prompts you: **Specify base radius or [Circumscribed]** - **(enter a value, specify a point, or else enter C to switch to defining a circumscribed base) Inscribed** means that the size of the base is the double the distance from the center point to one of the midpoint of the base: (6.2026 on page 5216)
Circumscribed	Specifies the radius of a circle circumscribed by the base of the pyramid; prompts you: **Specify base radius or [Inscribed]** - **(enter a value, specify a point, or else enter I to switch to defining an inscribed base)** Circumscribed means that the size of the base is determined by double the distance from the center point to one of the vertices of the base: (6.2027 on page 5217)
Specify height	Sets the height by picking a point or entering x,y,z coordinates

2Point	Set the height of the pyramid by specifying two points, such as along another entity; prompts you: 1. **Specify first point - (pick a point or enter x,y,z coordinates)** 2. **Specify second point - (pick another point or enter x,y,z coordinates)**
Axis endpoint	Sets the length and orientation of the pyramid's axis by specifying the top of the pyramid, creating a rotated pyramid; prompts you: **Specify axis endpoint - (specify a point or enter x,y,z coordinates)**
Top radius	Allows to create a truncated pyramid; prompts you: (6.2028 on page 5217) 1. **Specify top radius <0.0> - (type a value or specify a point to define the radius of the circle the top face of the pyramid is inscribed in)** 2. **Specify height or 2Point/Axis endpoint - (type a value or specify a point)**

Command Options in Classic

See the Ai_Pyramid (6.5.15) command.

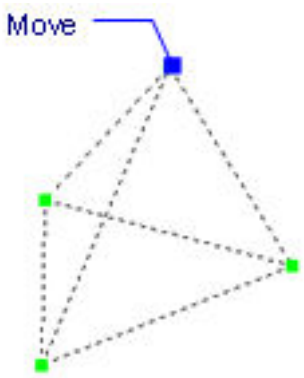
Grips Editing

Pyramids made of solid models can be edited directly through grips:

1. Select the pyramid. Notice that it has several grips.
2. Drag a grip to move the pyramid. (All grips perform the same function: move.)

(6.2025)

Figure 6.2025



Related Commands

Box (6.6.18) - creates 3D boxes as solid models. Cone (6.9.46) - creates 3D cones as solid models. Cylinder (6.9.49) - creates 3D cylinders as solid models. Dish (6.10.42) - creates the lower half of 3D balls as solid models. Dome (6.10.35) - creates the upper half of 3D balls as solid models. Extrude (6.13.25) - extrudes 2D entities into 3D solid models. Interfere (6.17.17) - creates 3D volumes of intersecting 3D solid models. Intersect (6.17.20) - removes volumes not in common between two solid models. MassProp (6.21.2) - reports the mass properties of 3D solid models and 2D regions. Pyramid (6.24.64) - creates a pyramid as a 3D solid (Pro and Platinum). Creates a pyramid as a polygon mesh (Classic) Revolve (6.26.45) - revolves 2D entities into 3D solid models. Slice (6.27.40) - cuts 3D solids into two parts. SolidEdit (6.27.42) - edits the bodies, faces, and edges of 3D models. Sphere (6.27.50) - creates 3D balls as solid models. Subtract (6.27.58) - removes one solid model from a second. Torus (6.29.29) - creates 3D donuts as solid models. Union (6.30.6) - joins two or more solid models into a single entity.

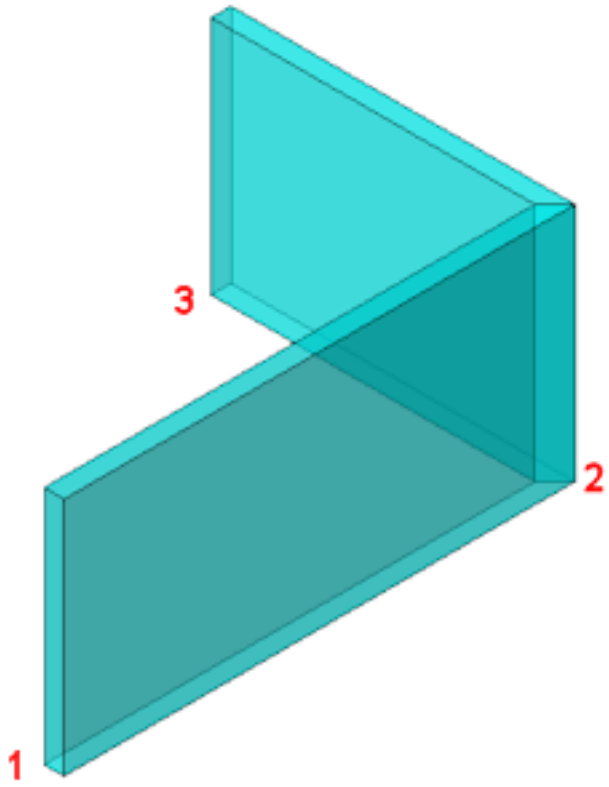
Figure 6.2030



6.24.65 PolySolid

(6.2932 on page 6037) Quickly 3D solids that look like walls and roofs. (6.2030)

Accessing the Command

 keyboard: **polysolid** alias: **pso** menu bar: **Model | 3D Solids | Polysolid** ribbon: **Model | Create 3D** toolbar: **Solids** quad tab: **Model** : **PolySolid Prompts you in the command bar:** Start point or [Height/Width/Justification/Entity/Separa solids/Dynamic] <Entity>: **(Specify a point, such as #1 in the figure above, or enter an option)** Set next point or [draw Arcs/Distance]: **(Specify a point, such as #2, or enter an option)** Set next point or [draw Arcs/Distance/Follow/Undo]: **(Specify a point, such as #3, or press Enter to specify the height)** Set next point or [draw Arcs/Close/Distance/Follow/Undo]: **(Specify a point, enter an option, or press Enter)** Height of polysolid <8.00>: **(Enter a height, or else press Enter accept the default height)** The height of the polysolid is perpendicular to the XY-plane of the current **coordinate system** (WCS or UCS) or dynamic UCS.

Command Options

Option	Description
Start point	Pick the starting point of the polysolid, or enter x,y coordinates.
Set next point	Pick the next vertex of the polysolid, or enter x,y coordinates.

Height	Sets the height of the polysolid; prompts you: **Height of polysolid <8>** - **(enter a value.)** The default height is saved to the PSOLHEIGHT variable for reuse by this command. This default height is used when the Dynamic option is off.
Width	Sets the width of the polysolid; prompts you: **Width of polysolid <0.5>** - **(enter a value.)** The default width is saved to the PSOLWIDTH system variable for reuse by this command.
Justification	Defines the position of the polysolid entity with respect to the base line; prompts you: **Select justification [Left/Right/Center] <Center>** - **(choose an option)**: • **Left** - the width of the polysolid is drawn to the left of the center line, which is defined by your pick points • **Right** - the width of the polysolid is drawn to the left of the center line • **Center** - width is drawn on both side of the center line; this is the default justification When Hot Key Assistant is on (**HKA** on the status bar), then the following widget appears on the screen; tap the **Ctrl** key to switch dynamically between left, center, and justification: (6.2031 on the following page)
Entity	Draws the polysolid along an existing 2D entity; prompts you: **Select polysolid base** - **(select a line, open or closed polyline, arc, circle, ellipse, elliptical arc, or splines.)**
Separate solids	Determines whether the 3D solids drawn by this command are created separately; prompts you: **Separate solids On/OFF <On>** - **(enter an option)**: • **On** - draws separate solids between vertices (at left, below) • **OFF** - draws the entire polysolid as a single, multi-segment entity; bisector connection lines are removed in sections depending on the Union Section (2.7.17) property of the material(s) in the composition that is assigned to the connected solids (at right, below (6.2032 on page 5221)
Dynamic	Determines whether the height of the polysolid is fixed; prompts you: **Dynamic height On/OFF <On>** - **(enter an option)**: • **On** - you will be prompted to specify the height of the polysolid entity; prompts you: **Height of polysolid <8.00>** - **(enter a value, press Enter to accept the default height; or click a point in the drawing.)** • **OFF** - uses the the height defined by the PSOLHEIGHT (1.17.10) variable You can also use dynamic dimensions (**DYN** on the status bar) to define the width and height of the polysolid in the dynamic entry fields; press the **Tab** key to switch to the other field, and then press **Enter** to confirm the values. (6.2033 on page 5221)

draw Arcs	Starts drawing arc segments; prompts you: **Set end of arc or [draw Lines/CLose/Direction/Second point/Undo]** - **(enter an option)**: • **End of arc** - enter a point to make the arc tangent to the previous segment • **Draw Lines** - switches back to drawing linear segments • **Direction** - specifies the direction of the tangent at the start point of the new arc segment • **Second point** - prompts you to specify a point along the arc's circumference
Distance	Specifies the length and angle of a linear segment; prompts you: 1. **Distance for segment** - **(type a value.)** 2. **Angle of segment** - **(type a value.)**
Follow	When switching from arc segments to linear segments, creates the linear segment tangent to the arc segment.
Close	Creates a closing segment between the previous point and the start point of the polysolid. If you snap to the start point of the currently created chain, the chain is closed automatically. This option is available after creating two polysolid segments.
Undo	Removes the previous segment.

Procedures

- Creating a single wall (2.5.7)
- Creating a chain of L-connected walls (6.20.19)

Related Commands

BimConnect (6.20.19) - Creates an L-connection between minor faces of two solids. Drag (6.10.38) - drags major faces of solids while preserving connections with minor faces. Drags minor faces; optionally connects minor faces to major faces of other solids. BimQuickDraw (6.7.41) - Allows to quickly create and edit rectangular and L-shaped rooms and buildings.

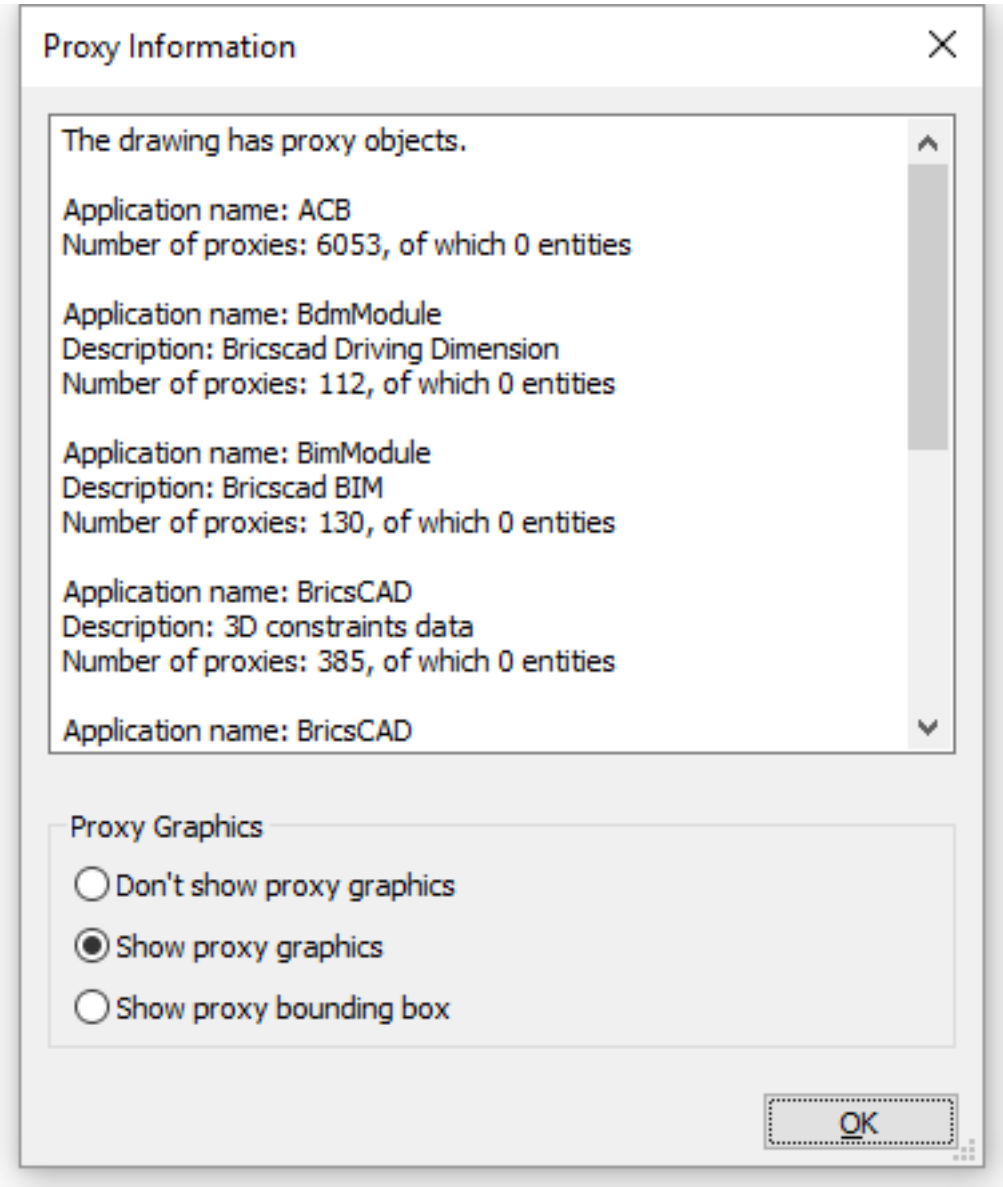
6.24.66 ProxyInfo

(6.2981 on page 6079) Displays information about proxy entities and toggles their display in the current drawing.
Note: Proxy graphics are CAD entities that are unknown to BricsCAD and so are shown in the drawing as geometry that can be edited only in the most basic manner.

Accessing the Command

command bar: **proxyinfo** : **proxyinfo** Displays a dialog box: (6.2035 on the facing page)

Figure 6.2035



Command Options

Option	Description
Proxy Graphics	Toggles the display of proxy graphics in the drawing: • **Don't show proxy graphics** - turns off the display of proxy graphics • **Show proxy graphics** - shows proxy graphics • **Show proxy bounding box** - displays a rectangle or cube, instead of the proxy

Related Commands

Audit (6.4.42) - repairs drawings that are open. Recover (6.26.3) - recovers damaged drawings.

Figure 6.2036

6.24.67 PointCloudAlign

(6.2880 on page 5977) Rotates the point cloud to optimally align it with the X and Y axes.

Accessing the Command

 Keyboard: **pointcloudalign** Toolbar: **Pointcloud Align :PointCloudAlign Prompts you:** Operate on full point cloud or a selection? [Full/Selection] <Selection>: (Enter F or S)

Command Options

Option	Description
Full	Analyzes the entire point cloud to determine the optimal orientation.
Selection	Analyses points within the selection window to determine the optimal orientation.

Related Commands

AttachmentsPanelOpen (6.4.30) - displays the Attachments panel from which point clouds and other attachments can be loaded and controlled. PointCloud2dVsDisplay (6.24.33) - controls whether a bounding box and a warning message display when trying to view a point cloud in the 2D Wireframe visual style. PointCloud (6.24.31) - opens the Drawing Explorer to the Point Cloud section; converts, loads, and unloads point cloud file attachments. PointCloudAttach (6.24.35) - attaches point cloud files (that were previously converted to BricsCAD's BPT format) to the current drawing. PointCloudBoundary (6.24.36) - sets the display of the bounding box of point clouds. PointCloudColorMap (6.24.37) - colorizes the points based on Intensity, Elevation, and Classification of the point cloud. PointCloudCrop (6.24.41) - crops a point cloud entity, displaying only the part of the point cloud inside or outside a prismatic or cylindrical volume. PointCloudDeleteItem (6.24.38) - deletes point cloud files from the cache folder through a dialog box. PointCloudExport (6.24.39) - exports a cropped selection of a point cloud to a .pts file. PointCloudImport (6.24.40) - imports a VRM file into the current point cloud cache location through a dialog box. PointCloudPointMax (6.24.49) - defines the maximum amount of points shown per point cloud. PointCloudPointSize (6.24.55) - specifies the size of points. PointCloudPointSize_Minus (6.24.43) - decreases the size of points. PointCloudPointSize_Plus (6.24.48) - increases the size of points. PointCloudReference (6.24.45) - attaches point cloud files from the cache folder to the current drawing through a dialog box. PointCloudUncrop (6.24.46) - removes all croppings from a point cloud.

Figure 6.2037

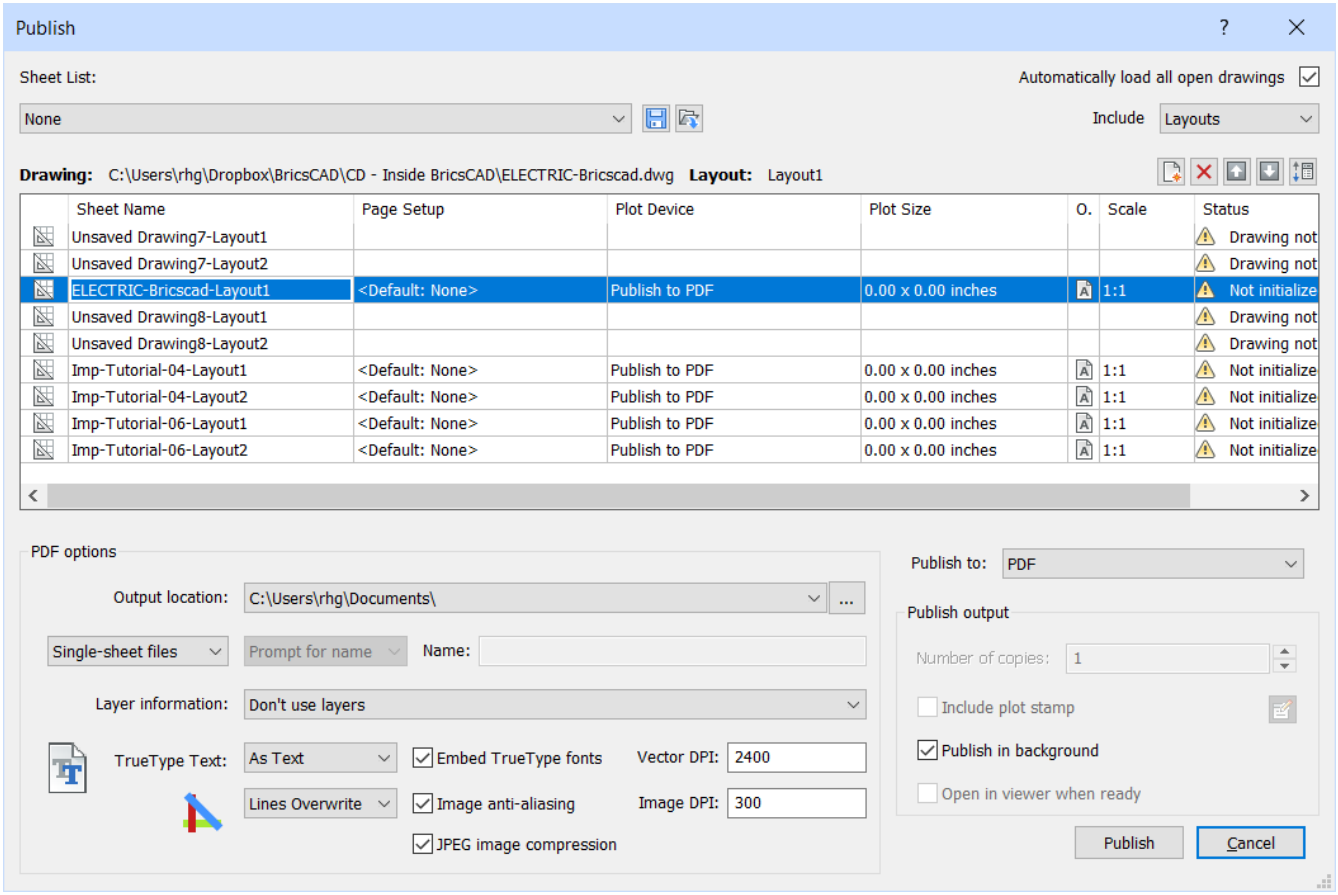
6.24.68 Publish

(6.2981 on page 6079) Sends one or more drawings. layouts, and sheets to the printer, or exports them in PDF format; useful for batch printing of "books" of drawings. **Note:** To print a batch of drawings when BricsCAD starts, use the **/pl** switch in the program's properties.

Accessing the Command

 command bar: **publish** menu bar: **File | Publish** ribbon: **Home | Print/Plot | Publish** toolbar: **Standard |**  : **publish** Displays a dialog box: (6.2038 on the next page)

Figure 6.2038



Command Options

Option	Description
Load Sheet List	Loads a saved sheet list through a file dialog box. (If the current list is not saved yet, you are prompted to save it.) 1. Select a *.dsd (Drawing Set Description) file. 2. Click **Open** button. 3. Choose whether to **Replace** all sheets in the list or to **Append** sheets to the list. (6.2039 on page 5231)
Save Sheet List	Saves the current sheet list to a a *.dsd (Drawing Set Description) file.
Automatically load all open drawings.	Determines how open drawings are handled: • **On** (checked) - adds all model and/or paper space layouts to the list of sheets to be plotted • **Off** (unchecked) - adds the model and/or paper space layouts of the current drawing only This option also sets the value of the PUBLISHALLSHEETS system variable.

Include	Determines which sheets must be included: • **Model** - include only model tabs of open drawings • **Layouts** - include only layout tabs of open drawings • **Model & Layouts** - include both model and layout tabs of open drawings
Add Sheets	Adds sheets to the current list; displays a file dialog box: 1. Select a drawing. 2. All layouts in the selected drawing are added to the sheet list. 3. If a sheet name already exists, a dialog box displays prompting you to enter a new name. (6.2040 on page 5231)
Remove Sheets	Removes the selected sheet(s) from the current list.
Arrange Sheets	Moves the selected sheets up or down, or reverses the sheet order (useful for printers and plotters that print in reverse order).
Drawing	Reports the path and name of the drawing of the currently selected sheet; ready-only.
Layout	Reports the name of layout of the currently selected sheet; read-only.
Sheet List	
Sheet Name	Lists the names of layouts in the sheet set.
Page Setup	Specifies the Page Setup (6.24.2) name of each sheet: • Click the down arrow on the droplist to select a different page setup: (6.2041 on page 5231) • Or else choose **Import...** to import page setups of another drawing: 1. In the file dialog box, select a drawing. 2. Click the **Open** button. 3. Choose a page setup from the list. (6.2042 on page 5232)
Plot Device	Selects the name of the plot device, as defined in the Page Setup (6.24.2) of the sheet.
Plot Size	Specifies the size of the paper in the currently selected page setup.
Orientation	Selects the paper orientation in the currently selected page setup: Landscape ( ) or Portrait ( ).
Scale	Specifies the scale of the currently selected page setup.
Status	Reports the status of the currently selected page setup, including errors detected.

Publish to:	Choose the output target of the Publish command: • Plotter named in page setup . (6.2043 on page 5232) • Number of copies: sets the number of copies for each sheet to be printed. • Include plot stamp: if checked adds a plot stamp. Click the **Edit Plot Stamp** button () to change plot stamp data. • Turning Drawings into PDFs Youtube (6.2044 on page 5232)

Publish in background	Determines if the sheet is published in the background: • **Yes** - sheets are published in the background, which takes longer to produce the prints, but allows you to continue to work in the program • **No** - sheets are published in the foreground, which is faster, but prevents you from working with the program until the print job is completed The BACKGROUNDPLOT system variable controls whether documents are published in the foreground or background.
Open in viewer when ready	Determines if the sheet set should be viewed; this option is available when **Publish To** is set to "PDF" and **Publish in Background** is "Off."
Publish	Publishes the current sheet set to the selected output target.

Related Commands

ExportPdf (6.13.20) - exports drawings to PDF documents. -Publish (6.24.62) - prints a saved sheet list. PageSetup (6.24.2) - assigns plot style to drawings. Plot (6.24.42) - plots drawings through the command bar. Print (6.25.2) - plots drawings through a dialog box. SheetSet (6.27.38) - manages sheet sets through the Sheet Sets panel.

6.25 Q

6.25.1 QNew

(7.3 on page 6132) Starts a new drawing (short for "quick new") based on the default template file. **Note:** The New (6.22.5) command start a new drawing after prompting you to select a template file.

Figure 6.2047

Accessing the Command

 command bar: **qnew** alias: **n** menu bar: **File | New** ribbon: **Home | File | QNew** toolbar: **Standard |**  : **QNew** Opens a new document tab based on the default template and user profile.

Command Options

No options.

Procedures

- To create a drawing using a default template drawing (1.19.1)
- To set the default template drawing (1.19.1)
- To create a drawing from scratch (1.19.1)
- To set the Plot style policy (1.19.1)
- To create a drawing using a template drawing (1.19.1)
- To create a drawing using the New command (1.19.1)
- To set the Template Path variable (1.19.1)
- To create a drawing using a wizard (1.19.1)

Related Commands

Units (6.30.8) - sets units through the Settings dialog box. -Units (6.30.9) - sets units through the command bar. NewWiz (6.22.6) - sets units and other parameters for new drawings. New (6.22.5) - opens new drawings.

Figure 6.2048

6.25.2 QPrint

(7.3 on page 6132) Prints the drawing using the default print configuration, without displaying the Print dialog box (short for "quick print"). **Note:** This command does not work when the default printer is set to "None." For full control over the printing process, use the Print (6.24.51) command.

Accessing the Command

command bar: **qprint** ribbon: **Home | Print/Plot | Print | Print** toolbar: **Standard |** : **QPrint** Displays no prompts in the command bar; prints the drawing. As this command does not work when the default printer is set to "None," you will want to configure the drawing's print properties ahead of time with the PageSetup (6.24.2) command.

Command Options

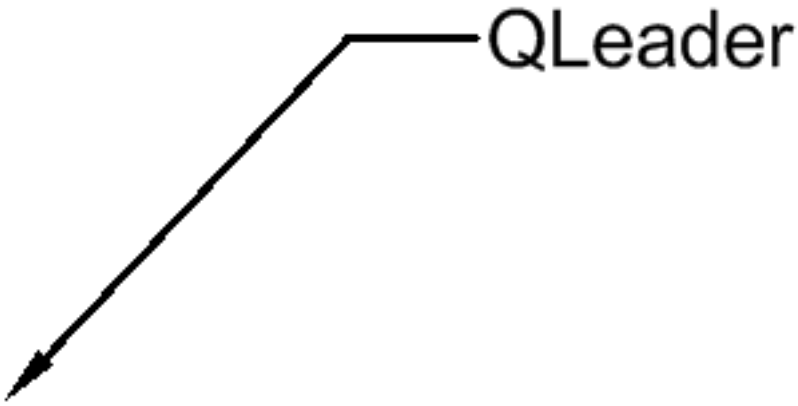
No options.

Related Commands

Print (6.24.51) - plots drawings through a dialog box. Plot (6.24.42) - plots drawings through the command line. Preview (6.24.50) - previews drawings before they are plotted. PageSetup (6.24.2) - assigns plot style to drawings. PlotStyle (6.24.28) - sets the current plot style. StylesManager (6.27.57) - creates and attaches plot styles to drawings.

Figure 6.2049

Figure 6.2050



6.25.3 QLeader

(6.2981 on page 6079) Draws leaders with a variety of annotation types; allows you to specify the properties through a dialog box. (6.2050)

Accessing the Command

 command bar: **qleader** : **QLeader Prompts you in the command bar:** Start of leader <Settings>: **(Pick a point, enter x,y coordinates, or else press Enter for the settings dialog box)** Next point: **(Pick another point)** To point: <Undo>: **(Pick another point, or enter U to undo the last leader segment)** Specify text width: <0>: **(Enter a width for the text bounding box; enter 0 for no limit on the width)** First line of annotation text: **(Type the first line of the annotation text)** Next line of annotation text: **(Type the another line of text, or else press Enter to end the command)**

Command Options

Option	Description
Start of leader	Specifies the start of the leader, the end at which the arrowhead is displayed: • Pick a point • Enter x,y coordinates
Settings	Displays the QLeader Settings dialog box; see below
Next point	Specifies the vertex of the leader, the start of the second leader line: • Pick a point • Enter x,y coordinates

To point	Specifies the end of the leader, also known as the landing line): • Pick a point • Enter x,y coordinates Hold down the **Shift** key to draw a horizontal landing line.
Undo	Undoes (un-draws) the last-drawn leader lin
Specify text width	Specifies the width for the text bounding box: • Enter a number in drawing units • Enter 0 for no limit on the width When the length of the text exceeds the bounding box width, the text flows automatically to the next line.
First line of annotation text	Specifies the text for the first line of leader annotation: • Enter text • Press **Enter** to carry on to the second line of text
Next line of annotation text	Specifies the text for the second line of leader annotation. The prompt continues until you press **Enter** without first entering text.

Dialog Box Options

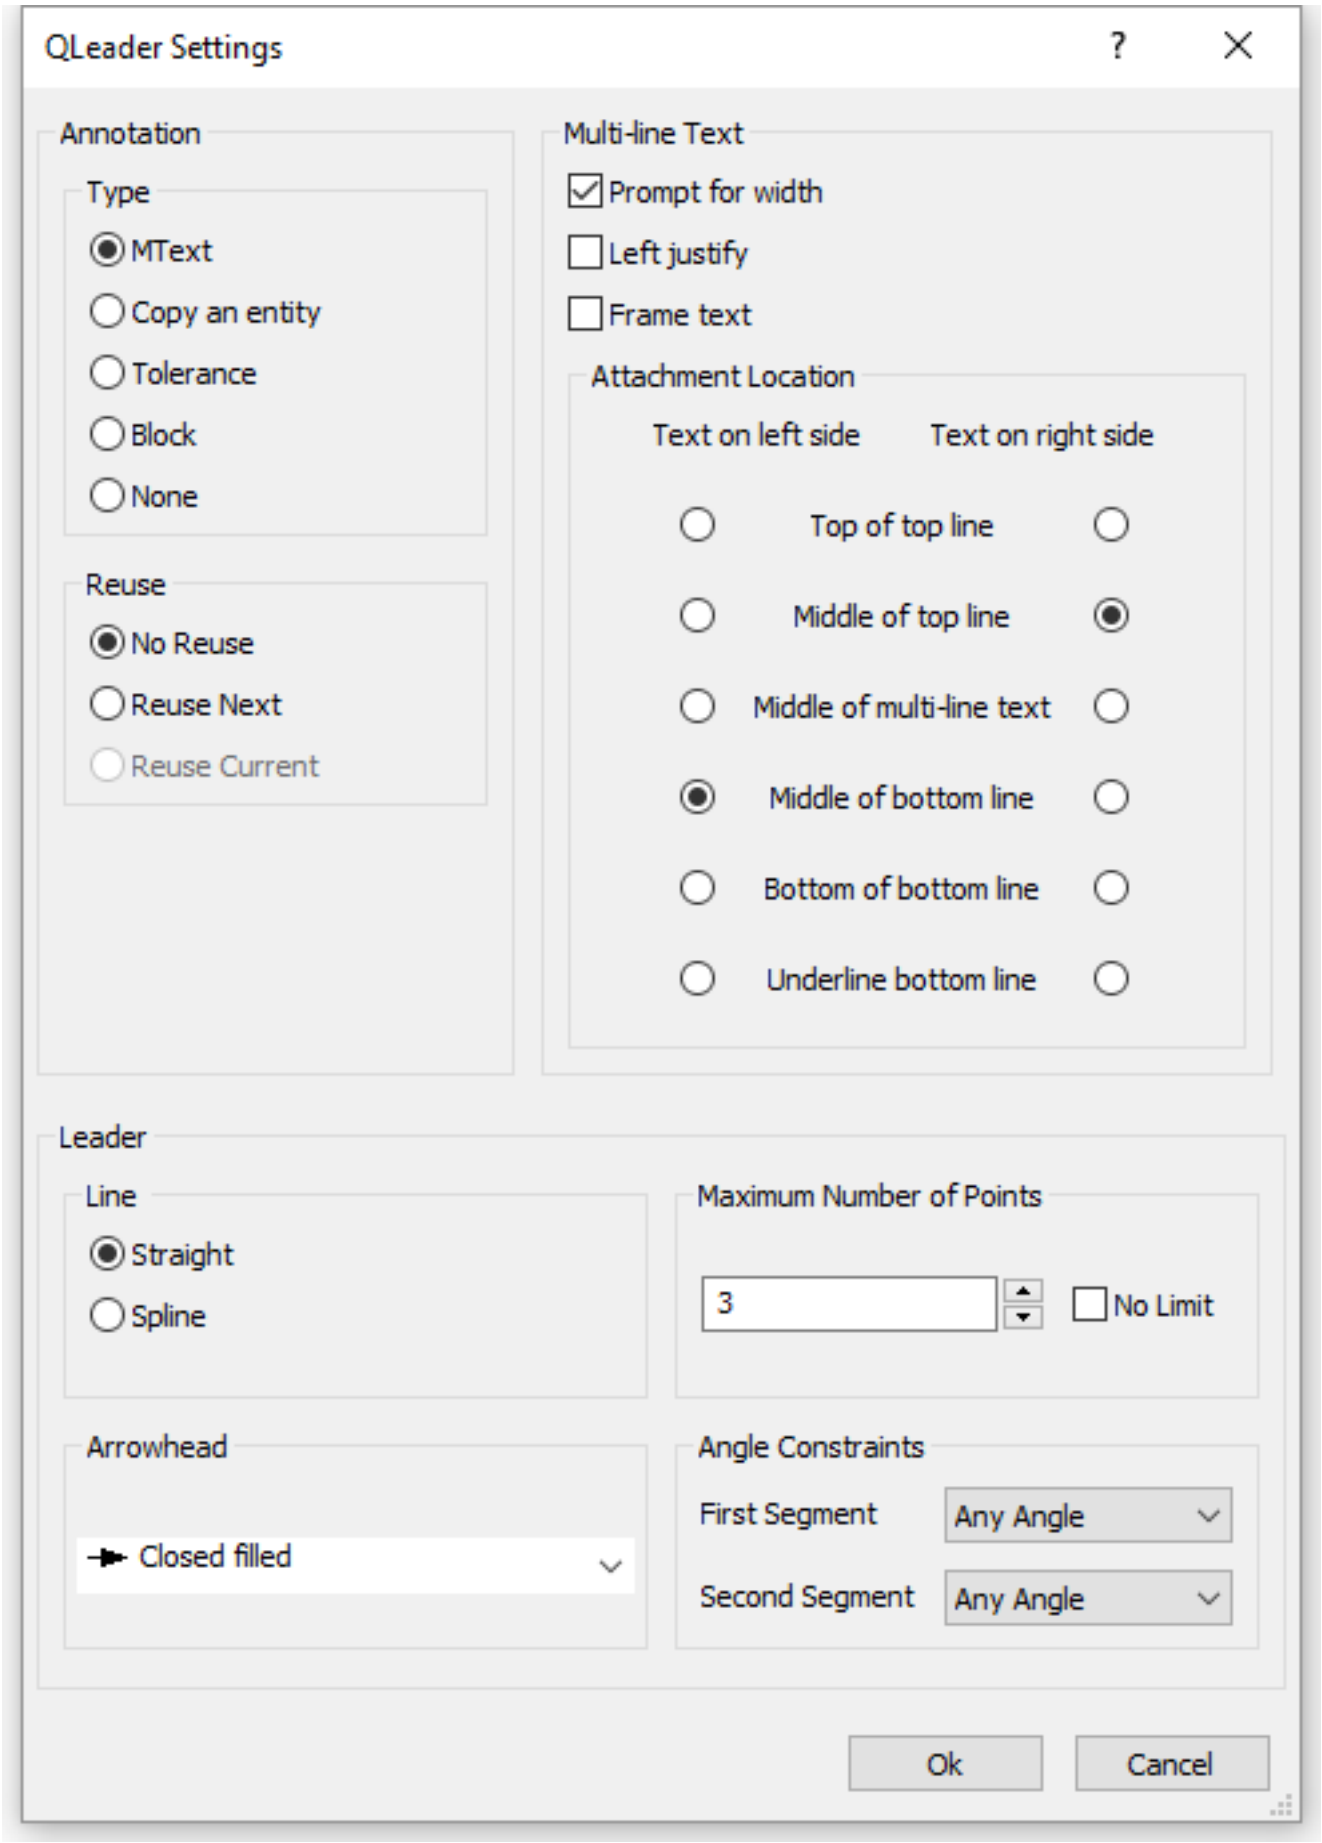
Enter the **Settings** options to see the dialog box: (6.2051 on page 5240)

Option	**Description**
Annotation type	Specifies the type of annotation: • **Mtext** - text is placed as the leader line's annotation; a leader can have one or more lines of text. Although the mtext editor does not appear when entering text (as with the MLeader command), the mtext editor does appear when editing the annotation (edit the text by double-clicking it) • **Copy of an entity** - uses any other entity in the drawing as the annotation; prompts you: **Select an entity** - choose an entity, other than the leader itself. • **Tolerance** - uses tolerance notation for the annotation; displays the Geometric Tolerance dialog box. See the Tolerance (6.29.26) command. (6.2052 on page 5241) • **Block** - uses a block as the annotation; displays prompts identical to that of the -Insert command: **? to list blocks in drawing/~ to open the file dialog/<Block to insert> - (enter an option.)** • **None** - no annotation is used

Multi-line Text	Specifies some multi-line text options: **Prompt for width** - toggles the use of the 'Specify text width' prompt: • **On** - displays the 'Specify text width' prompt and so wraps the text tot he specified width • **Off** - disables the prompt **Left justify** - determines the justification of the text: • **On** - forces the text to be left-justified always • **Off** - the text is left or right-justified, depending on the orientation of the landing line **Frame text** - toggles the use of a frame: • **On** - places a rectangle around the text • **Off** - no frame **Attachment location** - determines the relative location of where the mtext is attached to the landing line (6.2053 on page 5242)
Reuse	Specifies how to reuse the annotation: • **No reuse** - does not reuse the previous annotation text; you will be prompted to enter new text each time you use this command • **Reuse next** - you will be prompted to enter new text, which is then reused for subsequent leader(s). • **Reuse current** - the current text is reused for each new leader, and you will not be prompted to enter new text.
Leader line	Specifies the style of leader line: • **Straight** - draws the leader lines as straight segments • **Spline** - draws the leader line as a smooth continuous spline
Maximum number of points	Specifies the maximum number of vertices for the leader, before it stops drawing them automatically: • Enter a number; the minimum number is 2 • **No limit** - keeps drawing leader segments until you press **Enter** at the 'To point' prompt
Arrowhead	Specifies the type of arrow at the start of the leader; choose from the droplist: • Choose an arrowhead type • **None** - no arrow is drawn • **Select arrow** - choose a block from those int he current drawing; displays the Select Custom Arrow Block dialog box To create a custom arrow, draw it to your liking, and then use the Block (6.6.11) command to turn it into a block.

Angle Constraints	Set an angle to constrain the first and second leader segments. The angles are increments; for instance, choose 15 allows you to draw the leader at 0, 15, 30, 45, and so on degrees. Click the droplist, then choose an option: • **Any Angle** - no constraint; hold down the **Shift** key to draw the leader at 90 degrees • **Horizontal** - forces the leader line to be drawn at 90 degrees only • **90°** - draws leader lines at 90-degree increments • **45°** - draws leader lines at 45-degree increments • **30°** - draws leader lines at 30-degree increments • **15°** - draws leader lines at 15-degree increments
OK	Saves the changes you made to the settings, closes the dialog box, and then prompts you to specify the first point of the leader.

Figure 6.2051



Related Commands

Leader (6.20.21) - places leaders with text, blocks, entities, or tolerances. DimLeader (6.11.13) - places leaders with text, blocks, entities, or tolerances. MLeader (6.21.19) - creates multileader entities using the current multileader style.

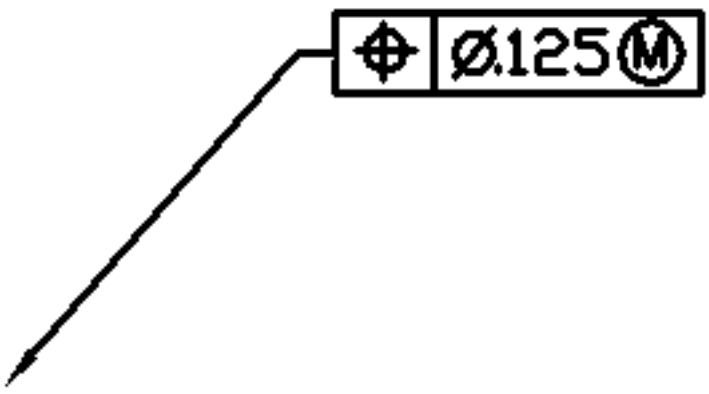

Figure 6.2053

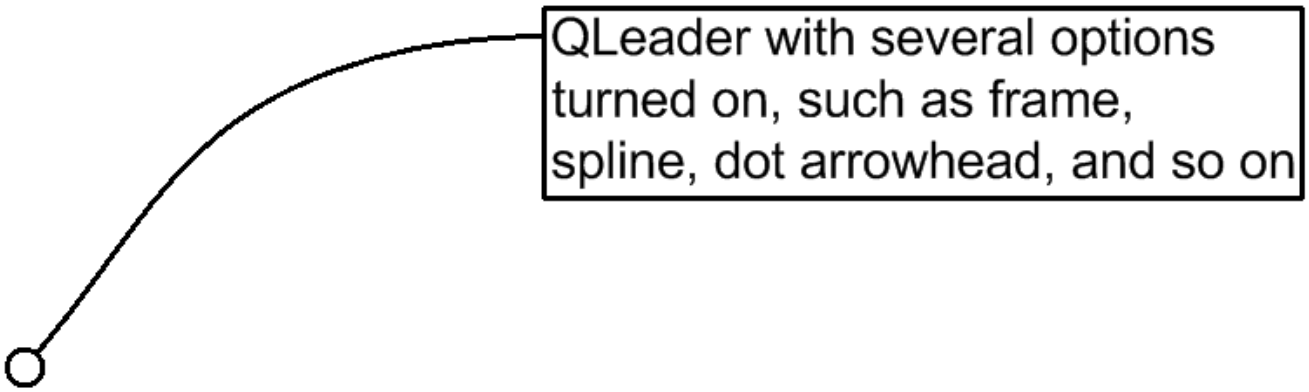

Figure 6.2054

6.25.4 QSave

(7.3 on page 6132) Saves the drawing immediately, without displaying the Save dialog box (short for "quick save").

Accessing the Command

 command bar: **qsave** shortcut: **Ctrl+S** menu bar: **File | Save** toolbar: **Standard |**  : **QSave**

- When the drawing has never been saved before
- When the drawing is opened as read-only

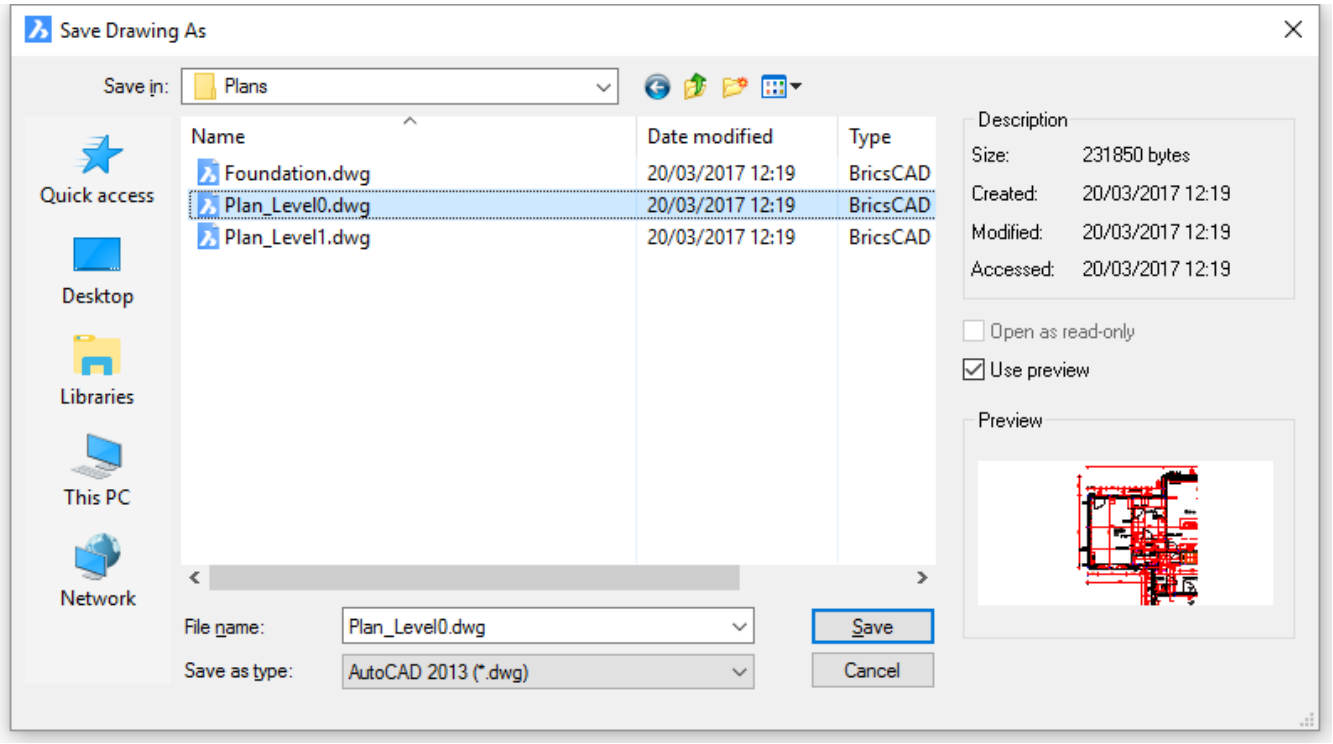
Displays a dialog box: (6.2188 on page 5372)

1. (Optional) Enter a file name or accept the default name generated by the program, such as 'Drawing1.dwg'.
2. (Optional) Choose a folder in which to save the drawing.
3. (Optional) choose a file format from the **Save As Type** droplist.
4. **Click Save.** See the Save (6.27.1) command.

- When the drawing has been already saved at least once:

Displays no dialog box or prompt in the command bar. To save the drawing by another name, use the Save command.

Figure 6.2055



Command Options

No options.

Related Commands

Save (6.27.1) - saves the current drawing through a dialog box. SaveAll (6.27.2) - saves all open drawings. SaveAs (6.27.3) - saves drawings by another name. SaveAsR12 (6.27.5) - saves drawing in older formats. Export (6.13.18) - exports drawings in a variety of vector and raster formats.

Figure 6.2056

6.25.5 QText

(6.2981 on page 6079) Changes the display of text between text and rectangles (short for "quick text"). (6.2058 on the following page)

Accessing the Command

command bar: **qtext** alias: **qt** : **QText Prompts you in the command bar:** QTEXTMODE is currently off: ON/Toggle/<Off>: **(Enter an option.)** The change in text does not occur until you enter the Regen (6.26.23) command: : **Regen Note:** This command is useful when drawings contain much text, thereby slowing down the display of the drawing, but you still need to see the location of the text.

Command Options

Option	Description
ON	Turns on quick text mode, rendering all text -- text, mtext, attributes, dimension text, and so on -- as rectangles: (6.2058 on the next page) Remember to run the Regen command.
Toggle	Changes quick text mode: • If on, turns it off • If off, turns it on
Off	Turns off quick text mode, returning text to its normal display: (6.2059 on the following page) Remember to run the Regen command.

Related Commands

Text (6.29.12) - places single-lines of text in drawings. MText (6.21.38) and -MText (6.21.40) - places paragraph text. AttDef (6.4.31) - defines attribute text. DdEdit (6.10.13) - edits text. Style (6.27.55) - creates and modifies text styles through the Drawing Explorer. -Style (6.27.56) - creates and modifies text styles through the command bar. TxtExp (6.29.36) - explodes text into polylines. Properties (6.24.54) - modifies the properties of text. Find (6.14.8) - finds and replaces text.

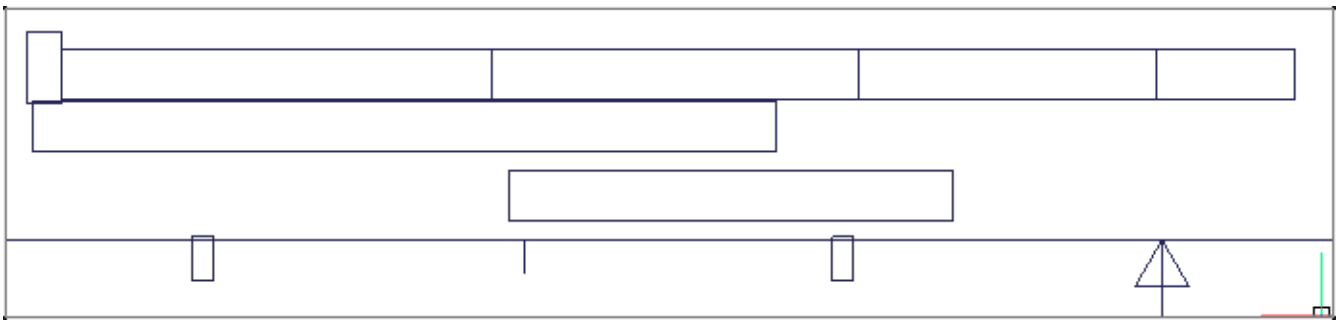

Figure 6.2058

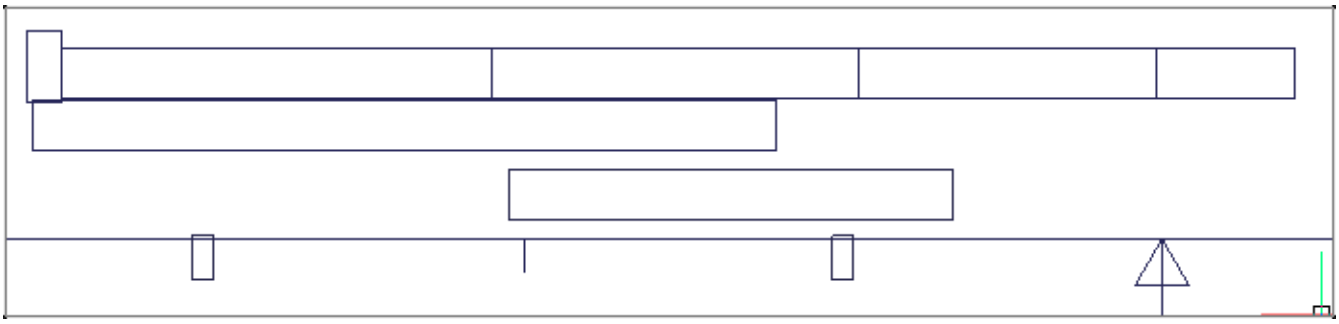

Figure 6.2059

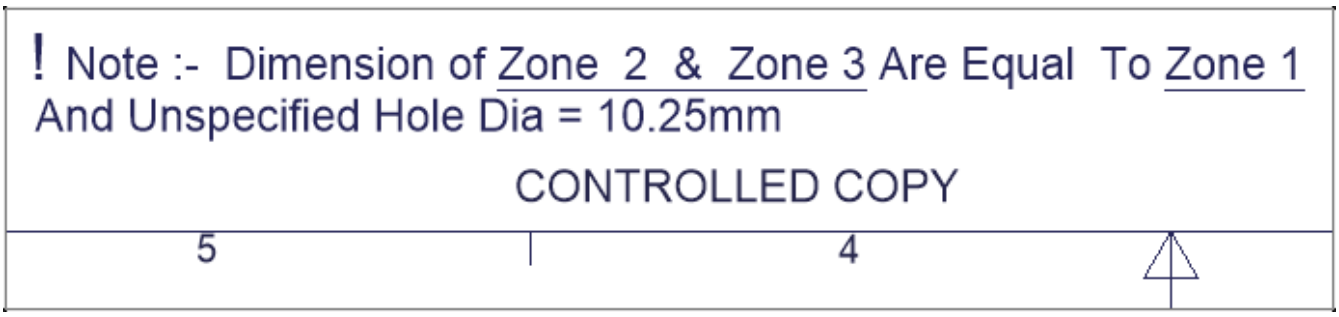

Figure 6.2060

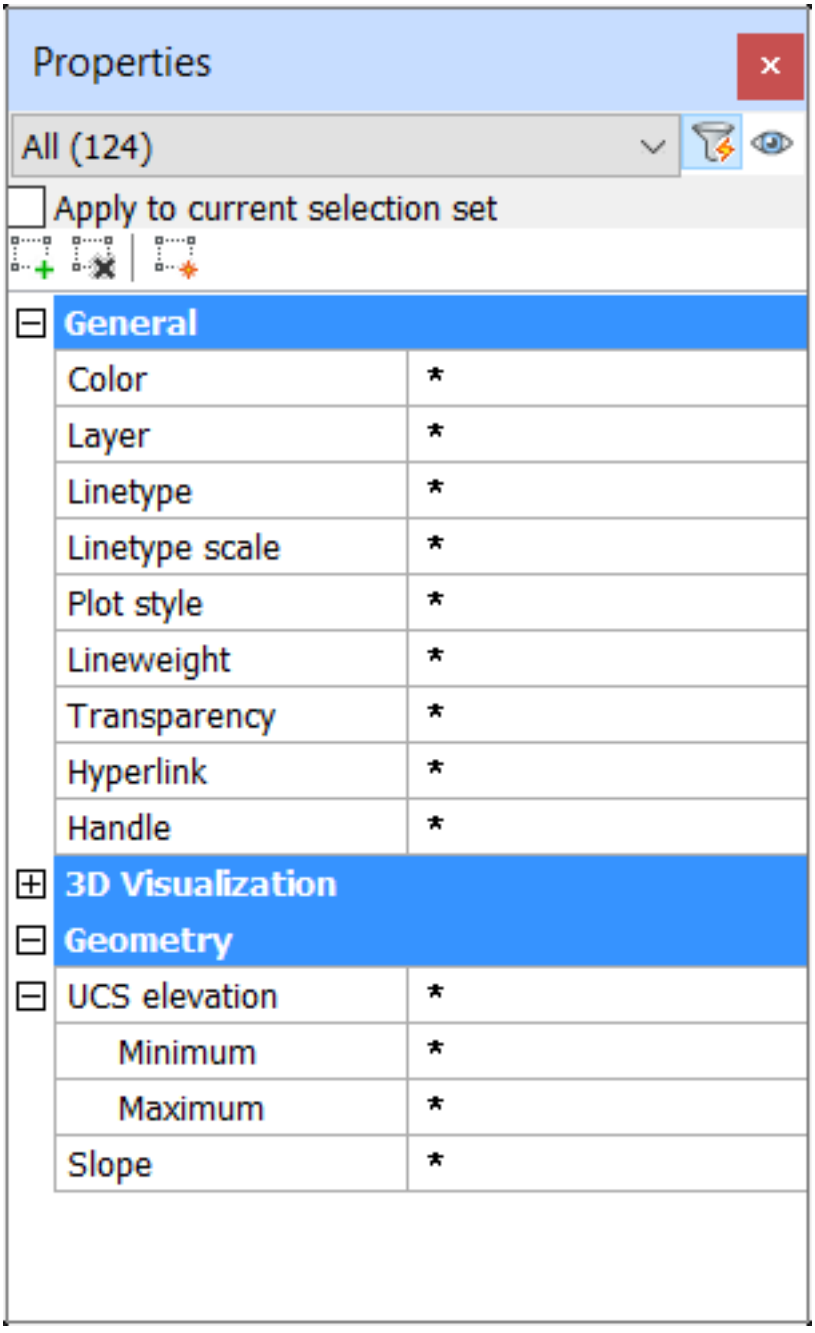
6.25.6 QSelect

(6.2981 on page 6079) Composes a selection set of entities based on their **properties**. **Note:** To create selection set of entities based on their **location** in the drawing, see the Select (6.27.16) command.

Accessing the Command

command bar: **qselect** properties panel: 
: **QSelect** Opens the Properties panel, switches to Quick Select mode, and then selects all entities in the drawing: (6.2061 on the following page) The panel does not open when the drawing contains no entities or all layers are frozen.

Figure 6.2061



Panel Options

Option	Description
Entities	Specifies the entities to be included in the selection set; click the droplist, then choose an entity type in the list: • **All** - includes all non-frozen entities in the drawing • **EntityName** - limits the selection set to specific entities • **(3)** - reports the number of entities of that type in the drawing.
Apply to Current Selection Set	Toggles whether the filter is continuously applied to the current selection set: • **On** - entities that match the properties are added to the current selection set • **Off** - entities are not added Applies the filter to the current selection set; the program highlights the selected entities in the drawing.
 Add to Current Selection Set	Adds the entities that match the filters to the current selection set.
 Remove from Current Selection Set	Removes the entities that match the filters from the current selection set.
 Add to New Selection Set	Creates a mew selection set from the the entities that match the filters, highlights the entities in the drawing, and then switches back to the Properties mode of the panel.
 Quick Select Mode	Toggles the Properties panel between properties and quick select mode; see the Properties (6.24.54) command
Property Preview	Toggles whether properties are previewed in real time: • **Yes** - properties of entities and settings change to show the property over which the cursor is hovering (it may take a second or two for the preview to appear) • **No** - properties are not previewed

Filter Options	Description
Entity Properties	The common properties of the entities in the drawing or in the current selection set are available. 1. Click the property field, such as Color, then do choose a value from the list, or type a value in the entry field. 2. Click * to choose an operator: (6.2062 on the next page) The properties listed in the panel vary depending on the entity types selected.

Procedures

- Creating a selection set (1.32.6).

Related Commands

dmSelect (6.12.28) - selects edges and faces of 3D solids or surfaces based on their geometric properties. Select (6.27.16) - selects one or more entities; can be accessed later with the Previous option. SelectSimilar (6.27.23) - selects all entities of the same type as the current selection, based on a set of matching properties, stored in the **SELECTSIMILARMODE** system variable DdSelect (6.10.19) - sets selection properties in the **Entity Selection** section of the **Settings** dialog box. SelGrips (6.27.22) - selects entities and displays grips.

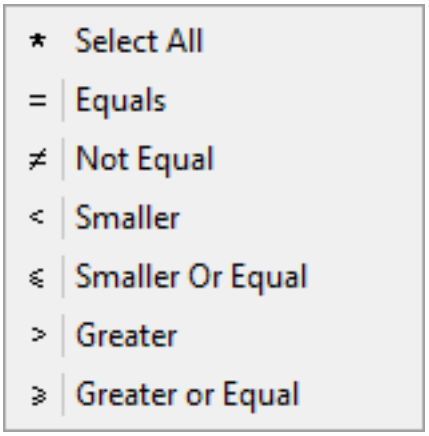

Figure 6.2063

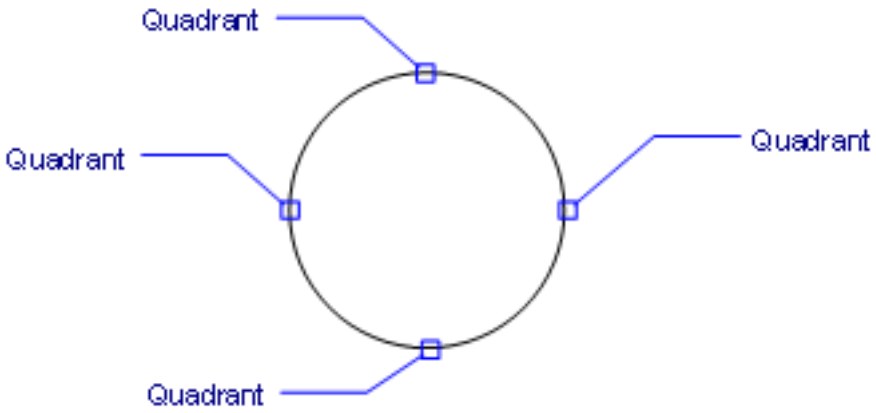
Figure 6.2064



6.25.7 Quadrant

(6.2981 on page 6079) Snaps to the quadrant points of circles, arcs, and polyarcs -- located at the 90-, 180-, 270-, and 0-degree points of the curve. (6.2064)

Accessing the Command

command bar: **quadrant** transparent: **qua** ribbon: **Home | Entity Snaps | Snap to Quadrant** toolbar: **Entity Snaps |** : **Quadrant** Displays no prompts in the command bar. The quadrant points are located at the 90-degree points of circular entities. When quadrant snap is on, the cursor snaps to the 90-degree points of circles, arcs, and polyarcs.

Command Options

Option	Description
Quadrant	Entering this command toggles Quadrant entity snap. It snaps to the 90-degree quadrant points on curved entities. This command can be entered transparently during commands, but must be entered without the apostrophe prefix (').

Related Commands

OSnap (6.23.16) - toggles entity snap modes in the Settings dialog box. -OSnap (6.23.13) - toggles entity snap modes in the command bar. Aperture (6.4.14) - sizes the aperture cursor for entity snaps. 2dIntersection (6.2.1) - toggles apparent intersection snap mode. 3dIntersection (6.3.7) - toggles intersection snap mode. Apparent (6.4.16) - toggles apparent intersection snap mode. Center (6.9.3) - toggles center snap mode. Endpoint (6.13.7) - toggles endpoint snap mode. Extension (6.13.22) - toggles extension snap mode. From (6.14.13) - allows to enter relative coordinates with respect to a reference point. GCenter (6.15.5) - toggles Geometric Center (GCenter) entity snap. Insertion (6.17.18) - toggles insertion snap mode. Intersection (6.17.19) - toggles intersection snap mode. Midpoint (6.21.16) - toggles midpoint snap mode. Mtp (6.21.35) - allows to specify a point as the midpoint between two points. Nearest (6.22.2) - toggles nearest snap mode. Node (6.22.7) - toggles node (point) snap mode. None (6.22.8) - turns off all entity snap modes. Parallel (6.24.5) - toggles parallel snap mode. Perpendicular (6.24.25) - toggles perpendicular snap mode. Tangent (6.29.10) - toggles tangent snap mode.

Figure 6.2065

6.25.8 Quit

(7.3 on page 6132) Closes all open drawings and exits BricsCAD; offers the opportunity to save unsaved drawings.

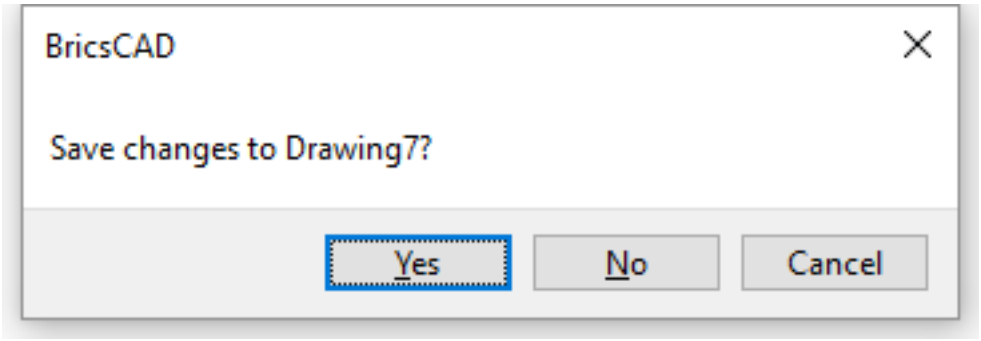
Accessing the Command

command bar: **quit** shortcuts: **Ctrl+Q Alt+F4** alias: **exit** menu bar: **File | Exit**
: **Quit**

- When no drawings need to be saved, this command exits without displaying a dialog box or prompts in the command bar.
- If drawings are unsaved, displays this dialog box for each drawing that needs to be saved to disc:

(6.2066)

Figure 6.2066



Command Options

Option	Description
Yes	Saves the drawing, and then exits BricsCAD.
No	Does not save the drawing, and then exits BricsCAD.
Cancel	Cancels the command; BricsCAD does not exit.

Related Commands

Open (6.23.8) - opens drawing files. Close (6.9.18) - closes the current drawing. WClose (6.33.7) - closes the current window.

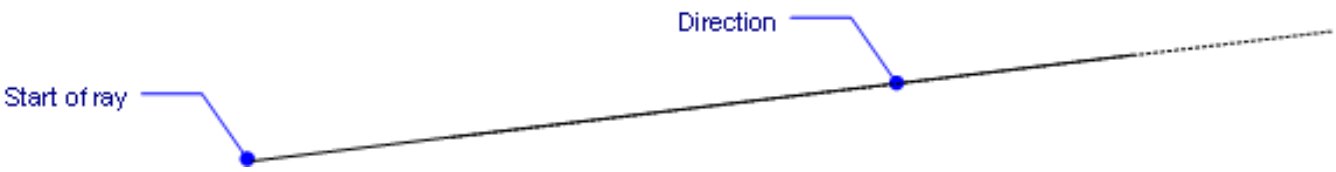
6.26 R

6.26.1 Ray

(6.2981 on page 6079) Draws rays, semi-infinite lines with start point at one end and then continue to beyond infinity at the other. (6.2068 on the next page)

Figure 6.2067

Figure 6.2068



Accessing the Command

 command bar: **ray** menu bar: **Draw | Ray** ribbon: **Draw | Draw | Line | Ray** toolbar: **Draw | Line |**  : **Ray Prompts you in the command bar.** Infinite ray: [Bisect/Horizontal/Vertical/Angle/Parallel] <Start of ray>: **(Pick a point, or else enter an option.)** Direction: **(Pick a point, or else enter x,y coordinates)** Direction: **(Pick another point, or else press Enter to exit command)** The program draws a ray from the starting point to "infinity." **Infinity** is defined as always appearing in the drawing, no mater how back back you zoom.

Command Options

Option	Description
Start of ray	Specifies the starting point of the ray: • Pick a point in the drawing • Enter x,y coordinates
Direction	Specify the direction of the ray from the starting point: • Pick a point in the drawing • Enter x,y coordinates • Press **Enter** to end the command The 'Direction' prompt repeats so that you can draw multiple rays from the same starting point; press **Enter** to exit the command.
Bisect	Draws a ray that bisects entities perpendicularly; prompts you: **Entity/<Vertex point>** - **(enter an option)**: **Entity** - draws rays perpendicular to the midpoints of lines and polyline segments, and the center point of arcs, polyarcs, and splined polylines; prompts you: 1. **Select line,arc, or polyline segment to bisect** - **(select a line, an arc, a polyline segment, or a polyarc.)** Line and polyline segments receive rays perpendicular to the segment's midpoint: (6.2940 on page 6046) Arcs and polyarcs receive rays drawn perpendicular to the arc's center point and through its midpoint: (6.2941 on page 6047) 2. **Select side for ray bisection** - **(choose the side on which the ray should emerge.)** 3. **Select line,arc, or polyline segment to bisect** - **(the command repeats its prompts so that you can draw rays on other entities, or else press Enter to exit the command.)** This option works with splined polylines, but not with spline entities.

Vertex point	Draws rays that bisect two points. The vertex is at the initial 'Set vertex point' prompt, and then you are prompted to pick two more points, which the ray will bisect: 1. **Set vertex point or [Entity]** - **(pick a point to start the ray.)** 2. **Bisection angle start point** - **(specify one part of the bisection angle.)** 3. **Bisection angle end point** - **(specify the other part of the bisection angle.)** 4. **Bisection angle end point** - **(specify another bisection, or else press Enter to end the command.)**
Horizontal	(6.2942 on page 6047) Draws rays horizontal to the current UCS; prompts you: 1. **Location** - **(pick the starting point of the ray, or enter x,y coordinates.)** 2. **Location** - **(the prompt repeats so that you can draw more horizontal rays with different starting points; press Enter to exit the command.)**
Vertical	Draws rays vertical to the current UCS; prompts you: 1. **Location** - **(pick the starting point of the ray, or enter x,y coordinates.)** 2. **Location** - **(the prompt repeats so that you can draw more vertical rays with different starting points; press Enter to exit the command.)**

Angle	Draws one or more rays at a specified angle; prompts you: (6.2073 on page 5260) 1. **Reference/<Enter angle (0)>** - **(enter an angle.)** 2. **Location** - **(pick the starting point of the ray, or enter x,y coordinates.)** 3. **Location** - **(the prompt repeats so that you can draw more angled rays with different starting points; press Enter to exit the command.)** **Reference** - draws one or more rays at an angle relative to another entity; prompts you: (6.2074 on page 5261) 1. **Select reference entity** - **(choose an entity, such as a line or another ray, to provide the reference ("base") angle.)** 2. **Enter angle** - **(specify the angle, will will be measured relative to the entity = angle of the reference entity + angle.)** 3. **Location** - **(specify the angle's start point; need not coincide with the entity's end points.)** 4. **Location** - **(the prompt repeats so that you can draw more angled rays with different starting points; press Enter to exit the command.)**

Parallel	Draws rays parallel to lines and polyline segments only; prompts you: (6.2075 on page 5261) **Set offset distance for parallel infinite line or [Through point] <Through> - (enter an option)**: 1. **Offset distance for parallel infinite line** - specifies the offset distance; enter a value or pick two points; prompts you: 2. **Select entity for parallel infinite line - (choose the entity to offset with a ray.)** 3. **Side for parallel infinite line - (specify the side on which to place the ray; the ray's start point is parallel to the line's start point.)** 4. **Select entity for parallel infinite line - (the prompts repeat themselves for drawing more rays at different offset distances; press Enter to exit.)** **Through point - (specify the point through which to draw the ray; this point also specifies the ray's start point.)** (6.2076 on page 5261) 1. **Select entity for parallel infinite line** - choose the entity to offset with a ray. 2. **Side for parallel infinite line** - specify the side on which to place the ray; the ray's start point is parallel to the line's start point. The two prompts repeat for drawing multiple rays at different offset distances; press **Enter** to exit.

Procedures

- Drawing rays (1.25.11)

Grips Editing

Rays can be edited directly through grips:

1. Select the ray. Notice that it has two grips.
2. Drag the grips to perform the following actions:

- Drag the endpoint grip to move the ray.
- Drag the other grip to rotate the ray.

(6.2069)

Figure 6.2069

Related Commands

XLine (6.34.6) - draws infinite lines. Properties (6.24.54) - modifies the properties of rays and xlines.

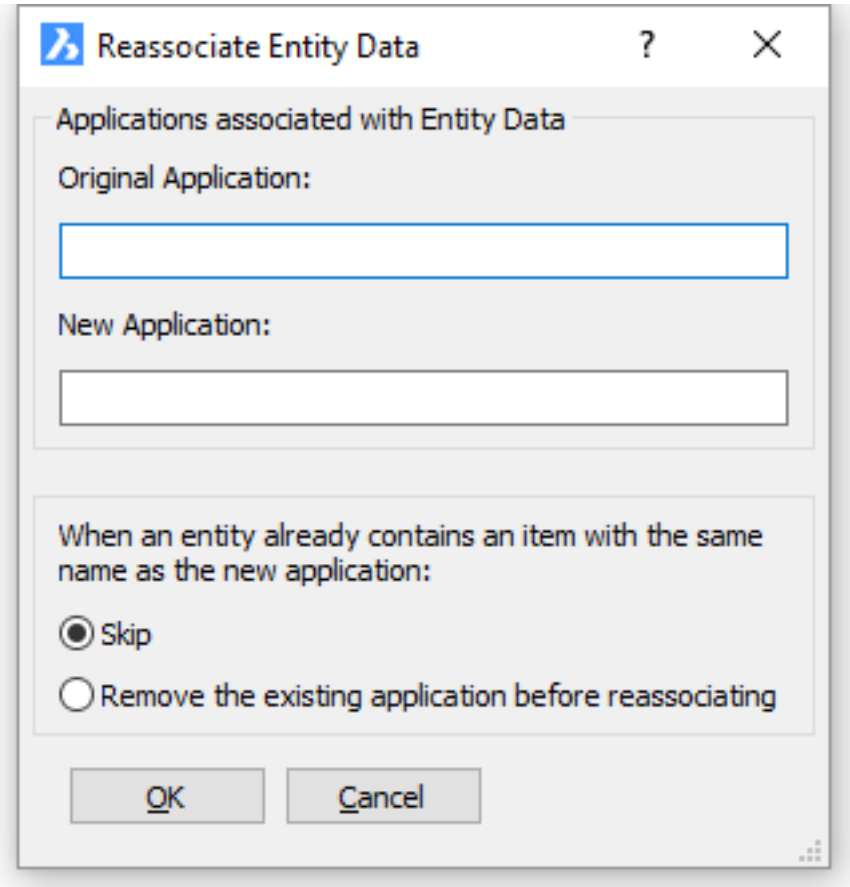
6.26.2 ReAssocApp

(6.2981 on page 6079) Associates extended entity data with a specific application (short for "re-associate application").

Accessing the Command

command bar: **reassocapp** menu bar: **Tools | Entity Data | Reassociate Entity Data** toolbar: **Entity Data |** : **ReAssocApp** Displays a dialog box: (6.2078 on the next page) Enter the names of original and new applications, and then click **OK**.

Figure 6.2078



Command Options

Option	Description
Original Application	Specifies the name of the original application.
New Application	Specifies the name of the new application. Entities will be reassociated with this application name.
Skip	Ignores the change.
Remove the existing application before reassociating	Replaces the application name.

Related Commands

CopyEData (6.9.37) - copies extended entity data to other entities. DelEData (6.10.28) - erases extended entity data from entities. EditEData (6.13.3) - creates and edits extended entity data. MoveEData (6.21.39) - moves extended entity data to other entities.

Figure 6.2079

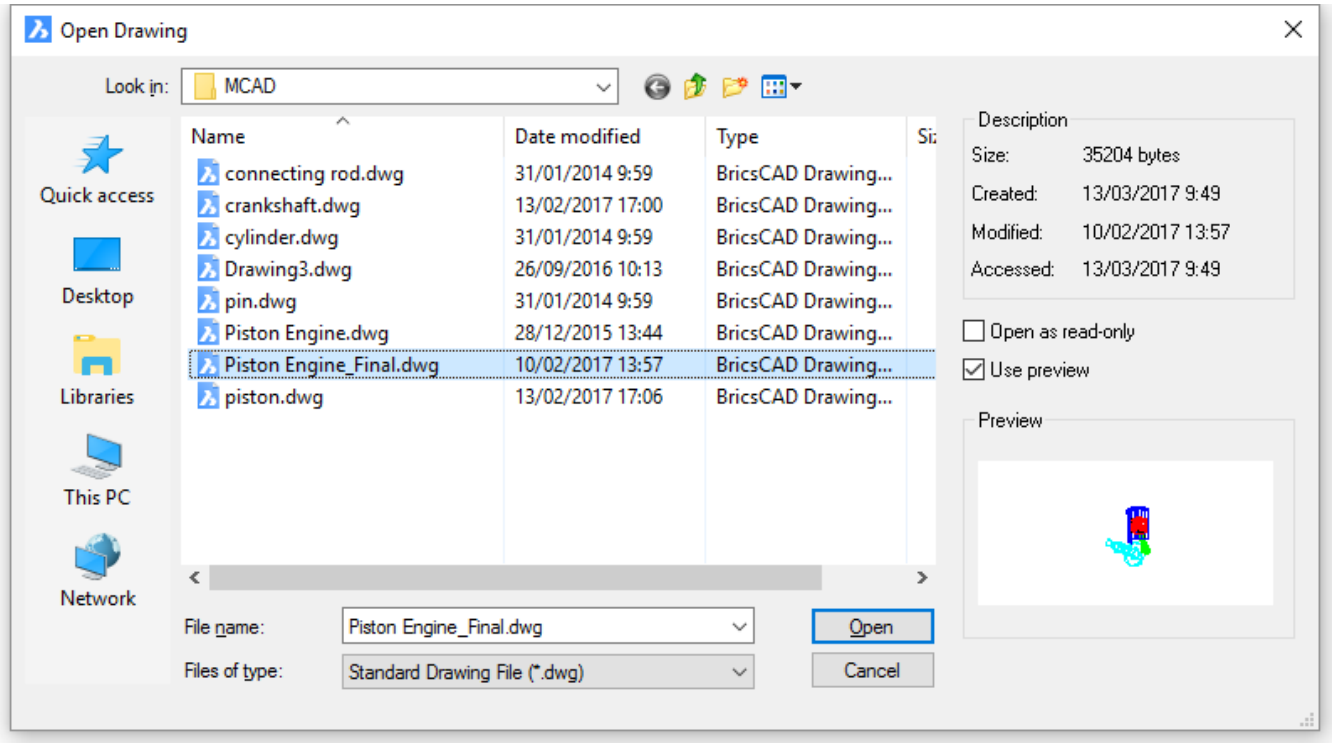
6.26.3 Recover

(7.3 on page 6132) Recovers data from a damaged DWG file.

Accessing the Command

 command bar: **recover** menu bar: **File | Recover** ribbon: **Home | File | Recover** : **Recover** Displays a dialog box: (6.2080 on the next page) Choose a file, and then click **Open**. When the drawing file contains damaged data, the program reports the changes it made, automatically. For example Name: Dwg file Value: CRC does not match in Object (167); Name: AcDbPolygonMeshVertex(130); Value: Owner Id (0); Validation: Invalid; Replaced by: Set to AcDbPolygonMesh(F0). When the drawing file contains no errors, no report is given. When the recovery is complete, the drawing is displayed.

Figure 6.2080



Command Options

No options.

Procedures

- To analyze the integrity of the current drawing (1.19.8)
- To repair a drawing (1.19.8)

Related Commands

Audit (6.4.42) - checks drawings that are open. ProxyInfo (6.24.66) - displays a information about proxy entities, contained in the current drawing, in a dialog box. RecoverAll (6.26.4) - recovers a drawing with all nested XRef drawings, each drawing is saved with .BAK copy and .ADT report.

Figure 6.2081

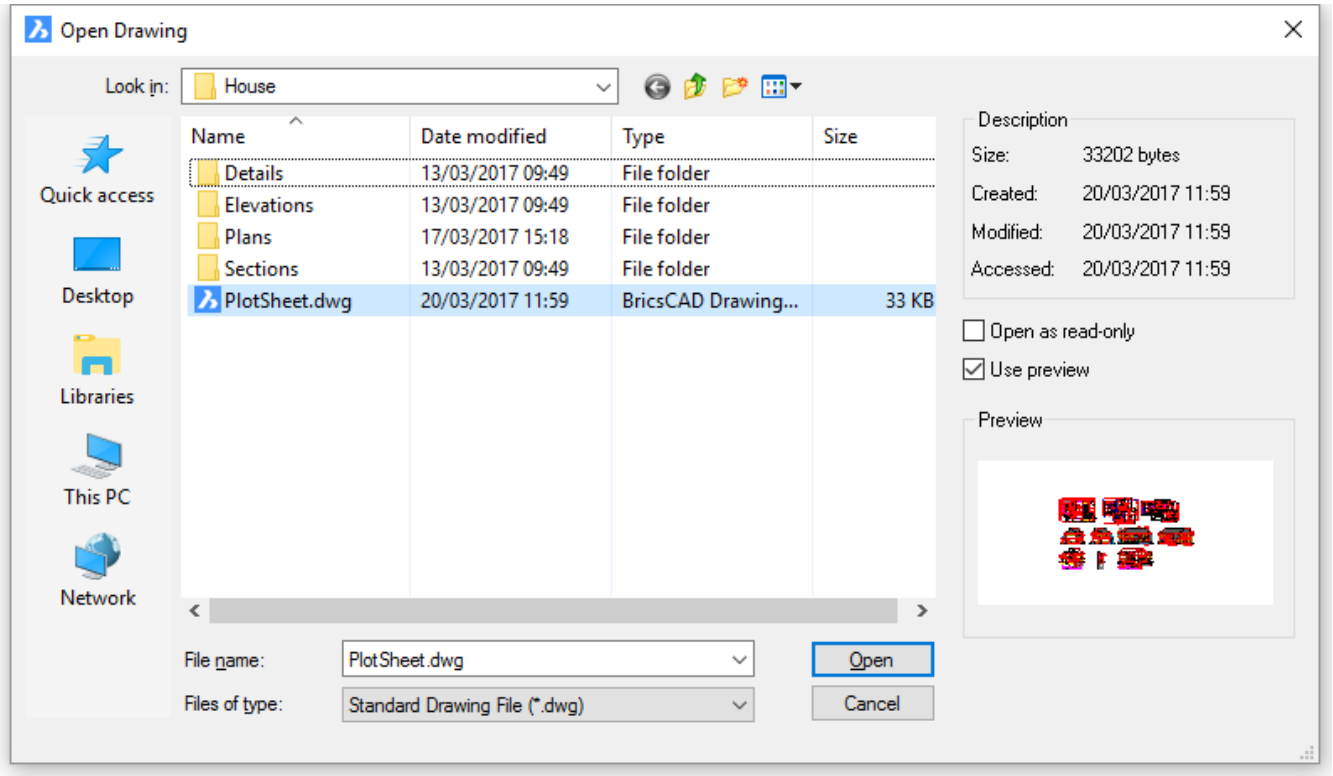
6.26.4 RecoverAll

(7.3 on page 6132) Recovers a drawing file, along with all nested xref'ed drawings; each drawing is saved with .BAK copy and .ADT report.

Accessing the Command

command bar: **recoverall** : **RecoverAll** Displays a File dialog box: (6.2082 on the next page) Select the drawing, the click the **Open** button. The selected drawing file and all attached xrefs, including all nested xrefs, are opened, repaired, saved and closed. The report of the audit report of the repair is saved to a *.adt file.

Figure 6.2082



Command Options

No command options.

Related Commands

6.26.5 RecScript

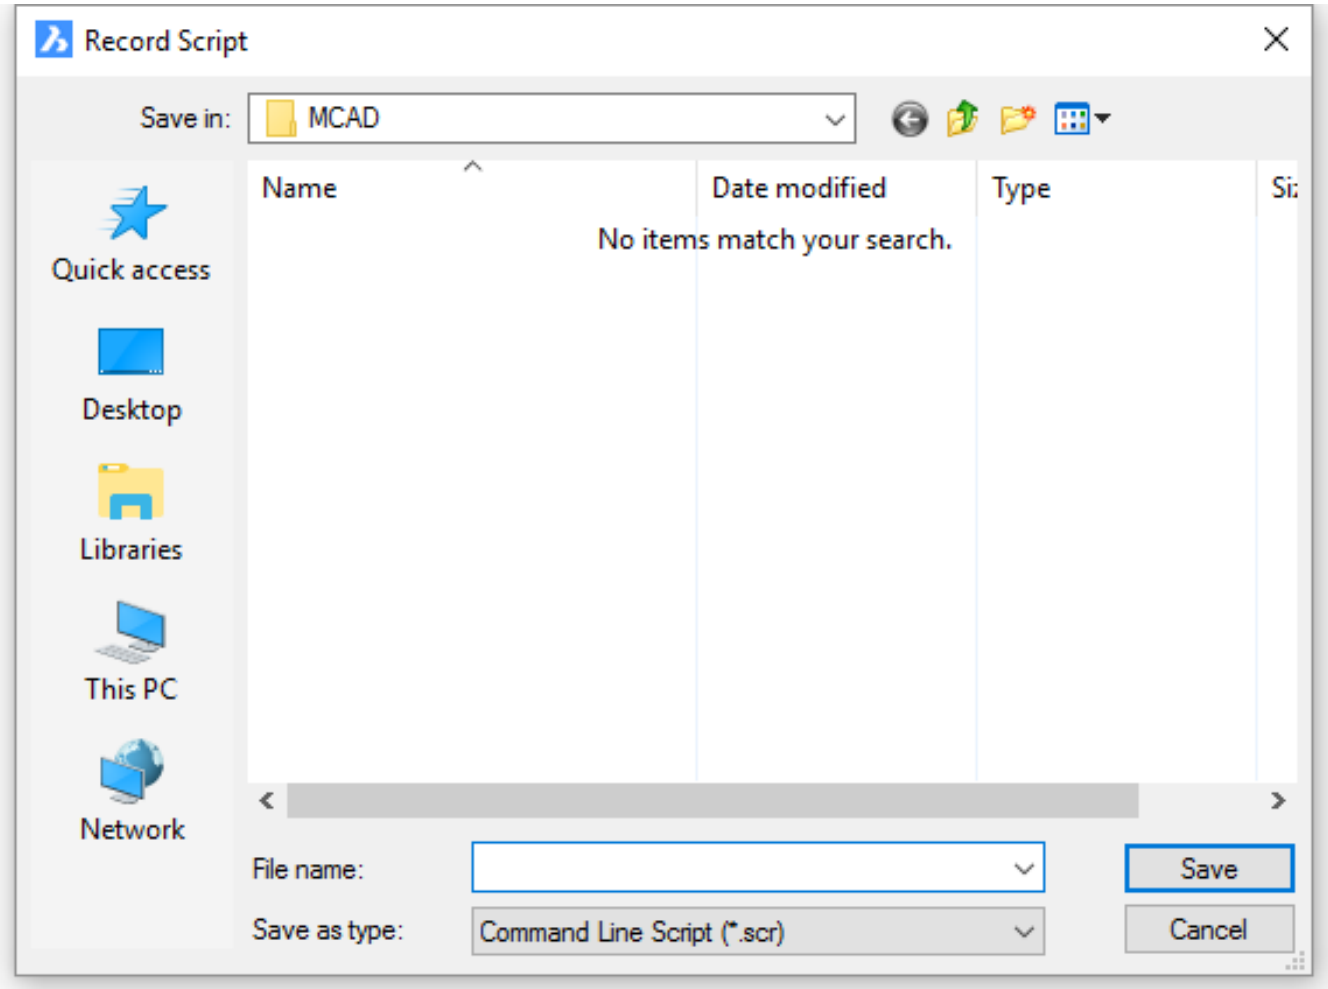
(6.2981 on page 6079) Records keystrokes to an SCR file for playback with the Script (6.27.9) command (short for "record script").

Accessing the Command

command bar: **recscript** menu bar: **Tools | Record Script** ribbon: **Tools | Action Recorder | Record Script** toolbar: **Tools |** : **RecScript** Displays a dialog box: (6.2084 on the next page)

1. Specify a file name, and then click **Save**.
2. Enter drawing and editing commands, and pick points in the drawing.
3. When done, enter the StopScript (6.27.62) command.
4. To playback scripts, use the Script (6.27.9) command.

Figure 6.2084



Command Options

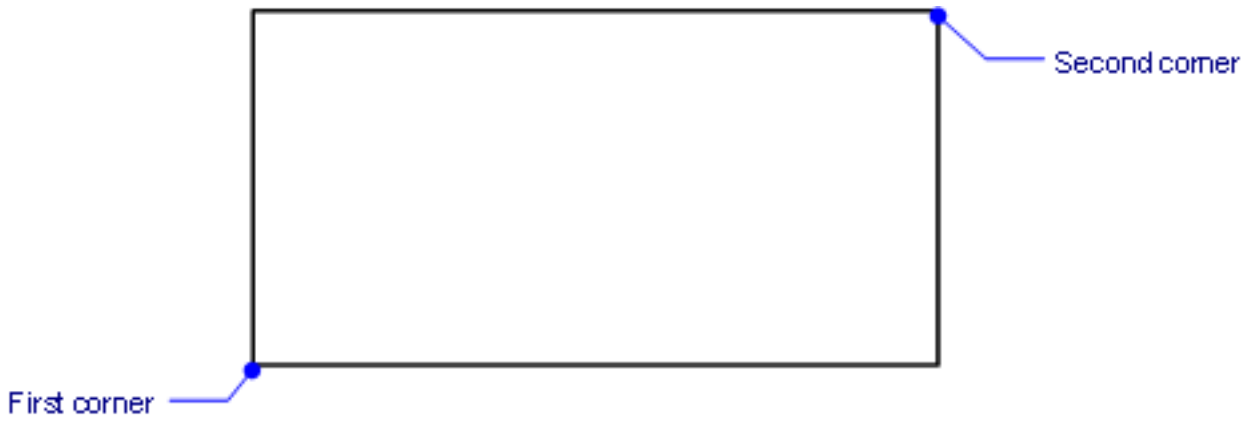
Option	Description
File name	Specifies the name of the SCR script file.

Related Commands

StopScript (6.27.62) - stops recording the script, and saves it to an SCR file. Script (6.27.9) - loads and runs a SCR script file. RScript (6.26.34) - reruns the script. Delay (6.10.29) - pauses the execution of the script for the specified number of milliseconds. Resume (6.26.26) - resumes a stopped script.

Figure 6.2085

Figure 6.2086



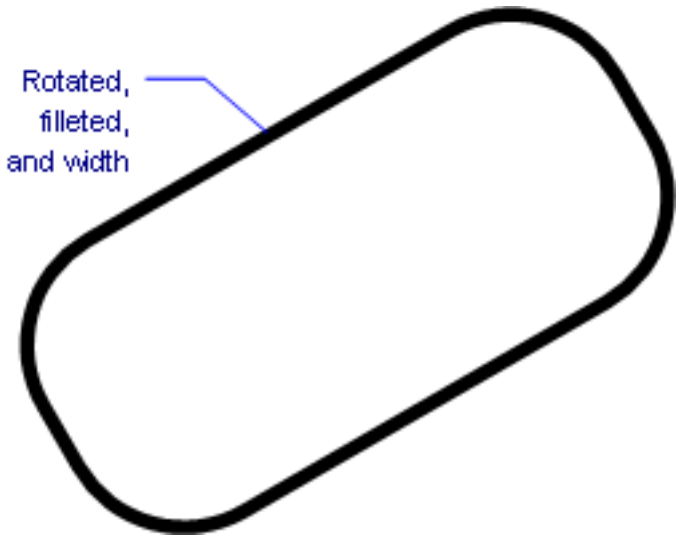
6.26.6 Rectang

(7.3 on page 6132) Draws rectangles and squares in a variety of styles from polylines (short for "rectangle"). (6.2086)

Accessing the Command

 command bar: **rectang** aliases: **rec rect rectangle** menu bar: **Draw | Rectangle** ribbon: **Draw | Draw | Polygons | Rectangle** toolbar: **Draw | Polygon |**  : **Rectang Prompts you in the command bar:** Select first corner of rectangle or [Chamfer/ Fillet/ Rotated/ Square/ Elevation/ Thickness/ Width of line/Area/Dimensions]: **(Pick a point, or enter an option)** Other corner of rectangle: **(Pick another point)** Rectangles are created as closed polylines, and so you can edit them later with the PEdit (6.24.24) command. During the Rectang command, you can combine options, such as creating a rotated rectangle with width and filleted corners: (6.2087)

Figure 6.2087



Command Options

Option	Description
Select first corner of rectangle	Specifies the first corner of the rectangle.
Other corner of rectangle	Specifies the opposite corner of the rectangle.
Chamfer	Applies a chamfer to all four corners of the rectangle; prompts you: (6.2091 on page 5275) 1. **First chamfer distance to use for all rectangles or [use Default setting] <0.00> - (specify a distance or press Enter for the default.)** 2. **Second chamfer distance to use for all rectangles <1.00> - (specify another distance or press Enter for the default.)** (6.2092 on page 5276) The same chamfer distances are applied to all four corners. You can specify chamfer distances only; you cannot specify a chamfer angle. You can edit the chamfers later with the Chamfer (6.9.9) command. This command does not use the ChamferA and ChamferB system variables. When a chamfer distance is different from 0, the prompt changes to: **First chamfer distance to use for rectangles or [turn chamfer Off/use Default setting] <1.00> - (press O to reset the distance to 0.)**
Fillet	Applies a the same fillet radius to all four corners; prompts you: (6.2093 on page 5276) **Fillet distance to use for all rectangles - (specify the fillet radius with a positive number.)** The same size of fillet is applied to all four corners. When the fillet radius is larger than the rectangle, an invisible rectangle is drawn. When fillet radius different from 0, prompts you: **Off/Default/Fillet distance to use for rectangles - (press O to reset the distance to 0.)**
Elevation	Specifies the elevation of the rectangle; prompts you: **Elevation to use for all rectangles - (specify the elevation as either a positive or negative number.)** The elevation is the height above or below the x,y-plane.
Rotated	Rotates the rectangle; delays the prompt until after the 'Other corner of rectangle' prompt: **Rotation angle for rectangle - (specify the rotation angle; pick a point or enter an angle.)** (6.2094 on page 5276) Positive angles are measured counter-clockwise from the positive x axis.
Square	Draws a square; delays the prompt until after the 'Select first corner of rectangle' prompt: (6.2095 on page 5277) **Second corner of square - (specify the opposite corner; pick a point, or enter x,y coordinates.)**
Thickness	Specifies the thickness of the rectangle; prompts you: (6.2096 on page 5277) **Rectangle thickness - (specify the thickness; enter 0 or a positive number.)** The thickness is the height of the rectangle in the z direction; it is measured upwards from the elevation. When thickness is different from 0, prompts you: **Rectangle thickness or [use Default] <2.00> - (press Enter to use the default thickness, or else enter a new one.)**

Width	Specifies the width of the rectangle's lines; prompts you: (6.2097 on page 5277) **Width to use for all rectangles - (enter 0 or a positive number.)** The width is applied equally to all four segments making up the rectangle. To give the rectangle tapered widths, edit the rectangle with the PEdit (6.24.24) command.
Area	Specifies the size of the rectangle by its area; prompts you: 1. **Enter Area of rectangle <current value> - (enter a non-zero value or press Enter to accept the current value.)** 2. **Calculate rectangle dimensions based on [Length/Width]<Length> - (enter L or W.)** 3. **Enter rectangle length <current value> - (enter a non-zero value for the length of the rectangle)**; the program calculates the width **Enter rectangle width <current value> - (enter a non-zero value for the width of the rectangle)**; the program calculates the length 4. **Select first corner of rectangle - (pick the position of one corner of the rectangle, or enter x,y coordinates.)** 5. **Other corner of rectangle - (as you move the cursor, the program ghosts the four possible locations of the rectangle, relative to the first corner point.)**
Dimensions	Specifies the length and width of the rectangle; prompts you: 1. **Length to use for rectangles <current value> - (enter a non-zero value, press Enter to accept the current value, or specify the length by clicking two points.)** 2. **Width to use for rectangles <current value> - (enter a non-zero value or press enter to accept the current value or specify the width of the rectangle by clicking two points.)** 3. **Select first corner of rectangle - (pick the position of one corner of the rectangle, or enter x,y coordinates.)** 4. **Other corner of rectangle - (as you move the cursor, the program ghosts the four possible locations of the rectangle, relative to the first corner point.)**

Grips Editing

Rectangles can be edited directly through grips: (6.2088 on the following page) Select the rectangle. Notice that it has a square grip at each vertex (1) and a triangular grip at the midpoint of each side (2)*. * If GRIPS = 1, midpoint grips do not display. Press and hold the Shift key to select multiple vertices. If **Dynamic Dimensions** (DYN) and **Polar Tracking** (POLAR) are active you can enter the distance(s) in the dynamic entry fields.

1. Drag a vertex grip (1) to stretch the a vertex. (6.2089 on the next page)

Figure 6.2088

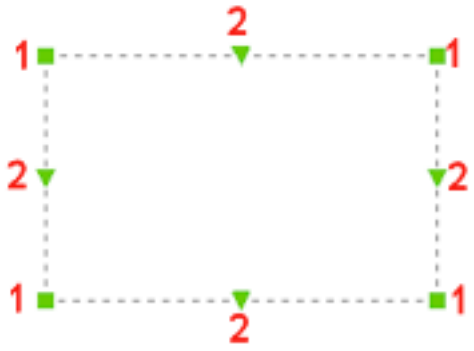


Figure 6.2089

6.26.7 Redefine

(6.2981 on page 6079) Activates commands that were deactivated with the Undefine (6.30.4) command. **Note:** You can temporarily reactivate a command by prefixing its name with a period, such as .line.

Accessing the Command

command bar: **redefine** : **Redefine Prompts you in the command bar:** Command to redefine: **(Enter name of an undefined command)**

Command Options

Option	Description
Command to redefine	Specifies the name of the command to redefine.

Related Commands

Commands (6.9.23) - lists the names of commands. Customize (6.9.47) - creates new commands through macros and LISP routines. Undefine (6.30.4) - removes commands from BricsCAD, temporarily.

Figure 6.2099

6.26.8 Redo

(7.3 on page 6132) Reverses the action of the last U (6.30.3) or Undo (6.30.5) command.

Accessing the Command

command bar: **redo** transparent: **'redo** shortcut: **Ctrl+Y** menu bar: **Edit | Redo** ribbon: **Home | Edit | Redo** toolbar: **Standard | ===NO VALID URL FOR IMAGE=== br>help/en_US/V18/CmdRef/source/ART/01_01_Redo_Button.png** : **Redo Reports in the command bar:** Redo: **(commandName)** This command works only when the U (6.30.3) or Undo (6.30.5) commands were used at least once in the current editing session. When the U or Undo commands have not been used since the drawing was opened, BricsCAD responds: There is nothing to redo.

Command Options

No options.

Related Commands

U (6.30.3) - undoes the last command. Undo (6.30.5) - undoes one or more commands. Oops (6.23.7) - unerases the last erased object, including newly created blocks. Zoom (6.35.7) - utilizes the Previous option to show the previous view.

Figure 6.2100

6.26.9 Redraw

(7.3 on page 6132) Redraws the current viewport to clean it up from drawing detritus, such as blip or drag marks.

Accessing the Command

 command bar: **redraw** transparent: **'redraw** alias: **r** menu bar: **View | Redraw** ribbon: **View | View | Redraw** toolbar: **View | Redraw/Regen |**  : **Redraw Displays no prompt in the command bar.** This command redraws the current viewport; use the RedrawAll (6.26.10) command to redraw all viewports.

Command Options

No options.

Related Commands

Regen (6.26.23) - regenerates the current viewport. RegenAll (6.26.24) - regenerates all viewports. RedrawAll (6.26.10) - redraws all viewports to clean them up.

Figure 6.2101

6.26.10 RedrawAll

(7.3 on page 6132) Redraws all viewports to clean up drawing detritus, such as blip and drag marks.

Accessing the Command

command bar: **redrawall** transparent: **'redrawall** alias: **ra** ribbon: **View | View | Redraw | Redraw All** toolbar: **View | Redraw/Regen |**  : **RedrawAll** Displays no prompt in the command bar. This command redraws all viewports; use the Redraw (6.26.9) command to redraw the current viewport.

Command Options

No options.

Related Commands

Regen (6.26.23) - regenerates the current viewport. RegenAll (6.26.24) - regenerates all viewports. Redraw (6.26.9) - redraws the current viewport to clean it up.

Command Options

No Options

Related Commands

Render (6.26.21) - generates a photorealistic rendering using materials and lights through a dialog box. ShadeMode (6.27.31) - sets the shading style for 3D entities.

Figure 6.2104

6.26.12 RefClose

(6.2981 on page 6079) Closes the reference drawing editor, used to edit externally-referenced files in the current drawing session. **Note:** This command can be used only after the RedEdit (6.26.13) command has commenced.

Accessing the Command

 **or**  command bar: **refclose** menu: **Tools | External Reference Editing | Reclose and Save Tools | External Reference Editing | Refclose and Discard** ribbon: **Insert | External References | Refclose and Save** toolbar: **Ref Edit |**  or  : **RefClose Prompts you in the command bar:** Enter option [Save/Discard reference changes] <Save>: (Type S or D.) When you use this command on its own, BricsCAD complains: ** Command not allowed unless a reference is checked out with REFEDIT command **

Command Options

Option	Description
 Save	Saves the changes back to the block reference.
 Discard	Does not save the changes; the block is unchanged.

Figure 6.2105

6.26.13 RefEdit

(6.2981 on page 6079) Edits block references and externally-referenced drawings through a dialog box (short for "reference editor").

Accessing the Command

command bar: **refedit** transparent: **'refedit** menu: **Tools | External Reference Editing | Refedit** ribbon: **Insert | External References | Refedit** toolbar: **Ref Edit |**  : **RefEdit Prompts you in the command bar:** Select reference: **(Choose a block or an xref)** Displays a dialog box: (6.2106 on the next page) Choose options, and then click **OK**. **Prompts you in the command bar:** Use REFCLOSE or the Refedit toolbar to end reference editing session. Make changes to the reference, and then use the RefClose (6.26.12) command to save the changes. The XFADECTL (1.17.10) system variable sets the fading the rest of the drawing when editing an external reference or block. Values between 0 (no fading) and 90 are accepted. If the XEDIT system variable of the selected external reference is 0 or OFF a dialog box displays: (6.2107 on the following page)

Figure 6.2106

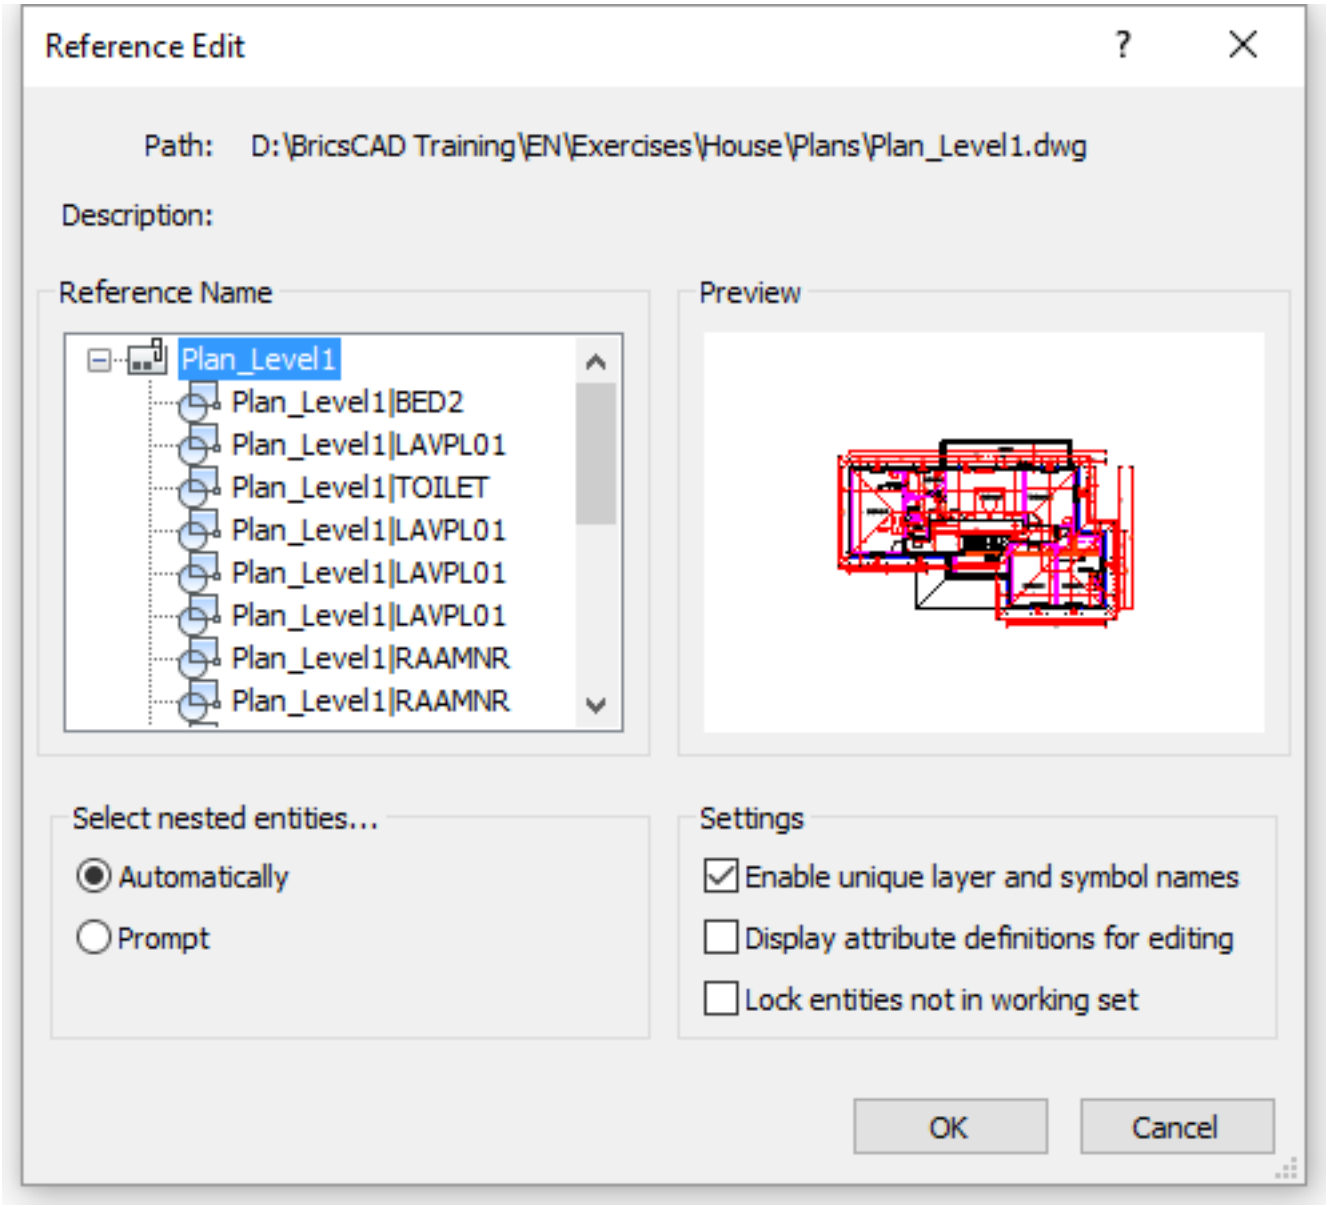

Figure 6.2107

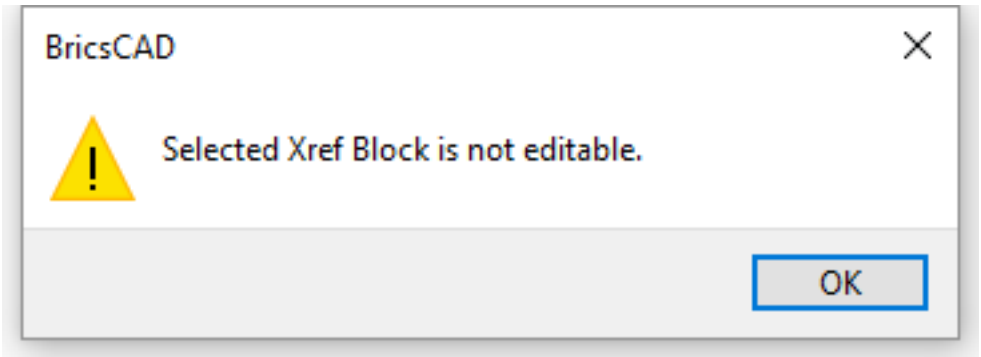

Command Line Options

Option	Description
Select reference	Chooses the reference to edit. Pick a single block or externally-referenced drawing. Only one reference can be edited at a time.

Dialog Box Options

This dialog box appears automatically after you select a block or xref for editing:

Option	Description
Reference Name	Lists the name of the block and nested blocks, if any.
Select nested entities	Determines how nested blocks/xrefs are handled: • **Automatically** - nested entities are included automatically • **Prompt** - nested entities are selected manually after you click **OK** to close this dialog box; prompts you: 1. **Select nested objects** - **(select one or more nested entities.)** 2. **Select nested objects** - **(select more nested entities, or else press Enter to continue.)**
Settings	Determines how entities are treated during editing: **Enable unique layer and symbol names** - toggles the use of 0 in layer and other names: • **Yes** - prefixes names with **filename0** • **No** - does not prefix names **Display attribute definitions for editing** - toggles the inclusion of attributes: • **Yes** - attribute definitions can be edited; attribute values are invisible • **No** - attributes are unavailable for editing Modified attribute definitions do not affect existing insertions; they come into effect with insertions made from now on. **Lock objects not in working set** - toggles locking of entities not being edited: • **Yes** - locks entities outside the reference being edited • **No** - does not lock other entities Locked entities are seen but cannot be edited.

Procedures

- Editing blocks and external references (1.30.21)

Related Commands

Bedit (6.6.7) - Edits the blocks' entities in a temporary drawing session, using the local coordinate system of the block. -RefEdit (6.26.14) - edits references in-place through the command bar Refclose (6.26.12) - closes the reference editor Refset (6.26.16) - adds and removes entities from the reference being edited XOpen (6.34.5) - opens an externally-referenced drawing (Xref) for editing in a separate window AttDef (6.4.31) - defines attributes through a dialog box. -AttDef (6.4.32) - defines attributes through the command bar. AttDisp (6.4.33) - toggles the display of attribute text. AttRedef (6.4.36) - redefines a block and updates associated attributes. AttSync (6.4.37) - synchronizes attribute definitions in all block references of a specified block definition. BattMan (6.6.1) - manages the attributes of a block definition. DdAtte (6.10.14) - edits the values of attributes through a dialog box. Block (6.6.11) and -Block (6.6.12) - create blocks from attribute definitions and entities. EAttEdit (6.13.1) - edits attribute values and most properties. Explode (6.13.16) - reduces blocks to constituent entities and attributes to tags. Insert (6.17.13) - inserts blocks and prompts for attribute values through a dialog box. -Insert (6.17.14) - insert blocks and prompts for attribute values through the command bar. Properties (6.24.54) - edits block and attribute values and properties.

Figure 6.2108

6.26.14 -RefEdit

(6.2981 on page 6079) Edits block references and externally-referenced drawings, prompting for options in the command bar (short for "reference editor").

Accessing the Command

command bar: **-refedit** : **-RefEdit Prompts you in the command bar:** Select reference: **(Pick a block or an externally-reference drawing)** Select nesting level [Ok/Next] <Next>: **(Press O or N)** Enter entity selection method [All/Nested] <All>: **(Press A or N)** Display attribute definitions [Yes/No] <No>: **(Press Y or N)** Use REFCLOSE or the Refedit toolbar to end reference editing session. The XFADECTL (1.17.10) system variable sets the fading the rest of the drawing when editing an external reference or block. Values between 0 (no fading) and 90 are accepted.

Command Options

Option	Description
Select reference	Chooses the reference to edit. Pick a single block or externally-referenced drawing. Only one reference can be edited at a time.
Select nesting level	Choose the nested reference to edit: • **Ok** - edits the entire block. • **Next** - the program highlights the next nested level within the reference; the command repeats the 'Select nesting level' prompt until you press **O**.
Enter entity selection method	Determines how nested entities are selected: • **All** - selects all nested entities automatically • **Nested** - prompts you to selects nested entities: 1. **Select nested objects - (select one or more nested entities.)** 2. **Select nested objects - (select more nested entities, or press Enter to continue.)**
Display attribute definitions	Toggles the inclusion of attributes: • **Yes** - attribute definitions can be edited; attribute values are invisible • **No** - attributes are unavailable for editing Modified attribute definitions do not affect existing insertions; they come into effect with insertions made from now on.

Related Commands

RefEdit (6.26.13) - edits references in-place through a dialog box. Refclose (6.26.12) - closes the reference editor Refset (6.26.16) - adds and removes entities from the reference being edited XOpen (6.34.5) - opens an externally-referenced drawing (Xref) for editing in a separate window AttDef (6.4.31) - defines attributes through a dialog box. -AttDef (6.4.32) - defines attributes through the command bar. AttDisp (6.4.33) - toggles the display of attribute text. AttRedef (6.4.36) - redefines a block and updates associated attributes. AttSync (6.4.37) - synchronizes attribute definitions in all block references of a specified block definition. BattMan (6.6.1) - manages the attributes of a block definition. DdAtte (6.10.14) - edits the values of attributes through a dialog box. Block (6.6.11) and -Block (6.6.12) - create blocks from attribute definitions and entities. EAttEdit (6.13.1) - edits attribute values and most properties. Explode (6.13.16) - reduces blocks to constituent entities and attributes to tags. Insert (6.17.13) - inserts blocks and prompts for attribute values through a dialog box. -Insert (6.17.14) - insert blocks and prompts for attribute values through the command bar. Properties (6.24.54) - edits block and attribute values and properties.

Figure 6.2109

6.26.15 ReferenceCurves

(6.2981 on page 6079) Creates reference geometry to automatically align a block during insertion.

Accessing the Command

command bar: **referencecurves**
: referencecurves You are prompted: Select reference curves [selection options (?)]: **(select the entities you want to use as a reference to align the inserted block)** Entities in set: 2 Select reference curves [selection options (?)]: **(select more entities or press Enter to conclude.)** 2 reference curve(s) created on REFERENCE_CURVES layer. 0 entities discarded from operation. When you select geometry to use for as a reference curve, BricsCAD creates a REFERENCE_CURVES layer (if it doesn't already exist) and moves the selected entities to that layer. With reference curves specified in a drawing or block definition, you can automatically align the block or drawing to relevant geometry when you insert it. The number of reference curves and the distance between them determines with which geometry it can align. As the cursor approaches relevant geometry, the block can automatically flip, offering multiple insertion options. Distances between the ends of the relevant geometry and block are displayed, enabling you to enter specific values if you wish. And, if the reference curves include gaps, relevant geometry is automatically trimmed to produce matching gaps. (6.2110 on the next page) You can also use reference curves to automatically align with corners. The following example includes 4 parallel reference curves and a single corner reference curve enabling the door block to align with geometry that matches the four parallel lines and single perpendicular line. (6.2111 on the following page)

Figure 6.2110

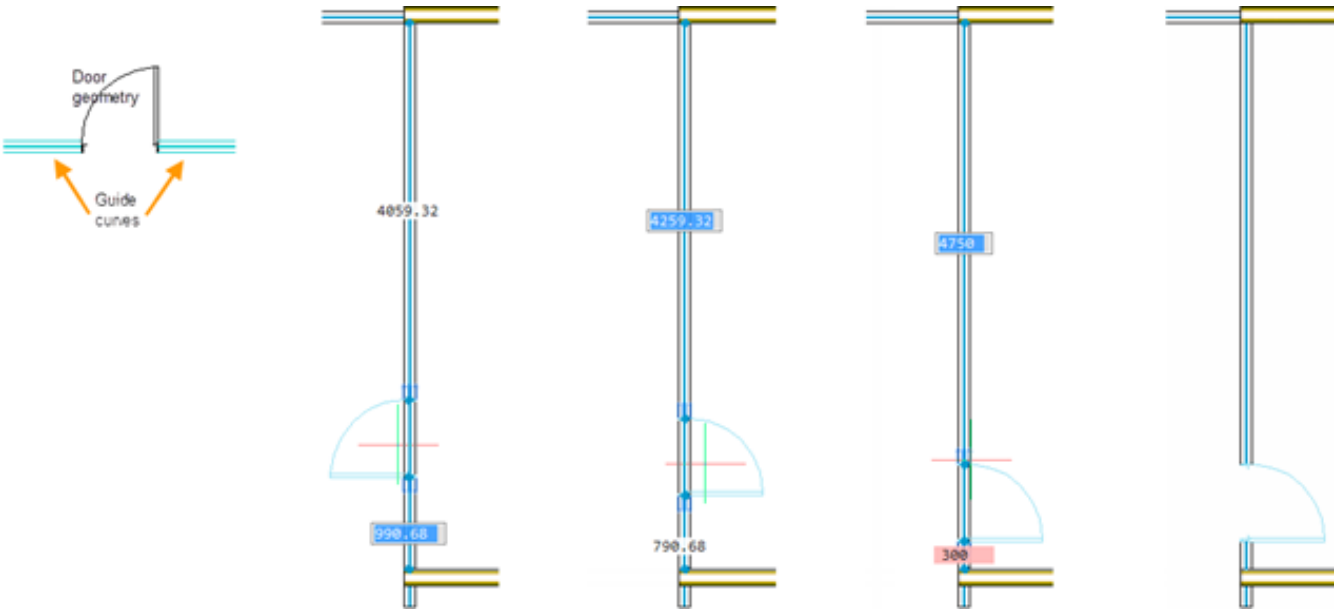

Figure 6.2111

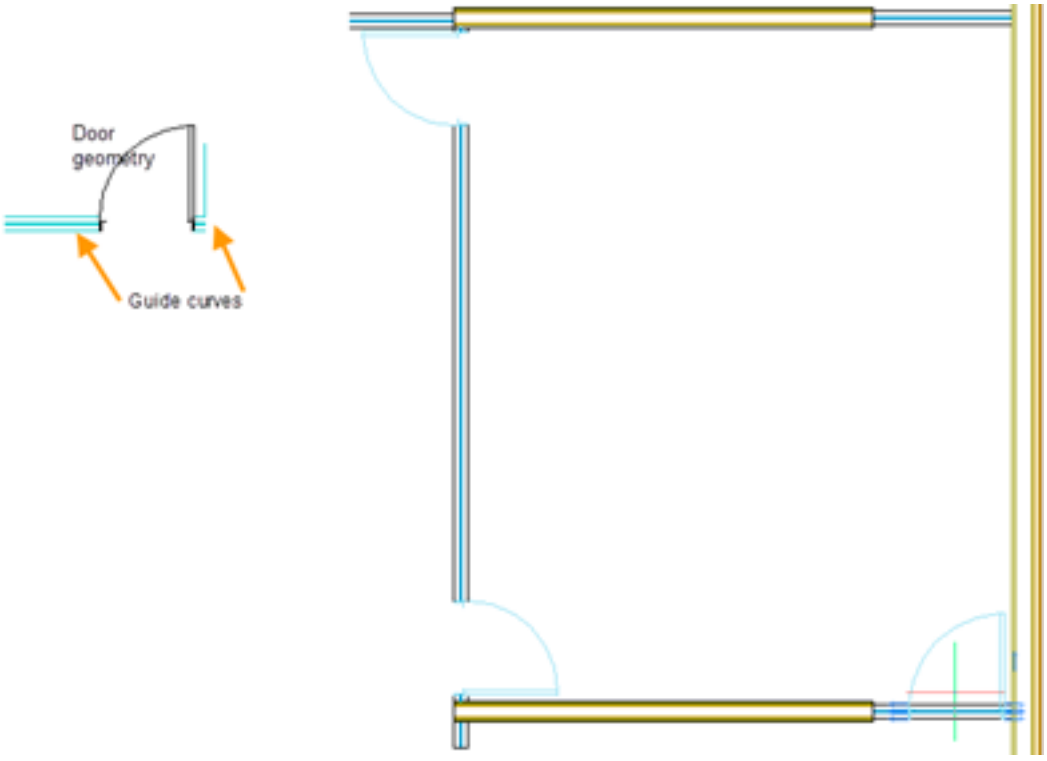


Command Options

No command options.

Related Commands

Block (6.6.11) - groups entities into a block (symbol), which can be reused in drawings. CopyGuided (6.9.50) - after selecting the entities, their relation to their reference curves will automatically guide you to inserting the copy in similar locations. MoveGuided (6.21.30) - after selecting the entities, their relation to their reference curves will automatically guide you to moving the entities in a similar location.

Figure 6.2112

6.26.16 RefSet

(6.2981 on page 6079) Adds and removes entities from the reference (block or xref) being edited **Note:** This command can be used only after the RedEdit (6.26.13) command has commenced.

Accessing the Command

 **or** command bar: **refset** menu: **Tools | External Reference Editing | Add to Refedit Tools | External Reference Editing | Remove from Refedit** ribbon: **Insert | External References | Add to Refedit** toolbar: **Ref Edit |**  **or** : **RefSet Prompts you in the command bar:** Transfer objects between the RefEdit working set and host drawing... Enter an option [Add/Remove] <Add>: **(Press A or R)** When you use this command on its own, BricsCAD complains: ** Command not allowed unless a reference is checked out with REFEDIT command **

Command Options

Option	Description
 Add	Adds entities from the drawing to the reference being edited.
 Remove	Removes entities from the reference being edited; removed entities are placed in the drawing. Entities not in the reference are shown in gray.

Figure 6.2113

6.26.17 RegenAuto

(7.3 on page 6132) Controls when BricsCAD regenerates the drawing automatically.

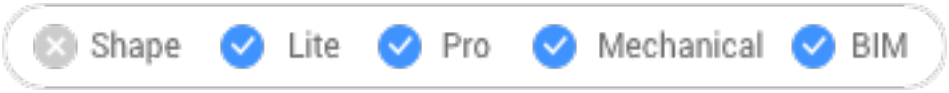
Accessing the Command

command bar: **regenauto** transparent: **'regenauto** : **RegenAuto Prompts you in the command bar:** REGENMODE is currently on: OFF/Toggle/<On>: **(Enter an option)**

Command Options

Option	Description
OFF	Automatic regeneration is turned off. If a regeneration is required, BricsCAD does not execute it; prompts you: **Regen queued.** The regeneration takes place when you enter the Regen (6.26.23) or RegenAll (6.26.24) commands. When the regeneration is required immediately, prompts you: **About to regen--okay? - (Answer yes or no.)**
Toggle	Toggles the state of the RegenMode system variable: • If on, turns it off. • If off, turns it on.
On	Turns on automatic regeneration. BricsCAD regenerates the drawing whenever it is required.

Figure 6.2114



6.26.18 Region

(6.2947 on page 6049) Creates regions from closed 2D entities. **Note:** Regions are ACIS objects, and can be used with solid editing commands, such as MassProp (6.21.2) and Subtract (6.27.58).

Accessing the Command

command bar: **region** alias: **reg** menu bar: **Draw | Region** ribbon: **Surface | Create | Region** toolbar: **Draw |**

: **Region Prompts you in the command bar:** Select entities: (Choose one or more closed entities.) Entities in set: 1 Select entities: (Choose more closed entities, or press Enter to continue.) 1 regions have been created. The source entities are erased if the DelObj variable is set to 2.

Command Options

Option	Description
Select entities	Specifies the entities to convert to regions. Choose one or more closed entities. Each entity is converted into a separate region. Closed entities include circles, closed polylines, and ellipses.

Related Commands

Extrude (6.13.25) - extrudes 2D entities into 3D solid models. Intersect (6.17.20) - removes areas not in common between two or more regions. MassProp (6.21.2) - reports the mass properties of 3D solid models and 2D regions. Revolve (6.26.45) - revolves 2D entities into 3D solid models. Section (6.27.11) - creates 2D regions from 3D models. Subtract (6.27.58) - removes one region from a second. Union (6.30.6) - joins two or more regions into a single entity.

6.26.19 -Rename

   Renames named entities in the command bar.

Accessing the Command

command bar: **-rename** alias: **-ren** : **-Rename Prompts you in the command bar:** Rename [Block/Dimension style/LAyer/LineType/text Style/Table style/ Ucs/ VIew/ ViewPort]: **(Enter an option)** To rename items such as mleader and view detail styles, use the Rename (6.26.20) command.

Command Options

Option	Description
Block	Renames blocks; prompts you: 1. **Block to be renamed** - **(enter the name of an existing block.)** 2. **New name for the Block name** - **(enter the new name.)** If you enter the name of an existing block, then the program prompts you: **A Block with that name already exists. New name for the Block name** - **(enter a different name.)** See the Block (6.6.11) command.
Dimension style	Renames dimension styles; prompts you: 1. **Dimension style to be renamed** - **(enter the name of an existing dimension style.)** 2. **New name for the Dimension style name** - **(enter the new name.)** If you enter the name of an existing dimension style, then the program prompts you: **A Dimension style with that name already exists. New name for the Dimension style name** - **(enter a different name.)** See DimStyle (6.11.19) command.
LAyer	Renames layers; prompts you: 1. **Layer to be renamed** - **(enter the name of an existing layer.)** 2. **New name for the Layer name** - **(enter the new name.)** If you enter the name of an existing layer, then the program prompts you: **A Layer with that name already exists. New name for the Layer name** - **(enter a different name.)** If you attempt to rename layer 0, then the program prompts you: **That name is reserved by BricsCAD, and cannot be renamed.** See Layer (6.13.17) command.

LineType

Renames linetypes; prompts you:

1. **Linetype to be renamed** - **(enter the name of an existing linetype.)**
2. **New name for the Linetype name** - **(enter the new name.)** If you enter the name of an existing linetype, then the program prompts you:

A Linetype with that name already exists. New name for the Linetype name - **(enter a different name.)** If you attempt to rename linetypes ByLayer, ByBlock, or Continuous, then the program prompts you: **That name is reserved by BricsCAD, and cannot be renamed.** See Linetype (6.20.32) command.

text Style

Renames text styles; prompts you:

1. **Text style to be renamed** - **(enter the name of an existing style.)**
2. **New name for the Text style name** - **(enter the new name.)** If you enter the name of an existing style, then the program prompts you:

A Text style with that name already exists. New name for the Text style name - **(enter a different name.)** See Style (6.27.55) command.

Tablestyle

Renames table styles; prompts you:

1. **Table style to be renamed** - **(enter the name of an existing style.)**
2. **New name for the Table style name** - **(enter the new name.)** If you enter the name of an existing style, then the program prompts you:

A Table style with that name already exists. New name for the Table style name - **(enter a different name.)**

Ucs

Renames user-defined coordinate systems; prompts you:

1. **UCS to be renamed** - **(enter the name of an existing UCS.)**
2. **New name for the UCS name** - **(enter the new name.)** If you enter the name of an existing UCS, then the program prompts you:

A UCS with that name already exists. New name for the UCS name - **(enter a different name.)** See UCS (6.30.1) command.

VIew

Renames views; prompts you:

1. **View to be renamed** - **(enter the name of an existing view.)**
2. **New name for the View name** - **(enter the new name.)** If you enter the name of an existing view, then the program prompts you:

A View with that name already exists. New name for the View name - **(enter a different name.)** See View (6.31.2) command.

VPort	Renames viewport configurations; prompts you: 1. **Viewport to be renamed - (enter the name of an existing viewport configuration.)** 2. **New name for the Viewport name - (enter the new name.)** If you enter the name of an existing viewport, then the program prompts you: **A Viewport with that name already exists. New name for the Viewport name - (enter a different name.)** See VPorts (6.31.26) command.

Related Command

Rename (6.26.20) - renames commands through the Drawing Explorer.

Figure 6.2115

6.26.20 Rename

(6.2981 on page 6079) Renames named entities through the Drawing Explorer.

Accessing the Command

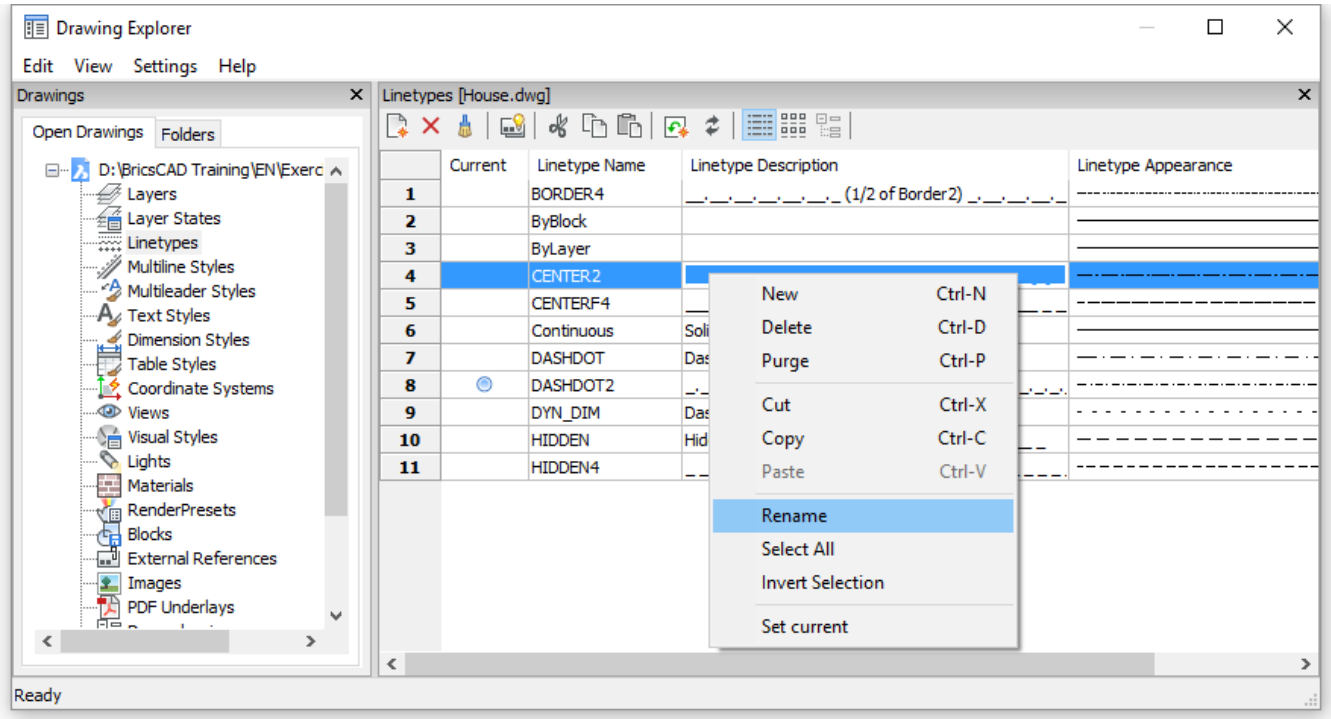
command bar: **rename** aliases: **ren ddrename** : **Rename** Displays the Drawing Explorer: (6.2116 on the next page)

1. Choose a section, such as Layers or Dimension Styles.
2. To rename an item, click twice on its name (do not double-click), then enter the new name. Alternatively, right-click the item, then choose Rename in the shortcut menu.

You can change the names of most layers, layer states, most linetypes, UCSs, views, blocks, most text styles, and most dimension styles. To change names at the command line, use the -Rename (6.26.19) command. You cannot change the names of attached files, such as images and external references, nor the following names:

- Layer "0"
- Linetype "ByBlock", "ByLayer", or "Continuous"
- Text style "Standard"
- Dimension style "Standard"
- Multiline style "Standard"
- Visual style "2DWireframe"
- Material "Global"
- Page layouts that have * as a prefix and suffix, such as *Model*
- View detail style "Metric50"
- View section style "Metric 50"

Figure 6.2116



Command Options

No options.

Related Command

-Rename (6.26.19) - renames commands through the command bar.

Figure 6.2117

6.26.21 Render

(6.2932 on page 6037) Generates a photo-realistic rendering using materials and lights, through a dialog box. **Note:** When a drawing contains only 2D entities, the result is a blank rendering.

Accessing the Command

 command bar: **render** alias: **rr** menu bar: **View|Rendering - Render** ribbon: **View | Render Modes | Render** toolbar: **Render|**  : **Render** Displays a dialog box: (6.2118 on the next page) **Reports the current render mode:** Current render preset: 'Medium" When the rendering appears in a window, the red square shows which part is currently being rendered: (6.2119 on the facing page)

Figure 6.2118

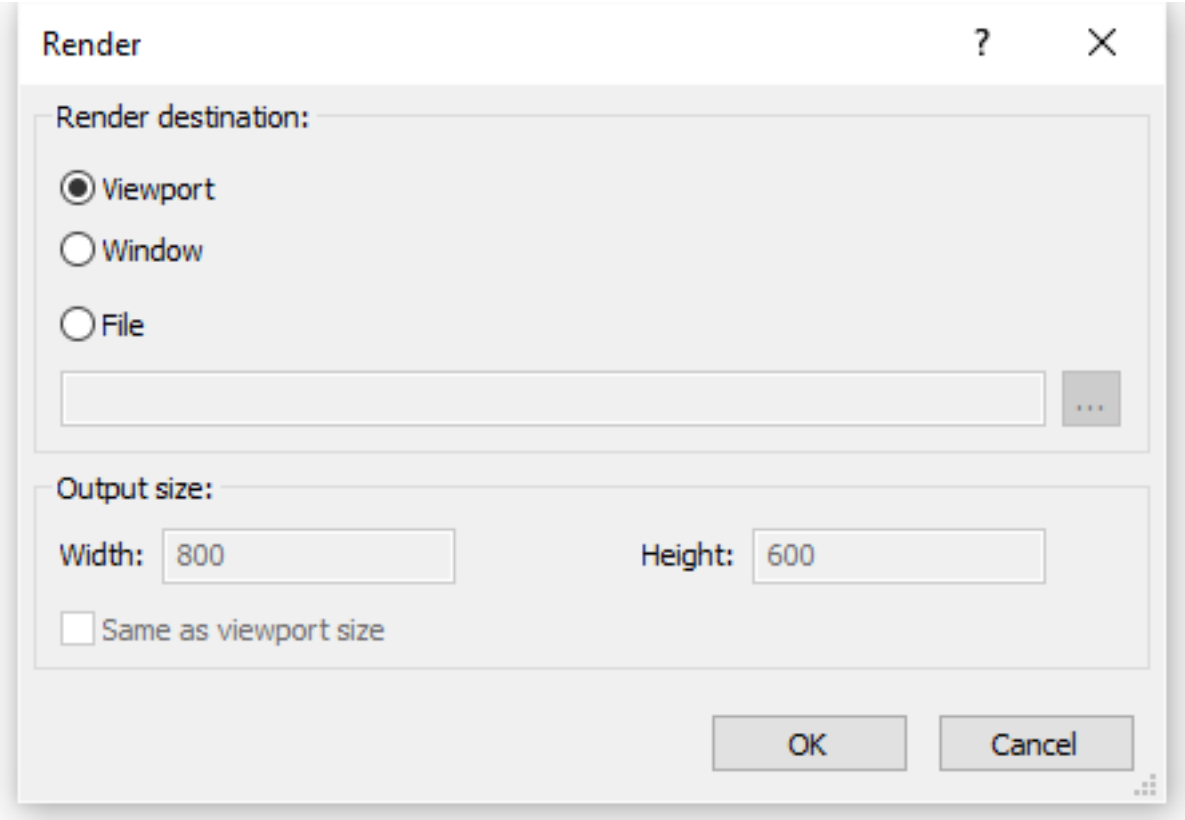


Figure 6.2119

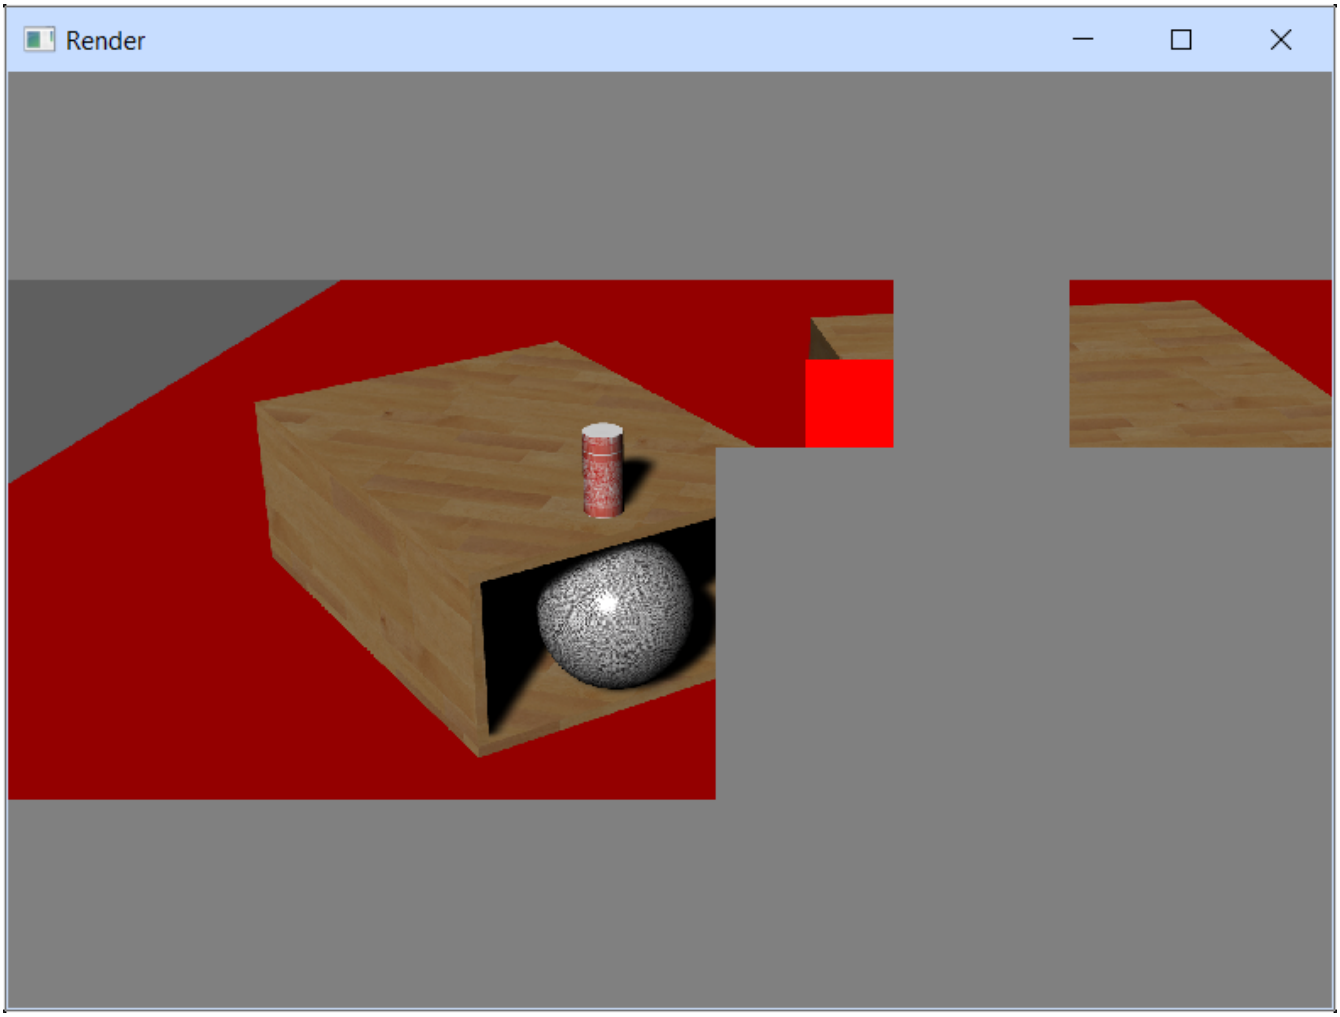


Dialog Box Options

Option	Description
Render destination	Specifies where the rendering will appear: • **Viewport** - the rendering is generated in the current viewport • **Window** - the program opens a new windows, and then generates the rendering in it • **File** - the rendering is saved to a file: 1. Click the **Browse** button to open the Render output file dialog. 2. (Optional) Select an output folder in the **Save In** droplist. 3. Type a name in the **File name** field. 4. Select an image file type from the **Save As Type** droplist: **BMP** - Windows bitmap format; largest file size as it is uncompressed **JPEG** - highly compress raster format; smallest file size but suffers from artifacts **PNG** - compressed raster format; medium file size with no artifact problem 5. Click **Save**.
Output Size	Specifies the size of the rendering, in pixels. Larger sizes provide more detail but take longer to render: • **Width** - specifies the width of the rendering, in pixels • **Height** - specifies the height of the rendering, in pixels • **Same as viewport size** - matches the ouput size or the size of the output window to the current viewport size.
OK	Starts calculating the rendering according to the settings established by the RenderPresets (6.26.27) command. The ANTIALIASRENDER (1.17.10) variable controls the amount of anti-aliasing (edge smoothing) applied during the rendering generation. The default value is 1, maximum value is 5. Note: high anti-alias values incur a high calculation cost.

Procedures

- To render a viewport (1.34.3)
- To save a rendering to a file (1.34.3)

Related Commands

AniPath (6.4.13) - records the animation of a camera moving along a path or panning in a 3D model and saves it to a movie file. -Render (6.26.35) - generates a photorealistic rendering using materials and lights through the command bar. RenderPresets (6.26.27) - allows to create and edit render presets, and to set the current render preset through a dialog box. Background (6.6.3) - sets the model space background for the current viewport and saved views. Distantlight (6.10.34) - creates a distant light. Hide (6.16.9) - removes hidden lines from 3D entities. Light (6.20.30) - creates a new light in the drawing. Lightlist (6.20.36) - displays the Drawing Explorer - Lights dialog window. Materials (6.21.10) - creates materials and edits their properties through the Drawing Explorer. Pointlight (6.24.47) - creates a point light. RedSdkInfo (6.26.11) - displays rendering related hardware and driver specifications in the command bar. Shade (6.27.30) - generates shaded images of 3D drawings. ShadeMode (6.27.31) - sets the shading style for 3D entities. Spotlight (6.27.47) - creates a spot light. Sunproperties (6.27.70) - displays the Sun Properties of the Active Viewport editor in the Drawing Explorer - Lights dialog. VisualStyles (6.31.15) - creates and controls visual style definitions in the Drawing Explorer. Weblight (6.33.4) - creates a web light.

Figure 6.2120

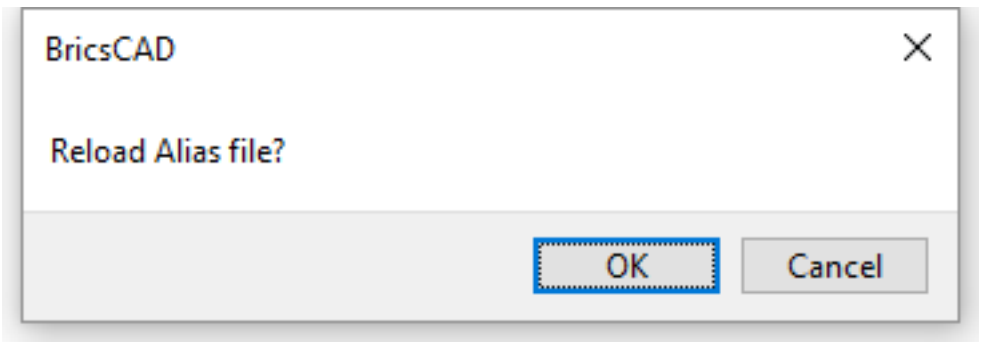
6.26.22 ReInit

(6.2981 on page 6079) Reloads the PGP file after it has been changed (short for "reinitialize"). **Note:** The PGP file (short for "program parameters") file holds command alias definitions and shell commands.

Accessing the Command

command bar: **reinit** alias: **ri**
: **ReInit** Displays a dialog box: (6.2121) Click **OK** or **Cancel**. This command is used to load the PGP file after it has been edited externally. The PGP file defines command aliases. See the "Customizing BricsCAD" ebook for details on aliases.

Figure 6.2121



Command Options

Option	Description
OK	Reloads the PGP file into BricsCAD.
Cancel	Does not reload the file.

Related Command

Customize (6.9.47) - creates and edits aliases.

Figure 6.2122

6.26.23 Regen

(7.3 on page 6132) Regenerates the current viewport by reading and reloading the DWG file (short for "regenerate").

Accessing the Command

command bar: **regen** alias: **re** menu bar: **View | Regen** toolbar: **View | Regen** ribbon: **View | Views | Regen** : **Regen** Displays no prompt in the command bar. This command regenerates the current viewport. Use the RegenAll (6.26.24) command to regenerate all viewports. This command reads the DWG file and reconstructs the entire drawing on the screen.

Command Options

No options.

Related Commands

RegenAll (6.26.24) - regenerates all viewports. Redraw (6.26.9) - redraws the current viewport to clean it up. RedrawAll (6.26.10) - redraws all viewports to clean them up.

Figure 6.2123

6.26.24 RegenAll

(7.3 on page 6132) Regenerates all viewports by reading and reloading the DWG file (short for "regenerate all").

Accessing the Command

command bar: **regenall** alias: **rea** ribbon: **View | View | Regen | Regen All** toolbar: **View | Redraw/Regen |**

: **RegenAll** Displays no prompt in the command bar. This command reads the DWG file and reconstructs the drawing in all viewports.

Command Options

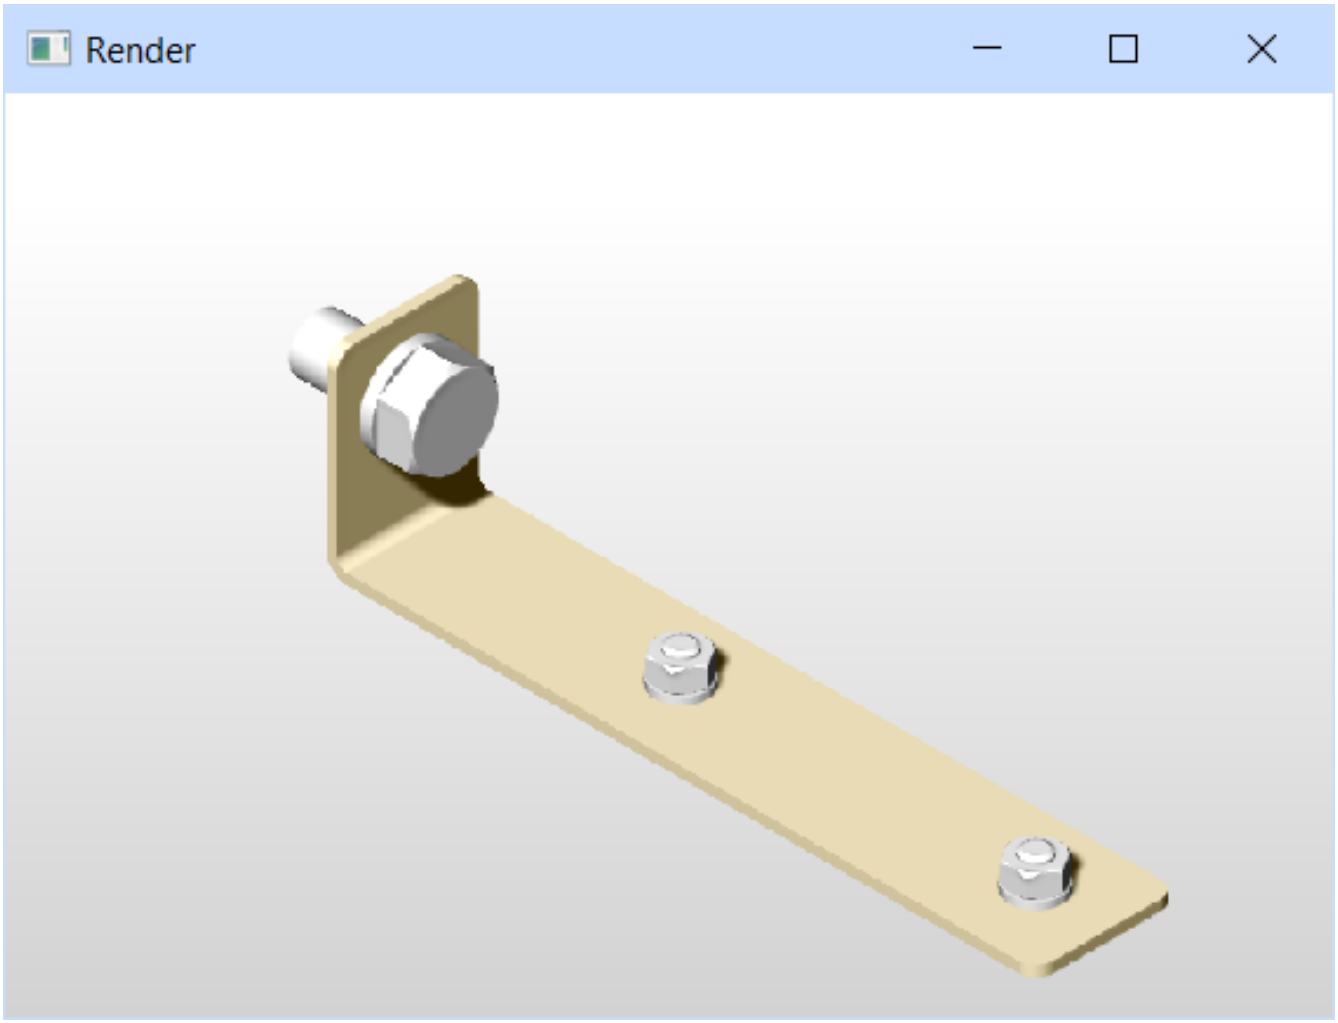
No options.

Related Commands

Regen (6.26.23) - regenerates the current viewport. Redraw (6.26.9) - redraws the current viewport to clean it up. RedrawAll (6.26.10) - redraws all viewports to clean them up.

Figure 6.2124

Figure 6.2125



6.26.25 RenderWinClose

(7.3 on page 6132) Closes the Render window, after it displays a rendering. **Note:** To open the Render window, select the Window option of the Render (6.26.21) command. (6.2125)

Accessing the Command

command bar: **renderwinclose** transparent: '**renderwinclose** : **RenderWinClose** Does not prompt you; closes the Render window.

Command Options

No options.

Related Command

Render (6.26.21) - generates a photorealistic rendering using materials and lights through a dialog box.

Figure 6.2126

6.26.26 Resume

(6.2981 on page 6079) Resumes paused scripts. **Note:** Start a script with the Script (6.27.9) command.

Accessing the Command

command bar: **resume** transparent: **'resume** : **Resume** Displays no prompts in the command bar. This command resumes scripts after they have been stopped with Esc.

Command Options

No options.

Related Commands

RecScript (6.26.5) - records scripts to SCR files. StopScript (6.27.62) - stops recording the script, and saves it to an SCR file. Script (6.27.9) - loads and runs a SCR script file. RScript (6.26.34) - reruns the script. Delay (6.10.29) - pauses the execution of the script for the specified number of milliseconds.

Figure 6.2127

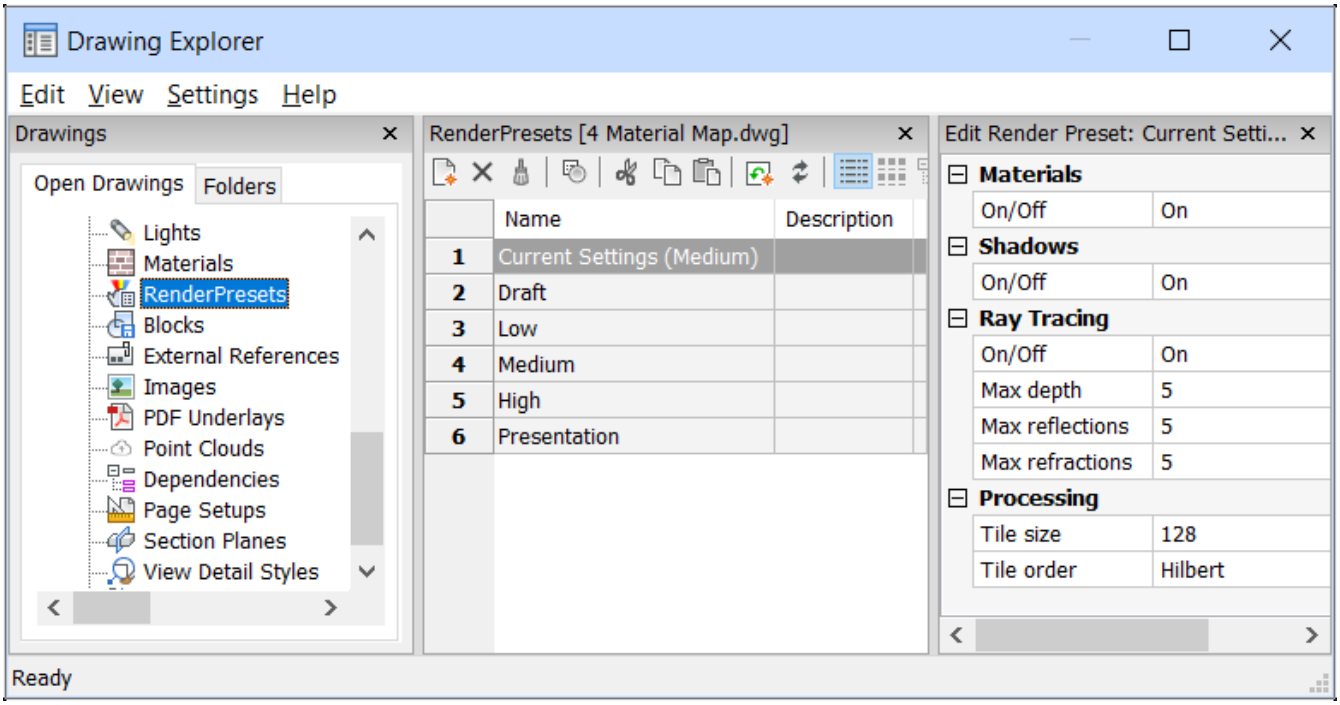
6.26.27 RenderPresets

(6.2981 on page 6079) Creates and edits properties for renderings, through a dialog box.

Accessing the Command

command bar: **renderpresets** alias: **roptions** menu bar: **Tools | Drawing Explorer | Render Presets** ribbon: **Home | Settings | Drawing Explorer | Render Presets View | Render Modes | Render Presets** : **RenderPresets**
Displays the Render Presets section of the Drawing Explorer dialog box: (6.2128 on the next page)

Figure 6.2128

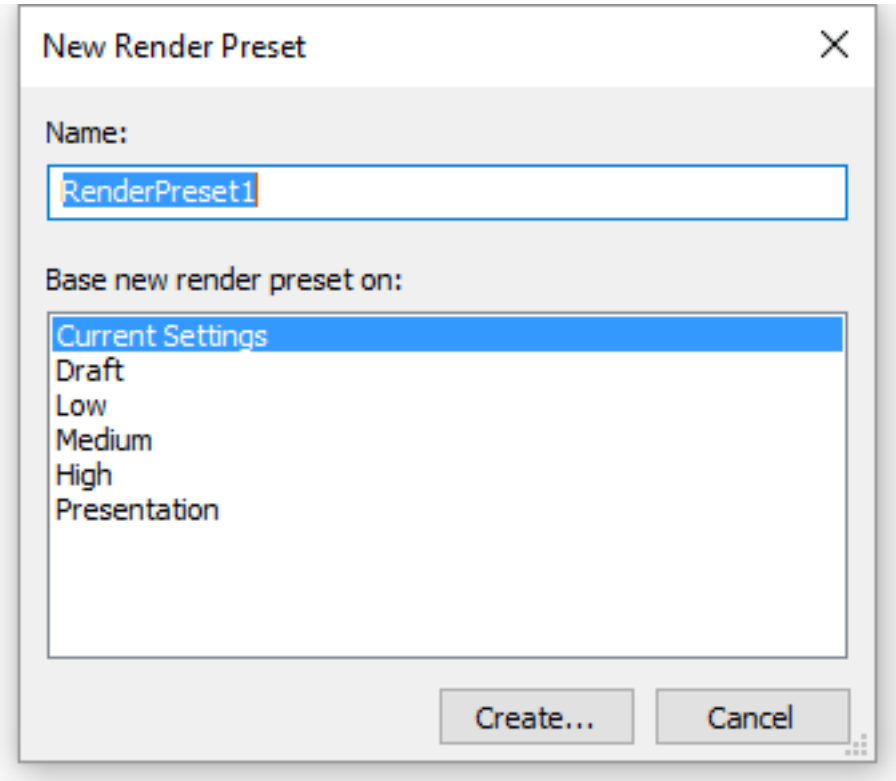


Command Options

Toolbar Option	Description
New	Creates new render preset definitions; follows these steps: 1. Click **New**. The New Render Preset dialog box displays. (6.2129 on page 5315) 2. Type a name in the **Name** field. 3. Select an existing render preset to use as a template for the new one. 4. Click **Create**. The Drawing Explorer - Render Presets dialog box reopens. 5. (Optional) Type a description in the **Description** field.
Delete	Deletes the currently selected user defined render preset(s). You cannot delete predefined render presets: Draft, Low, Medium, High, and Presentation.
Set Current	Sets the selected render preset current. The current render preset is used by the Render (6.26.21) command or when printing using the shade plot type Rendered as defined in **Shade Plot** setting in the Page Setup (6.24.2) and the Print (6.25.2) commands. The name of the current render preset displays between brackets: e.g. Current Settings (Medium). You can override the properties of a preset in the Edit Render pane. When overrides exist, an asterisk displays in front of the current render preset name: e.g. Current Settings (*Medium)

Edit Render Preset Options	Description
Materials	Toggles the use of materials in the rendering: • **On** - uses material definitions for rendering, at the cost of a slower rendering • **Off** - does not use material, at the cost of a less realistic rendering Materials are applied to layers and to entities. See Materials (6.21.10) commands.
Shadows	Toggles the use of shadows in the rendering: • **On** - uses shadows for rendering, at the cost of a slower rendering • **Off** - does not use shadows, at the cost of a less realistic rendering Shadows are cast by entities in the drawing onto other entities.
Ray Tracing	Ray tracing tracks each ray of light from each light source as it travels through the scene and bounces off (or travels through) entities. **On/Off** toggles the use of ray tracing in the rendering: • **On** - uses ray tracing, at the cost of a slower rendering • **Off** - does not use ray tracing, at the cost of a less realistic rendering **Max. depth** - specifies the maximum total number of times light bounces and refracts **Max reflections** - specifies the maximum times that light beams bounce of of entities **Max refractions** - specifies the maximum times that light beams refract through transparent entities
Processing	Specifies how the rendered image is processed; applies to renderings sent to a separate window. In the figure below, the bright red square is a "tile." (6.2130 on page 5316) **Tile size** - sets the size of the tile, representing the area of the rendered image being processed. **Tile order** - defines the order in which the tiles are generated: • **Hilbert** - renders with a Hilbert curve, a continuous fractal space-filling; see http://en.wikipedia.org/wiki/Hilbert_curve for a description. • **Spiral** - renders in a counterclockwise spiral from the center • **Left to right** - renders vertical columns, starting from the bottom left corner • **Right to left** - renders vertical columns, starting from the bottom right corner • **Top to bottom** - renders horizontal rows, starting at the top left corner • **Bottom to top** - renders i horizontal rows, starting at the bottom left corner

Figure 6.2129



Related Commands

Render (6.26.21) - generates a photorealistic rendering using materials and lights through a dialog box. -Render (6.26.35) - generates a photorealistic rendering using materials and lights through the command bar. Explorer (6.13.15) - Opens the Drawing Explorer dialog box.

Figure 6.2130

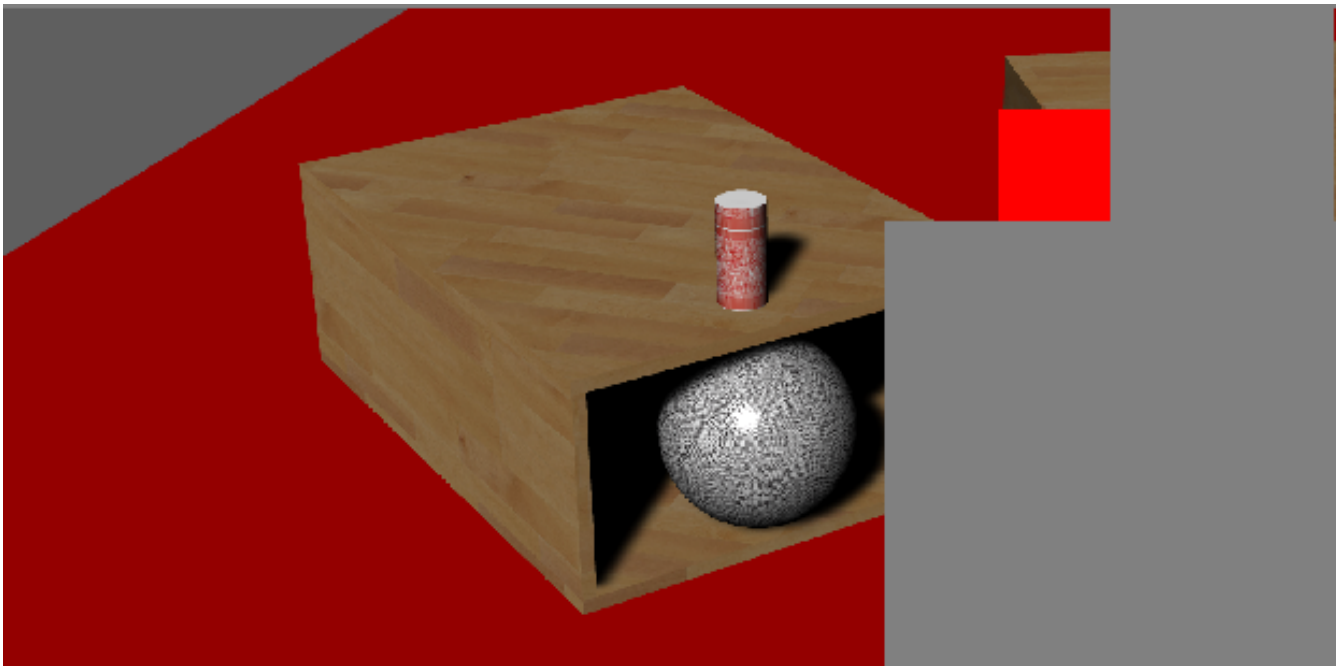


Figure 6.2131

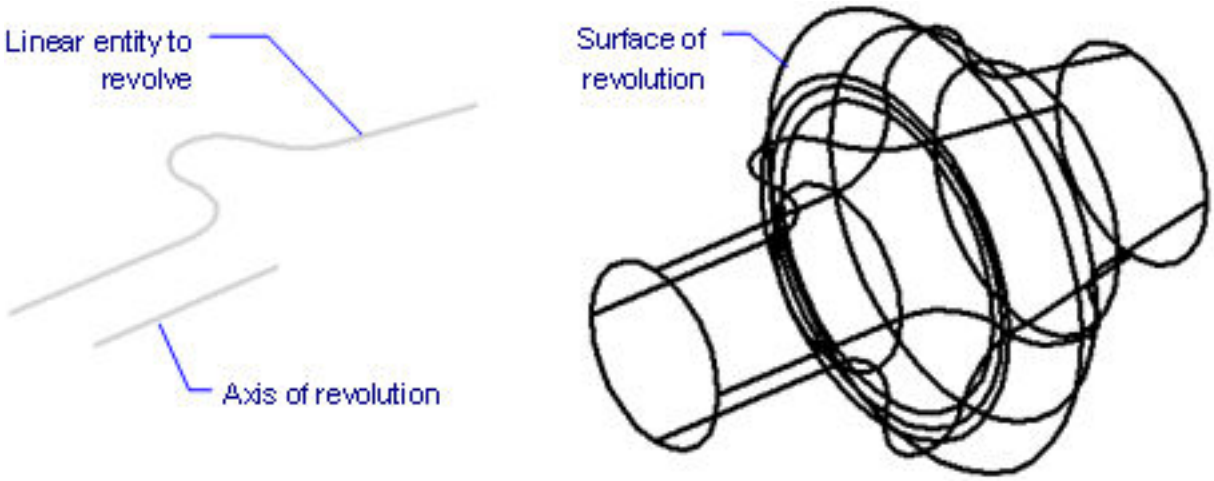
Figure 6.2132



6.26.28 RevSurf

(6.2981 on page 6079) Creates a 3D mesh surface by revolving a linear entity around a line (short for "revolved surface"). **Note:** To create 3D surfaces and 3D solids that are revolved, use the Revolve (6.26.45) command. (6.2132)

Accessing the Command

command bar: **revsurf** menu bar: **Model | Meshes | Revolved Surface** ribbon: **Model | Meshes | Revolved Surface** toolbar: **Meshes | 3D Surfaces |**  : **RevSurf Prompts you in the command bar:** Select a linear entity to revolve: **(Pick a single 2D linear or curved entity)** Select the axis of revolution: **(Pick a line or polyline segment)** Angle to begin surface of revolution <0>: **(Specify a starting angle, or press Enter to accept the default)** Degrees to revolve entity (+ for ccw, - for cw <360>): **(Specify an angle through which to revolve, or press Enter to accept the defaul.)** The SURFTAB1 (1.17.10) variable controls the number of segments of the revolution surface. The SURFTAB2 (1.17.10) variable controls the number of segments of each arc segment in the revolved entity.

Command Options

Option	Description
Select a linear entity to revolve	Specifies a single entity to be revolved into a 3D surface mesh. You may choose a line, circle, arc, open or closed polyline, or open or closed spline; 3D objects do not work.
Select the axis of revolution	Specifies the entity about which the surface is revolved; you may choose a line or polyline; curved objects do not work.
Angle to begin surface of revolution	Specifies the starting angle of the revolution; the default is 0 degrees.
Degrees to revolve entity	Specifies the extent of the revolution; to construct a closed object, start with 0 and revolve by 360 degrees. The revolved surface is drawn counterclockwise; prefix the angle with a negative sign to draw the revolution clockwise. (6.2133) Note that this is not the ending angle, but the number of degrees by which the entity is revolved.

Related Commands

Ai_Box (6.5.7) - draws 3D boxes as mesh surfaces. Ai_Cone (6.5.8) - draws 3D cones as mesh surfaces. Ai_Cylinder (6.5.9) - draws 3D cylinders as mesh surfaces. Ai_Dish (6.5.12) - draws 3D dishes as mesh surfaces. Ai_Dome

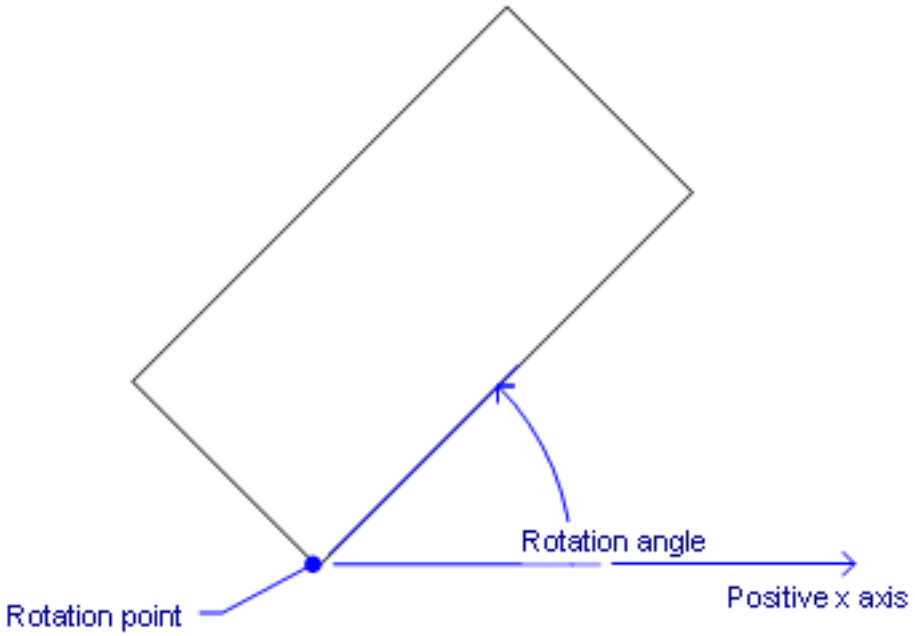
Shape Classic Pro Platinum Mechanical BIM

Figure 6.2135



6.26.29 Rotate

(7.3 on page 6132) Rotates entities in 2D. (6.2135)

Accessing the Command

command bar: **rotate** alias: **ro** menu bar: **Modify | 2D Rotate** ribbon: **Change | Arrange | 2D Rotate** toolbar: **Modify |** : **Rotate Prompts you in the command bar:** Select entities to rotate: **(Select one or more entities)** Entities in set: 1 Select entities to rotate: **(Select more entities, or else press Enter to continue)** Rotation point: **(Pick a point, or enter x,y coordinates)** Rotation angle or [Base angle/Copy] <0>: **(Enter an angle, or choose an option.)**

Command Options

Option	Description
Select entities to rotate	Chooses the entities to be rotated. You can choose one or more entities using any entity selection method. Press **Enter** to end entity selection.
Rotation point	Specifies the point about which the entities will rotate: • Pick a point • Enter x,y coordinates Use entity snaps for an accurate rotation point.

Rotation angle	Specifies the angle by which to rotate the entities about the rotation point: • Pick a point to show the angle to the program. • Enter a positive number to rotate the entities counter clockwise • Enter a negative number to rotate the entities clockwise The starting angle is 0 degrees, and the rotation angle is measured from the positive x axis.
Base angle	Specifies the a new base angle, which is a starting angle other than 0. This option lets you define a different angle as the starting point. (6.2136) Prompts you: 1. **Base angle** - **(type a value or pick a point)**; you are prompted: **Second point** - **(pick a point.)** 2. **New angle** - specifies the angle by which to rotate the entities, by typing a value or picking another point
Copy	Rotates a copy of the source entity, instead of rotating the source itself.

Procedures

- Rotating a selection set (1.32.12)
- Rotating a selection set in reference to a base angle (1.32.12)
- To rotate entities using grips (1.32.3)
- To rotate the display in a viewport (1.23.16)

Related Commands

dmRotate (6.12.24) - rotates faces of a 3D solid around an axis. Rotate3D (6.26.31) - rotates entities about axes in 3D space. Align (6.4.7) - aligns one entity with another. Snap (6.27.41) - rotates the cursor, ortho angle, and grid. UCS (6.30.1) - rotates the coordinate system.

Figure 6.2136

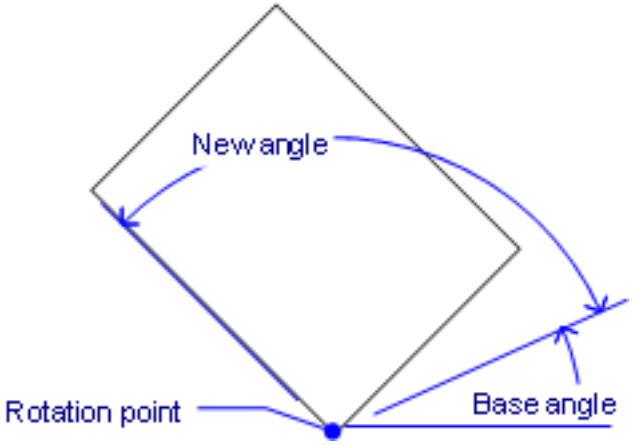


Figure 6.2137

6.26.30 ResetAssocViews

(6.2880 on page 5977) Removes the associativity from 2D drawings generated from 3D models. **Note:** The ViewBase (6.31.4), ViewSection (6.31.12), and BimSection (6.7.54) commands generate 2D drawings associated with the source 3D model so that drawings are updated automatically as the 3D model is modified (when the GENERATEASSOCVIEWS variable is on). The ResetAssocViews command removes associativity from between 2D drawings and 3D models, including associative dimensions, which is useful for archival purposes.

Accessing the Command

command bar: **resetassocview** transparent: **resetassocview** : **ResetAssocView Prompts you in the command bar:** Select several entities/subentities: **(Select one or more entities)** Entities in set: 42 Select several entities/subentities: **(Select more entities, or else press Enter to finish the command)** Associative attributes were removed from selected entities.

Command Options

Option	Description
Select several entities/subentities	Selects the entities whose associative dimensions should be removed: • Select one or more entities • Enter **all** to select all entities in the drawing • Press **Enter** to finish the command

Figure 6.2138

6.26.31 Rotate3D

(7.3 on page 6132) Rotates entities about an axis in 3D space.

Accessing the Command

 command bar: **rotate3d** aliases: **3drotate 3r** menu bar: **Modify | 3D Rotate** toolbar: **Modify |**  : **Rotate3D**
Prompts you in the command bar: Select entities to rotate: (Choose one or more entities) Entities in set: 1 Select entities to rotate: **(Choose more entities, or press Enter to continue)** Select axis by [Entity/Last/View/Xaxis/Yaxis/Zaxis/2poin <2points>: **(Pick a point, or enter an option)** Specify the second rotation axis point: **(Pick another point)** Rotation angle or [Base angle/Copy]: **(Type a value, or enter an option.)**

Command Options

Option	Description
Select entities to rotate	Chooses the entities to be rotated: • Choose one or more entities using any entity selection method. • Press **Enter** to end entity selection.
2 points	Defines the rotation axis by two points; prompts you: 1. **Specify the first rotation axis point** - **(pick a point.)** 2. **Specify the second rotation axis point** - **(pick a point.)**
Entity	Uses the geometry of an entity as the axis for rotating the entities; prompts you: **Select an arc, circle, ellipse, line, 2D or 3D polyline segment** - **(specify the entity.)** The program uses the geometry of the entity to determine the axis of rotation: • **Arc, circle, ellipse, 2D polyline arc segment** - axis of rotation is centered vertically on the arc's center point • **Line,** 2D polyline segment, 3D polyline segment - the line or segment is the axis of rotation
Last	Uses the last entered axis for rotating the entities.
View	Uses the current view as the axis for rotating the entities; prompts you: **Specify point on view direction axis** - **(locate the axis of rotation.)** The axis of rotation is parallel to the direction of view, passing through the picked point.

Xaxis	The x axis is the axis of rotation; prompts you: **Specify point on the X axis** - **(locate the axis of rotation.)** The axis of rotation is parallel to the x axis, passing through the picked point.
Yaxis	The y axis is the axis of rotation; prompts you: **Specify point on the Y axis** - **(locate the axis of rotation.)** The axis of rotation is parallel to the y axis, passing through the picked point.
Zaxis	The z axis is the axis of rotation; prompts you: **Specify point on the Z axis** - **(locate the axis of rotation.)** The axis of rotation is parallel to the z axis, passing through the picked point.
Rotation angle	Specifies the angle by which to rotate the entities; prompts you: **Rotation angle or [Base angle/Copy]** - **(do one of the** following): • Type a value. Positive values rotate entities counterclockwise from the positive rotation axis • Specify two points **Base angle** - specifies the a new base (starting) angle; prompts you: 1. **Base angle <0>** - **(type a value, or pick two points.)** 2. **New angle** - **(type a value, or pick two points.)** **Copy** - rotates a copy of the selection set.

Procedures

- Rotating in 3D (1.32.12)

Related Commands

dmRotate (6.12.24) - rotates faces of a 3D solid around an axis. Rotate (6.26.29) - rotates entities about a point in 2D planes. Align (6.4.7) - aligns one entity with another. Snap (6.27.41) - rotates the cursor, ortho angle, and grid. UCS (6.30.1) - rotates the coordinate system.

6.26.32 Ribbon

(6.2981 on page 6079) Displays the ribbon. **Note:** The content of the ribbon depends on the current workspace. (6.2140)

Accessing the Command

command bar: **ribbon** shortcut: **Ctrl+F2** menu: **View | Ribbon Bar** context menu: right-click any toolbar or panel, choose **Panels > Ribbon** : **Ribbon** Displays the ribbon.

Command Options

No options.

Procedures

- Exploring the ribbon (1.17.6)
- Creating a ribbon tab (1.17.6)
- Editing a ribbon tab (1.17.6)
- Creating a ribbon panel (1.17.6)
- Editing a ribbon panel (1.17.6)
- Editing a panel row (1.17.6)

Related Commands

CleanScreenOff (6.9.14) - displays user interface elements that were hidden by te CleanScreenOn (6.9.17) command. CleanScreenOn (6.9.17) - hides elements of the user interface. RibbonClose (6.26.49) - hides the ribbon. ToolPalettes (6.29.28) - opens the Tool Palettes bar. Customize (6.9.47) - customizes the user interface of BricsCAD: menus, toolbars, keyboard shortcuts, aliases, and shell commands.

Figure 6.2141

6.26.33 RevCloud

(6.2981 on page 6079) Draws revision clouds commonly used for redlining drawings (short for "revision cloud").

Accessing the Command

command bar: **revcloud** menu bar: **Draw | Revision Cloud** ribbon: **Draw | Markup | Revision Cloud** toolbar: **Draw | Polygon |** 
: **RevCloud Prompts you in the command bar:** Specify first corner point or [Arc length/Entity/Rectangular/Polygonal/Freehand <Entity>: **(Pick a point, or enter an option)** Guide crosshairs along cloud path... **(Move the cursor to create the free form cloud shape)** (6.2142 on the next page) Do one of the following:

- Move the cursor near the start point. Revision cloud finished. **(When the cursor reaches the starting point, the cloud closes automatically)** (6.2143 on the following page)
- Right click to stop adding segments, thus creating an unclosed revision cloud. Prompts you to optionally reverse the direction. Reverse direction [Yes/No <No>: **(Press Y or N)**

Figure 6.2142

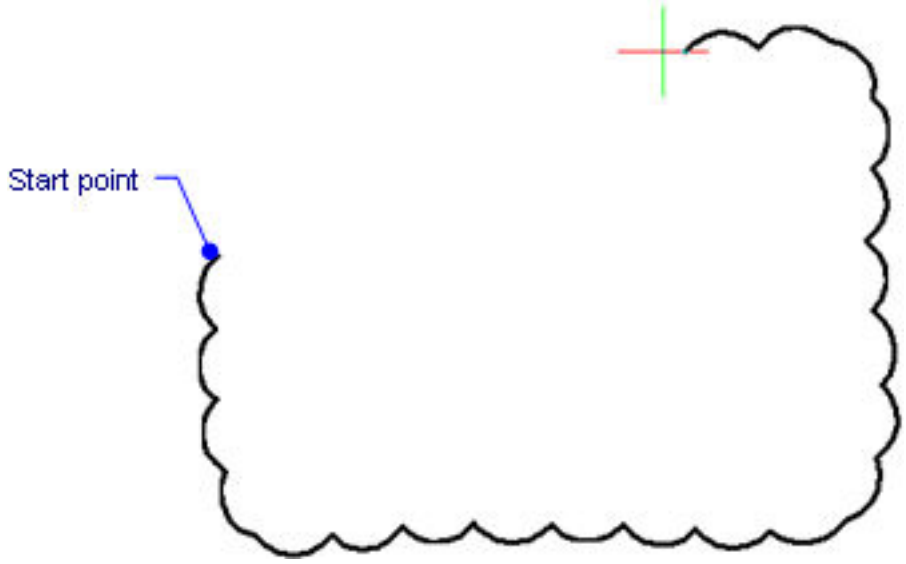

Figure 6.2143

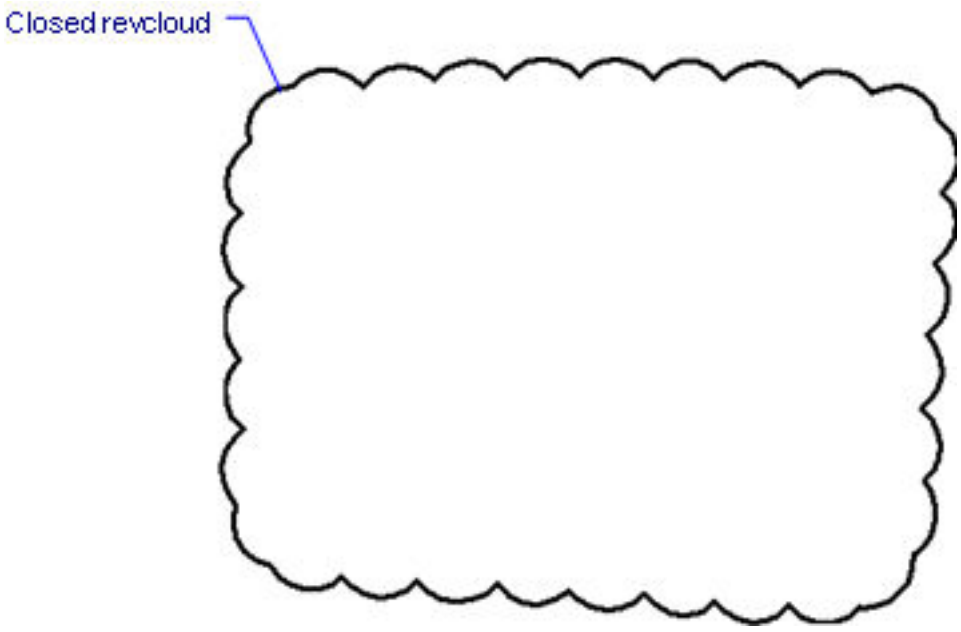


Command Options

Option	Description
Specify start point	Click a point to start drawing; when the cursor returns to the start point, the revision cloud closes automatically. The revision cloud is drawn as a closed polyline composed of arcs. For red revision clouds, set the layer color to red.
Arc length	Specifies the shortest length for the arcs that form the cloud; prompts you: **Specify minimum length of arc - (enter a value.)**
Entity	Converts entities into a revision cloud; prompts you: **Select entity - (choose the entity to be converted into a revision cloud.)** (6.2145 on page 5329) Entities can be open or closed; the original entity is erased.
Rectangular	Draws a cloud shape that is rectangular; prompts you: 1. **Specify first corner point or [Arc length/Entity/Rectangular/ Polygonal/Freehand/Style] <Entity> - (pick a point at one corner of the rectangle.)** 2. **Specify opposite corner point - (pick the opposite corner for the rectangle shape.)**
Polygonal	Draws a cloud shape defined by several pick points; prompts you: 1. **Specify first point or [Arc length/Entity/Rectangular/Polygonal/ Freehand/Style] <Entity> - (pick a point to start the polygon.)** 2. **Specify next point - (pick the next point of the polygon.)** 3. **Specify next point or [Undo] - (pick the next point of the polygon, or else enter U to undo the last point, or press Enter to finish the cloud shape.)**
Freehand	Draws a cloud shape for as long as you keep the mouse button pressed down; when you let go, the program automatically closes the cloud shape. 1. **Specify start point or [Arc length/Entity/Rectangular/Polygonal/ Freehand/Style] <Entity> - (pick a point to start the cloud.)** 2. **Guide crosshairs along cloud path... - (move mouse to create the shape.)** 3. Do one of the following: • Move the mouse near the start point. **Revision cloud finished.** • Right click to stop adding segments. **Reverse direction [Yes/No <No>: (Press Y or N)**

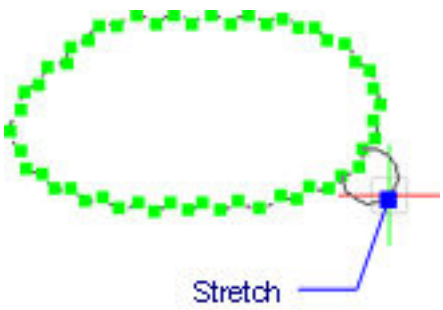
Style	Toggles between normal and calligraphic drawing style; prompts you: **Select arc style [Normal/Calligraphy] <Normal>** - **(type N or C)**: • **Normal** - polyline making up the cloud has uniform width • **Calligraphy** - polyline has varying width (tapered polyarcs) to simulate a calligraphic look (6.2146 on page 5330)

Grips Editing Revision clouds can be edited directly through grips:

1. Select the revcloud. Notice that it has many grips.
2. Drag a grip to stretch the cloud.

(6.2144)

Figure 6.2144



Procedures

- Drawing revision clouds (1.25.24)

Related Commands

PEdit (6.24.24) - edits polylines. Sketch (6.27.69) - draws freehand sketches.

Figure 6.2145

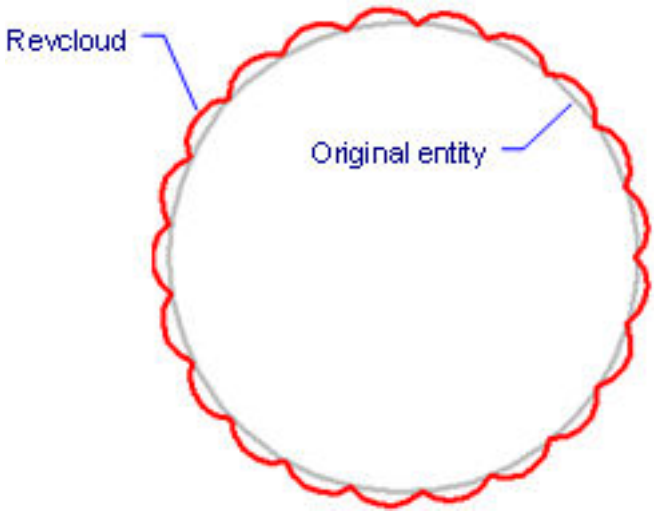


Figure 6.2146

Figure 6.2147

6.26.34 RScript

(6.2981 on page 6079) Reruns the currently loaded SCR script file (short for "repeat script"). **Note:** You load and run SCR script files with the Script (6.27.9) command.

Accessing the Command

command bar: **rscript** transparent: **'rscript** : **RScript** Displays no prompts in the command bar. This command reruns the currently loaded script file. This command can be placed at the end of a script file to make it loop repeatedly. You create script files with the RecScript (6.26.5) command or through the Notepad text editor.

Command Options

Option	Description
Esc	Press **Esc** to stop the script.

Related Commands

RecScript (6.26.5) - records scripts to SCR files. StopScript (6.27.62) - stops recording the script, and saves it to an SCR file. Script (6.27.9) - loads and runs a SCR script file. Delay (6.10.29) - pauses the execution of the script for the specified number of milliseconds. Resume (6.26.26) - resumes a stopped script.

Figure 6.2148

6.26.35 -Render

(6.2932 on page 6037) Generates a photo-realistic rendering using materials and lights, through the command bar.

Accessing the Command

command bar: **-render** : **-Render Prompts you in the command bar:** Specify render preset [Draft/Low/Medium/High/Presentat <Medium>: **(Choose a render preset, or press Enter to accept the current preset)** Specify render destination [Viewport/File/Render window] <Viewport>: **(Choose an option, or press Enter to accept the default.)**

Command Options

Option	Description
Specify render preset	Sets the settings to be used for the rendering. See the RenderPresets (6.26.27) command. Do one of the following: • Select one of the hard-coded presets (Draft, Low, High, Presentation) • Choose **Other** , to choose a user-defined preset; prompts you: **Enter custom render preset name or [?]** - **(type the name of a preset or type ? to list the available custom presets.)**
Specify render destination	Determines where the rendering ends up; choose one: • **Viewport** - the rendering is displayed in the current viewport • **File** - exports the rendering to an file; prompts you: **Specify output file name** - **(type a file name.)** • **Render view** - Displays the rendering in a pop-up window; prompts you: **Enter output width or [Viewport size] <800>** - **(type a value or enter V to set the size of the pop-up window equal to the current viewport size.) Enter output height <600>** - **(type a value.) Save also to file?[Yes/No] <No>** - if Yes , you are prompted: **Specify output file name** - **(type a file name.)**

The ANTIALIASRENDER (1.17.10) system variable controls the amount of anti-aliasing (edge smoothing) applied during the rendering generation. The default value is 1, maximum value is 5.

Related Commands

AniPath (6.4.13) - records the animation of a camera moving along a path or panning in a 3D model and saves it to a movie file. Render (6.26.21) - generates a photorealistic rendering using materials and lights through a dialog box. RenderPresets (6.26.27) - allows to create and edit render presets, and to set the current render preset through a dialog box. Background (6.6.3) - sets the model space background for the current viewport and saved views. Distantlight (6.10.34) - creates a distant light. Hide (6.16.9) - removes hidden lines from 3D entities. Light (6.20.30) - creates a new light in the drawing. Lightlist (6.20.36) - displays the Drawing Explorer - Lights dialog window. Materials (6.21.10) - creates materials and edits their properties through the Drawing Explorer. Pointlight (6.24.47) - creates a point light. RedSdkInfo (6.26.11) - displays rendering related hardware and driver specifications in the command bar. Shade (6.27.30) - generates shaded images of 3D drawings. ShadeMode (6.27.31) - sets the shading style for 3D entities. Spotlight (6.27.47) - creates a spot light. Sunproperties (6.27.70) - displays the Sun Properties of the Active Viewport editor in the Drawing Explorer - Lights dialog. VisualStyles (6.31.15) - creates and controls visual style definitions in the Drawing Explorer. Weblight (6.33.4) - creates a web light.

Figure 6.2149

6.26.36 RtPan

(7.3 on page 6132) Pans the drawing in real-time (short for "real time panning").

Accessing the Command

 command bar: **rtpan** transparent: **'rtpan** shortcut: hold down middle mouse button menu bar: **View | Real-Time Motion | Real-time Pan** ribbon: **View | Navigate | Real-Time Pan** toolbar: **Real-Time Motion|** 
: **RtPan Prompts you in the command bar:** »Press ENTER or Esc to complete, or right-click to display context menu **(Hold down the mouse's left button, and then move the mouse to pan the drawing in real-time; press Enter to exit command)** BricsCAD shows the pan cursor during realtime panning: 

Command Options

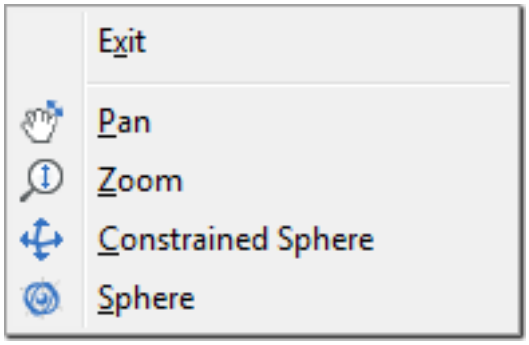
Option	Description
Shift key	Hold down the shift key to restrict panning to the X and Y direction of the viewport.
Enter, Esc	Exits the command.

Shortcut Menu Options

Right-click to switch viewing mode through the shortcut menu: (6.2177 on page 5361)

Option	Description
Exit	Exits the command.
Pan	Pans the drawing in real-time. Starts the RtPan (6.26.36) command.
Zoom	Zooms the drawing in real-time. Starts the RtZoom (6.26.42) command.
Constrained Sphere	Rotates the 3D drawing in real-time. Starts RtRotctr (6.26.38) the command.
Sphere	Rotates the 3D drawing in real-time Starts the RtRot (6.26.37) command.

Figure 6.2150



Related Commands

Pan (6.24.3) and -Pan (6.24.4) - move the drawing within the current viewport. View (6.31.2) and -View (6.31.3) - set up named views of drawings. DdVPoint (6.10.23) - changes the 3D viewpoint of the drawing through a dialog box. VPoint (6.31.21) - changes the 3D viewpoint of the drawing through the command bar. RtLook (6.26.40) - Look around in a 3D scene. RtRot (6.26.37) - rotates the 3D viewpoint in realtime. RtRotCtr (6.26.38) - rotates the 3D viewpoint in realtime about a user defined center point. RtRotF (6.26.39) - rotates the 3D viewpoint in realtime. RtRotX (6.26.50) - rotates the 3D viewpoint about the x axis in realtime. RtRotY (6.26.41) - rotates the 3D viewpoint about the y axis in realtime. RtRotZ (6.26.44) - rotates the 3D viewpoint about the z axis in realtime. RtUpDown (6.26.46) - move up / down and left / right in a 3D scene. RtWalk (6.26.47) - walk left / right and forward / backward in a 3D scene. Zoom (6.35.7) - increases and decreases the size of the drawing within the current viewport. RtZoom (6.26.42) - performs real-time zooming of the drawing.

Figure 6.2151

6.26.37 RtRot

(7.3 on page 6132) Rotates 3D drawings in a constrained manner, in real-time (short for "real time rotation"). **Note:** The OrbitAutoTarget variable determines if the viewpoint rotates around your pick point (0) or the center of the objects (1).

Accessing the Command

 command bar: **rtrot** transparent: **'rtrot** shortcut: hold down **Ctrl** and right mouse button menu bar: **View | Real-Time Motion | Real-time Constrained Sphere** ribbon: **View | Navigate | Real-Time Constrained Sphere** toolbar: **Real-Time Motion |**  : **RtRot Prompts you in the command bar:** »Press ENTER or Esc to complete, or right-click to display context menu **(Hold down the mouse's left button, and then move the mouse to rotate the drawing in real-time; press Enter to exit command.)** BricsCAD shows the constrained rotation cursor during real-time rotation:

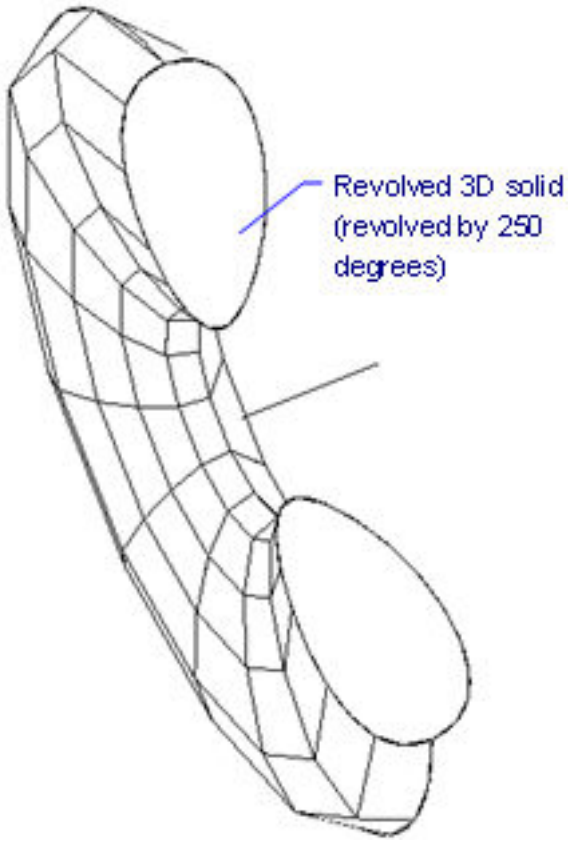
Figure 6.2166

Figure 6.2167



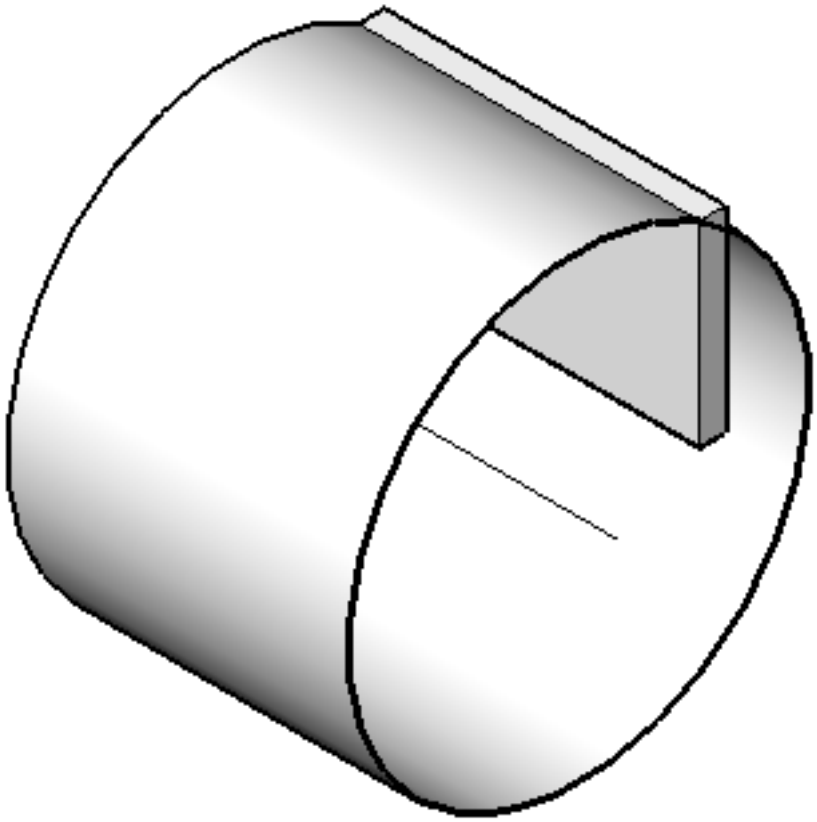
6.26.45 Revolve

(6.2880 on page 5977) Revolves open or closed 2D entities, solid edges, and faces into 3D solids or 3D surfaces. (6.2167)

Accessing the Command

command bar: **revolve** alias: **rev** menu bar: **Model | 3D Solids | Revolve** ribbon: **Model | Solids | Revolve** toolbar: **3D Solids |** : **Revolve Prompts you in the command bar:** Select entities/subentities to revolve or set [MOde]: **(Choose one or more closed 2D entities, or press M)** Entities in set: 1 Select entities/subentities to revolve or set [MOde]: **(Choose more closed 2D entities, or else press** Enter **to continue.)** Specify start point for axis of revolution or define axis by [Object/Xaxis/Yaxis]: **(Pick a point, or enter an option)** Specify endpoint of axis: **(Pick a point)** Specify angle of revolution <360>: **(Press Enter to accept a 360° revolution, or else type a value)** In the figure below, the edge of a 3D solid was revolved about the line. (6.2168 on the next page) The DELOBJ (1.26.1) variable determines whether the source entities are retained or deleted following this command.

Figure 6.2168



Command Options

Option	Description
Select entities/ subentities to revolve	Selects the entities and/or sub-entities to be revolved. Choose one or more of the following entities: • **Open 2D entities** - constructs 3D surfaces • **Closed 2D entities** - constructs 3D solids or 3D surfaces, depending on the setting of Mode • **Edges on 3D solids** - constructs 3D surfaces • **Faces of DD solids** - constructs 3D solids or 3D surfaces, depending on the setting of Mode To more easily choose a face or edge on a 3D solid, hold down the **Ctrl** key. You can use almost any kind of 2D and 3D entity as the source, as long as the resulting 3D entity does not intersect itself: • Lines, and open and closed polylines • Circles, arcs, open and closed polyarcs, open and closed splines, elllipses, elliptical arcs, and helices • Edges and faces of 3D objects

MOde	Sets the 3D entity type this command will create; prompts you: **Choose type of created entity [SOlid/SUrface] <SOlid>** - **(enter an option)**: • **Solid** - constructs 3D solids • **Surface** - constructs 3D surfaces This option applies only to closed source entities; open entities always construct 3D surfaces.
Specify start point for axis of revolution	Specifies the first point of the axis, about which the entity is revolved: • Pick a point in the drawing • Enter x,y,z coordinates Prompts you: **Specify endpoint of axis** - **(pick the other point of the axis)**; as you move the cursor, the program displays a yellow, dashed drag line from the start point to the end point. When the result would bes a self-intersecting entity, the program complains: **Modeling operation error. The sweep results in self-intersecting surface**
Object	Specifies the axis of rotation by an object. Pick a line or a polyline segment. (6.2169 on the following page) The axis entity must be outside of the source entity being revolved.
Xaxis	Uses the x axis of the current coordinate system as the axis of rotation.
Yaxis	Uses the y of the current coordinate system axis as the axis of rotation.
Specify angle of revolution	Specifies how far around the source entity is rotated about the axis: • Type a value larger than 0 and up to 360 for degrees • Press **Enter** to accept the default value

Related Commands

dmRevolve (6.12.21) - creates 3D solids or surfaces by revolution of open or closed 2D entities or regions about an axis. Extrude (6.13.25) - extrudes 2D entities into 3D solids or surfaces. Interfere (6.17.17) - creates 3D volumes of intersecting 3D solid models. Intersect (6.17.20) - removes volumes not in common between two solid models. MassProp (6.21.2) - reports the mass properties of 3D solid models and 2D regions. Slice (6.27.40) - cuts 3D solids into two parts. SolidEdit (6.27.42) - edits the bodies, faces, and edges of 3D models. Subtract (6.27.58) - removes one solid model from a second. Sweep (6.27.68) - creates 3D solids or 3D surfaces by sweeping profiles (open or closed 2D entities or 3D subentities) along an open or closed path. Union (6.30.6) - joins two or more solid models into a single entity.

RtUpDown (6.26.46) - move up / down and left / right in a 3D scene. DdVPoint (6.10.23) - changes the 3D viewpoint of the drawing through a dialog box. VPoint (6.31.21) - changes the 3D viewpoint of the drawing through the command bar. Pan (6.24.3) and -Pan (6.24.4) - move the drawing within the current viewport. RtPan (6.26.36) - performs real-time panning of the drawing. Zoom (6.35.7) - increases and decreases the size of the drawing within the current viewport. RtZoom (6.26.42) - performs real-time zooming of the drawing.

Figure 6.2174

6.26.48 ResetBlock

(6.2981 on page 6079) Resets dynamic blocks to their default values.

Accessing the Command

command bar: **resetblock** : **ResetBlock Prompts you in the command bar:** Select entities: **(Select one or more dynamic blocks)** Entities in set: 1 Select entities: **(Select more dynamic blocks, or else press Enter)**

Command Options

Option	Description
Select entities	Selects the dynamic blocks whose properties are to be reset: • Choose one or more dynamic blocks • Enter **all** to select all of them in the drawing • Press **Enter** to end the command

Related Commands

-Insert (6.17.14) - inserts blocks, by prompting in the command bar and prompts for attribute values through the command bar or a dialog box. Insert (6.17.13) - inserts blocks, through a dialog box and prompts for attribute values through the command bar or a dialog box.

Figure 6.2175

6.26.49 RibbonClose

(6.2981 on page 6079) Hides the ribbon.

Accessing the Command

command bar: **ribbon** shortcut: **Ctrl+F2** menu: **View | Ribbon Bar** context menu: right-click any toolbar, choose **Ribbon** : **RibbonClose** Closes the ribbon.

Command Options

No options.

Related Commands

CleanScreenOff (6.9.14) - displays user interface elements that were hidden by te CleanScreenOn (6.9.17) command. CleanScreenOn (6.9.17) - hides elements of the user interface. Ribbon (6.26.32) - displays the ribbon.

Figure 6.2176

6.26.50 RtRotX

(6.2981 on page 6079) Rotates 3D drawings in real-time about the x axis (short for "real time rotation x-axis").

Accessing the Command

 command bar: **rtrotx** transparent: **'rtrotx** menu bar: **View | Real-Time Motion | Real-time X** ribbon: **View | Navigate | Real-Time Y** toolbar: **Real-Time Motion|**  **: RtRotX Prompts you in the command bar:** »Press ENTER or Esc to complete, or right-click to display context menu **(Hold down the mouse's left button, and then move the mouse to rotate the drawing in real-time; press Enter to exit command.)** BricsCAD shows the rotation cursor during real-time rotation: 

Command Options

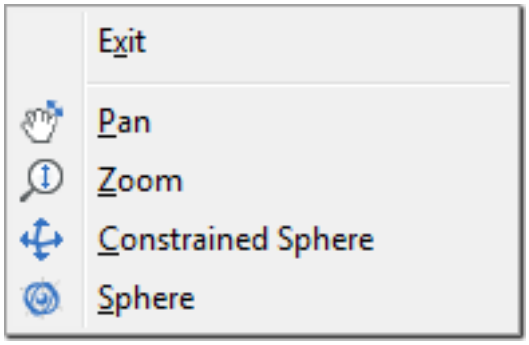
Option	Description
Enter, Esc	Exits the command.

Shortcut Menu Options

Right-click to switch viewing mode through the shortcut menu: (6.2177)

Option	Description
Exit	Exits the command.
Pan	Pans the drawing in real-time. Starts the RtPan (6.26.36) command.
Zoom	Zooms the drawing in real-time. Starts the RtZoom (6.26.42) command.
Constrained Sphere	Rotates the 3D drawing in real-time. Starts RtRotctr (6.26.38) the command.
Sphere	Rotates the 3D drawing in real-time Starts the RtRot (6.26.37) command.

Figure 6.2177

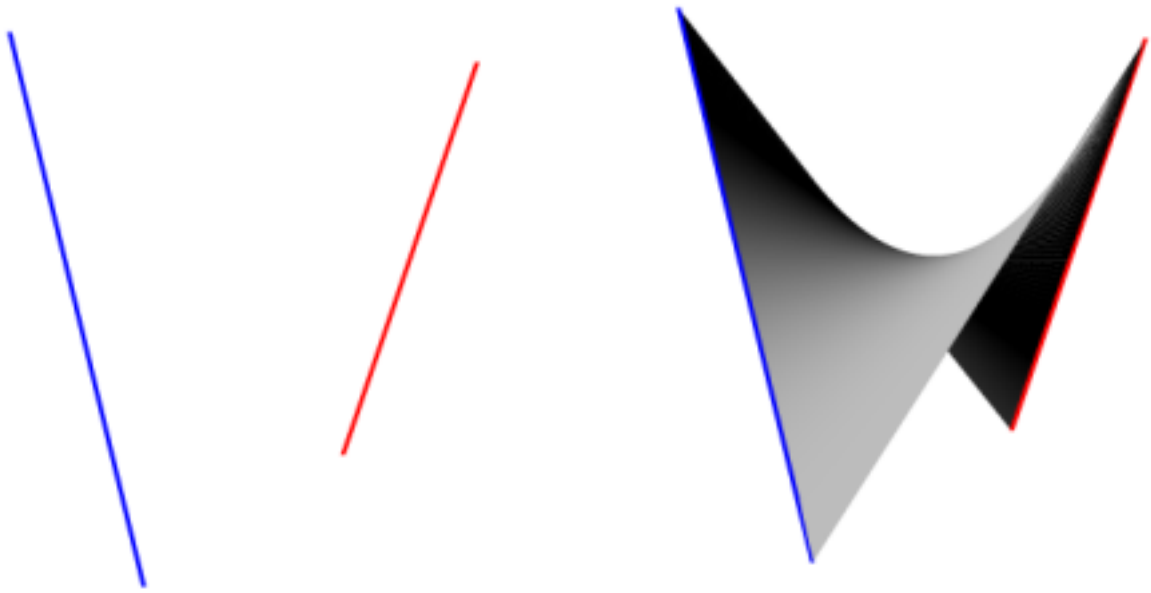


Related Commands

RtLook (6.26.40) - Look around in a 3D scene. RtRot (6.26.37) - rotates the 3D viewpoint in realtime. RtRotF (6.26.39) - rotates the 3D viewpoint in real time. RtRotCtr (6.26.38) - rotates the 3D viewpoint in real time about a user defined center point. RtRotY (6.26.41) - rotates the 3D viewpoint about the y axis in realtime. RtRotZ (6.26.44) - rotates the 3D viewpoint about the z axis in realtime. RtUpDown (6.26.46) - move up / down and left / right in a 3D scene. RtWalk (6.26.47) - walk left / right and forward / backward in a 3D scene. DdVPoint (6.10.23) - changes the 3D viewpoint of the drawing through a dialog box. VPoint (6.31.21) - changes the 3D viewpoint of the drawing through the command bar. Pan (6.24.3) and -Pan (6.24.4) - move the drawing within the current viewport. RtPan (6.26.36) - performs real-time panning of the drawing. Zoom (6.35.7) - increases and decreases the size of the drawing within the current viewport. RtZoom (6.26.42) - performs real-time zooming of the drawing.

Figure 6.2178

Figure 6.2179



6.26.51 RuleSurf

(7.3 on page 6132) Creates 3D mesh surfaces by connecting two separate linear entities (short for "ruled surfaces"). (6.2179)

Accessing the Command

command bar: **rulesurf** menu bar: **Model | Meshes | Ruled Surface** ribbon: **Model | Meshes | Ruled Surface** toolbar: **Meshes | 3D Surfaces |**  **: RuleSurf Prompts you in the command bar:** Select entity to define first end of ruled surface: **(Select an open object)** Select entity to define other end: **(Select another open object)**

Command Options

Option	Description
Select entity to define first end of ruled surface	Specifies the first boundary entity; choose any open object, such as line, arc, polyline, or spline. Closed entities and 3D entities are not accepted; prompts you: **Unable to use the selected entity. Please pick again.**
Select entity to define other end	Specifies the second boundary entity.

Grips Editing

Ruled surfaces can be edited directly through grips:

1. Select the rulesurf. Notice that it has one grip at each vertex.
2. Drag the grip to move the adjacent faces.

Related Commands

Ai_Box (6.5.7) - draws 3D boxes as mesh surfaces. Ai_Cone (6.5.8) - draws 3D cones as mesh surfaces. Ai_Cylinder (6.5.9) - draws 3D cylinders as mesh surfaces. Ai_Dish (6.5.12) - draws 3D dishes as mesh surfaces. Ai_Dome (6.5.19) - draws 3D domes as mesh surfaces. EdgeSurf (6.13.2) - draws edge surfaces as mesh surfaces. Ai_Pyramid (6.5.15) - draws 3D pyramids as mesh surfaces. RevSurf (6.26.28) - draws revolved surfaces as mesh surfaces. Ai_Sphere (6.5.17) - draws 3D spheres as mesh surfaces. TabSurf (6.29.7) - draws tabulated surfaces as mesh surfaces. Ai_Torus (6.5.20) - draws 3D donuts as mesh surfaces. Ai_Wedge (6.5.21) - draws 3D wedges as mesh surfaces.

6.27 S

6.27.1 Save

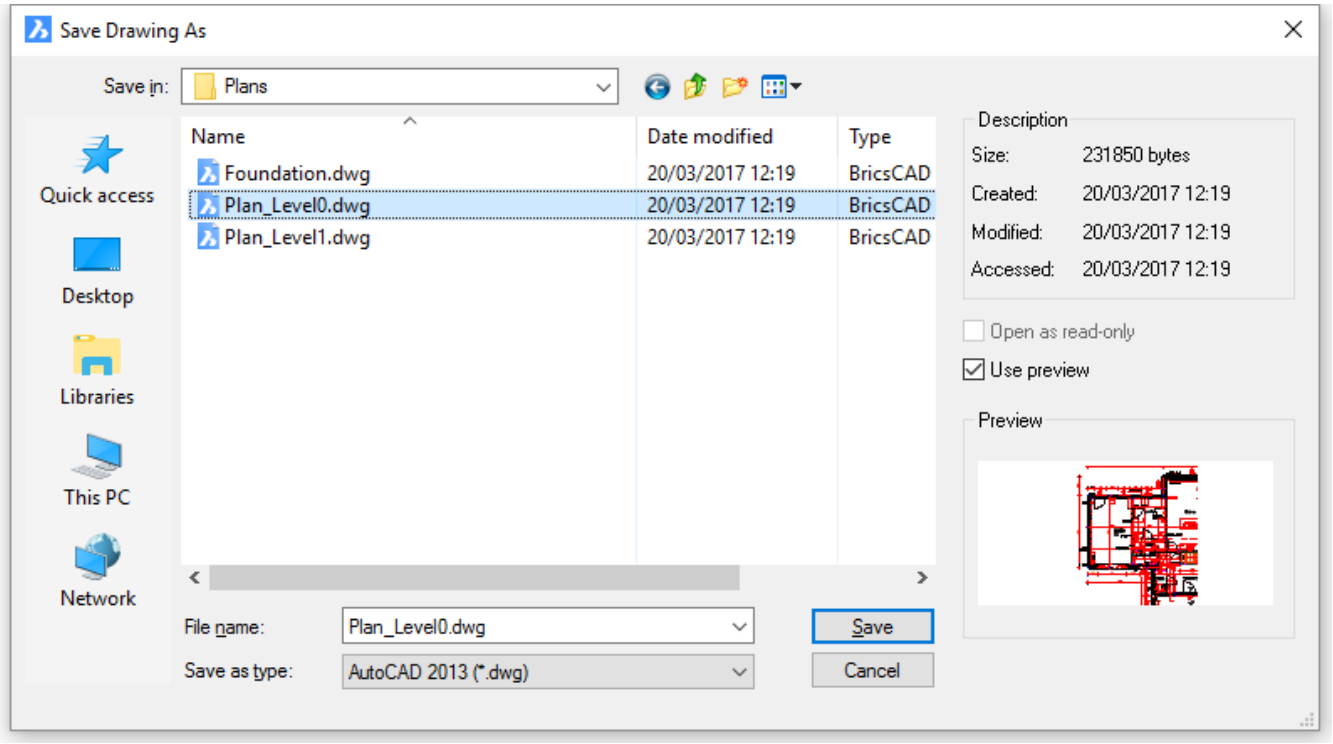
(7.3 on page 6132) Saves drawings in DWG drawing, DWT template, and DXF interchange formats; always displays a dialog box.

Figure 6.2181

Accessing the Command

 command bar: **save** shortcut: **Ctrl+S** alias: **sa** toobar: **Standard |**  ribbon: **Home | File | Save : Save** Displays a dialog box: (6.2188 on page 5372) Enter a file name, and then click **Save**. Use the QSave (6.25.4) command to save drawings without seeing this dialog box.

Figure 6.2182



Command Options

Option	Description
Save in	Selects the drive and folder in which to save the drawing. • Click the droplist to access additional locations. (6.2196 on page 5379)
File name	Specifies the name by which to save the drawing: • Accept the default **drawing.dwg** file name • Enter another name • Click the droplist to access names of previously-saved drawings: (6.2197 on page 5380)
Save as Type	Specifies the format of the saved file. Accept the default (AutoCAD 2013 .dwg) or click the droplist to choose another format. There are three basic formats: • **DWG** - drawing file • **DXF** - interchange file (ASCII or Binary) • **DWG** - template file (6.2198 on page 5380)
Use Preview	Determines whether a preview image is included with the drawing file: • **Yes** - includes the bitmap preview image, which is displayed by file managers and other programs • **No** - does not include the preview image The preview is a bitmap (raster) image of the drawing's view at the time it is saved.

Save	Saves the drawing, and then returns to the drawing editor.
Cancel	Cancels the command: does not save the drawing, and returns to the drawing editor.

6.27.4 SaveFileFolder

(7.3 on page 6132) Opens the folder in which the automatic save and backup files are being saved, usually **C:\Users\login\AppData\Local\Temp** by default. **Note:** Use this command to quickly find AC$ and BAK files, with which you can recover "lost" files.

Accessing the Command

command bar: **savefilefolder** transparent: '**savefilefolder : SaveFileFolder** Opens a file dialog box in the folder defined by the SAVEFILEPATH variable: (6.2193 on the following page) This folder holds temporary files used by many applications. This program stores the following files there:

- **.SV$** - automatic backup files made by the program automatically, at the interval defined by the SAVETIME variable (default = 60 minutes).
- **.BAK** - manual backup files made each time you save the drawing, such as by pressing **Ctrl+S** or entering commands like Save and SaveAll.

You can change the location of the backup folder by editing the value of the SAVEFILEPATH variable in the Settings (6.27.25) dialog box. You can rename the extension of these files to .DWG and then open them in a CAD program.

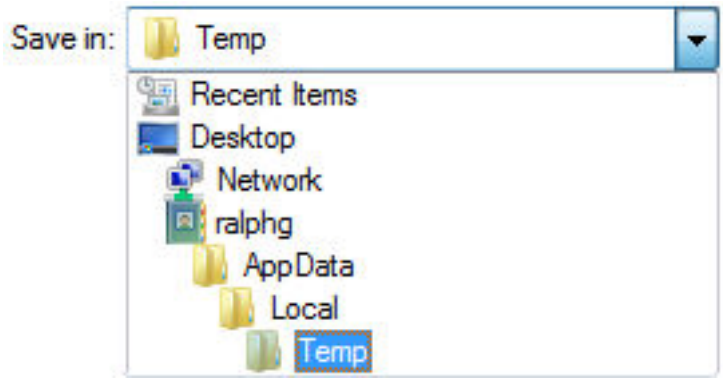

Figure 6.2197

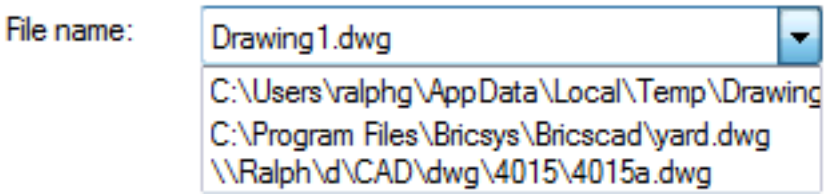

Figure 6.2198

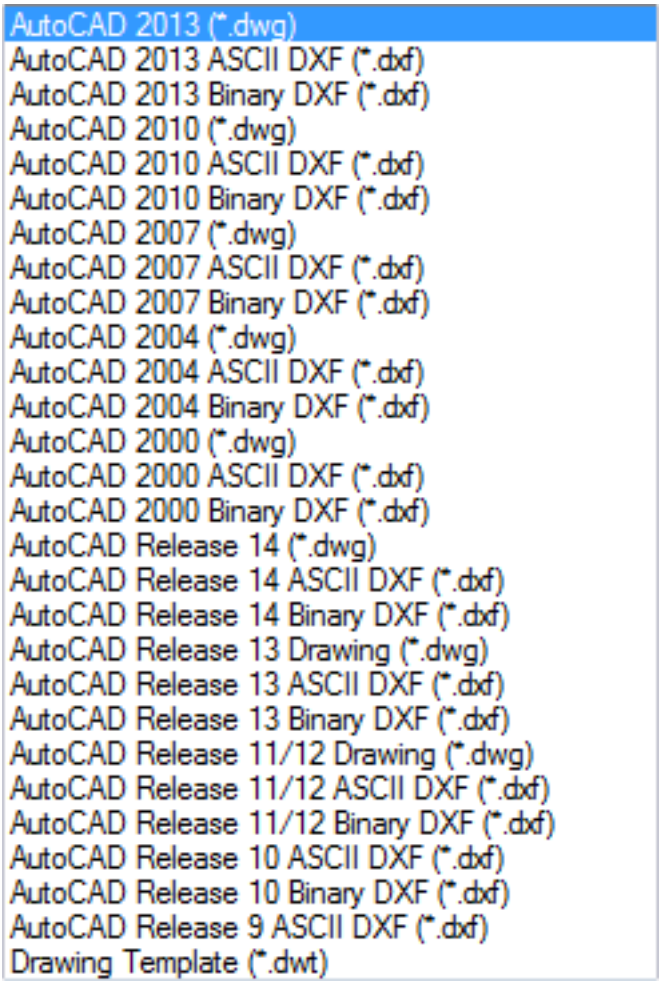

Figure 6.2199

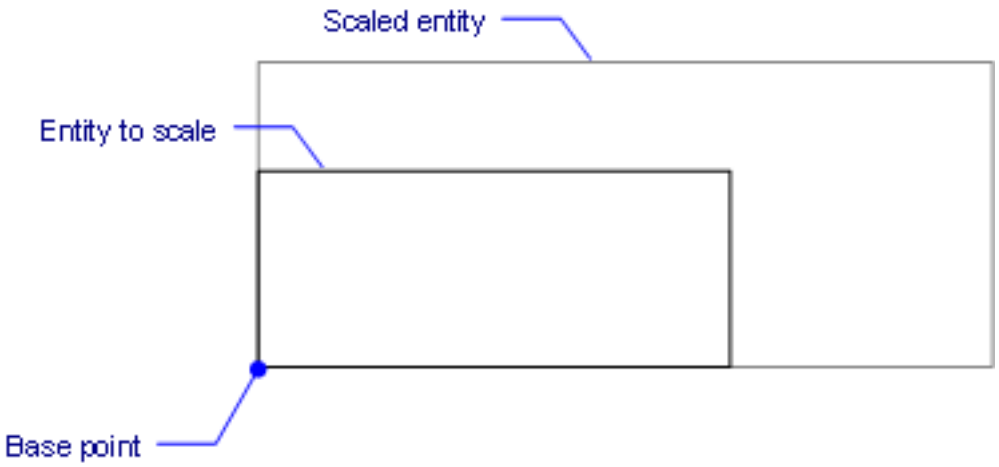

6.27.6 Scale

Resizes 2D and 3D entities. (6.2199)

Accessing the Command

 command bar: **scale** alias: **sc** menu bar: **Modify | Scale** ribbon: **Change | Modify | Scale Solid | Edit | Scale** toolbar: **Modify |**  **: Scale Prompts you in the command bar:** Select entities to scale: **(Choose one or more entities)** Entities in set: 1 Select entities to scale: **(Choose more entities, or else press Enter to continue)** Base point: **(Pick a point, or enter x,y,z coordinates)** Scale factor or [Reference/Copy] <1>: **(Enter a number, or enter an option)**

Command Options

Option	Description
Select entities to scale	Chooses the entities to be resized: • Use any selection method • Enter **all** to select all entities in the drawing • Press **Enter** to end entity selection, and carry on
Base point	Specifies the base point, the point from which the entities "grow" or "shrink": • Pick a point in the drawing • Enter x,y,z coordinates Use entity snap to pick a geometric feature accurately.
Scale factor	Specifies the scale factor: • Enter a number smaller than 1 to shrink the entities • Enter 1 to leave the entities the same size (black in the figure below) • Enter a number larger than 1 to make the entities larger (green, in the figure below) • Enter a negative number to scale the entities in the negative direction (red, in the figure) (6.2200 on page 5383)

Copy	Scales a copy of the selection set, leaving the original entities intact.
Reference	Resizes entities using a base or **reference** scale; prompts you: 1. **Reference scale <1>** - **(enter a scale factor, or pick two points.)** 2. **New scale <1>** - **(enter the new scale factor.)** Use this option to scale entities relative to other entities. For example, pick two points on an existing entity; when you pick two points, BricsCAD prompts you: **Second point** - **(pick another point.)** This command normally scales from a base factor of 1.

Procedures

- To scale a selection set (1.32.25)
- Scaling an entity using a base scale (1.32.25)
- To scale entities using grips (1.32.3)

Related Commands

Align (6.4.7) - scales one entity with another. Insert (6.17.13) - scales blocks. Print (6.24.51) - scales drawings upon plotting.

Figure 6.2200

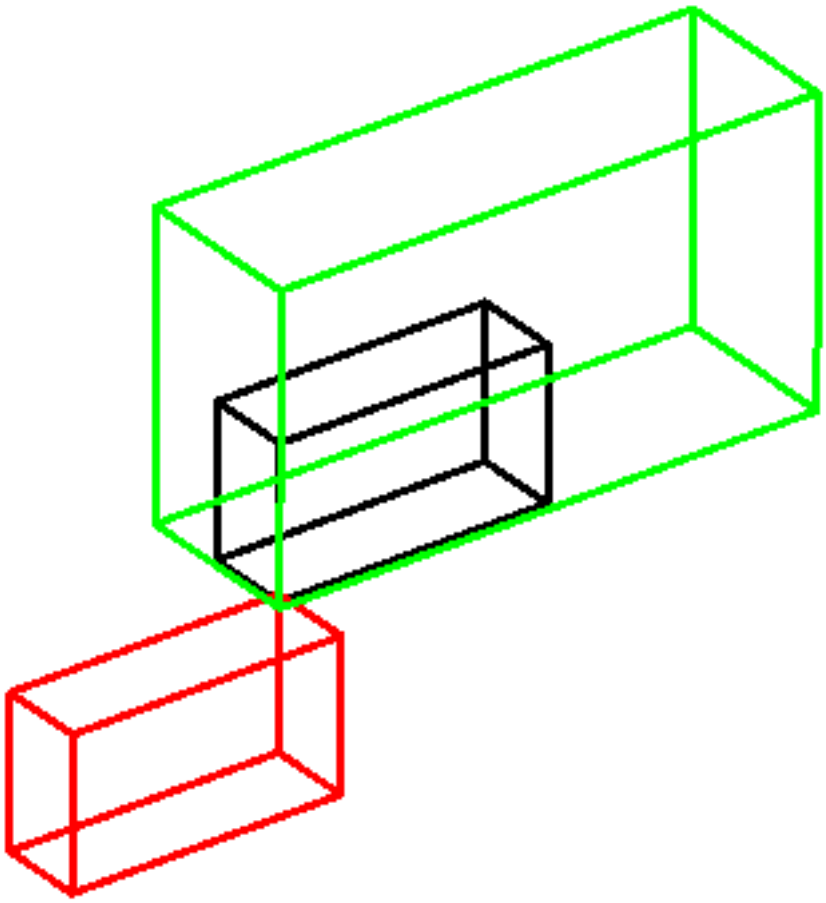

Figure 6.2201

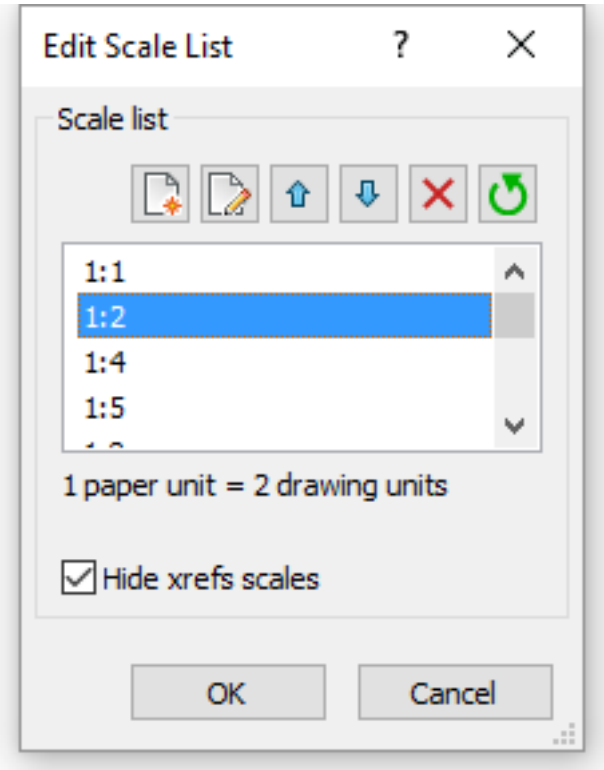
6.27.7 ScaleListEdit

(6.2981 on page 6079) Edits the list of scale factors displayed by commands, such as Print and PageSetup, and by annotative scale factors.

Accessing the Command

command bar: **scalelistedit** status bar: right-click **Annotation Scale** and choose **Custom : ScaleListEdit** Displays a dialog box: (6.2202 on the next page)

Figure 6.2202



Command Options

Option	Description
Scale List	Lists the scale factors that are displayed by other commands. To add and remove scale factors, click the buttons: • **Add a New Scale** - adds a scale factor to the list; see below • **Edit Scale** - edits the factors of an existing scale; see below • **Move Up** - moves the selected factor up the list • **Move Down** - moves the selected factor down the list • **Delete the Selected Scale** - deletes the selected factor(s); hold down the **Ctrl** key to select and delete more than one factor at a time. Scale 1:1 cannot be deleted. • **Reset** - returns the list to its original pristine condition, adding back in the deleted factors and removing those that were added but are not being used

 Add a New Scale	Displays a dialog box: (6.2203 on the facing page) 1. **Name appearing in scale list** - **(type a name , such as the scale factor itself (1:333) or a descriptive name, like Triple-Treat.)** 2. **Scale properties** - **(specify the scale factor in paper (size when plotted) and drawing units.)** 3. **OK** - adds the scale to the list
 Edit Scale	Displays a dialog box: (6.2204 on the next page) 1. **Name appearing in scale list** - **(edit the name.)** 2. **Scale properties** - **(change the scale factors in paper (size when plotted) and/or drawing units)** 3. **OK** - save the changes to the list
Hide xrefs scales	Determines if scale factors from xrefs are displayed in this list: • **Yes** - scale factors from externally-referenced drawings are not shown in this list • **No** - scales in the attached xrefs not in the current drawing are listed here. Toggles the HIDEXREFSCALES variable.
OK	Saves the changes made to the list, and then closes the dialog box.
Cancel	Closes the dialog box without saving the changes you made.

Related Commands

ObjectScale (6.23.1) - adds or removes supported scales for annotative entities through a dialog box. -ObjectScale (6.23.2) - adds or removes supported scales for annotative entities at the command line. Print (6.24.51) - prints drawings to plotters and files through a dialog box. PageSetup (6.24.2) - creates and edits page setups for plotting drawings in the Drawing Explorer. -ScaleListEdit (6.27.20) - edits the scale list of a drawing in the command bar.

Figure 6.2211

6.27.11 Section

(6.2880 on page 5977) Creates section planes of 3D solids, surfaces, polyface meshes, and 3D faces; the result is a slice made of region entities. (6.2215 on page 5398)

Accessing the Command

command bar: **section** alias: **sec** menu bar: **Model | 3D solids| Section** toolbar: **3D Solids | Section : Section Prompts you in the command bar:** Select entities: **(Choose one or more 3D entities)** Entities in set: 1 Select entities: (**Choose more 3D entities, or else press Enter to continue.)** Specify first point on section plane or Object/Zaxis/View/XY/YZ/ZX: **(Enter an option.)** Specify a point on the current view plane <0,0,0>: **(Pick a point, or enter x,y,z coordinates)** Section made in the current view plane (left); section made of a region (right) (6.2212 on the facing page) (6.2213 on the next page)

Figure 6.2212

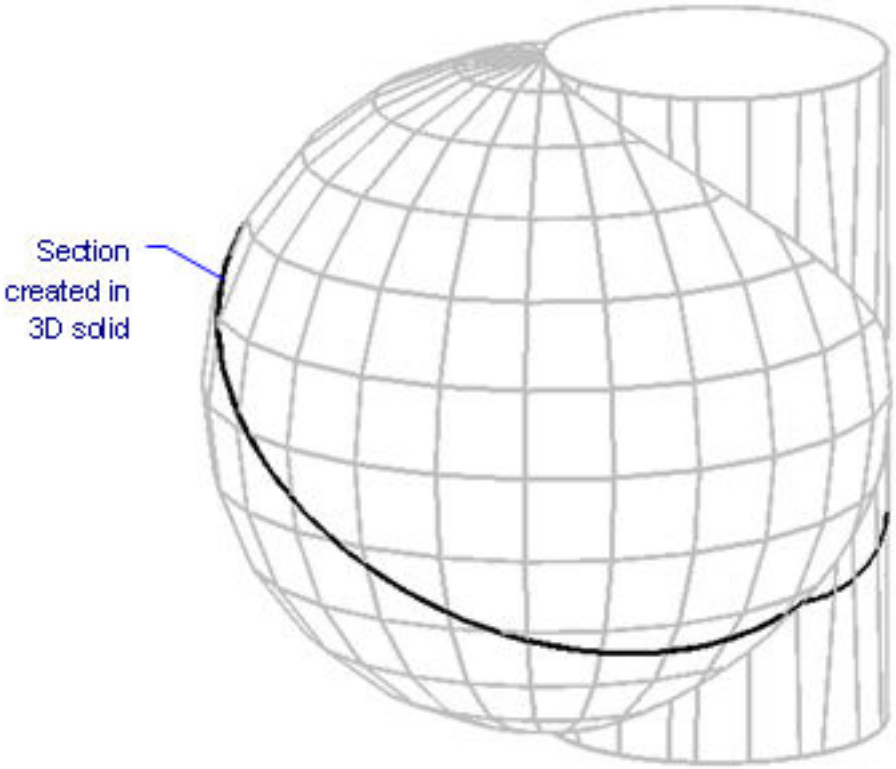

Figure 6.2213

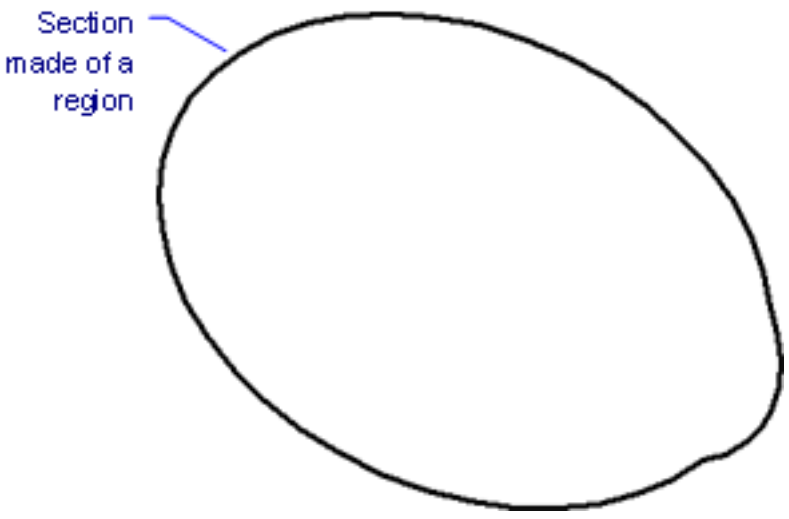
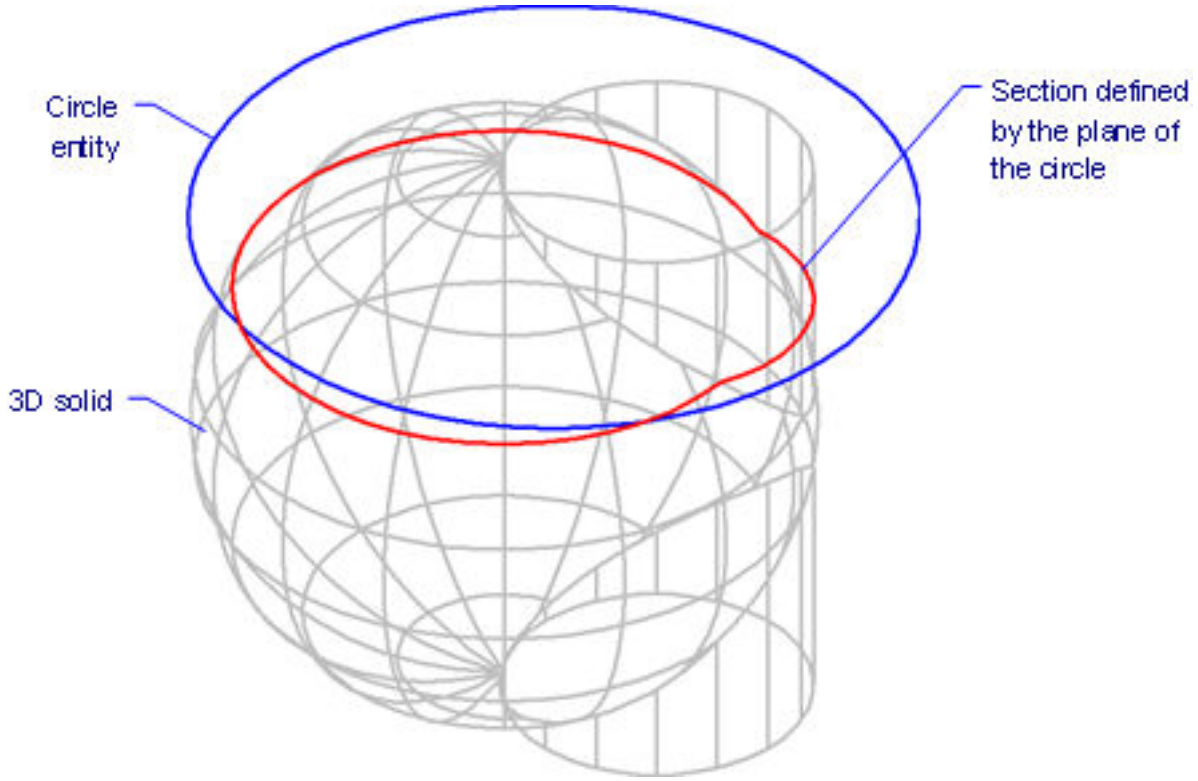


Command Options

Option	Description
Select entities	Specifies one or more 3D entities from which the section is created: • 3D solids • 3D surfaces • 3D polyface meshes • 3D faces
Specify first point on section plane	Pick a point to specify the location of the plane in which the section lies; prompts you: 1. **Specify second point on plane - (pick another point.)** 2. **Specify third point on plane - (pick a third point, as three points define a plane.)**
Object	Creates the section from entities that intersect the 3D solid; prompts you: **Select a circle, ellipse, arc, 2D-spline, or 2D-polyline - (choose an entity; you can also use elliptical arcs.)** The entity defines the plane through which to create the section. (6.2215 on page 5398)
Zaxis	Creates a section in the plane defined by one point on the plane, and a second on the plane's normal (z axis); prompts you: 1. **Specify a point on the section plane - (pick a point to define the location of the section plane.)** 2. **Specify a point on the Z-axis (normal) of the plane - (pick another point to locate the normal, which determines the angle of the plane.)**
View	Creates a section in the plane of the current 3D viewpoint; prompts you: **Specify a point on the current view plane - (pick a point to define the height of the section.)** This is probably the easiest of the options.
XY	Creates a section parallel to the x,y plane; prompts you: **Specify a point on the XY-plane - (pick a point to define the height of the section above or below the x,y plane.)** (6.2216 on page 5399)
YZ	Creates a section parallel to the y,z plane; prompts you: **Specify a point on the YZ-plane - (pick a point to define the height of the section above or below the y,z plane.)**
ZX	Creates a section parallel to the z,x plane; prompts you: **Specify a point on the ZX-plane - (pick a point to define the height of the section above or below the z,x plane.)**

Figure 6.2214



Related Commands

Interfere (6.17.17) - creates 3D volumes of intersecting 3D solid models. Intersect (6.17.20) - removes volumes not in common between two solid models. Slice (6.27.40) - cuts 3D solids into two parts. Subtract (6.27.58) - removes one solid model from a second. Union (6.30.6) - joins two or more solid models into a single entity. ClipDisplay (6.9.22) - toggles the Clip Display property of a section plane or a BIM section entity. BimSection (6.7.54) - creates a BIM section entity. BimSectionOpen (6.7.49) - opens the drawing file related to a BIM section entity; or the 3D BIM model related to a BIM section drawing. BimSectionUpdate (6.7.43) - exports or updates the result of a BIM section in a drawing. LiveSection (6.20.43) - switches the **Live Section** property of a section plane on or off. SectionPlane (6.27.18) - creates a section entity that creates sections of 3D solids, 3D Faces, and Surfaces. SectionPlaneSettings (6.27.12) - defines the properties of a section plane entity in the Drawing Explorer - Section Planes dialog. SectionPlaneToBlock (6.27.13) - saves the selected section plane to a 2D cross section / elevation block or a 3D cutaway section block.

Figure 6.2215

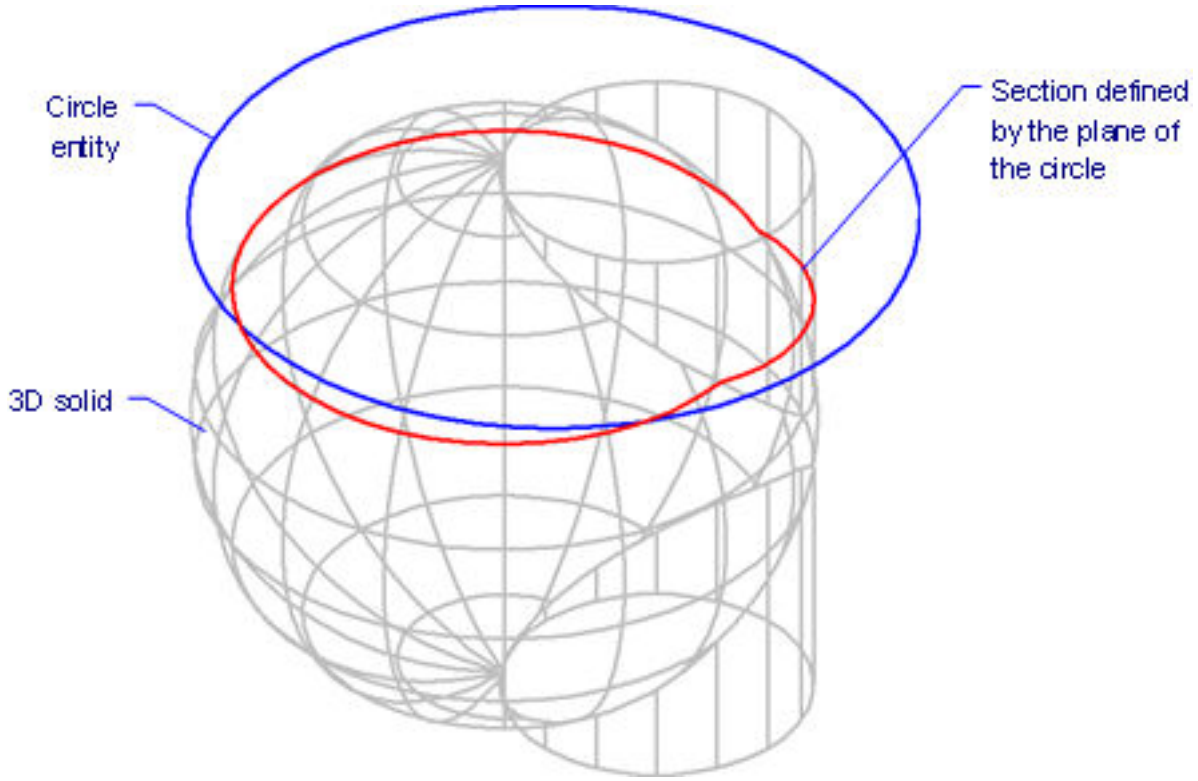


Figure 6.2216

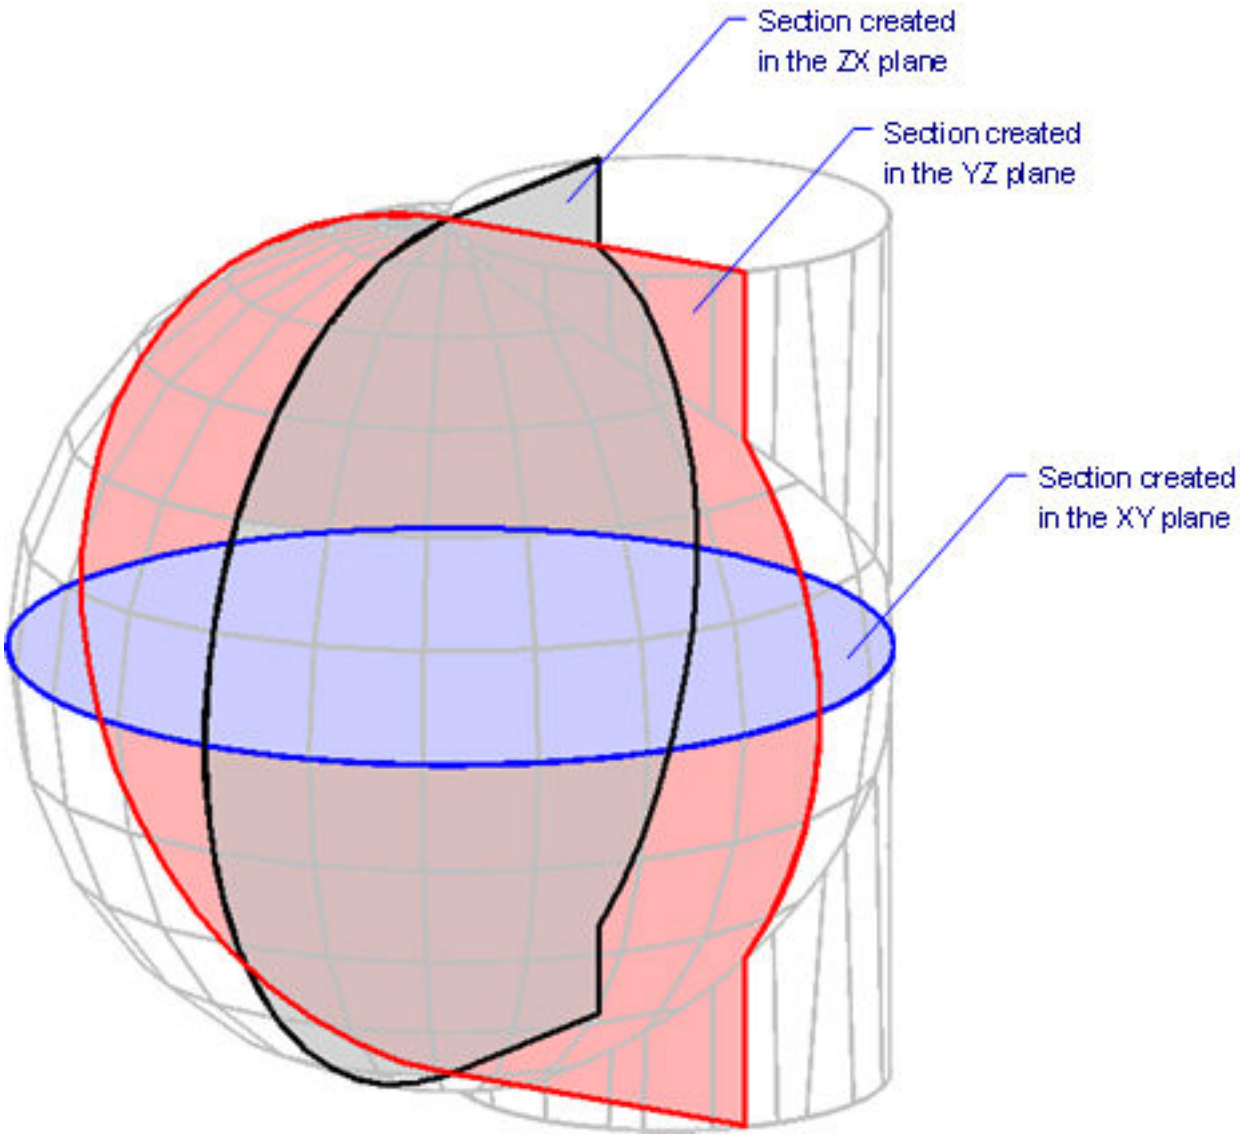

Figure 6.2217

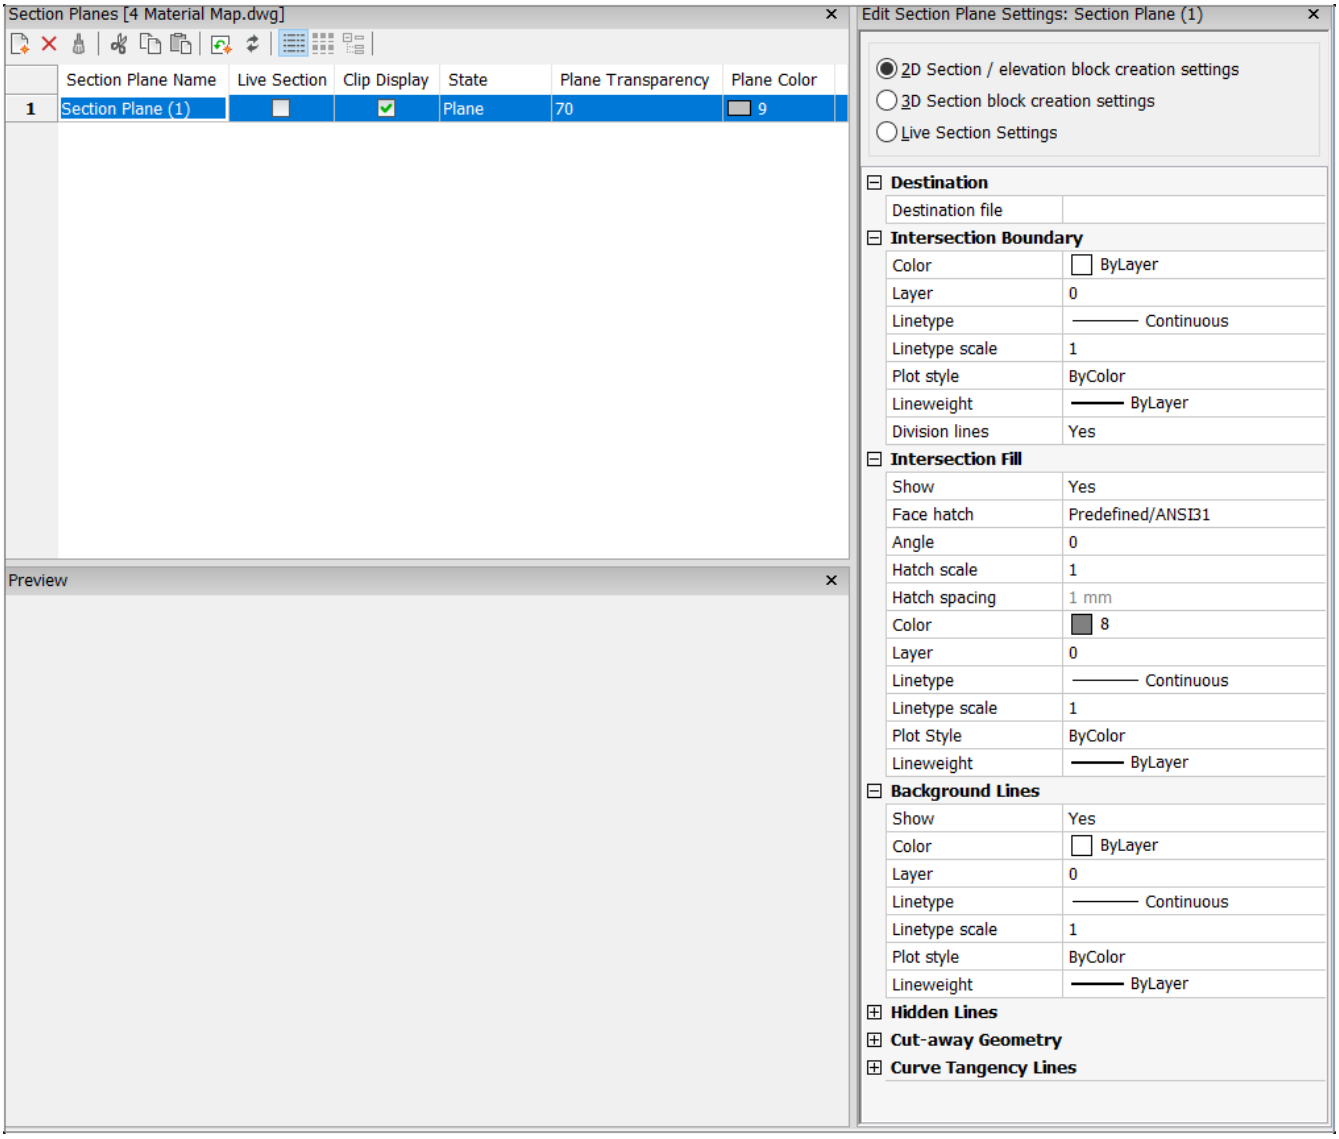
6.27.12 SectionPlaneSettings

(6.2981 on page 6079) Creates and edits properties of named section planes, through a dialog box. **Note:** Section planes are created with the SectionPlane (6.27.18) command.

Accessing the Command

command bar: **sectionplanesettings** menu bar: **Tools | Drawing Explorer | Section Planes Model | Direct Modeling | Sections | Section Plane Settings** ribbon: **Home | Settings | Drawing Explorer | Section Planes** toolbar: **sections |**  **: SectionPlaneSettings** Displays the Section Plane section of the Drawing Explorer dialog box: (6.2218 on the next page)

Figure 6.2218



Toolbar Options

Option	Description
 New	Creates new sections planes; see the SectionPlane (6.27.18) command.
 Delete	Deletes the currently selected section plane definition without warning

Header Options

Option	Description
Section Plane Name	Names the section plane; double click the field to rename it.
Live Section	Determines whether the section plane is of the live variety: • **On** - the section is a live one, and so can be edited interactively • **Off** - section plane cannot be edited directly
Clip Display	Determines whether the section plane clips the 3D model: • **On** - the model is clipped by the section plane • **Off** - the model is not clipped
State	Determines the state of the section plane: 1. Click the field 2. From the droplist, choose another state: • **Plane** - shows the cutting plane as a plane that extends infinitely in all directions. When cutting plane is covert to Plane state, the first segment of a jogged section plane entity defines the properties of the cutting plane. (6.2219 on page 5404) • **Boundary** - the cutting plane is a 2D box, indicating the extents of the cutting plane in the XY-plane. The cutting plane extends infinitely in the Z direction. (6.2220 on page 5404) • **Volume** - the cutting plane is a 3D box, indicating the 3D extents of the cutting plane, display (6.2221 on page 5404)
Plane Transparency	Specifies the level of transparency of the cutting plane: 1. Click the field 2. Enter a different level of transparency, from 0 (opaque) to 90 (nearly transparent)

Plane Color	Sets the color of the cutting plane in the drawing. 1. Click the field 2. In the Select Color dialog box, choose another color 3. Click **OK** See the Color (6.9.19) command.

Edit Panel Options

When you select two or more section plane names, you can edit their properties simultaneously in this panel

Edit Panel Option	**Description**
Type	Specifies the type of section plane: • **2D Section / elevation block creation settings** - specifies properties for 2D sections and elevations • **3D Section block creation settings** - specifies properties for 3D sections • **Live Section Settings** - specifies properties for live sections A different set of properties are available for each type of section plane, and each type can look different in drawings.
2D Section / elevation block creation settings	Sets the properties of 2D sections and elevations (used by the BIM module): (6.2222 on page 5405)
3D Section block creation settings	Sets the properties of 3D sections: (6.2223 on page 5406)
Live section settings	Sets the properties of live sections: (6.2224 on page 5407)

Related Commands

LiveSection (6.20.43) - switches the **Live Section** property of a section plane on or off. Section (6.27.11) - creates section planes of 3D solids; the results are region entities. SectionPlane (6.27.18) - creates a section entity that creates sections of 3D solids. SectionPlaneToBlock (6.27.13) - saves the selected section plane to a 2D cross section / elevation block or a 3D cutaway section block. Explorer (6.13.15) - Opens the Drawing Explorer dialog box.

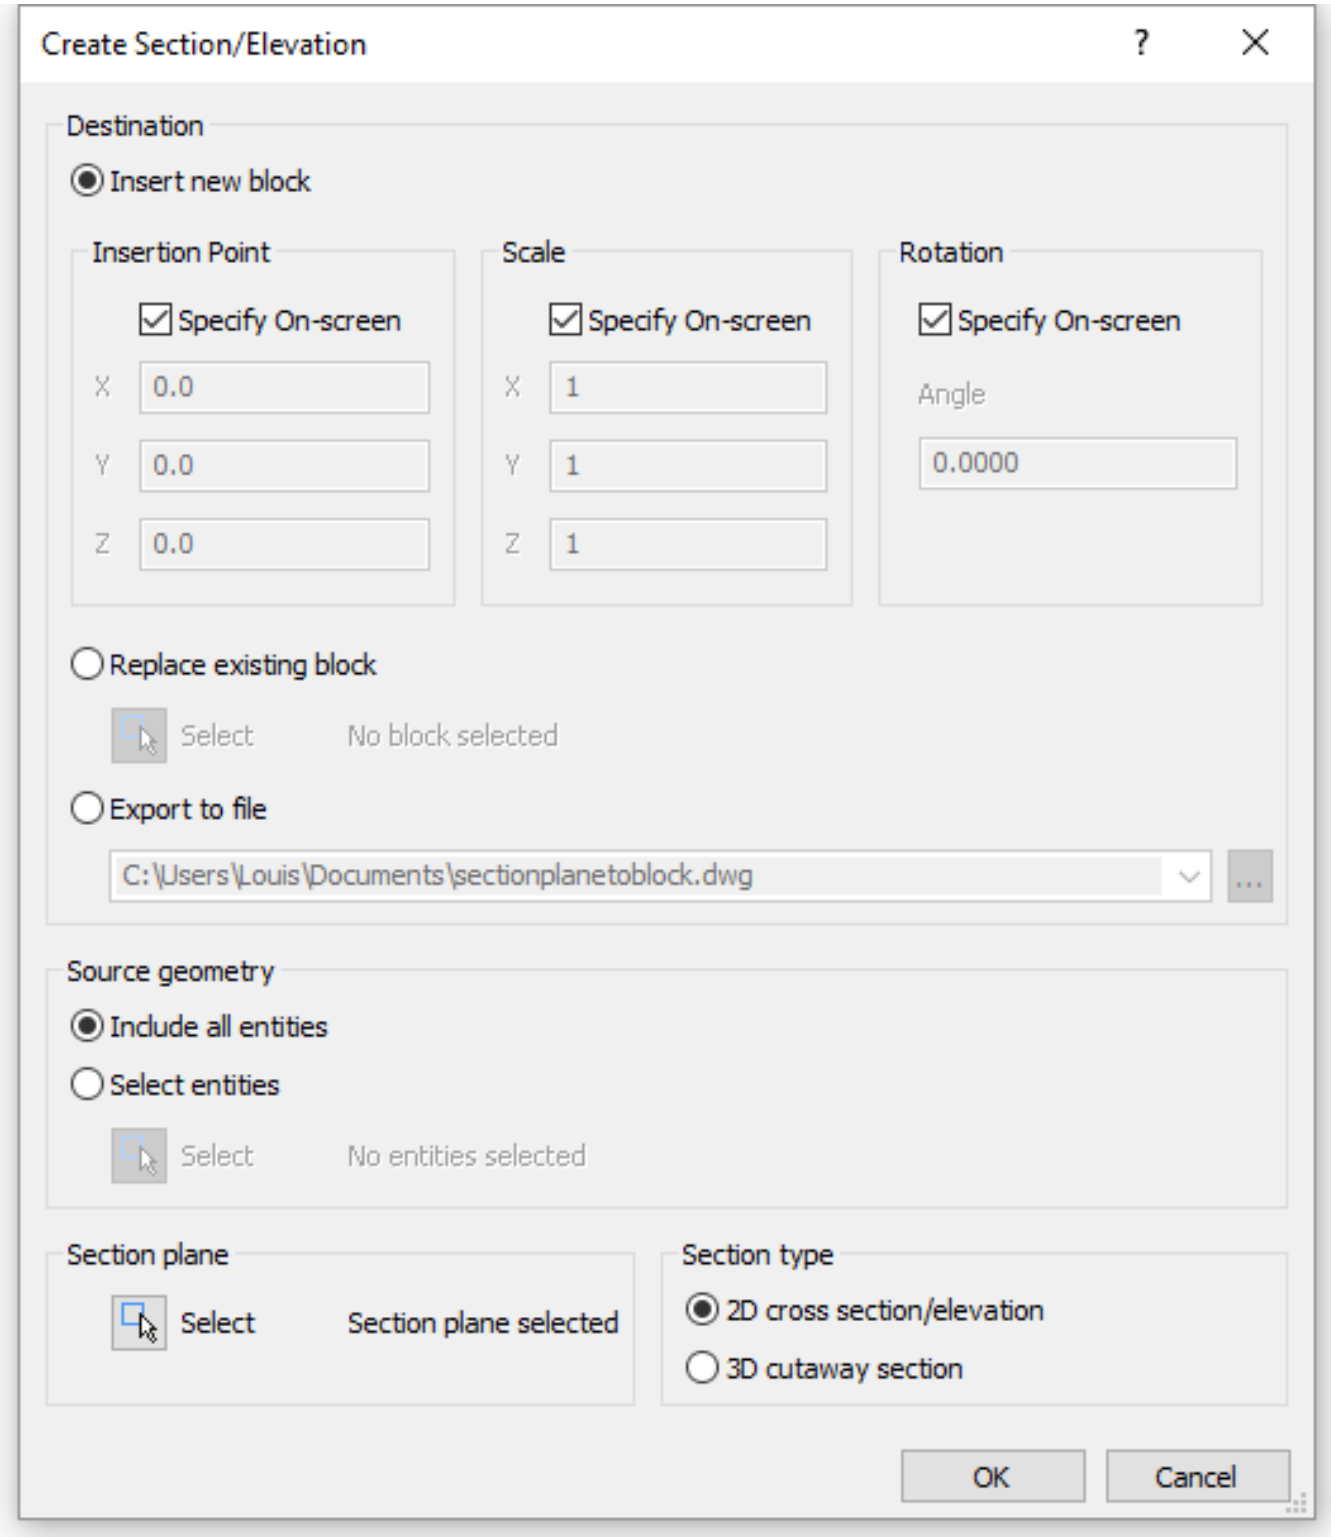
6.27.13 SectionPlaneToBlock

(6.2880 on page 5977) Saves section planes as blocks inserted in the current drawing (see below, at right) or saved to disk as DWG files. (6.2226) **Note:** Section planes are created with the SectionPlane (6.27.18) command.

Accessing the Command

command bar: **sectionplanetoblock** menu bar: **Model | Sections | Section plane to block** ribbon: **Model | Sections | Section Plane | Section Plane to Block** toolbar: **Sections |**  **: SectionPlaneToBlock** Displays a dialog box: (6.2227 on the facing page)

Figure 6.2227



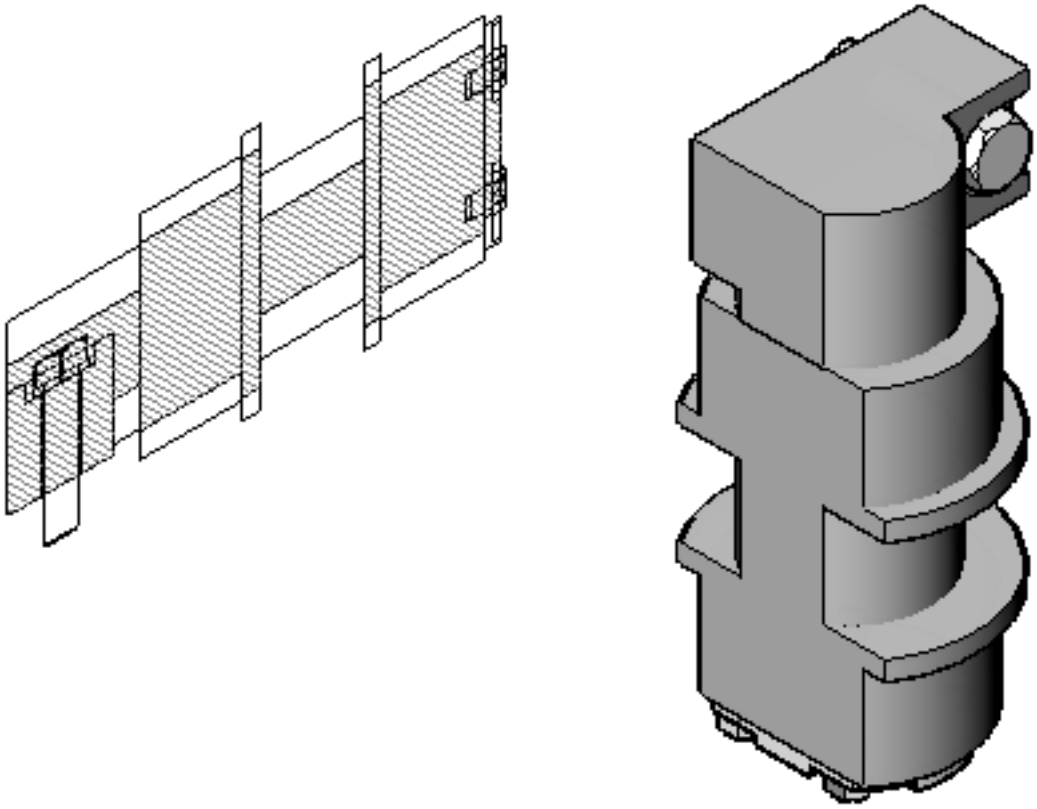
Dialog Box Options

Option	Description
Destination	Defines where the block will be placed: **Insert New Block** - converts the section plane geometry as a block, and then inserts it into the current drawing: • **Insertion point** - specify the insertion point after you dismiss this dialog box, or else enter the insertion point coordinates as X, Y, and Z • **Scale** - specify the scale factor after you dismiss this dialog box, or else enter individual scale factors for the X, Y, and Z directions • **Rotation** - specify the rotation angle after you dismiss this dialog box, or else enter an angle now **Replace Existing Block** - replaces a block that already sits in the drawing: • **Select** - selects the block to replace; use this option to update changed sections **Export to File** - saves the block as a file: • **Browse** - choose the folder in which to save the block, and whether to save the file in DWG or DXF format
Source geometry	Determines how many of the entities in the drawing will be included: **Include all entities** - all 3D geometry in the drawing is processed; this command works with 3D solids, 3D surfaces, polyface meshes, and 3D faces. **Select entities** - chooses the entities to include: • Select ( ) prompts you to select entities; **(press Enter to return to this dialog box.)**
Section plane	Selects the section plane to be converted to a block: **Select**) - prompts you to select entities; **(press Enter to return to this dialog box.)**
Section type	Determines the kind of section plane block to create; shown below is a 2D cross section (left) and 3D cross section (right) (6.2228 on the next page) **2D cross section/elevation** - block is created used the 2D section settings defined by the SectionPlaneSettings (6.27.12) dialog box **3D cutaway section** - block is created used the 3D settings defined by the SectionPlaneSettings (6.27.12) dialog box
OK	Closes the dialog box; when this command is creating a block, you are prompted to specify its insertion point, scale factor(s), and rotation angle.

Procedures

- Working with sections (1.26.4)
- To export a section to a file (1.26.4)

Figure 6.2228



Related Commands

LiveSection (6.20.43) - switches the **Live Section** property of a section plane on or off. Section (6.27.11) - creates section planes of 3D solids, 3D Faces, and Surfaces; the results are region entities. SectionPlane (6.27.18) - creates a section entity that creates sections of 3D solids, 3D Faces, and Surfaces. SectionPlaneSettings (6.27.12) - defines the properties of a section plane entity in the Drawing Explorer - Section Planes dialog.

Figure 6.2229

6.27.14 Security

(6.2880 on page 5977) * Command only available on the Windows platform Sets the security level to Low, Medium, High or Very High to determine whether VBA macros are allowed to run automatically. **Note:** This command helps protect your computer, because Microsoft's design of VBA applications allows them to run destructive code, which can damage files on your computer. See the VbaSecurity (6.32.8) command.

Figure 6.2230

6.27.15 SecurityOptions

(6.2981 on page 6079) * Command only available on the Windows platform Sets a password to protect your drawing from unauthorized access. **Note:** If you forget the password, you can no longer open the drawing.

Accessing the Command

command bar: **securityoptions** menu bar: **File | Drawing Utilities | Security Options : SecurityOptions** Displays a dialog box: (6.2231)

1. Enter a password, and then click **OK**. A dialog box displays: (6.2232 on the next page)
2. Confirm the password, and then click **OK**.

Figure 6.2231

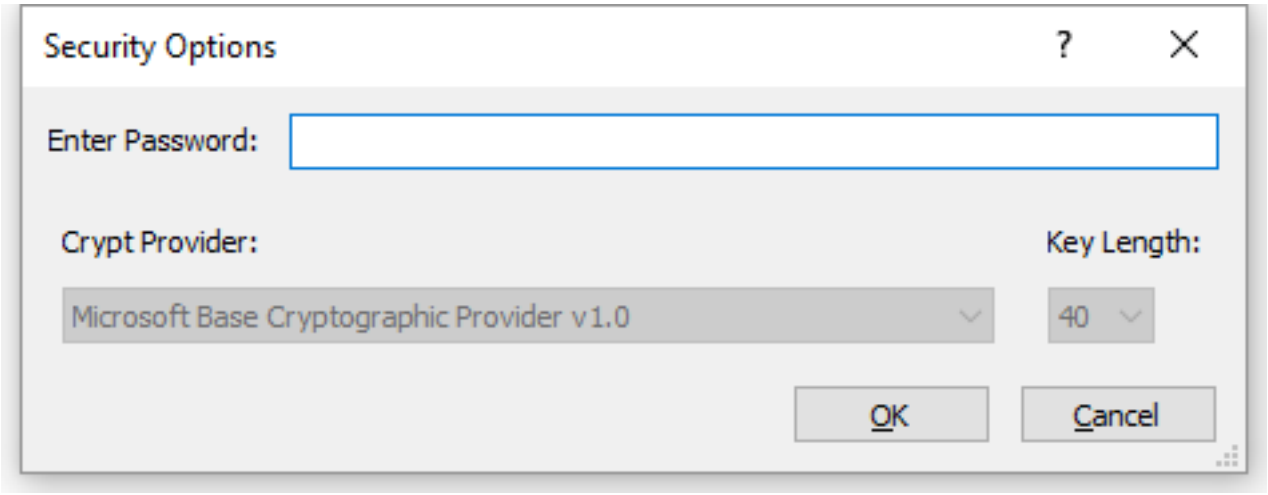


Figure 6.2232

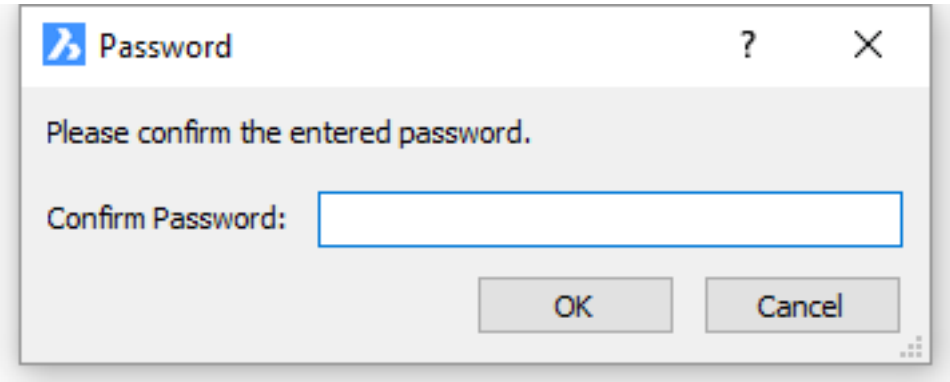

Dialog Box Options

Option	Description
Enter password	Enter one or more characters; you cannot see what you are writing, unfortunately, as the characters are turned into dots.
Crypt Provider	Specifies the encryption level for **drawing properties**. Choose an encryption provider supplied the operating system. (6.2233)
Key Length	Select a length for the encryption key: The longer the key, the higher the level of protection is, because it takes longer to break the encrypted password.
Confirm Password	Enter the same password, and then click **OK**.

Procedures

- To set the password (1.19.5)
- To remove the password (1.19.5)

Related Commands

Dwgprops (6.10.46): opens the Drawing Properties dialog box QSave (6.25.4) - saves the drawing without displaying the Save dialog box. Save (6.27.1) - saves the current drawing through a dialog box. SaveAll (6.27.2) - saves all open drawings. Open (6.23.8): opens a drawing WhoHas (6.33.8) - reports the ownership of a drawing file.

Figure 6.2233

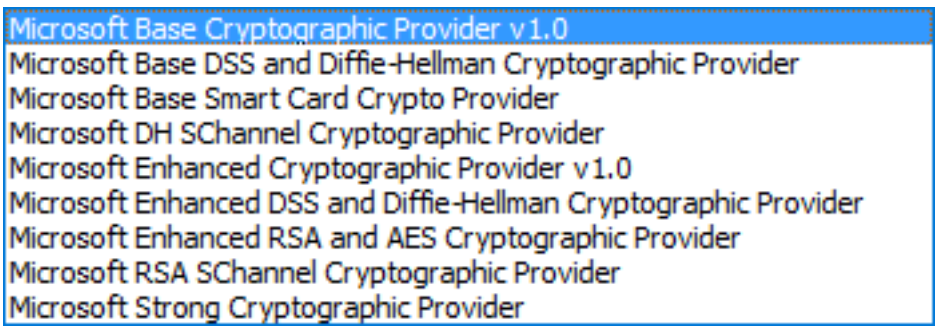

Figure 6.2234

6.27.16 Select

(7.3 on page 6132) Selects one or more entities through a variety of selection methods **Note:** You access the selection set during subsequent commands with the Previous option.

Accessing the Command

command bar: **select** shortcut: **Ctrl+A** selects all entities on non-frozen layers ribbon: **Home | Settings | Select : Select Prompts you in the command bar:** Select entities to include in set: **(Choose one or more entities)** Entities in set: 1 Select entities to include in set: **(Choose more entities, or else press Enter to end the command)** To see a list of the selection modes, press ? at the prompt: Select entities to include in set: **(Press ?)** Select entities: ALL/ Add/ +/ Remove/ -/ Previous/ Last/ Window/ Crossing/ Outside/ WPolygon/ CPolygon/ OPolygon/ WCircle/ CCircle/ OCircle/ Box/ POint/ Fence/ AUto/ Multiple/ Single/ PROperties/ Dialog/ Undo/ Group: **(Enter an option)**

Command Options

Option	Description
Select entities to include in set	Chooses entities to add to the selection set; use one of methods listed below. As you add entities to the selection set, the program highlights them with dashes, as shown below: (6.2235 on page 5422)
ALL	Selects all entities in the drawing, except for those on frozen layers.
Add **and +**	(Used after the Remove option.) Adds additional entities to the selection set; prompts you: 1. **Select entities to include in set - (add one or more entities to the selection set.)** 2. **Select entities to include in set - (enter an option:)** • Add more entities to the selection set • Enter another selection option, such as Remove • Press **Enter** to end the command
Remove **and -**	Removes entities from the selection set; as you remove entities from the selection set, the program unhighlights them Prompts you: 1. **Subtract entities from selection set - (select one or more entities to remove from the selection set.)** 2. **Subtract entities from selection set - (enter an option:)** • Select more entities to remove from the selection set • Enter another selection option, such as Add • Press **Enter** to end the command

Previous	Add the entities from the previous selection to the current select set, and then continues with the 'Select entities to include in set' prompt.
Last	Adds the last entity drawn to the selection set, and then continues with the 'Select entities to include in set' prompt.
Window	Selects all entities that are entirely inside a rectangular selection window; prompts you: 1. **First corner of inclusive window - (specify the first point of the selection rectangle.)** 2. As you move the cursor, the program draws a rectangle filled with transparent blue 3. **Opposite corner - (specify the other corner)** (6.2236 on page 5422) All entities fully within the rectangle are added to the selection set; the command continues with the 'Select entities to include in set' prompt.
Crossing	Selects all entities that are inside of and cross a rectangular selection window; prompts you: 1. **First corner of crossing window - (specify the first point of the selection rectangle with a pick point or x,y coordinates.)** 2. As you move the cursor, the program draws a dashed rectangle filled with transparent green 3. **Opposite corner - (specify the other corner.)** (6.2237 on page 5422) All entities inside the rectangle and crossing it are added to the selection set; the command continues with the 'Select entities to include in set' prompt.
Outside	Selects all entities fully outside a rectangular selection window; prompts you: 1. **First corner of crossing window - (specify the first point of the selection rectangle with a pick point or x,y coordinates.)** 2. As you move the cursor, the program draws a dashed rectangle 3. **Opposite corner - (specify the other corner.)** (6.2238 on page 5423) All entities fully outside the rectangle are added to the selection set; the command continues with the 'Select entities to include in set' prompt.

WPolygon (Windowed polygon)

Selects all entities fully inside a polygonal selection window; prompts you:

1. **First vertex of inclusive polygon - (specify the first point of the selection polygon.)**
2. **Next vertex - (specify the next point.)**
3. As you move the cursor, the program draws the outline of a polygon filled with transparent blue
4. **Next vertex - (pick another point, or else press Enter to close the polygon.)**

(6.2239 on page 5423) All entities fully within the polygon are added to the selection set; the command continues with the 'Select entities to include in set' prompt.

CPolygon (Crossing polygon)

Selects all entities inside and crossing a polygonal selection window; prompts you:

1. **First vertex of crossing polygon - (specify the first point of the selection polygon.)**
2. **Next vertex - (specify the next point.)**
3. As you move the cursor, the program draws the outline of a dashed polygon filled with transparent green
4. **Next vertex - (pick another point, or else press Enter to close the polygon.)**

(6.2240 on page 5423) All entities inside the polygon and crossing it are added to the selection set; the command continues with the 'Select entities to include in set' prompt.

OPolygon (Outside polygon)

Selects all entities fully outside a polygonal selection window; prompts you:

1. **First vertex of outside polygon - (specify the first point of the selection polygon.)**
2. **Next vertex - (specify the next point.)**
3. As you move the cursor, the program draws the outline of a polygon
4. **Next vertex - (pick another point, or else press Enter to close the polygon.)**

(6.2241 on page 5423) All entities fully outside the polygon are added to the selection set; the command continues with the 'Select entities to include in set' prompt.

WCircle (Windowed circle)	Selects all entities fully inside a circular selection window; prompts you: 1. **Center of circle - (pick a center point or specify x,y coordinates.)** 2. As you move the cursor, the program draws the outline of a circle filled with transparent blue 3. **Radius of circle - (specify a radius by picking or entering a value.)** (6.2242 on page 5424) All entities fully within the circle are added to the selection set; the command continues with the 'Select entities to include in set' prompt.
CCircle (Crossing circle)	Selects all entities inside and crossing a circular selection window; prompts you: 1. **Center of circle - (pick a center point or specify x,y coordinates.)** 2. As you move the cursor, the program draws the outline of a dashed circle filled with transparent green 3. **Radius of circle - (specify a radius by picking or entering a value.)** (6.2243 on page 5424) All entities inside the circle and crossing it are added to the selection set; the command continues with the 'Select entities to include in set' prompt.
OCircle (Outside circle)	Selects all entities fully outside a circular selection window; prompts you: 1. **Center of circle - (pick a center point or specify x,y coordinates.)** 2. As you move the cursor, the program draws the outline of a circle 3. **Radius of circle - (specify a radius by picking a point, or entering a value.)** (6.2244 on page 5425) All entities fully outside the circle are added to the selection set; the command continues with the 'Select entities to include in set' prompt.
Box	Selects entities depending on the direction you move the cursor: • Right to left - Box acts like Crossing mode; see Crossing mode • Left to right - Box acts like Window mode; see Window mode

POint	Selects all closed entities surrounding the pick point, such as all walls of a room; prompts you: **Point to locate entity around** - **(specify a point inside closed objects.)**  All closed entities outside the pick point are added to the selection set; the command continues with the 'Select entities to include in set' prompt.
Fence	Selects all entities that cross the fence selection lines; prompts you: 1. **First point of fence** - **(specify the first point of the selection line.)** 2. **Next vertex** - **(specify the next point.)** 3. As you move the cursor, the program draws a dashed polyline 4. **Next vertex** - **(pick another point, or else press Enter to close the polygon.)** (6.2245 on page 5425) All entities crossing the fence line are added to the selection set; the command continues with the 'Select entities to include in set' prompt.
AUto	Selects entities depending on how you use the cursor: • Pick an entity - the entity is selected • Pick two points right to left - Auto acts like Crossing mode; see Crossing mode • Pick two points left to right - Auto acts like Window mode; see Window mode All entities selected by one of these three modes are added to the selection set; the command continues with the 'Select entities to include in set' prompt.
Multiple	Should select entities **without** highlighting them during this selection mode in order to speed up entity selection in complex drawings, but entities are nevertheless highlighted by the program. All entities selected during this mode are added to the selection set; the command continues with the 'Select entities to include in set' prompt.
Single	After you select a single entity, the command ends; prompt you: 1. **Select entities to include in set** - **(press s.)** 2. **Select entities to include in set** - **(pick a single entity, and the command ends.)**
Previous	Reuses the entities selected with the previous selection.

Properties	Selects entities based on their properties; prompts you: **Select by properties** - **(enter an option name.)** In some cases, you can enter * to specify all entities with the property; separate more than one property value with a comma. • **Color** - prompts you to enter a color name or number • **LAyer** - prompts you to enter one or more layer names, or * for all • **LType** - prompts you to enter one or ore linetype names, or * for all • **Name** - prompts you to enter one or more entity names, or * for all • **THickness** - prompts you to enter a value for the thickness • **TYpe** - prompts you to enter one or more entity types (such as line, circle, arc, and so on), or * for all • **Value** - prompts you to enter one or more values, or * for all • **Width**- prompts you to enter a value for the width of entities • **Handle** - prompts you to enter a value of a handle, a hexadecimal number that uniquely identifies each entity in the drawings; the List command reports handle numbers • **LOcation** - returns to the 'Select entities to include in set' prompt • **Dialog** - displays the Entity Selection section of the Settings (6.27.25) dialog box For the panel version of this option, see the QSelect (6.25.6) command.

Dialog	Displays the Entity Selection section of the Settings (6.27.25) dialog box: (6.2246 on page 5425) **PICKAUTO** - controls automatic inside or crossing window selection: • **1** - entity under the cursor is selected • **2** - start window selection even when the cursor is over an entity **PICKBOX** - sets the size in pixels of the small square attached to the crosshairs; entities highlight when  when captured by the pickbox. **PICKDRAG** - controls the method for window selection: • **0** - click to start the window, then pick a second point • **1** - press and hold the left mouse button, then move the mouse and release the mouse button **PICKFIRST** - controls whether commands accept an existing selection set. • **0** - existing selection sets are ignored when a command is launched • **1** - commands which prompt to select entities can use an existing selection set
Undo	Undoes the last action during this command.
Group	Add a group to the selection set; prompts you: **Enter group name** - (type the name of a group; see the Group (6.15.26) command.)

NOTE: In macros, the **^S** metacharacter selects the entity under the cursor automatically.

Procedures

- Selection and grip settings (1.32.4)
- Composing a selection set before (pre-pick) (1.32.7)
- Composing a selection set afterwards (post-pick) (1.32.7)
- Selecting overlapping entities (1.32.7)
- To create a selection set using QuickSelect (1.32.6)

Related Commands

DdSelect (6.10.19) - sets selection properties in the **Entity Selection** section of the **Settings** dialog box. SelectSimilar (6.27.23) - selects all entities of the same type as the current selection, based on a set of matching properties, stored in the **SELECTSIMILARMODE** system variable. dmSelect (6.12.28) - selects edges and faces of 3D solids or surfaces based on their geometric properties. SelGrips (6.27.22) - selects entities and displays grips. QSelect (6.25.6) - composes a selection set using filters.

Tutorial: Use Quick Select

6.27.17 SelectAlignedFaces

(7.3 on page 6132) Selects all faces of a 3D model that are in the same plane (coplanar) with a selected face.

Accessing the Command

command bar: **selectalignedfaces** Quad cursor: **Solid/Face Selection |** : **SelectAlignedFaces Prompts you in the command bar:** Select face: **(Click a face in the model)** The program selects all other faces that are in the same plane, shown outlined in blue in the figure below **(6.2248 on the next page) (6.2249 on the facing page)**

Figure 6.2248

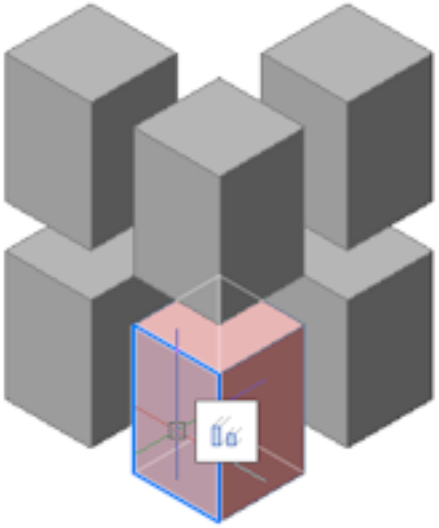

Figure 6.2249

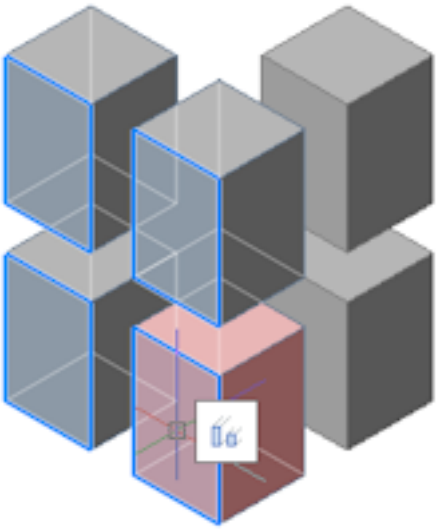


Command Options

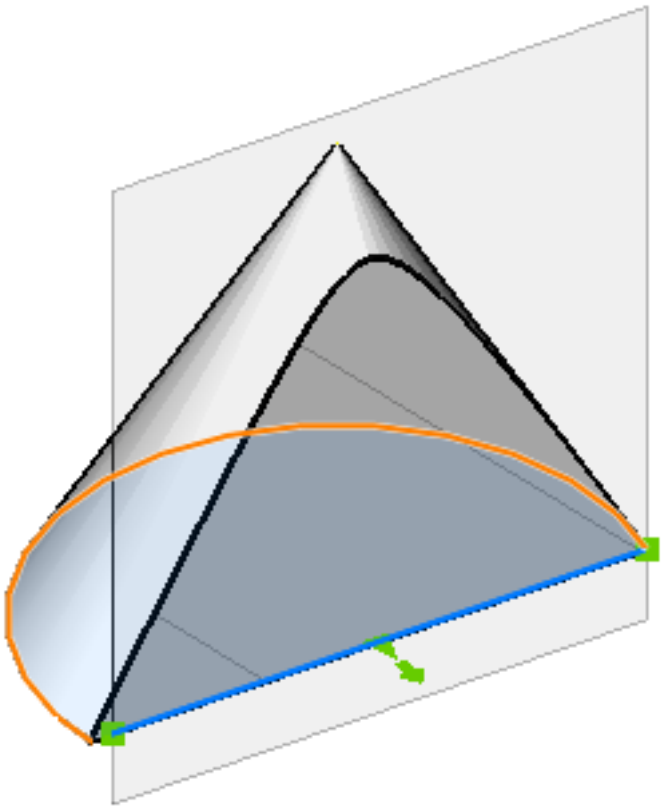
Option	Description
Select face	Select a single face for the program to match to other coplanar faces

Related Commands

BimMultiSelect (6.7.25) - selects linear solids with coplanar and/or parallel axes. dmSelect (6.12.28) - selects edges and faces of 3D solids or surfaces based on their geometric properties. SelectAlignedSolids (6.27.19) - selects all solids in a model of which a face is coplanar with a selected face. SelectConnectedFaces (6.27.21) - selects all faces in a model which are connected to a selected face. SelectConnectedSolids (6.27.27) - selects all solids in a model which are connected to a selected face.

Figure 6.2250

Figure 6.2251



6.27.18 SectionPlane

(6.2880 on page 5977) Creates section entities from 3D solids, 3D surfaces, polyface meshes, and 3D faces, so that you can see inside the 3D entity. (6.2251)

Accessing the Command

 command bar: **sectionplane** menu bar: **Model | Sections | Section Plane** ribbon: **Model | Sections | Section Plane** toolbar: **Sections |**  **: SectionPlane Prompts you in the command bar:** Specify start point or [select Face/Draw/Orthographic]: **(Specify the start point of the section plane)** Specify through point: **(Specify a second point)** Newly created section planes have their **Clip Display** status set to on. As sectionplanes are entities, they can be edited and deleted.

Command Options

Option	Description
Specify start point	Specifies the starting point of a 2D section plane; prompts you: **Specify through point - (pick a second point.)** As you move the cursor, the program ghosts the section plane: (6.2252 on page 5431) Use entity snaps to make the pick points accurate.

select Face	Select the planar face of a 3D solid; this option does not work with non-planar faces, such as on spheres. (6.2253 on the facing page) Prompts you: **Select entity** - **(Choose a face.)** The section plane coincides with the selected face. The LiveSection (6.20.43) property is turned on automatically. Live sections are sections that can be interactively edited. (6.2254 on page 5432)
Draw	Define the section plane by two or more points; draws L and U-shaped sections planes. (6.2255 on page 5432) Prompts you: 1. **Specify start point** - **(pick the first point or enter x,y,z coordinates; use entity snaps to place the plane accurately.)** 2. **Specify next point** - **(pick another point.)** 3. **Specify next point or ENTER to finish** - **(pick another point, or else press Enter to stop specifying points.)** 4. **Specify the direction of the section entity** - **(pick a point to specify the view direction of the section plane; the side of the section plane you pick is the side that is not cut away.)**
Orthographic	The section plane is created through the specified points and perpendicular to the current UCS. The Image below shows an L-shape section plane. Places a section plane entity in one of the six standard drawing orientations, relative to the current UCS is created; prompts you: **Align section to [Front/bAck/Top/Bottom/Left/Right]: <Top>** - **(enter an option)** The program draws the orthographic section plane through the center of the bounding box that contains all 3D entities in the drawing. The figure shows the result of the Top section plane: (6.2256 on page 5433) The Live Section property is turned on automatically.

Procedures

Align a section plane to a face (1.26.4) To create a vertical section plane (1.26.4) To create a horizontal section plane (1.26.4) To create a vertical jogged section plane (1.26.4) To create a horizontal jogged section plane (1.26.4) To create an orthographic section plane (1.26.4) To open the Drawing Explorer - Section Planes dialog (1.26.4) Editing the properties of a section plane (1.26.4) Difference between Live Section and Clip Display (1.26.4) To modify the size and position of a section plane (1.26.4) To save a section (1.26.4) To launch SectionPlaneToBlock command (1.26.4) To export a section to a file (1.26.4)

Related Commands

ClipDisplay (6.9.22) - toggles the **Clip Display** property of a section plane or a BIM section entity. LiveSection (6.20.43) - switches the **Live Section** property of a section plane on or off. Section (6.27.11) - creates section planes of 3D solids, 3D Faces, and Surfaces; the results are region entities. SectionPlaneSettings (6.27.12) - defines the properties of a section plane entity in the Drawing Explorer - Section Planes dialog. SectionPlaneToBlock (6.27.13) - saves the selected section plane to a 2D cross section / elevation block or a 3D cutaway section block. BimSection (6.7.54) - creates a BIM section entity. BimSectionOpen (6.7.49) - opens the drawing file related to a BIM section entity; or the 3D BIM model related to a BIM section drawing. BimSectionUpdate (6.7.43) - exports or updates the result of a BIM section in a drawing.

Command Options

Option	Description
Select face	Select a single face for the program to match to other solids with coplanar faces

Related Commands

BimMultiSelect (6.7.25) - selects linear solids with coplanar and/or parallel axes. dmSelect (6.12.28) - selects edges and faces of 3D solids or surfaces based on their geometric properties. SelectAlignedFaces (6.27.17) - selects all faces in a model which are coplanar with a selected face. SelectConnectedFaces (6.27.21) - selects all faces in a model which are connected to a selected face. SelectConnectedSolids (6.27.27) - selects all solids in a model which are connected to a selected face.

Figure 6.2260

6.27.20 -ScaleListEdit

(6.2981 on page 6079) Edits the list of scale factors displayed by commands, such as Print and PageSetup and by annotative scale factors, at the command line.

Accessing the Command

command bar: **-scalelistedit : -ScaleListEdit Prompts you in the command bar:** Enter option [?/Add/Delete/Reset/Exit] <Add>: **(Enter an option)**

Command Options

Option	Description
?	Displays the current scale list in the command bar. Press the **F2** function key to open the Prompt History window, such as `Scale Name Paper Units Drawing Units Effective Scale`
Add	Creates a new scale; prompts you: 1. **Enter new scale name - (type a name for the scale in the command bar.)** 2. **Enter scale ratio - (type the scale ration in the command bar.)** The following formats are accepted to define a scale of, say, 1 paper unit = 10 drawing units. • 1:10 • 1=10
Delete	Removes unused scale factors from this list; prompts your: **Enter scale name to delete or * to delete all unused scales - (Do one of the following:)** • Type the name of the scale to delete. • Type * to delete all unreferenced scales.
Reset	Reloads hard-coded default scales; Deletes all unreferenced user defined scales.
Exit	Concludes the command.

Related Commands

Print (6.24.51) - prints drawings to plotters and files through a dialog box. PageSetup (6.24.2) - creates and edits page setups for plotting drawings in the Drawing Explorer. ScaleListEdit (6.27.7) - edits the scale list of a drawing in a dialog box.

Figure 6.2261

6.27.21 SelectConnectedFaces

(7.3 on page 6132) Selects all faces that connected a solid with the selected face.

Accessing the Command

 command bar: **selectconnectedfaces** Quad cursor: **Solid/Face Selection |**  : **SelectConnectedFaces** Select face: **(Click a face in the model)** The program selects all other faces that on solids that connect to the solids with the selected face, shown outlined in blue in the figure below (6.2262 on the next page) (6.2263 on the facing page)

Figure 6.2262

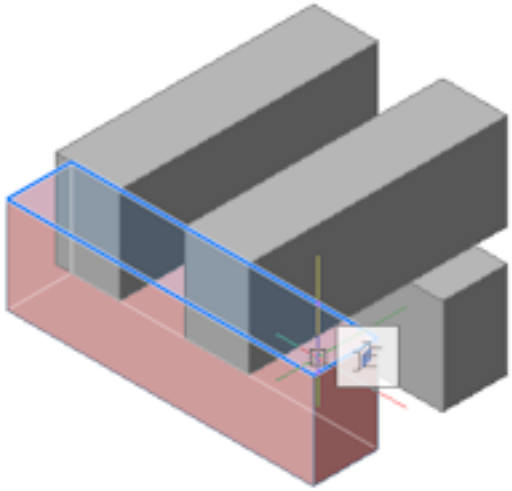

Figure 6.2263

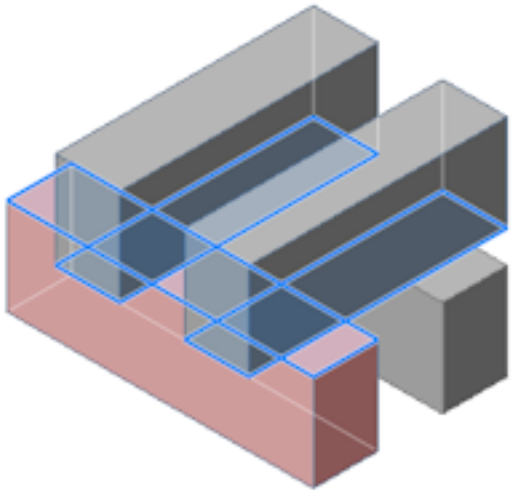


Command Options

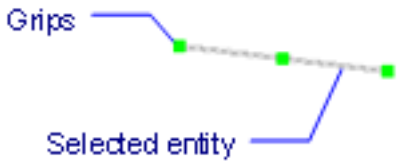
Option	Description
Select face	Select a single face for the program to match to faces on other, connected solids

Related Commands

BimMultiSelect (6.7.25) - selects linear solids with coplanar and/or parallel axes. dmSelect (6.12.28) - selects edges and faces of 3D solids or surfaces based on their geometric properties. SelectAlignedFaces (6.27.17) - selects all faces in a model which are coplanar with a selected face. SelectAlignedSolids (6.27.19) - selects all solids in a model of which a face is coplanar with a selected face. SelectConnectedSolids (6.27.27) - selects all solids in a model which are connected to a selected face.

Figure 6.2264

Figure 6.2265



6.27.22 SelGrips

(7.3 on page 6132) Selects entities, and then displays their grips (short for "select grips"). (6.2265)

Accessing the Command

command bar: **selgrips** shortcut: select one or entities with the cursor keyboard: **Ctrl+A** alias: **selgrip** menu: **Edit | Select All : SelGrip Prompts you in the command bar:** Select entities to display grips: **(Choose one or more entities)** S elect entities to display grips: **(Choose more entities, or else press Enter to end the command)** BricsCAD highlights selected entities and displays their grips. You edit the entities by dragging the grips. To select all entities in the drawing, press Ctrl+A.

Command Options

Option	Description
Select entities to display grips	Chooses one or more entities.

Related Commands

Select (6.27.16) - selects entities. SelectSimilar (6.27.23) - selects all entities of the same type as the current selection, based on a set of matching properties, stored in the SELECTSIMILARMODE (1.17.10) system variable DdGrips (6.10.25) - sets the parameters for grips through the Settings dialog box.

Figure 6.2266

6.27.23 SelectSimilar

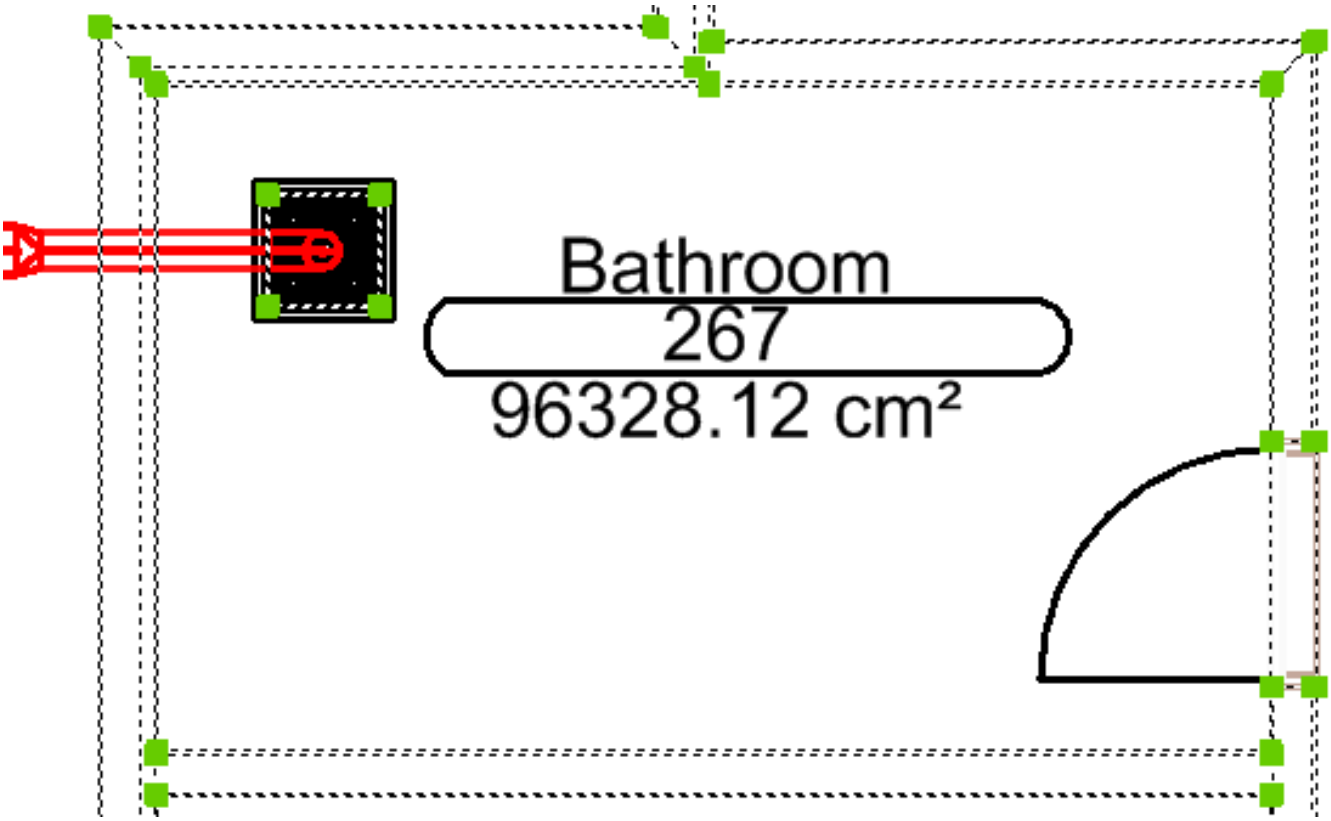
(7.3 on page 6132) Selects all entities with the same properties as the currently selected entity.

Accessing the Command

command bar: **selectsimilar** menu bar: **Edit | Select Similar** ribbon: **Home | Settings | Select | Select Similar** toolbar: **Standard |** 

: SelectSimilar Prompts you in the command bar: Select entities or [SEttings]: **(Select one or more entities, or else type SE to display a dialog box to specify the properties to match)** Entities in set: 1 Select entities or [SEttings]: **(Select more entities, or else press Enter to end the command)** When you exit the command, the entities that match the properties are selected (shown as dashed and with entity grips): (6.2267 on the facing page)

Figure 6.2267



Command Options

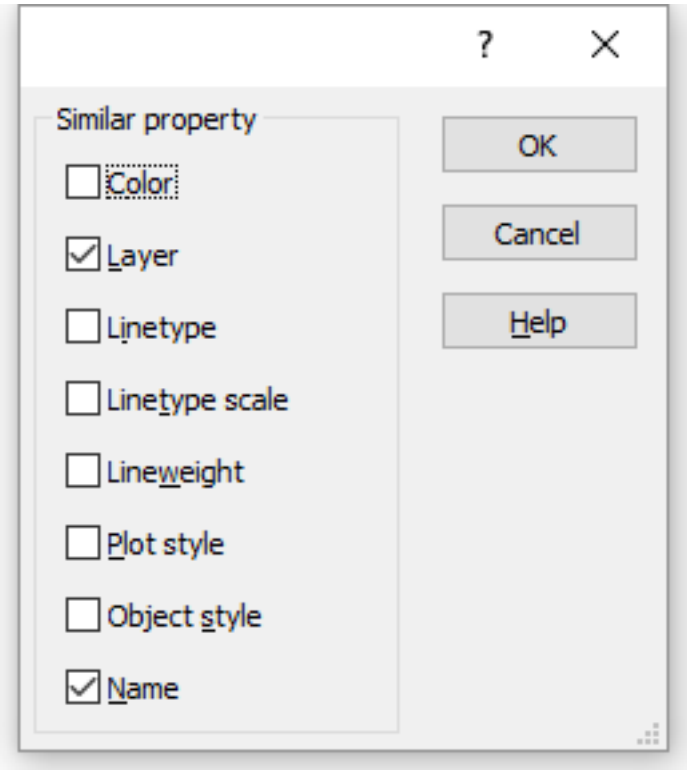
Option	Description
Select entities	Selects representative entities, whose properties should be matched by entities elsewhere in the drawing: • Select one or more entities • Press **Enter** to end the command and show the selected entities
SEttings	Displays a dialog box; see below

Dialog Box Options

Enter the SEttings option to access this dialog box: (6.2268 on the next page)

Option	Description
Similar Property	Specifies the properties that this command should match: • **On** - property is matched in other entities • **Off** - property is not matched For this command to operate as intended, at least one property must be turned on. When all properties are turned off, this command selects only the entity(ies) you pick at the 'Select entities' prompt. Selects all other entities with the same property as the selected entity(ies): • **Color** - color number or name • **Layer** - layer name • **Linetype** - linetype name • **Linetype Scale** - linetype scale factor

Figure 6.2268



Related Commands

QSelect (6.25.6) - composes a selection set using filters. Select (6.27.16) - selects one or more entities; can be accessed later with the Previous option. SelGrips (6.27.22) - selects entities and displays grips.

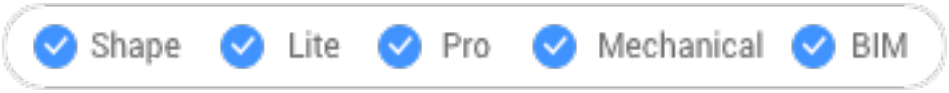
Figure 6.2270



6.27.24 -SetByLayer

(6.2717 on page 5823) Sets the property overrides of selected entities to ByLayer.

Accessing the Command

Keyboard: **-setbylayer : -setbylayer Prompts you:** Active settings: Color Linetype Lineweight Material Transparency Plotstyle* Select objects or [Settings/selection options (?)]: **(Select entities or choose an option.)** Entities in set: 1 Select objects or [Settings/selection options (?)]: **(Select more entities or press Enter.)** Change ByBlock to ByLayer? [Yes/No] <Yes>: **(Press Enter to confirm or choose an option.)** Include blocks? [Yes/No] <Yes>: **(Press Enter to confirm or choose an option.)** * The **Plotstyle** option is available for STB drawings only. See the CONVERTCTB (6.9.28) and CONVERTPSTYLES (6.9.38) commands.

Command Options

Option	Description
Settings	Allows to select the entity properties to be changed. Prompts you: Active settings: Color Linetype Lineweight Material Transparency **Toggle the properties [Color/LType/LWeight/Material/Transparency/Plotstyle*]** Do the following: • Click property name or type the capitalized letter then press Enter to toggle its current state. BricsCAD reports the current active settings. • Repeat the previous step or press Enter. The settings are saved through the SETBYLAYERMODE system variable.
Change ByBlock to ByLayer?	Allows to change selected entity properties set to ByBlock to ByLayer.
Include blocks?	Allows to process entities in blocks.

Settings

Name	Title	Description
SETBYLAYERMODE	Options for SETBYLAYERMODE	The value is saved as the sum of the following bitcodes: 1: Color 2: Linetype 4: Lineweight 8: Material 16: Plot style 32: ByBlock 64: Blocks 128: Transparency

Related Commands

MatchProp (6.21.18) - copies the properties and styles from one entity and then applies them to one or more other entities, with control over which properties are copied Properties (6.24.54) - displays the Properties panel with either the default properties or the properties of selected entities. SetByLayer (6.27.34) - sets the property overrides of selected entities to ByLayer.

Figure 6.2271

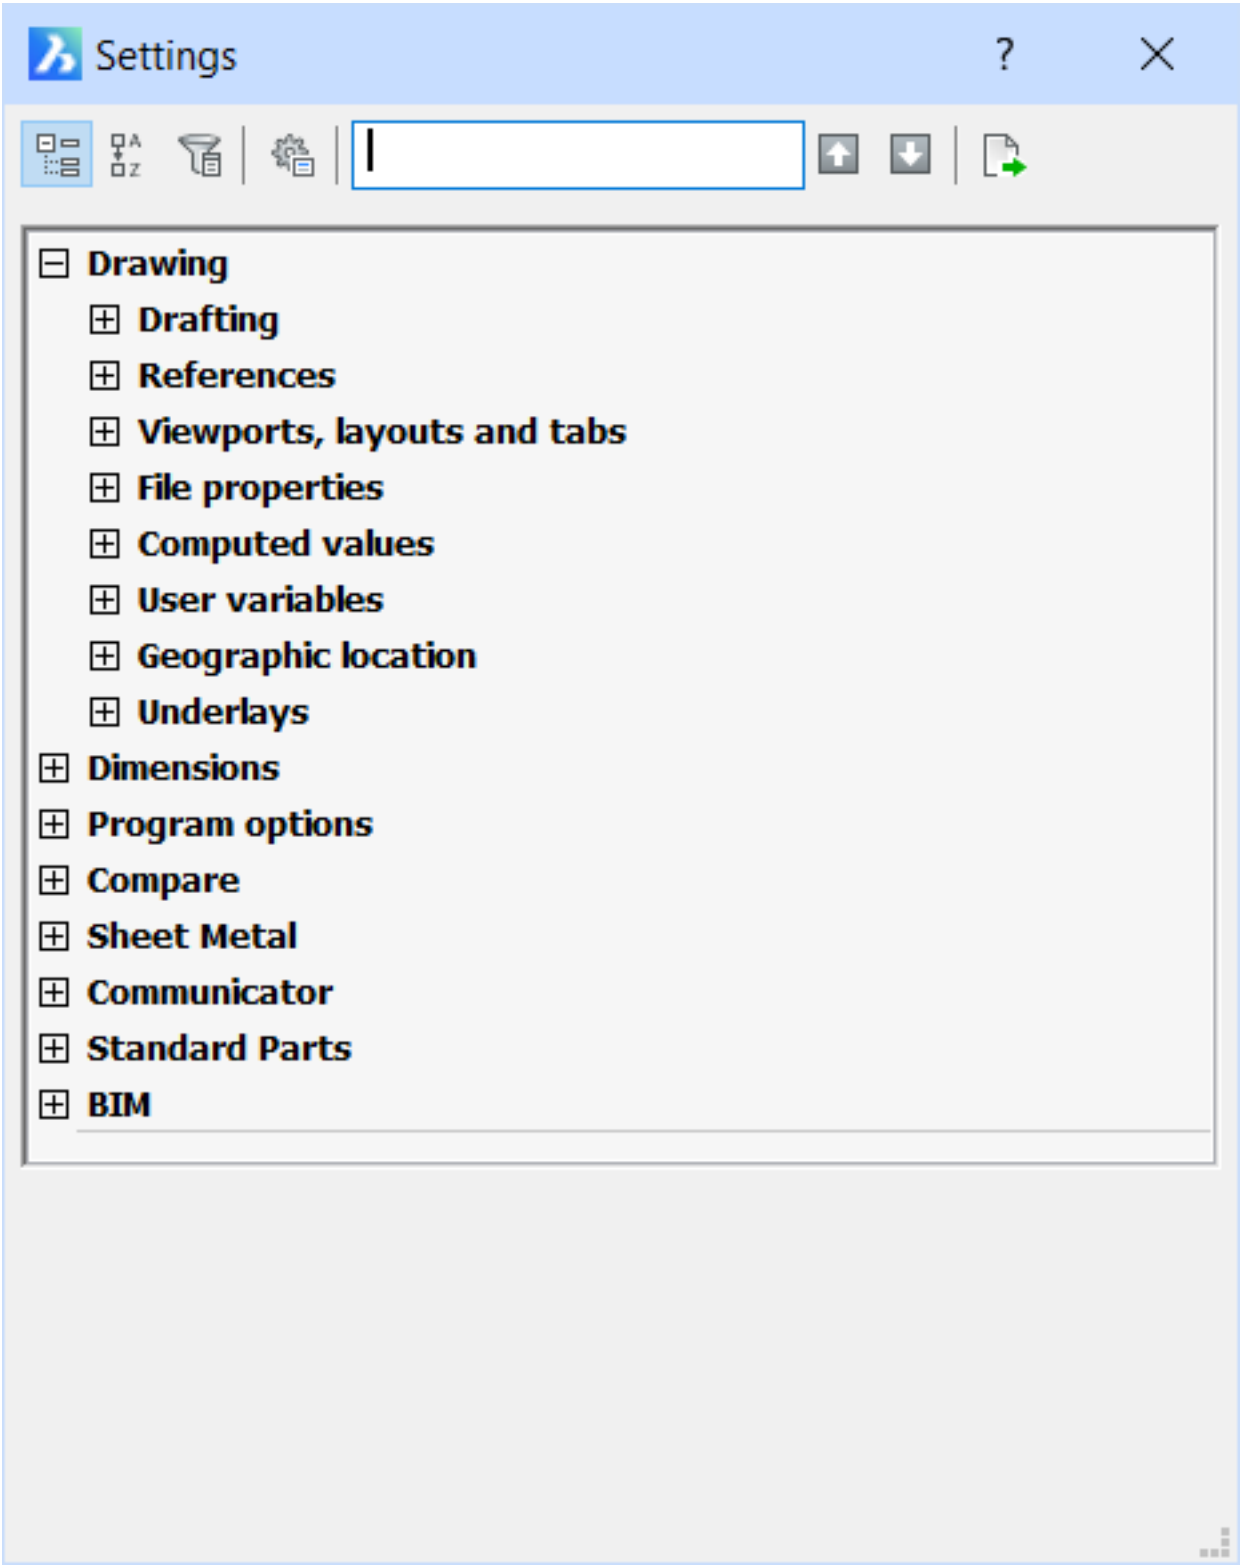
6.27.25 Settings

(6.2981 on page 6079) Changes the values of system variables and user preferences through a dialog box.

Accessing the Command

command bar: **settings** aliases: **ddrmodes, rm, options, dsettings, ddsetva (6.10.21)r (6.10.21)** menu bar: **Settings | Settings** toolbar: **Settings** ribbon: **Home | Settings | Settings : Settings** Displays a dialog box: (6.2272 on the next page)

Figure 6.2272



Dialog Box Options

Toolbar Option	Description
Categorized	Lists variables in related groups
Alphabetic	Lists variables alphabetically by description (rather than by name)
Show Differences	Lists variables whose values are changed from the initial (default) values: (6.2273 on page 5450) Make a change to a variable, and it will show up here. This is handy for figuring out what might have changed. To change a value back to the default: 1. Right-click the name 2. Choose **Restore Default Value** from the shortcut menu
Dialog Configurations	Search for variables, configures how the search is carried out, and specifies how differences are handled; displays a dialog box: (6.2274 on page 5451) **Search** - finds variables and limits where the program searches: • **Find What** - specifies the search phrase • **Find** - executes the search • **Find Where** - determines which part(s) of the Settings dialog box should be searched • **Match Case** - when on, search phrase's capitalization must match that of the words in the Settings dialog box Modified Settings - determine which variables are displayed by the Show Differences dialog box: • **Display All** - lists variables whose values have changed • **Display Settings Stored in Drawing** - lists variables that affect the current drawing • **Display Settings Not Stored in Drawing** - lists variables that affect all drawings • **Display Modified Settings in a Different Color** - when on, displays changed entities in a color other than black • **Color swatch** - click the color swatch to choose a different color

Find	Real-time search field that lists variables when you enter the first few letters of their names or descriptions. As you type into the search field, BricsCAD immediately jumps to the first item that matches the letters. For instance, when entering “lastpoint,” the following occurs: 1. **l** — focus jumps to Insertion Unit, because the description contains the letter ‘l’ 2. **la** — focus jumps to Unit Mode, because ‘la’ is in “displayed” in the description 3. **las** — focus jumps to Text Angle, because of ‘las’ in “last” of the description 4. **lastp** — focus jumps to Last Point As you enter text, the color of the search box changes: • **Green** - one word matches the search phrase; you have arrived! • **White** - two or more words match the search phrase; click the Next and Previous buttons to review them • **Orange** - no words match the search phrase; check your spelling
Next	Jumps to the next candidate that matches the search phrase
Previous	Jumps to the previous candidate that matches the search phrase
Export	Saves all settings and values to a CSV file, short for “comma-separated values." The file contains names of variables in true alphabetical order, along with their current values, and other information. The file can be imported into a spreadsheet.
X	Closes the dialog box.

Procedures

Understanding the Settings dialog box (1.17.10)

Related Commands

SetVar (6.27.28) - changes system variables through the command bar. SettingsSearch (6.27.29) - opens the Settings dialog box at the specified category, system variable or user preference.

Figure 6.2273

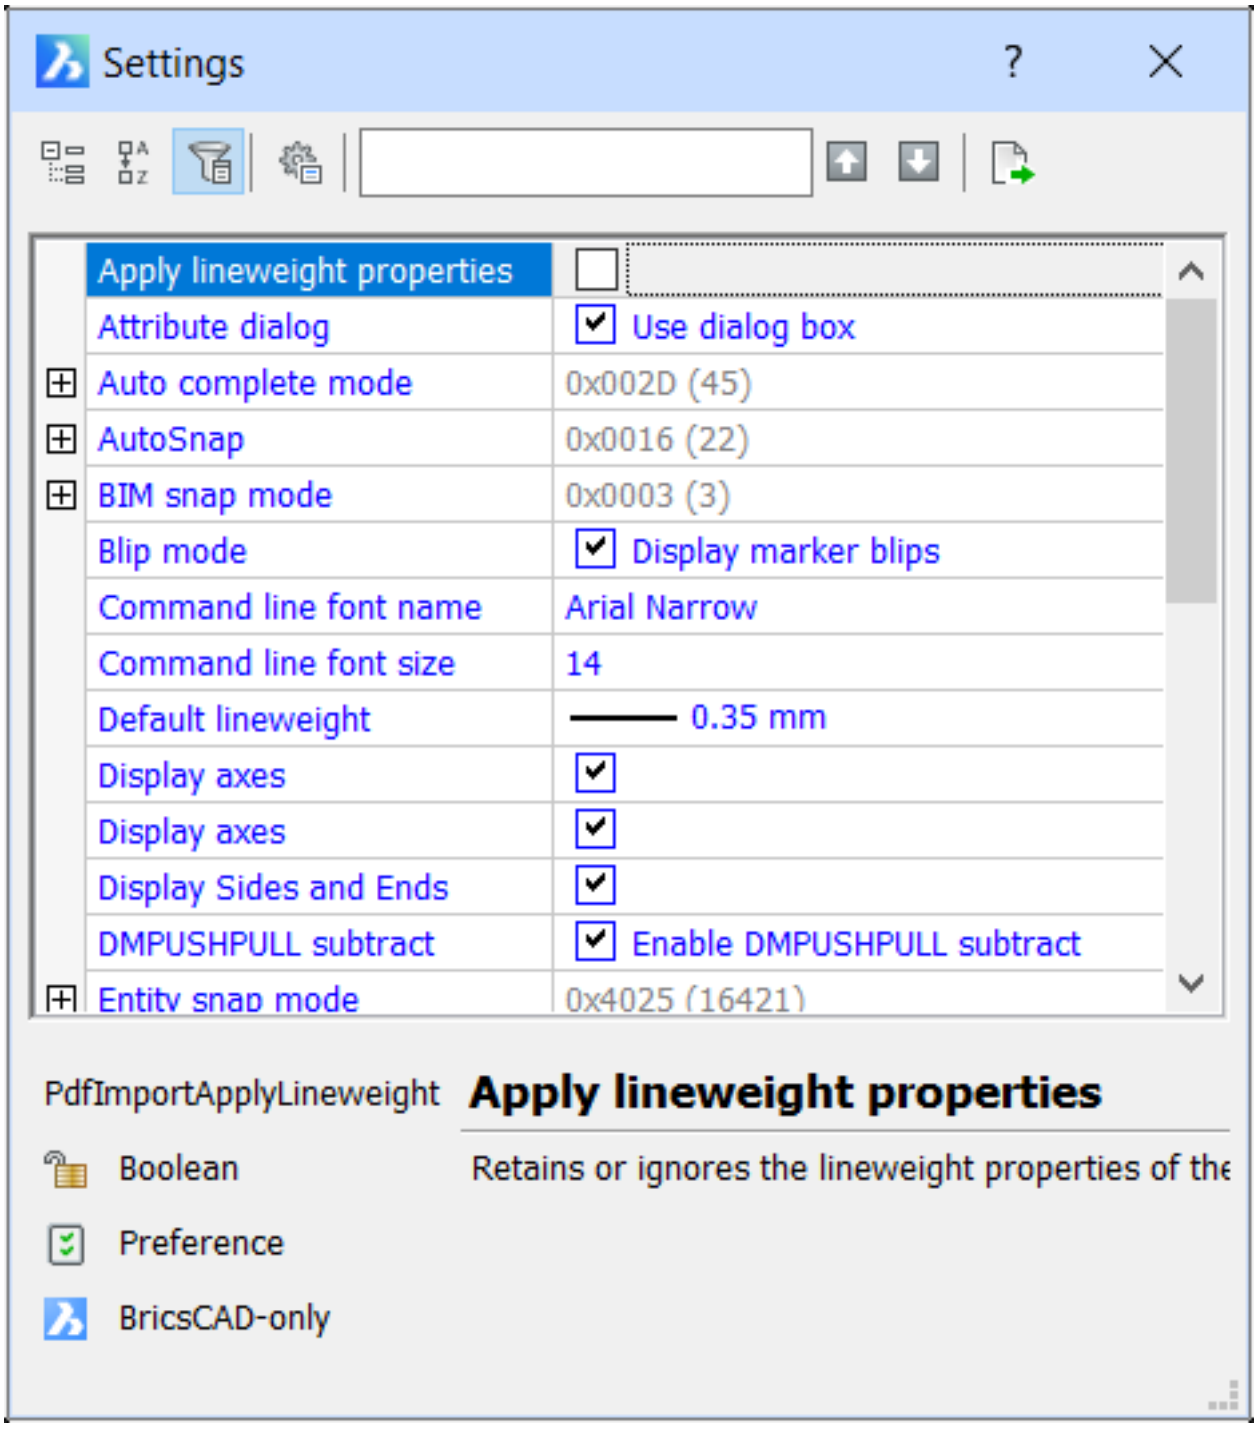


Figure 6.2274

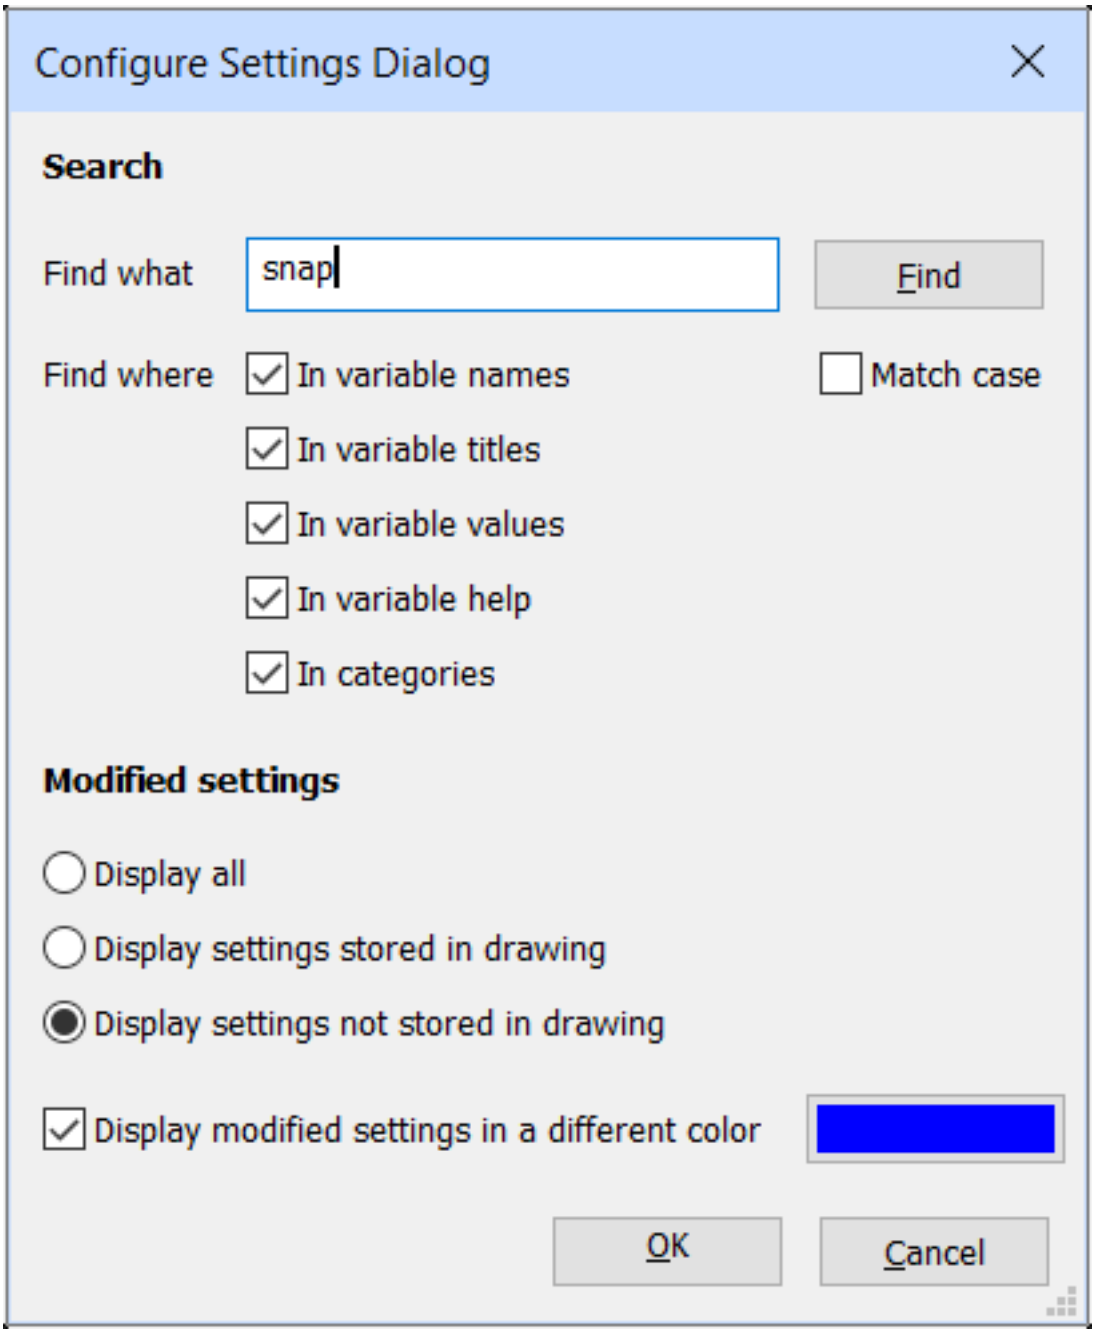

Figure 6.2275

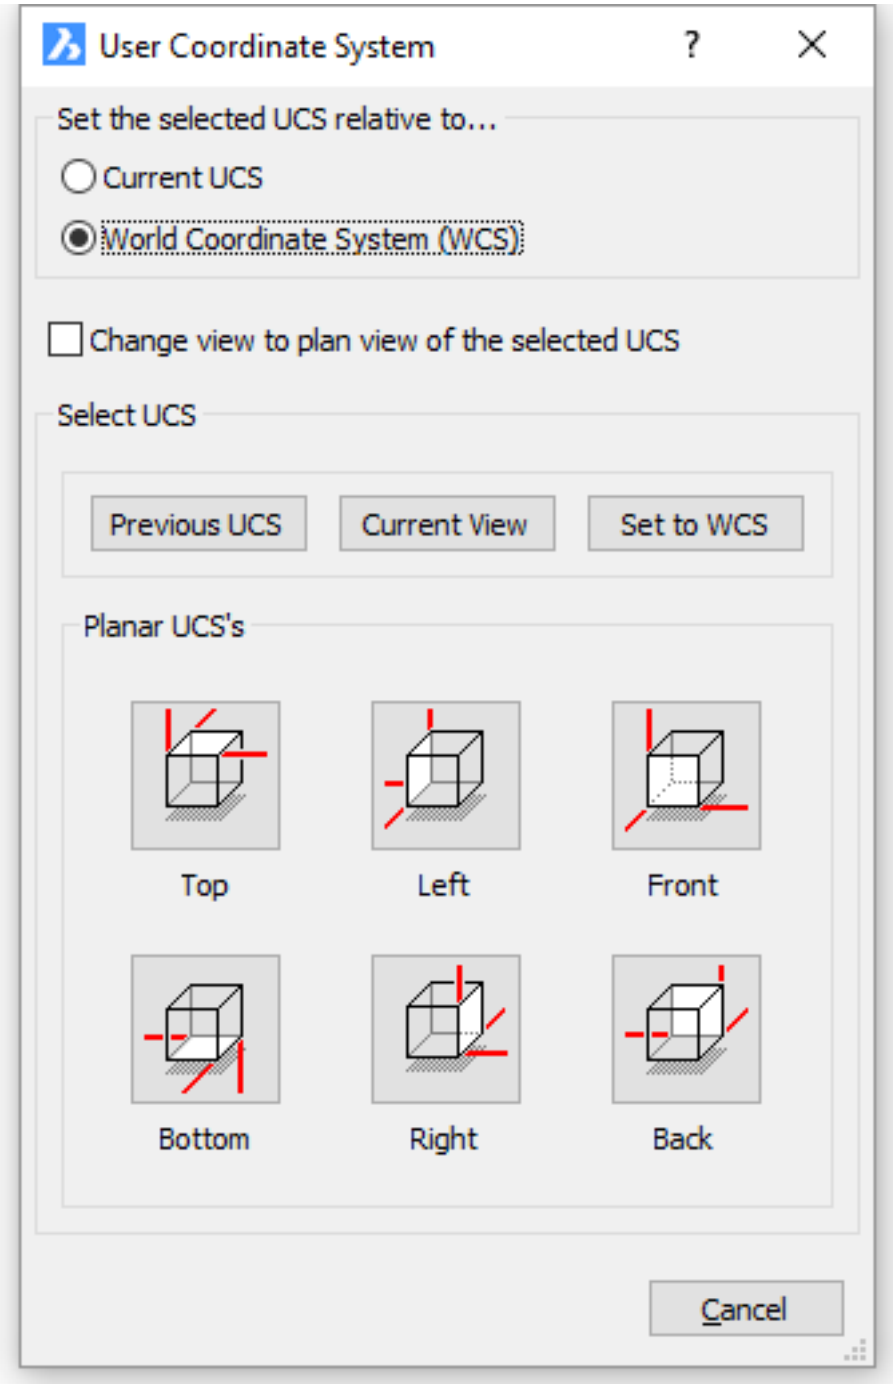
6.27.26 SetUCS

(6.2981 on page 6079) Sets the UCS to a specified viewpoint (short for "set user-defined coordinate system").

Accessing the Command

 command bar: **setucs** aliases: **dducsp ucp** menu bar: **Settings | Set UCS** ribbon: **Settings | UCS** toolbar: **Settings |**  **: SetUCS** Displays a dialog box: (6.2276 on the next page) Click on a button to use a perset UCS; the dialog box disappears automatically. Use the UCS (6.30.1) command's View option to name the UCS generated by this command.

Figure 6.2276



Dialog Box Options

Option	Description
Set the selected UCS relative to	Specifies how the new UCS is set: • **Current UCS** - sets the new UCS relative to the current UCS • **World Coordinate System -** sets the new UCS relative to the WCS WCS is short for "world coordinate system," and is the default coordinate system when no UCS is set; it cannot be changed.
Change view to plan view of the selected UCS	Toggles whether the plan view is displayed when switching UCSes: • **Yes** - plan view of the enw UCS is displayed • **No** - the viewpoint does not change Plan view looks down the z axis at the x,y plane.
Select UCS	Sets the UCS to one of the following coordinate systems. Clicking one of these buttons sets the UCS, and then immediately exits the dialog box: • **Previous UCS** - changes the UCS to the previous UCS • **Current View** - changes the UCS to match the current viewpoint • **Set to WCS** - changes the UCS to match the WCS

Planar UCSs	Sets the UCS to one of the following standard orthographic views: 1. Click one of the buttons 2. The program sets the UCS, and then exits the dialog box •  **Top** - changes the UCS to match the top view. •  **Left** - changes the UCS to match the left view. •  **Front** - changes the UCS to match the front view. •  **Bottom** - changes the UCS to match the bottom view. •  **Right** - changes the UCS to match the right view. •  **Back** - changes the UCS to match the back view.
Cancel	Closes the dialog box without changing the UCS.

Related Commands

Ucs (6.30.1) - creates and modifies user-defined coordinate systems. UcsIcon (6.30.2) - controls the appearance of the UCS icon. ExpUcs (6.13.24) - creates, modifies, and deletes named UCSs through the Drawing Explorer. Plan (6.24.26) - changes the viewpoint to the plan view of the WCS or current UCS. DdVPoint (6.10.23) - changes the 3D viewpoint of the drawing through a dialog box. VPoint (6.31.21) - changes the 3D viewpoint of the drawing through the command bar. Settings (6.27.25) - sets parameters of UCSs.

Figure 6.2277

6.27.27 SelectConnectedSolids

(7.3 on page 6132) Selects all solids connected to a selected face.

Accessing the Command

 command bar: **selectconnectedsolids** Quad cursor: **Solid/Face Selection |**  **: SelectConnectedSolids** Select face: **(Click a face in the model)** The program selects all solids connect to the solid with the selected face, shown outlined in blue in the figure below: (6.2278 on the next page) (6.2279 on the facing page)

Figure 6.2278

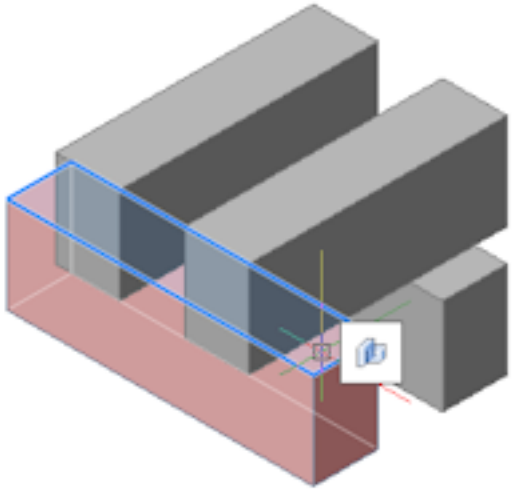


Figure 6.2279

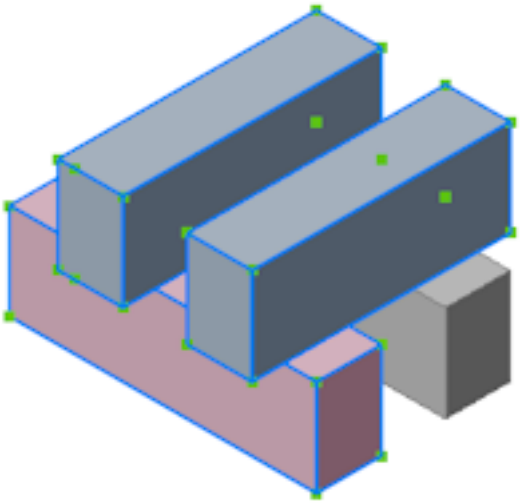

Command Options

Option	Description
Select face	Select a single face for the program to match to connected solids

.

Related Commands

BimMultiSelect (6.7.25) - selects linear solids with coplanar and/or parallel axes. dmSelect (6.12.28) - selects edges and faces of 3D solids or surfaces based on their geometric properties. SelectAlignedFaces (6.27.17) - selects all faces in a model which are coplanar with a selected face. SelectAlignedSolids (6.27.19) - selects all solids in a model of which a face is coplanar with a selected face. SelectConnectedFaces (6.27.21) - selects all faces in a model which are connected to a selected face.

Figure 6.2280

6.27.28 SetVar

(6.2981 on page 6079) Displays and changes the values of system variables (short for "set variables"). **Note:** You can also enter the names of system variables directly at the command prompt, without using this command.

Accessing the Command

command bar: **setvar** transparent: **'setvar** alias: **set** menu bar: **Tools | Set Variable** : **SetVar Prompts you in the command bar.** Variable name or ?: **(Enter the name of a system variable, or press ?)** For example: Variable name or ?: chamferd New current angle for CHAMFERD <0>: **(Enter a value, or press Enter to accept the current value)** The values of read-only variables cannot be changed. For example: : **program** PROGRAM = "BRICSCAD" (read only)

Command Options

Option	Description
Variable name	Specifies the name of a system variable.
?	Lists the names of system variables; prompts you: **Variable(s) to list <*> - (enter one of the following:)** • * to list all system variables • **name*** to list all system variables starting with name • **name** to list one system variable

Related Commands

Settings (6.27.25) and DdSetVar (6.10.21) - change the values of system variables through a dialog box. SettingsSearch (6.27.29) - opens the Settings dialog box at the specified category, system variable or user preference.

Figure 6.2281

6.27.29 SettingsSearch

(6.2981 on page 6079) Opens the Settings dialog box at the word specified by the user.

Accessing the Command

command bar: **settingssearch** : S**ettingsSearch Prompts you in the command bar:** Search setting/category: **(Type a word used in the Settings dialog box)** Search is case sensitive, which affects the results. In general, the Settings dialog box uses fully capitalizes variable names (like INSUNITS) but uses mixed-case for user preferences names, such as SnapMarkerSize.

Command Options

Option	Description
Search setting/category	Type the name of a setting category, variable, user preference, or other word that might be found in the Settings dialog box; accepts only a single word

Related Commands

Settings (6.27.25) and DdSetVar (6.10.21) - changes the values of system variables through a dialog box. SetVar (6.27.28) - changes system variables through the command bar.

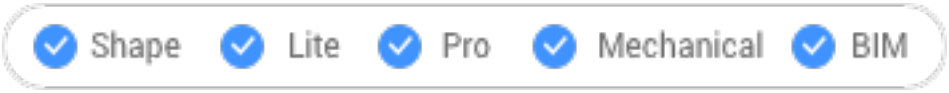
Related CommandsStart (6.27.49) - starts other applications.Sh (6.27.53) - opens the operating system command prompt window; runs other applications.Files (6.14.4) - displays the operating system's File Manager.

Option	Description
OS Command	Specifies the name of the Windows program to run. Press Enter to open the Windows command prompt window.

Figure 6.2287



6.27.34 SetByLayer

(6.2717 on page 5823) Sets the property overrides of selected entities to ByLayer.

Accessing the Command

Keyboard: **setbylayer : setbylayer Prompts you:** Active settings: Color Linetype Lineweight Material Transparency Plotstyle* Select objects or [Settings/selection options (?)]: **(Select entities or choose an option.)** Entities in set: 1 Select objects or [Settings/selection options (?)]: **(Select more entities or press Enter.)** Change ByBlock to ByLayer? [Yes/No] <Yes>: **(Press Enter to confirm or choose an option.)** Include blocks? [Yes/No] <Yes>: **(Press Enter to confirm or choose an option.)** * The **Plotstyle** option is available for STB drawings only. See the CONVERTCTB (6.9.28) and CONVERTPSTYLES (6.9.38) commands.

Command Options

Option	Description
Settings	Displays the **SetByLayer settings** dialog box: (6.2288 on the next page) Click the checkbox of the properties to by changed. The settings are saved through the SETBYLAYERMODE system variable.
Change ByBlock to ByLayer?	Allows to change selected entity properties set to ByBlock to ByLayer.
Include blocks?	Allows to process entities in blocks.

Settings

Name	Title	Description
SETBYLAYERMODE	Options for SETBYLAYERMODE	The value is saved as the sum of the following bitcodes: 1: Color 2: Linetype 4: Lineweight 8: Material 16: Plot style 32: ByBlock 64: Blocks 128: Transparency

Related Commands

MatchProp (6.21.18) - copies the properties and styles from one entity and then applies them to one or more other entities, with control over which properties are copied Properties (6.24.54) - displays the Properties panel with either the default properties or the properties of selected entities. -SetByLaye (6.27.24)r - sets the property overrides of selected entities to ByLayer.

Figure 6.2288

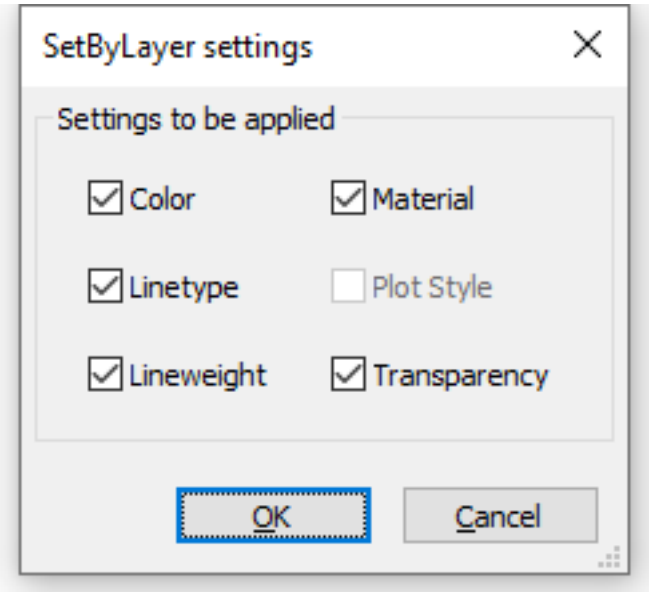


Figure 6.2289

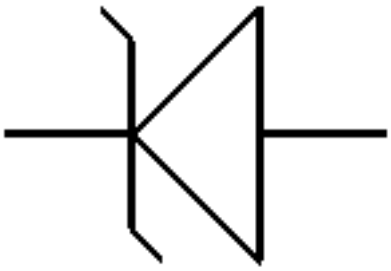
Shape Classic Pro Platinum Mechanical BIM

Figure 6.2290



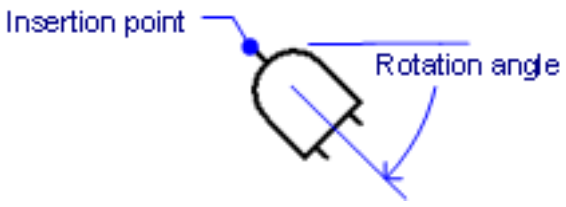
6.27.35 Shape

(7.3 on page 6132) Places shapes in drawings. **Note:** Before you can place shapes in drawings, you must first load a SHP shape file with the Load (6.20.35) command. (6.2290)

Accessing the Command

command bar: **shape** : **Shape Prompts you in the command bar:** ? to list/Shape to insert: **(Enter the name of a shape, or press ?)** Insertion point for shape: **(Pick a point, or enter x,y coordinates)** Scale factor for shape <1.0>: **(Enter a positive or negative number)** Rotation angle for shape <0>: **(Enter a positive or negative number)** (6.2291) Shapes are an early version of blocks that were highly efficient but difficult to code; shapes are rarely used anymore. The SHP format is also used by certain fonts; it contains a flag to distinguish between shapes and fonts. To code shapes, see **Customizing BricsCAD**.

Figure 6.2291



Command Options

Option	Description
Shape to insert	Specifies the name of the shape; prompts you: 1. **Insertion point for shape - (specify the insertion point; pick a point, or enter x,y coordinates.)** 2. **Scale factor for shape - (specify the scale factor; enter a positive or negative number larger or smaller than 1.0;)** Negative numbers mirror the shape. 3. **Rotation angle for shape - (specify the rotation angle; enter a positive or negative number;)** positive angles are measured clockwise from the positive x axis.
? to list	Lists the names of shapes loaded in the current drawing. Reports the file name and names of shapes: `Loaded shapes: Shape file: C:\dwg \ES .SHX  CON1  RES` If no shapes are loaded, reports: * **no file** * Use the Load (6.20.35) command to load shapes.

Grips Editing

Shapes can be edited directly through grips:

1. Select the shape. Notice that it has one grip at its insertion point.
2. Drag the grip to move the shape.

(6.2292)

Figure 6.2292

Related Commands

Load (6.20.35) - loads SHP shape files. Insert (6.17.13) - inserts blocks into drawings.

Figure 6.2293

6.27.36 SIMPLIFY

(7.3 on page 6132) Reduces the number of vertices of polylines and hatch boundaries without changing their general shape. Simplified entities are easier to manipulate and can significantly reduce file size.

Accessing the Command

command bar: **simplify : simplify You are prompted:** Select entity: **(select a polyline or hatch boundary)** Choose mode [Simplify/sMoothen] <Simplify>: **(specify which mode to apply)** Additional prompts enable you to control the amount of deviation from the original entity: Choose polyline simplification method [max Angle and distance/max Deviation] <Angle>: Maximum distance between non-collinear vertices to straighten <0.500000>: Maximum change (angle) in direction between each two consecutive segments to straighten <1.000000>: Straighten polylines arc segments? [Yes/No] <No>: Smoothen polylines segments? [Yes/No] <No>:

Figure 6.2294

6.27.37 SetLicenseLevel

(6.2981 on page 6079) Allows you to run BricsCAD in a lower license level:

- Lite
- Pro
- BIM
- Mechanical
- Ultimate
- With Communicator add-on

The command sets the value of the **RunAsLevel** and **UseCommunicator** user preferences.

Accessing the Command

command bar: **setlicenselevel : setlicenselevel Prompts you in the command bar:** Change license level for product [BricsCAD/Communicator] <BricsCAD>: **(Choose an option)**

Command Options

Option	Description
BricsCAD	Sets the BricsCAD license level. Prompts you: **Run BricsCAD as [Lite/Pro/Bim/Mechanical/Ultimate] <Ultimate>:** - **(choose an option.)** • **Lite** - runs BricsCAD Lite mode, without the commands exclusive to the Pro, BIM, and Mechanical licenses. • **Pro** - runs BricsCAD Pro mode, without the commands exclusive to the Mechanical and BIM licenses. • **Mechanical** - runs BricsCAD Mechanical mode without the commands exclusive to BIM license. • **BIM** - runs BricsCAD BIM mode without the commands exclusive to Mechanical license. • **Ultimate** - runs BricsCAD Ultimate mode with all the commands, including BIM and Mechanical. The new level is applied after restarting the program. The selected level is saved through the **RunAsLevel** user preference.

Communicator	Determines the type of Communicator license; a Pro license is also required. Prompts you: **Run Communicator with license [No licence/Trial/Full] <Trial>** - **(choose an option.)** • **No license** - Communicator import and export formats are not available • **Trial** - runs Communicator in trial mode, expiring after 30 days • **Full** - runs the full Communicator import-export set The new level is applied after restarting the program. The selected level is saved through the **UseCommunicator** user preference. Note that Communicator is installed through a separate installer.

Related Commands

LicenseManager (6.20.27) - displays the License Manager dialog, summarizing your available licenses (BricsCAD / BIM / Mechanical / Communicator).

Figure 6.2295

6.27.38 SheetSet

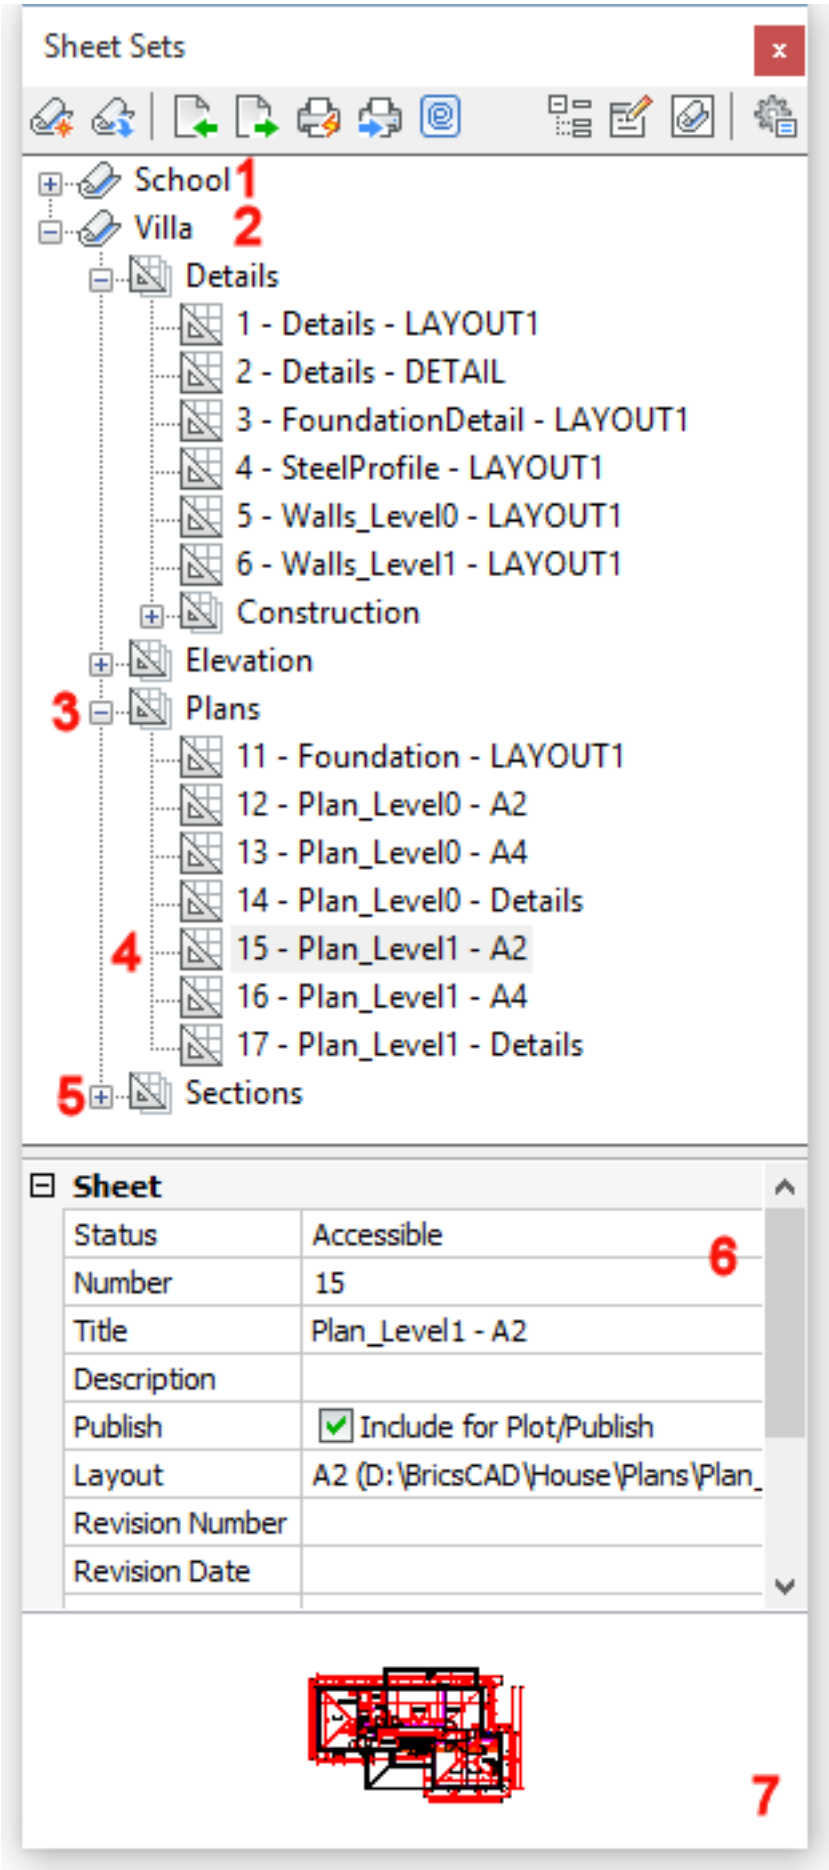
(6.2981 on page 6079) Opens the Sheet Sets panel.

Accessing the Command

 command bar: **sheetset alias: ssm** menu bar: **Tools | Sheet Sets** toolbar: **Standard |**  context menu: right-click a toolbar or ribbon, then choose **Sheet Sets** : **SheetSet** Displays a panel: (6.2296 on the next page)

1. Sheet Set (collapsed)
2. Sheet Set (expanded)
3. Sheet Subset (Expanded)
4. Sheet
5. Sheet Subset (collapsed)
6. Properties and variables of the currently selected sheet set, subset or sheet
7. Preview of the currently selected sheet

Figure 6.2296



Panel Options

Option	Description
New sheet set	Launches the NewSheetSet (6.22.4) command.
Open sheet set	Launches the OpenSheetSet (6.23.10) command. When a DST file is dropped on the application, it is opened in the Sheet Set Explorer.
Export to XML	Exports a sheet set in XML format. Displays the Export Sheet Set dialog box.
Import from XML	Displays the Import Sheet Set dialog box: (6.2297 on page 5483) • **XML File** - click **Browse** ..., select an XML file in the Select XML File dialog box, then click **OK**. • **Save Sheet Set As** - choose whether to save the imported XML file as DST file using the same location and name as the XML file or to save it to a new location or name. If you choose the latter option, click **Browse** ... in the DST File field, then specify a folder and file name. • **OK** - imports the XML file and saves it to a DST file.
Plot	Plots the currently selected sheet set(s), subset(s) or sheet(s). Depending on the **Publish Sheets in Subset** property of a subset and the **Publish** property of sheets, sheets might not be included.
Publish	Publishes the currently selected sheet set(s), subset(s) or sheet(s). Depending on the **Publish Sheets in Subset** property of a subset and the **Publish** property of sheets, sheets might not be included.
eTransmit	Launches the eTransmit (**??**) command. The currently selected sheet set(s), subset(s) or sheet(s) are included in the eTransmit procedure.
Selection sets	Opens the Sheet Selection Sets dialog: (6.2298 on page 5483). • Select a selection set, then click the **Activate** button to restore the selection. • Right-click a selection set to display a context menu: (6.2299 on page 5483)

 Custom Properties

Opens the Custom Properties dialog, which allows you to add custom properties for sheet sets and sheets. Alternatively, in the sheet tree right-click the name of a sheet set or a sheet, and then choose **Custom Properties** in the context menu; displays a dialog box: (6.2300 on page 5484)

- Click the **Sheet Set** tab to manage custom sheet set properties.
- Click the **Sheets** tab to manage custom sheet properties.
- Click the **Add** button to add a custom property; displays the Add Custom Property dialog box in which you add a property name and its initial value: (6.2301 on page 5484)
- **Edit** - select a custom property, then click the **Edit** button to edit the value of a custom property. Displays the Custom Sheet Property or Custom Sheet Set Property dialog box in which you edit the name of the property: (6.2302 on page 5484)
- **Delete** - select a custom property, then click the **Delete** button to delete the selected property.

 View Categories

Expands and collapses the currently loaded sheet sets.

Sheet Set Options

Opens the Sheet Sets options in the Settings (1.17.10) dialog. (6.2303 on page 5485)

- **Sheet set found** (SSFOUND) - displays the sheet set file name associated with the current drawing.
- **Sheet set locate** (SSLOCATE) - controls whether BricsCAD tries to locate and open a sheet set when a drawing is being opened.
- **Sheet set manager auto open** (SSMAUTOOPEN) - controls whether or not the rpgram displays the Sheet Set Manager when a drawing is opened which is associated with a Sheet Set.
- **Sheet set manager poll time** (SSMPOLLTIME) - controls the time interval between automatic refereshes of the status data in a sheet set if the value of SSMSHEETSTATUS = 2.
- **Sheet set manager status** (SSMSHEETSTATUS) - controls whether the status data in a sheet set is refreshed.
- **Sheet set manager state** (SSMSTATE) - determines whether the Sheet Set Manager is active or not.
- **Sheet set template path** (SheetSetTemplatePath) - specifies the path to the Sheet Set Templates folder. Click the **Browse** button (), then select the path in the File dialog. The default path is: **C:\Users\<user name>\AppData\Local\ Bricsys\BricsCAD\Vxx\en_US\Templates\Sheet Sets**
- **Default new sheet template** (DefaultNewSheetTemplate) -specifies the default drawing template file (*.dwg or *.dwt) for new sheets. Click the **Browse** button (), then select the file in the F**ile** dialog.
- **Sheet number leading zeroes** (SheetNumberLeadingZeroes) -specifies how to format the **Number** value of new sheets.
- **Sheet set automatic backup** (SheetSetAutoBackup) - determines whether a backup is created whenever a sheet set is opened. The backup files have a *.ds$ extension.

New Sheet(s)

Right click the sheet set name, a subset or a sheet, then choose **New Sheet(s)** in the context menu. The New Sheet(s) dialog box displays: (6.2304 on page 5485)

- **Create from scratch, add new drawing** - creates a new drawing and adds a layout in the drawing to the sheet list in the current sheet set or subset:

  Number - accept the automatically calculated number, or else type a new number
  Title - type a name in the Title field to give new sheet a name
  File name - accept the automatically generated name (<Number>+<Title>) or else type a new name
  Folder Path - accept the current path or else click **Browse**  to set a different path
  Template - accept the current template or else click **Browse**  to select a different template drawing
  Open drawing - when checked, opens the newly created drawing after you click **OK**.

- **Import layouts from existing drawings** - creates new sheets through the New Sheet(s) dialog box: (6.2305 on page 5486) Click **Add drawing(s)** to select the drawings from which you want to import layouts. The layout(s) in the selected drawing(s) are listed: (6.2306 on page 5486) Uncheck the layouts you do not want to import as a sheet. Choose a option from the **Sheet titles** droplist. The options are: **Drawing name**, **Drawing name - Layout name**, and **Layout name**. Choose whether or not to number the new sheets automatically. Click **OK** to create the new sheet(s).

Context Menus

(6.2307 on page 5486)

Right click a sheet set to open the **Sheet Set** context menu.

- **Close Sheet Set** - closes the sheet set.
- **Export to XML** - displays the **Export Sheet Set As** file dialog box. Writes the sheet set definition to an XML file.
- **New Sheet** - displays the New Sheet dialog box, which allows to add new sheet(s) to the current sheet set.
- **New Subset** - adds a new subset to the current sheet set.
- **Selection Sets** - displays the Selection Sets dialog box.
- **Custom Properties** - displays the Custom Properties dialog box.
- **Plot** - prints all sheets in the sheet set.
- **Publish** - launches the Publish (6.24.68) command and loads all sheets in the sheet set and its subsets.
- **eTransmit** - launches the eTransmit (**??**) command to package together all drawings and support files.

(6.2308 on page 5487)

Right click a sheet subset to open the **Subset** context menu:

- **Collapse / Expand** - collapses or expands the subset.
- **New Sheet** - displays the New Sheet dialog box, which allows to add a new sheet to the subset.
- **New Subset** - adds a new subset to the subset.
- **Rename Subset** - changes the name for the subset.
- **Remove Subset** - deletes the subset. The deletion is definitive when the modifications are saved when closing the sheet set.
- **Plot** - prints all sheets in the subset.
- **Publish** - launches the Publish (6.24.68) command and loads all sheets in the subset.
- **eTransmit** - launches the eTransmit (**??**) command to package together all drawings and support files.

(6.2309 on page 5487)

Right click a sheet to open the **Sheet** context menu:

- **Open** - opens the drawing with the layout of the selected sheet.
- **Open read-only** - opens the drawing with the layout of the selected sheet in read-only mode to protect it
- **New Sheet** - displays the New Sheet dialog box, which allows to add a new sheet to the sheet set or current subset.
- **Remove Sheet** - deletes the sheet. The deletion is definitive when the modifications are saved when closing the sheet set.
- **Plot** - prints the sheet.
- **Publish** - launches the Publish (6.24.68) command and loads the sheet.
- **eTransmit** - launches the eTransmit (**??**) command to package together all drawings and support files.

(6.2310 on page 5487)

Right-click when multiple sheets are selected to open the **Sheet Selection** context menu. Hold the **Ctrl** key to select multiple sheets. Sheets in different subsets of the same sheet set can be selected. Choose **Save Sheet Selection** to save the currently selected sheets; displays a dialog box: (6.2311 on page 5488) Type a name for the sheet selection, and then click **OK**.

Mouse actions

Double click

- Expands/Collapses a sheet set or a subset.
- Opens a sheet.

Define Properties

Sheet Set properties

Sheet set properties, subset properties and sheet properties can be used in fields. See the Field (6.14.7) command. (6.2312 on page 5488) (6.2313 on page 5489)

- Select a field, and then define the property.
- **New Sheet Location** - click **Browse** , and then specify a folder.
- **Sheet Template Layout** - click **Browse** , and then choose a template drawing and a layout. (6.2314 on page 5489)
- **Prompt** - choose whether or not to be prompted for a template drawing when creating a new sheet from scratch.

Subset properties	(6.2315 on page 5489) • **Name** and **description** - select the field, and then type a name and description. • **Publish Sheets in Subset** - choose an option • **New Sheet Location** - click **Browse** , and then specify a folder. • **Sheet Template Layout** - click **Browse** , and then choose a template drawing and a layout.
Sheet properties	(6.2316 on page 5490) • **Number**, **Title**, **Description**, **Revision Number**, **Revision Date**, **Issue Purpose** and **Category** - select a field, and then define the property The **Title** field is mandatory; the other fields are optional. • **Publish** - choose whether or not to include the sheet when the sheet set or the subset is published or plotted. • **Layout** - click **Browse** ) and then specify a different drawing and/or layout. • **Sheet Custom Properties** - specify the custom properties for the sheet.

Procedures

- Using sheet set properties in a title block (1.30.13)
- To open or close a panel (1.15.7)
- To dock a panel (1.15.7)

Related Commands

SheetSetHide (6.27.32) - closes the Sheet Set panel. NewSheetSet (6.22.4) - creates a new sheet set. OpenSheetSet (6.23.10) - opens an existing sheet set; displays a file dialog box. -OpenSheetSet (6.23.9) - opens an existing sheet set; prompts you in the command bar. Publish (6.24.68) - allows to print a sheet list (= a list of model space or paper space layouts). Saves a sheet list to a file. -Publish (6.24.62) - prints a saved sheet list (= a list of model space or paper space layouts). -ToolPanel (6.29.37) - allows to control the display of tool panels, such as the Properties Bar, the Ribbon or the Sheet Sets panel from the command line.

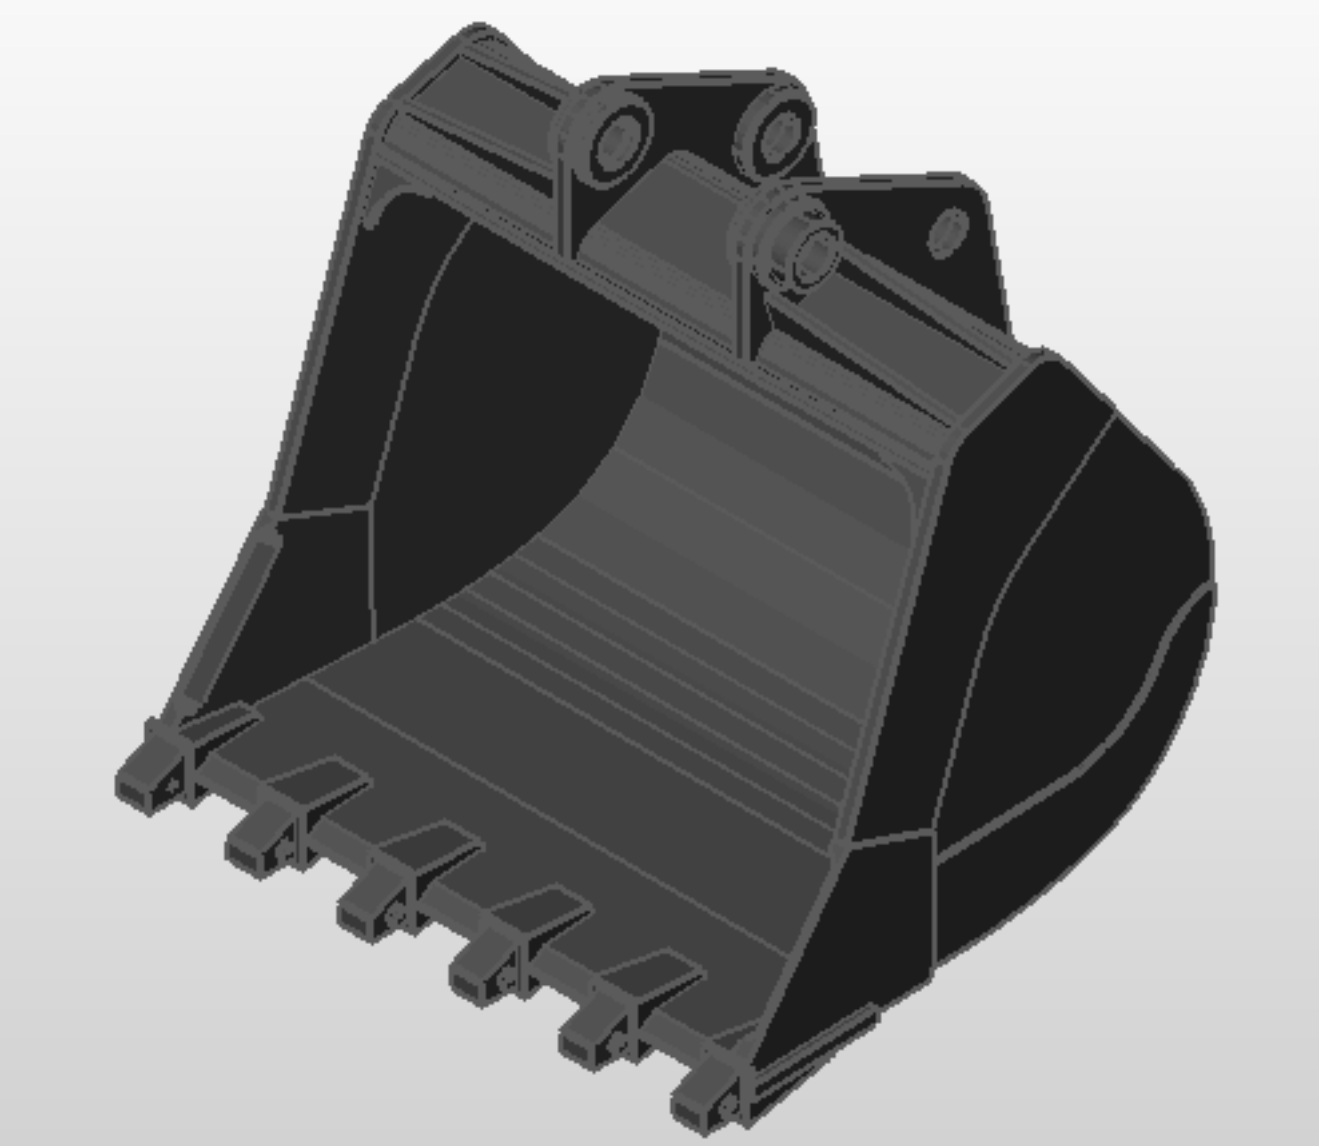
6.27.39 -ShadeMode

(6.2981 on page 6079) Shades 3D models in a variety of older rendering modes. **Note:** This command is largely superseded by the VisualStyles (6.31.15) command. (6.2318 on the next page)

Figure 6.2318



Accessing the Command

command bar: **-shademode** : **-shademode Prompts you in the command bar:** Enter option [2d wireframe/3d wireframe/ Hidden/ Flat/ Gouraud/ fLat+edges/ gOuraud+edges]: **(Enter an option)**

Command Options

Option	Description
2d wireframe	Displays 3D models in normal wireframe mode, with all edges shown; ignores the background
3d wireframe	Displays 3D models in wireframe mode showing all edges and the background specified by the Background (6.6.3) command
Hidden	Hide edges that are hidden by faces, with the background specified by the Background command
Flat	Renders faces with flat shading, with the background specified by the Background command
Gouraud	Renders faces with smoothed shading, with the background specified by the Background command
fLat+edges	Renders faces with flat shading, outlining faces with the background color (illustrated above), with the background specified by the Background command
gOuraud+edges	Renders faces with smoothed shading, outlining faces with the background color, with the background specified by the Background command

Related Commands

VisualStyles (6.31.15) - selects a visual style for drawing and editing Background (6.6.3) - sets the background coloration Render (6.26.21) - renders 3D models with optional materials and lights

Figure 6.2319

6.27.40 Slice

(6.2932 on page 6037) Creates 3D solids and surfaces by cutting existing entities. (6.2322 on page 5498)

Accessing the Command

command bar: **slice** alias: **sl** menu bar: **Model | 3D Solids | Slice ribbonP** toolbar: **3D Solids : Slice Prompts you in the command bar.** Select entities: **(Choose one or more 3D solids or surfaces.)** Entities in set: 1 Select entities: **(Choose more 3D solids or surfaces, or press Enter to continue)** Specify first point on slicing plane or [Object/Surface/Zaxis/View/XY/YZ/ZX/Line-point/3points/Multislice] <3points>: **(Pick a point or enter an option)**

Command Options

Option	Description
Select entities	Specifies the entities that will be sliced. Choose one or more 3D solids or surfaces; this command does not work with 2D regions.
Specify first point on slicing plane	Slices solids and surfaces with a plane which is perpendicular to the XY-plane of the current coordinate system, defined by two points; prompts you: (6.2321 on page 5497) 1. **Specify first point on slicing plane - (pick a point, such as #1 in the figure, or enter x,y,z coordinates.)** 2. **Specify second point on slicing plane - (pick another point such as #2)** 3. **Specify a point on desired side of the plane or Both - (enter an option)**: • Choose one of the parts, the other is erased • **B** - retains both. The section plane is perpendicular to the XY-plane of the World coordinate system (WCS): The sliced entity can be separated and its two parts manipulated as independent entities: (6.2322 on page 5498)
Object	Slices solids and surfaces with an intersecting entity; the entity defines the plane that slices the 3D selected entities. Prompts you: **Select a circle, ellipse, arc, 2D-spline, 2D-polyline, planar 3d Solid face, planar Surface face, or planar region - (choose an entity. In addition to the entities listed by the prompts, you can also use an elliptical arc.)** (6.2323 on page 5498) To use a planar 3D solid face as the slicing plane, ensure that the **Select Faces** option of the **SELECTIONMODES** system variable is on. (6.2324 on page 5498) (6.2325 on page 5499)(6.2326 on page 5499)
Surface	Slices solids and surfaces with a surface; prompts you: **Select a surface - (select a surface entity.)**

Zaxis	Slices solids and surfaces with a plane defined by one point on the plane, and a second point on the plane's normal (z axis); prompts you: 1. **Specify a point on the section plane** - **(pick a point to define the location of the section plane (1).)** 2. **Specify a point on the Z-axis (normal) of the plane** - **(pick another point to define the normal (2).)**The section plane is perpendicular to the line through the specified points. (6.2327 on page 5499) The section plane is defined by the centroid of the front face of the cube (1) and the Z axis through this point and a corner of the cube (2). The section plane is perpendicular to line 1-2.
View	Slices solids and surfaces with a plane defined by the current 3D viewpoint; prompts you: **Specify a point on the current view plane** - **(pick a point to define the height of the plane.)** The section plane is perpendicular to the view direction and passes through the picked point. (6.2328 on page 5500)
XY	Slices solids and surfaces with a plane parallel to the XY-plane of the current coordinate system; prompts you: **Specify a point on the XY-plane** - **(pick a point to define the position of the slicing plane.)** (6.2329 on page 5500)
YZ	Slices solids and surfaces with a plane parallel to the YZ-plane of the current coordinate system; prompts you: **Specify a point on the YZ-plane** - **(pick a point to define the position of the slicing plane.)** (6.2330 on page 5501)
ZX	Slices solids and surfaces with a plane parallel to the ZX-plane of the current coordinate system; prompts you: **Specify a point on the ZX-plane** - **(pick a point to define the position of the slicing plane.)** (6.2331 on page 5501)
Line-point	Slices solids and surfaces with a plane defined by a linear entity and a point; prompts you: 1. **Select a line, 2d-polyline segment, linear edge of 3dSolid or surface, or axial entity to use its axis** - **(select a linear entity.)** 2. **Specify point on slicing plane** - **(pick a point.)** (6.2332 on page 5502)
3points	Slices solids and surfaces with a plane defined by three points; prompts you: 1. **Specify first point on plane** - **(pick a point or enter x,y,z coordinates.)** 2. **Specify second point on plane** - **(pick another point.)** 3. **Specify third point on plane** - **(pick a third point.)** (6.2333 on page 5502)

Multislice	Slices solids and surfaces in more than one place using a face; prompts you: 1. **Select a planar Face or a planer Surface or <XY>** - **(pick a face.) Specify distance to create slice** - **(pick a slice location.) Specify distance to create slice or Repeat [Repeat]** - **(pick another slice location,or else press Enter to exit the command.)**
Specify a point on desired side of the plane or Both	(6.2334 on page 5503) Specifies which of the two portions to keep; prompts you: **Specify a point on desired side of the plane or [Both] <Both>:** Do one of the following: • Specify a point on the desired side of the slicing plane. • **Both** - retains both parts

Related Commands

BimSplit (6.7.52) - splits segmented solids into separated solids and allows to split a solid using a selection of cutting faces. Interfere (6.17.17) - creates 3D volumes of intersecting 3D solid models. Intersect (6.17.20) - removes volumes not in common between two solid models. Region (6.26.18) - creates 2D regions from 2D entities. Section (6.27.11) - creates 2D regions from 3D models. Subtract (6.27.58) - removes one solid model from a second. Union (6.30.6) - joins two or more solid models into a single entity.

6.27.41 Snap

(6.2981 on page 6079) Toggles snap mode for setting cursor movement increments, and sets properties for snap distances.

Accessing the Command

 command bar: **snap** transparent: **'snap** shortcut: **F9 Ctrl+B** alias: **sn** menu bar: **Settings | Snap** ribbon: **Settings | Snap** status bar: **SNAP** toolbar: **Settings |**  **: Snap Prompts you in the command bar:** Snap is off (x and y = 10): Set snap spacing or [snap ON/Rotate/snap Style/Aspect]: **(Enter a number for spacing, or enter an option)** Snap acts as a cursor resolution, constraining cursor movement to discrete distances, such as 0.5".

Command Options

Option	Description
Set snap spacing	Specifies the distance the cursor moves: • Enter a single number to specify the spacing between snap points • Pick a point, or else enter x,y coordinates to show the snap spacing; prompts you: **Second point** - **(pick another point, or enter x,y coordinates.)**
snap ON	Turns on snap in the current viewport, and so the cursor's movement jumps by the snap increment, with some exceptions: • Snap must be turned on in each viewport separately • When DRAGSNAP is off, snap is only in effect during drawing and editing commands; when DRAGSNAP is on, the cursor also snaps when no command is active. • When SNAPSTYL is on, the cursor snaps instead to the isometric grid • When the SNAPTYPE variable = 1, the cursor snaps instead to the polar (radial) distance specified by the POLARDIST variable. • When the SNAPTYPE variable = 2, the cursor's snap distance is adjusted by the AdapticeGripdStepSize variable.
snap OFf	Turns off snap.

Rotate	Rotates the snap grid; prompts you: 1. **Base point for snap grid - (specify the point about which the snap grid rotates; pick a point or enter x,y coordinates.)** 2. **Rotation angle - (specify the angle to which to rotate the snap grid.)** This option also rotates the grid, the crosshair cursor, and the orthographic axes. It does not affect the WCS or the UCS icon.
snap Style	Toggles between standard and isometric style; prompts you: **[Standard/Isometric] <Standard> - (enter an option:)** • **Standard** - rectangular snap distances • **Isometric** - sets grid, snap distance and crosshair cursor to the current isometric plane (determined by the SNAPISOPAIR variable), and adds the Isocircle option to the Ellipse (6.13.5) command.
Aspect	Specifies the snap spacing independently in the x and y directions; creates a rectangular snap grid. Prompts you: 1. **Horizontal spacing - (specify the space between snap points in the x direction.)** 2. **Vertical spacing - (specify the space between snap points in the y direction.)**

Status Bar Menu

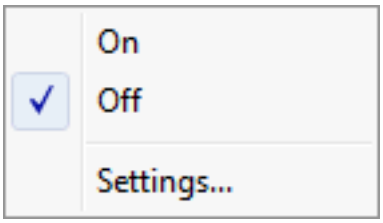
Right-click SNAP on the status bar for the shortcut menu: (6.2741 on page 5846) (6.2622 on page 5746)

Shortcut Menu	Description
On	Turns on snap.
Off	Turns off snap.

Figure 6.2336

Settings	Opens the Snap/Grid section of the Settings dialog box: **Snap angle** - sets the angle of the snap, grid display, and ortho mode in the current viewport, relative to the current UCS. **Snap base** - specifies the x,y-coordinates about which the snap rotates. **Snap isometric pair** - specifies the current isometric plane (requires Snap Style to be set to Isometric Snap; see the Isometric (6.17.21) command): • **Left** - left isometric plane • **Top** - top isometric plane • **Right** - right isometric plane **Snap mode** - toggles snap mode: • On - turns on snap • Off - turns off snap **Snap style** - specifies the snap style; click the droplist and choose one: • **Rectangular snap** - regular snap mode • **Isometric snap** - isometric mode **Snap type** - specifies the snap type; click the droplist and choose one: • **Grid snap** - uses distances along the x and y axes • **Polar snap** - uses relative distance and angle **Snap unit** - specifies the snap increment distance: • **X** - spacing in the x direction • **Y** - spacing in the y direction There is no snap in the z direction.

Figure 6.2337



Procedures

- Using snap and grid (1.21.12)

Related Commands

Settings (6.27.25) - sets parameters related to snap mode. Grid (6.15.23) - controls the display of the grid. Isoplane (6.17.21) - switches to the next isometric plane.

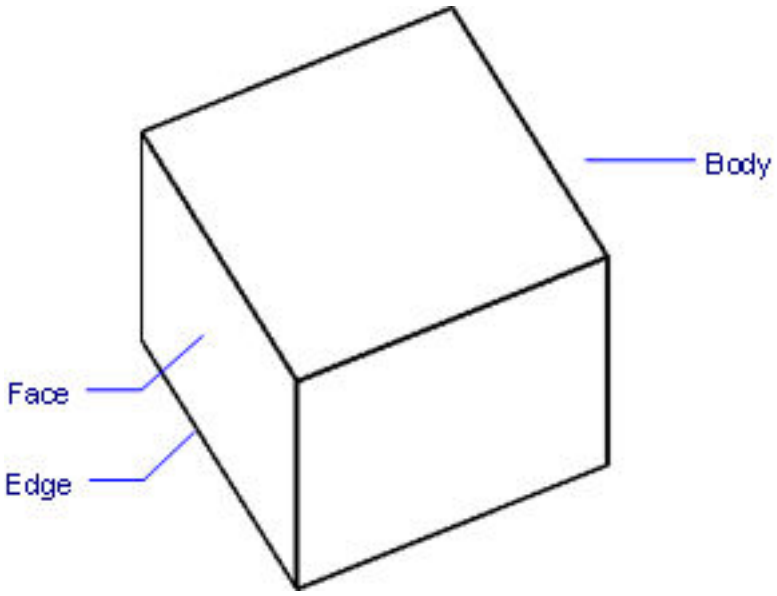
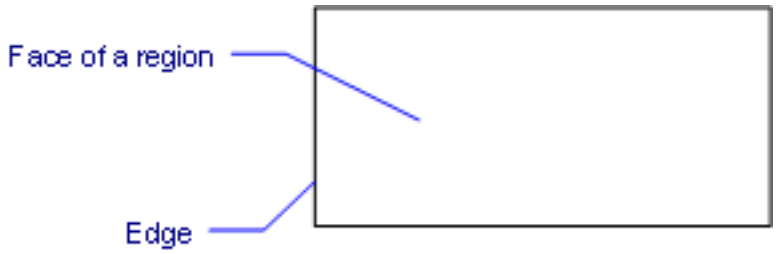
Figure 6.2339



6.27.42 SolidEdit

(6.2932 on page 6037) Edits the faces, edges, and bodies of 3D solids and 2D regions. (6.2339) (6.2340)

Figure 6.2340



Accessing the Command

command bar: **solidedit** menu bar: **Model | 3D Solid Editing | Extrude - Copy Faces Model | 3D Solid Editing | Extrude Copy, Color Edges Model | 3D Solid Editing | Clean, Separate, Shell, Check** ribbon: **Solid | Edit | Shell** toolbar: **3D Solid Editing |** (6.2341) : **SolidEdit Prompts you in the command bar:** Enter a solids editing option: Face/Edge/Body/Undo/<eXit>: **(Enter an option, or press Enter to end the command)**

Figure 6.2341

Face Editing Options

To access these options, enter the Face option: Enter a face editing option: Extrude/ Move/ Rotate/ Offset/ Taper/ Delete/ Copy/ coLor/Undo/<eXit>: **(Enter an option, or press Enter to return to the previous prompt)**

 Extrude

Extrudes the selected face or region; prompts you: (6.2342 on page 5515) **Select faces: Remove/Undo/ALL** - **(choose the face(s) to change:)** (6.2343 on page 5515)

- Pick one or more faces)
- **Remove** - removes faces from the selection set
- **Undo** - undoes the last selection operation
- **ALL** - selects all faces in the drawing
- **Enter** - continues the command to the next prompt:

2. **Specify height of extrusion or Path** - **(specify a distance, or press P to select an entity that defines the path:)**

- **Positive distance** - extrudes outwards from the face (creates a post)
- **Negative distance** - extrudes into the body (creates a hole)

3. **Specify angle of taper for extrusion** - **(specify an angle, or enter 0 for no taper:)** (6.2344 on page 5516)

- **Positive angle** - tapers inwards (gets narrower)
- **Negative angle** - tapers outwards (gets wider)

Path - Specifies the entity for defining the extrusion shape and direction; prompts you: (6.2345 on page 5516) **Select extrusion path** - **(choose a open entity, such as line, arc, polyline, or spline.)** See the Extrude (6.13.25) command.

 Move

Moves the selected face; prompts you: (6.2346 on page 5517)

1. **Select faces: Remove/Undo/ALL** - **(choose one or more faces to move.)**
2. **Select faces: Remove/Undo/ALL** - **(choose more faces, or else press Enter to continue.)**
3. **Specify <Base point>/Vector** - **(pick a point, enter x,y,z coordinates, or press V.)**
4. **Specify end point** - **(pick the destination point.)**

(6.2347 on page 5517) **Vector** - specifies the displacement through a vector measured from the origin (0,0,0) to the cursor's pick point; prompts you: **Specify end point** - **(pick a point or enter x,y,z coordinates.)** (6.2348 on page 5518) See the Move (6.21.29) command.

 Rotate

Slants the selected face about an axis; prompts you: (6.2349 on page 5518)

1. **Select faces: Remove/Undo/ALL - (choose one or more faces to rotate.)**
2. **Select faces: Remove/Undo/ALL - (choose more faces, or else press Enter to continue.)**
3. **Specify the base point - (pick the first point of the axis of rotation.)**
4. **Specify another point along the axis - (pick the axis of rotation's second point.)**
5. **Specify the rotation angle - (enter an angle:)**

- **Positive angle** - face rotates counterclockwise around the axis.
- **Negative angle** - face rotates clockwise.

(6.2350 on page 5519) See the Rotate (6.26.29) command.

 Offset

Extends the selected face; prompts you: (6.2351 on page 5519)

1. **Select faces: Remove/Undo/ALL - (choose one or more faces to offset.)**
2. **Select faces: Remove/Undo/ALL - (choose more faces, or else press Enter to continue.)**
3. **Specify offset distance - (enter a distance:)**

- **Positive distance** - face is offset outwards (3D body becomes larger)
- **Negative distance** - face is offset inwards (3D body becomes smaller)

(6.2352 on page 5520) See the Offset (6.23.3) command.

 Taper

Tapers (slants) the selected face; prompts you: (6.2353 on page 5520)

1. **Select faces: Remove/Undo/ALL - (choose one or more faces to taper.)**
2. **Select faces: Remove/Undo/ALL - (choose more faces, or else press Enter to continue.)**
3. **Specify the base point - (pick the first point of the axis of rotation.)**
4. **Specify another point along the axis - (pick the axis of rotation's second point.)**
5. **Specify the rotation angle - (enter an angle:)**

- **Positive angle** - face rotates counterclockwise around the axis.
- **Negative angle** - face rotates clockwise.

(6.2354 on page 5521)

 Delete	Deletes the selected face, and then repairs the model; prompts you: (6.2355 on page 5521) 1. **Select faces: Remove/Undo/ALL - (choose one or more faces to delete.)** 2. **Select faces: Remove/Undo/ALL - (choose more faces, or else press Enter to continue.)** (6.2356 on page 5522) The selected faces are deleted, and the program repairs the 3D solid to keep it solid. This option cannot remove inate faces, such as those on the cube illustrated above.
 Copy	Copies faces; selected faces turn into regions; prompts you: (6.2357 on page 5522) 1. **Select faces: Remove/Undo/ALL - (choose one or more faces to copy.)** 2. **Select faces: Remove/Undo/ALL - (choose more faces, or else press Enter to continue.)** 3. **Specify <Base point>/Vector - (pick a point, enter x,y,z coordinates, or press V.)** 4. **Specify end point - (pick the destination point.)** (6.2358 on page 5523) **Vector** - specifies the displacement through a vector measured from the origin (0,0,0) to the cursor's pick point; prompts you: **Specify end point - (pick a point or enter x,y,z coordinates.)** To copy edges to lines, use the **Edge | Copy** option. See the Copy (6.9.35) command.
 coLor	Changes the color of the selected face; prompts you: 1. **Select faces: Remove/Undo/ALL - (choose one or more faces to color.)** 2. **Select faces: Remove/Undo/ALL - choose more faces, or else press Enter to continue.)** 3. **Color to select [BYLayer/ BYBlock/ Red/ Yellow/ Green/ Cyan/ Blue/ Magenta/ White] <BYLAYER> - (specify a color.)**
Undo	Undoes the last editing operation.
eXit	Returns to the previous prompt.

Edge Editing Options

To access these options, enter the Edge option: Enter an edge editing option: Copy/coLor/Undo/<eXit>: **(Enter an option, or press Enter to return to the previous prompt)**

 Copy	Copies the selected edge, and turns it into a line; the copied edges are turned into entities such as lines and splines. (6.2359 on page 5523) Prompts you: 1. **Select edges: Remove/Undo/ALL** - **(enter an option:)** • Pick one or more edges • **Remove** - removes edges from the selection set • **Undo** - undoes the last selection operation • **ALL** - selects all edges in the drawing • **Enter** - continues the command to the next prompt: 2. **Select edges: Remove/Undo/ALL** - **(choose more edges, or else press Enter to continue.)** 3. **Specify <Base point>/Vector** - **(pick a point, enter x,y,z coordinates, or else press V)** 4. **Specify end point** - **(pick the destination point, or enter x,y,z coordinates.) Vector** - specifies the displacement through a vector measured from the origin (0,0,0) to the cursor's pick point; prompts you: **Specify end point** - **(pick a point or enter x,y,z coordinates)**
 coLor	Changes the color of the selected edge; prompts you: 1. **Select faces: Remove/Undo/ALL** - **(choose one or more edges to color.)** 2. **Select faces: Remove/Undo/ALL** - **(choose more edges, or else press Enter to continue.)** 3. **Color to select [BYLayer/ BYBlock/ Red/ Yellow/ Green/ Cyan/ Blue/ Magenta/ White] <BYLAYER>** - **(specify a color.)**
Undo	Undoes the last editing operation.
eXit	Returns to the previous prompt.

Body Editing Options

To access these options, enter the **Body** option: Enter a body editing option Imprint/seParate/Shell/cLean/Check/Undo/<eXit: **(Enter an option, or press Enter to return to the previous prompt)**

 Imprint	Imprints 2D entities onto 3D solids; the 2D entity must lie on, or intersect, one of the 3D solid's faces. (6.2360 on page 5524) Prompts you: 1. **Select 3d solid - (choose a 3D solid.)** 2. **Select an object to imprint - (choose a 2D entity lying on or intersecting at least one face.)** (6.2361 on page 5525) 3. **Delete the source object Yes/<No> - (enter an option:)** • **Yes** - deletes the 2D entity • **No** - does not delete the 2D entity, which can be reused 4. **Select an object to imprint - (choose another 2D entity, or press Enter to end.)** You can extrude the imprint. (6.2362 on page 5525)
 seParate	Separates disjointed 3D solids; prompts you: **Select 3d solid - (choose a 3D solid.)** This option does not work on bodies created through Boolean operations (Union, Intersect, Subtract).
 Shell	Turns the 3D solid into a hollow entity (shelled); prompts you: (6.2363 on page 5526) 1. **Select 3d solid - (choose a 3D solid.)** 2. **Remove faces: Add/Undo/ALL - (press Enter)**; removing faces creates unexpected results. 3. **Enter the shell offset distance - (specify a distance):** • **Positive distance** - shells body outwards • **Negative distance** - shells body inwards If the shell offset distance is larger than the 3D solid, this command fails.
 cLean	Cleans the 3D solid; the cleaning operation checks for errors in the 3D solid. Prompts you: **Select 3d solid - (choose a 3D solid.)**
 Check	Reports on the 3D solid; prompts you: (6.2364 on page 5526) **Select 3d solid - (choose a 3D solid; a typical report looks like this:)** `checked: 1 lumps 2 shells 0 wires 12 faces 12 loops 48`
Undo	Undoes the last editing operation.
eXit	Returns to the previous prompt.

Related Commands

BimSplit (6.7.52) - splits segments of wall-like solids into separated solids. Box (6.6.18) - creates 3D boxes as solid models. Cone (6.9.46) - creates 3D cones as solid models. Cylinder (6.9.49) - creates 3D cylinders as solid models. Dish (6.10.42) - creates the lower half of 3D balls as solid models. Dome (6.10.35) - creates the upper half of 3D balls as solid models. Extrude (6.13.25) - extrudes 2D entities into 3D solid models. Imprint (6.17.12) - mprints 2D entities onto planar faces of 3D solids and surfaces. Interfere (6.17.17) - creates 3D volumes of intersecting 3D solid models. Intersect (6.17.20) - removes volumes not in common between two solid models. MassProp (6.21.2) - reports the mass properties of 3D solid models and 2D regions. Revolve (6.26.45) - revolves 2D entities into 3D solid models. Section (6.27.11) - creates 2D regions from 3D models. Slice (6.27.40) - cuts 3D solids into two parts. Sphere (6.27.50) - creates 3D balls as solid models. Subtract (6.27.58) - removes one solid model from a second. Torus (6.29.29) - creates 3D donuts as solid models. Union (6.30.6) - joins two or more solid models into a single entity. Wedge (6.33.6) - creates 3D wedges as solid models.

6.27.43 Solprof

(6.2981 on page 6079) Creates hidden line representations of 3D solids in layout viewports (short for "solid profiles"); the representations are blocks. **Note:** This command operates only in model space of a layout tab viewport. (6.2366)

Accessing the Command

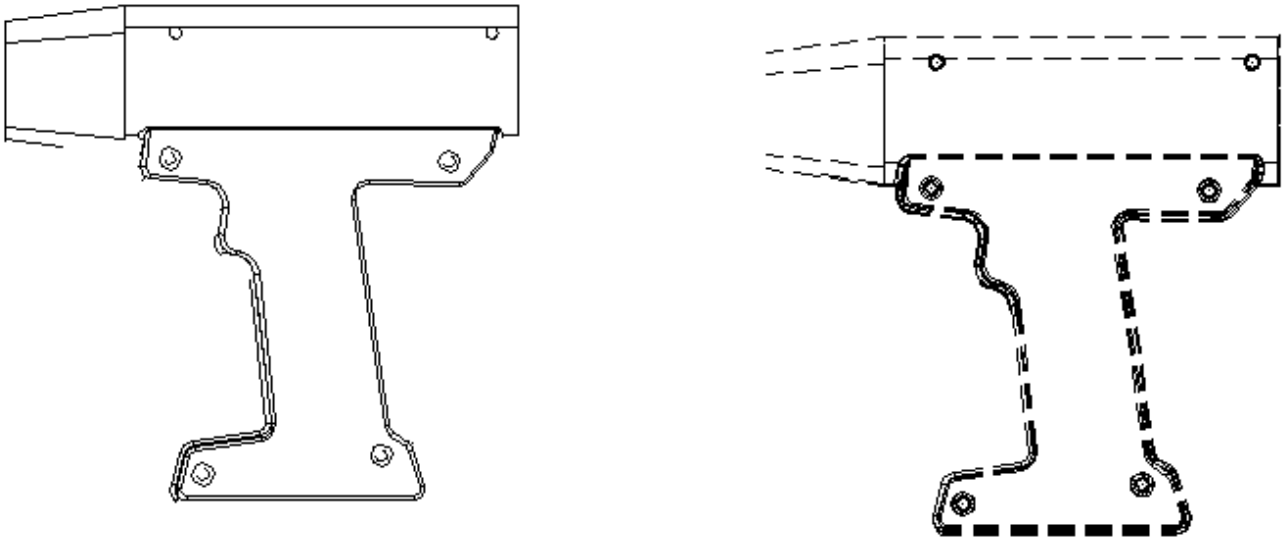
command bar: **solprof** menu bar: **Model | Solprof** ribbon: **Model | Sections | Section Plane | Solprof** toolbar: **Sections |**  : **Solprof** In a layout tab, double-click inside a viewport. **Prompts you in the command bar:** Select entities: **(Select one or more 3D solids) Select entities: (Select more 3D solids, or else press Enter to stop selecting entities)** Use separate layer for hidden lines? [Yes/No] <Yes>: **(Press Y or N)** Project results onto plane? [Yes/No] <Yes>: **(Press Y or N)** Hide tangential edges? [Yes/No] <Yes>: **(Press Y or N)**

Command Options

Option	Description

Select entities	Select one or more 3D solids; this command does not work with any other kind of 3D entity, or with 3D solids referenced externally (xrefs): • Select one or more entities in the viewport • Enter **all** to select all entities; the program filters out ineligible ones • Press **Enter** to end entity selection (This command operates only in the model space of a layout tab viewport.)
Use separate layer for hidden lines?	Determines if hidden lines are placed on a separate layer from the visible lines: • **Yes** - creates two 2D blocks, one for the visible lines placed on layer PV-**<viewport handle>** (left, in the figure below) and another block for hidden lines on layer PH-**<viewport handle>** (at right) **(6.2367 on the facing page)** • **No** - creates one block of both hidden and visible lines on layer PV-**<viewport handle>** The blocks and layers are named by the program, such as block *U3 and layers PH-88 and PV-88: • ***U** identifies blocks created by the program • **PH-** is short for "profile hidden" • **PV-** is short for "profile visible"
Project results onto plane?	Determines if the profiles are projected, which is code for, "Are the resulting blocks 2D? • **Yes** - profile lines are projected onto the viewing plane. The 3D solids (shown in yellow below) are projected onto a plane parallel with the layout's viewport (i.e., your point of view), creating a block in 2D (shown by the black lines below). In the figure, the viewpoint has been rotated to show that the block(s) are indeed 2D. (6.2368 on page 5530) • **No** - no projection; the blocks are made of 3D entities, as shown below (6.2369 on page 5530)
Hide tangential edges?	Toggles the display of tangential lines: • **Yes** - hides tangential lines • **No** - displays tangential lines Tangential lines are used to show the transition between two faces that are curved. In a 3D shaded model, they are not needed as highlights and shadows indicate the transition; but in 2D wireframe mode it can be useful to show them. (6.2370 on page 5531)

Figure 6.2367



Related Commands

Flatshot (6.14.10) - creates a hidden line representation of 3D solids in model space. Hide (6.16.9) - removes hidden lines from 3D entities. Shademode (6.27.31) - sets the shading style for 3D drawings. ViewExport (6.31.11) - exports the content of drafting views and sections obtained by VIEWBASE and VIEWSECTION to the Model Space of the drawing.

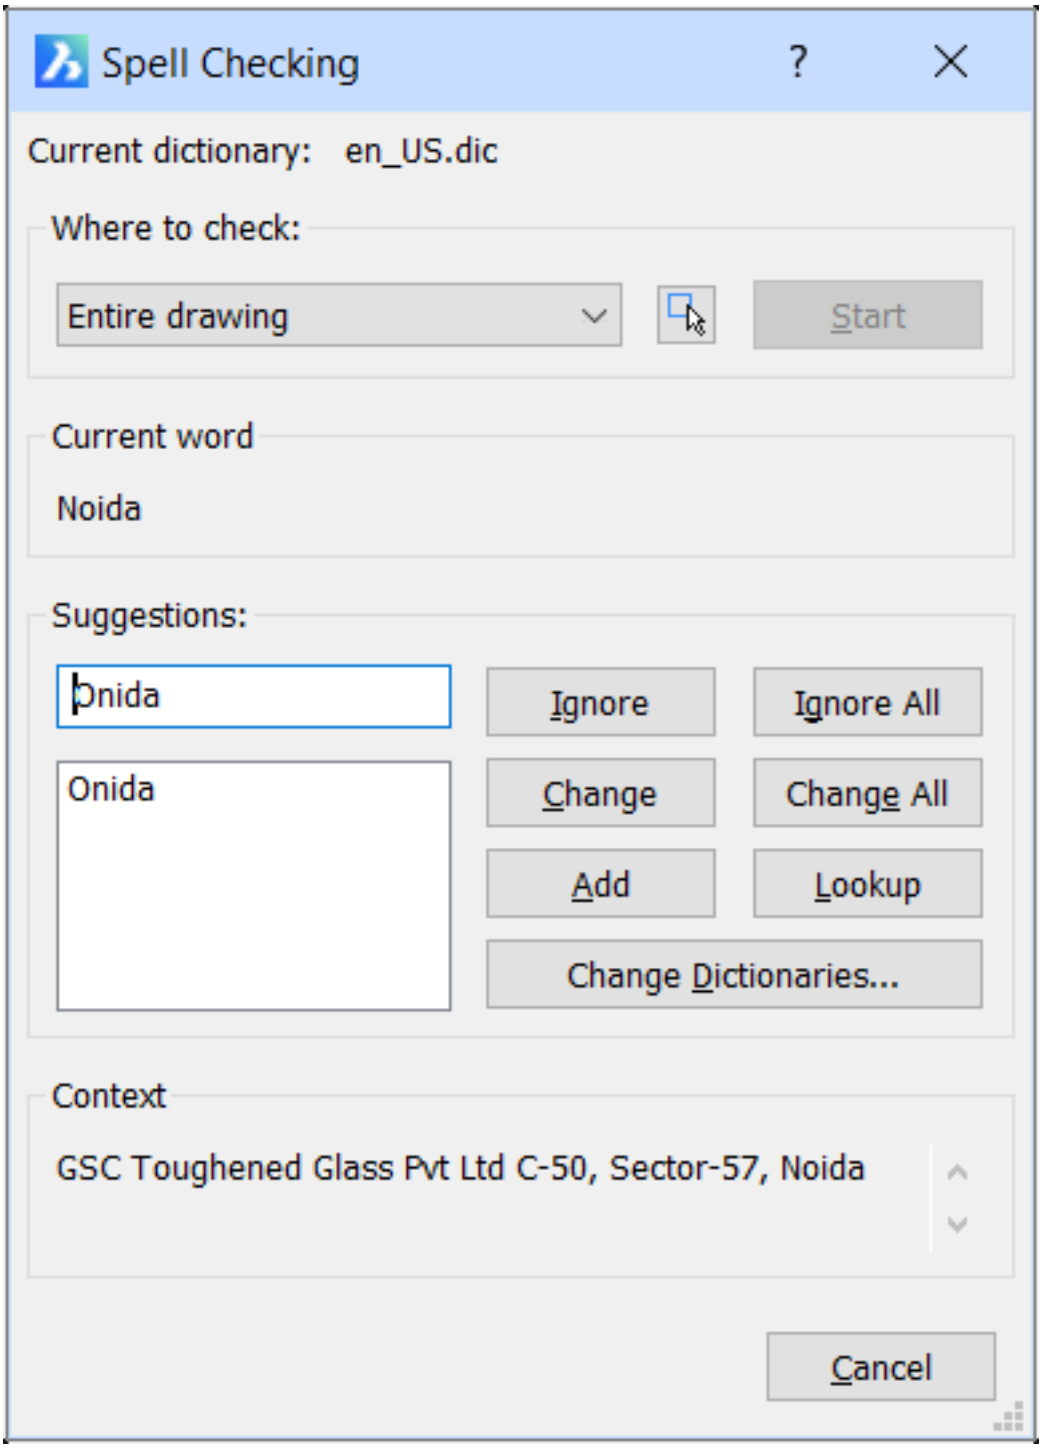
6.27.44 Spell

(6.2981 on page 6079) Checks the spelling of words in drawings, including fields in texts, mtexts, leaders, mleaders, tables, and block attributes.

Accessing the Command

command bar: **spell** transparent: **'spell** alias: **sp** menu bar: **Tools | Check Spelling : Spell** Displays a dialog box: (6.2372 on the next page) **Click Start.**

Figure 6.2372



Dialog Box Options

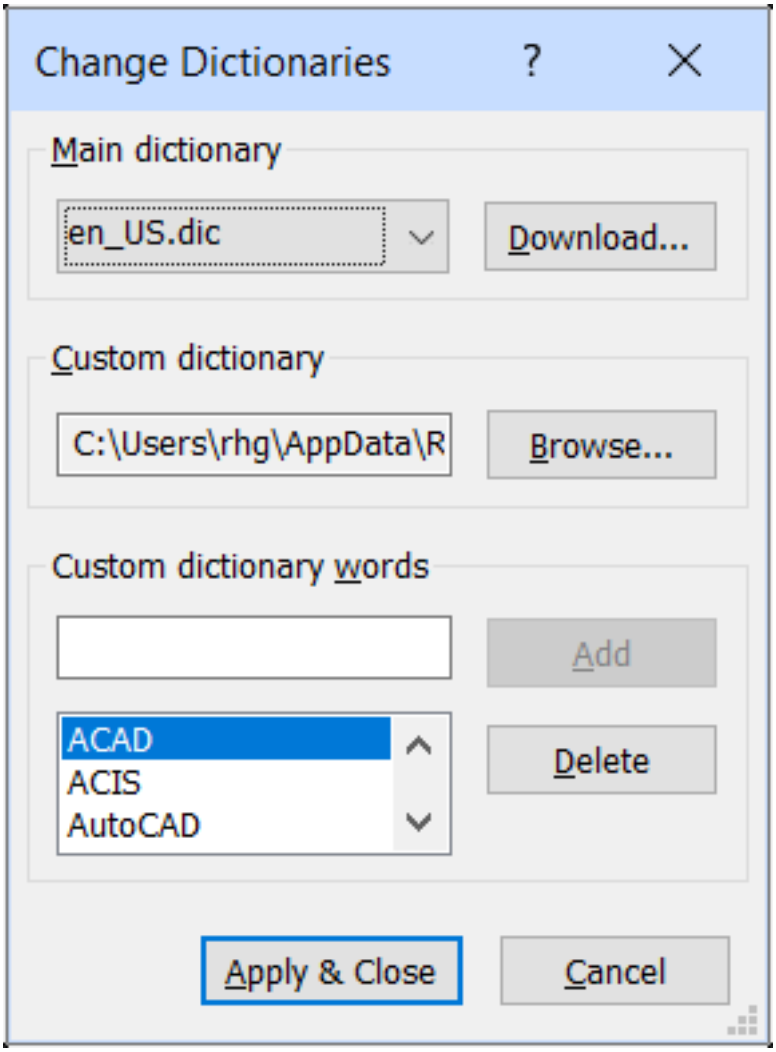
Option	Description
Where to check	Checks text in: • **Entire drawing** - checks all text in the drawing, except for text on frozen layers • **Selected entities** - checks selected text; click the Select Entities button to choose text
 Select entities	Selects the text to be checked; prompts you: **Select entities - (choose one or more pieces of text; press Enter to return to the dialog box.)**
Start	Starts checking the spelling of words.
Suggestions	Lists the suggested replacements for misspelled words. Choose a replacement word, and then click **Change** or **Change All**.
Ignore	Ignores the spelling of the word.
Ignore All	Ignores all instances of the word.
Change	Changes the word to the one selected from the Suggestions list.
Change All	Changes all instances of the word to the one selected from the Suggestions list.
Add	Adds the word to the word list.
Lookup	Provides additional alternative spellings for the word selected in the Suggestions list.
Change Dictionaries	Changes the dictionary used for spell checking; displays the Change Dictionaries dialog box.

Change Dictionaries Dialog Box Options

Click **Change Dictionaries** to arrive at this dialog box: (6.2373 on the facing page)

Change Dictionaries	Description
Main Dictionary	Specifies the dictionary to use for spell checking. To change dictionaries: 1. Click the droplist 2. Choose another dictionary
Download	Accesses additional dictionaries from the OpenOffice.org Wiki. Opens the Web browser at **https://extensions.openoffice.org/dictionaries**
Custom dictionary	Specifies the name of a custom dictionary. Custom dictionaries are used for discipline-specific words, such as medical or mechanical.
Browse	Selects a CUS custom dictionary file. Opens the Select Custom Dictionary dialog box: 1. Choose a CUS file 2. Click **Open**.
Custom dictionary words	Enters words to be stored in the custom dictionary.
Add	Adds the word to the custom dictionary. Words are also added when Add is clicked on the Spell Checking dialog box.
Delete	Removes the word from the custom dictionary.

Figure 6.2373



Procedures

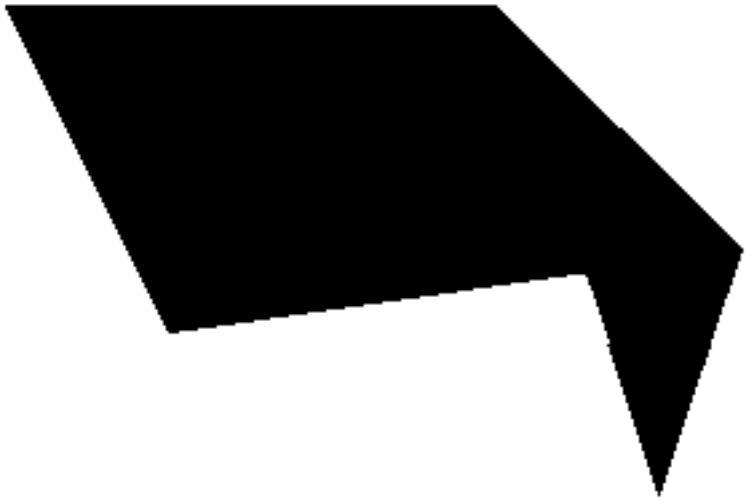
- To check the spelling (1.29.21)
- To change dictionaries (1.29.21)
- To add a new main dictionary (1.29.21)
- To add a new custom dictionary (1.29.21)

Related Commands

Text (1.29.20) - places single-lines of text in drawings. -Text (6.29.12) - places text and evaluates LISP expressions. MText (6.21.38) and -MText (6.21.40) - places paragraph text. AttDef (6.4.31) - defines attribute text. DdEdit (6.10.13) - edits text. Find (6.14.8) - finds and replaces text. Properties (6.24.54) - modifies the properties of text.

Figure 6.2374

Figure 6.2375



6.27.45 Solid

(6.2981 on page 6079) Draws 3 and 4-sided solid-filled regular and irregular 2D polygons; does not draw 3D solids. (6.2375)

Accessing the Command

 command bar: **solid** aliases: **plane so** menu bar: **Draw | Solid** ribbon: **Draw | Draw | Polygons | Solid** toolbar: **Draw | Polygons |**  **: Solid Prompts you in the command bar:** Set first point of plane or [Rectangle/Square/Triangle]: **(Pick a point, or enter an option)** Second point: **(Pick another point)** Third point of plane: **(Pick another point)** Fourth point: **(Pick another point to draw a quadrangle, or else press Enter to draw a triangle and exit the command)** Third point of plane: **(Pick another point to draw an adjoining triangle, or press Enter to exit the command.)**

Command Options

Option	Description
Set first point of plane	Specifies the first corner of the solid-filled polygon: • Pick a point • Enter x,y coordinates After picking this point, the program draws a ghost line to the next point.
Second point	Specifies the second corner of the polygon. The program previews the shape and size of the polygon.
Third point of plane	Specifies the third corner of the polygon. (6.2377 on page 5539)
Fourth point	To draw a solid-filled triangle, press **Enter** at this prompt; otherwise, specify the fourth corner of the polygon. (6.2378 on page 5540)

Third point on plane	Starts drawing an adjacent polygon. The third and fourth points of the first polygon become the first and second points of the second polygon. (6.2379 on page 5540) To end the command, press **Enter** at the this prompt.
Rectangle	Draws one or more connected solid-filled rectangles; prompts you: 1. **First point of plane - (pick a point or enter x,y coordinates.)** 2. **Other corner of rectangle - (pick another point.)** 3. **Rotation angle for plane - (pick a point, or enter an angle.)** 4. **Other corner of rectangle - (pick a point, or else press Enter to stop.)** (6.2380 on page 5540)
Square	Draws one or more connected solid-filled squares; prompts you: 1. **First point of plane - (pick a point or enter x,y coordinates.)** 2. **Second corner of square - (pick a point.)** 3. **Second corner of square - (pick a point, or else press Enter to stop.)** (6.2381 on page 5541)
Triangle	Draws one or more connected equilateral solid-fileld triangles; prompts you: 1. **First point of plane - (pick a point or enter x,y coordinates.)** 2. **Second corner of triangle - (pick a point; the cursor's movement determines the orientation of the triangle:)** • **Right** - triangle is drawn upside down. • **Left** - triangle is drawn right side up. (6.2382 on page 5541) 3. **Second corner of triangle - (pick a point, or else press Enter to stop.)**

Grips Editing

2D solids can be edited directly through grips:

1. Select the solid. Notice that it has one grip at each vertex.
2. Drag a grip to stretch the solid.

(6.2376 on the next page)

6.27.46 SplinEdit

(6.2981 on page 6079) Modifies the properties of a spline; converses a spline to a polyline. **Note:** It is easier to edit the spline and its grips when Snap is turned off.

Accessing the Command

 command bar: **splinedit** transparent: **'splinedit** menu bar: **Menu| command** toolbar: **Modify |**  **: SplinEdit Prompts you in the command bar:** Select spline: **(Select a spline entity)** Edit spline [Close/Join/Fit data/Edit vertex/convert to Polyline/Reverse/Undo/eXit] <eXit>: **(Select an option)** Edit spline [Close/Join/Fit data/Edit vertex/convert to Polyline/Reverse/Undo/eXit] <eXit>: **(Select another option, or else press Enter to end the command)**

Command Options

Option	Description
Select spline to edit	Selects the spline to which the editing operations should apply: pick a single spline. The program shows the spline's fit points (green squares) and places a triangle at the start of the spline: (6.2384 on page 5545)
Close **or** Open	Depending on whether the selected spline is open or closed, one of the options is available: • **Close** - closes an open spline connection the start and endpoint. • **Open** - opens a closed spline by removing the segment between the first and last points specified when the spline was originally created.
Join	Joins the spline with an open 2D entity that shares an endpoint with the spline (coincident endpoints); you can join lines, polylines, arcs, elliptical arcs, and other splines. Prompts you: 1. **Select any open curves to join to source - (select a connected entity.)** 2. **Entities in set: 1** 3. **Select any open curves to join to source - (select another connected entity, or else press Enter.)** The entities joined to the spline take on the properties of the spline, such as its color and linetype.

Fit Data

Edits fit point data using several options; fit points determine the curvature of the spline. Prompts you: **Edit fit data [Add/Close/Delete/Kink/Move/Purge/Tangents/toLerance/eXit] <eXit>** - **(choose an option:) Add** - adds fit point between two existing ones; prompts you:

1. **Select existing fit point <exit>** - **(select a fit point:)** the selected and the next fit point are highlighted in red: (6.2385 on page 5546)
2. **Specify new fit point to add <exit>** - **(pick a point to add, as shown by the cursor, above.)**
3. **Specify new fit point to add <exit>** - **(pick another point to add, or else press Enter to return to the previous prompt.)**

Close/Open - closes an open spline by connecting the start and end points, or else opens a closed spline by removing the segment between the first and last points when the spline was originally created. **Delete** : Removes fit points; prompts you:

1. **Select fit point to delete <exit>** - **(select a fit point; the program removes the fit point, and adjusts the shape of the spline.)**
2. **Select fit point to delete <exit>** - **(select another point or press Enter to exit.)**

Kink - adds a knot and fit point at the specified location on the spline, which does not maintain tangent or curvature continuity at that point; prompts you:

1. **Specify a point on the spline <exit>** - **(pick a point on the spline to locate the new knot.)**
2. **Specify a point on the spline <exit>** - **(pick another point or press Enter.)**

Move - moves a fit point; prompts you: **Enter new location or [Next/Previous/Select point/eXit] <N>** - **(the program automatically selects the first fit point, the one marked by the triangle; enter an option:)** (6.2386 on page 5546)

- Pick a new point to relocated the selected fit point
- Choose an option to move to another fit point
- Press **Enter** to move the next fit point
- Press **X** to return to the previous prompt

Purge - replaces the fit data from the spline with control vertices: (6.2387 on page 5546) **Tangents** - changes the starting and ending tangents of an open spline; prompts you:

1. **Specify start tangent or [System default] <System default>** - **(pick a point for the new starting tangency, or else press Enter to accept the system default.)** (6.2388 on page 5547)
2. **Specify end tangent or [System default] <System default>** - **(pick a point for the new ending tangency, or else press Enter to accept the system default.)**

For closed splines you are prompted to define the

Edit Vertex

Edits control frame data using several options; prompts you: **Edit vertex [Add/Delete/Elevate order/Move/Weight/eXit] <eXit> - (choose an option.) Add** - adds a new control vertex at the point you specify; prompts you:

1. **Specify a point on the spline <exit> - (pick a point on the spline to add the control vertex.)**
2. **Specify a point on the spline <exit> - (pick another point on the spline, or else press Enter to return to the previous prompt.)**

Delete - removes control vertex; prompts you:

1. **Select control point to delete <exit> - (select a vertex to delete.)**
2. **Select control point to delete <exit> - (pick another vertex to delete, or else press Enter to return to the previous prompt.)**

Elevate Order - increases the polynomial order (degree plus one) of the spline to increase the number of control vertices across the spline; the maximum value is 26. Prompts you: **Enter new order <xx> - (type an integer.) Move** - relocates control vertices one by one; prompts you:

1. **Enter new location or [Next/Previous/Select point/eXit] <N> - (pick a point, choose an option or press Enter to move the next fit point.)**
2. **Enter new location or [Next/Previous/Select point/eXit] <N> - (pick a point, choose an option or press Enter to move the next fit point or press X to stop moving vertices and return to the previous prompt.)**

Weight - changes the weight of a specified control vertex and then recalculates the spline based on the new weight value; larger weights pull the spline closer to the control vertex. In the figure below, the red control vertex has a weight of 1: (6.2389 on page 5547) And here the red control vertex has a weight of 6: (6.2390 on page 5548) Prompts you:

1. **Enter new weight (current = 1.00) or [Next/Previous/Select point/eXit] <N>: - (enter new weight or enter an option.)**
2. **Enter new weight (current = 1.00) or [Next/Previous/Select point/eXit] <N> - (press Enter to move to the next vertex, enter a value, or else press X to return to the previous prompt.)**

Exit - accepts the changes and returns to the previous prompt.

Convert to Polyline	Converts the spline to a polyline. The precision determines how closely the resulting polyline matches the spline: values between 0 and 99 are accepted, with higher values creating more polyline segments. Prompts you: **Specify a precision <10>** - **(enter an integer.)** The PLINECONVERTMODE (1.17.10) variable specifies the kind of polyline to convert to: • **0** - create polylines with line segments • **1** - create polylines with arc segments
Reverse	Reverses the direction of the spline; the triangle icon appears on what was formerly the spline's end point.
Undo	Undoes the previous modification.
Exit	Concludes the editing of the spline.

Related Commands

Join (6.18.1) - joins lines, LW polylines, 2D polylines, 3D polylines, circular arcs, elliptical arcs, splines and helixes at their common endpoints. PEdit (6.24.24) - edits polylines, 3D polylines, and 3D meshes. Spline (6.27.63) - draws open and closed splines.

6.27.47 Spotlight

(7.3 on page 6132) Creates a spot light, which casts a narrow beam towards a target point. (6.2392)

Accessing the Command

command bar: **spotlight** menu bar: **View | Rendering | Lights | New spot light** ribbon: **View | Lights | Create | New spot light** toolbar: **Lights |**  **: Spotlight Prompts you in the command bar:** Specify source position <0,0,0>: **(Pick a point in the drawing to position of the light, or enter an x,y,z coordinate)** Specify target position <0,0,-10>: **(Specify the target point for the light)**

- When LIGHTINGUNITS variable is 0 (no lighting units specified), **the following prompt is displayed next:**

Enter an option to change [Name/ Intensity/ Status/ Hotspot/ Falloff/ shadoW/ Attenuation/ Color/eXit] <eXit>: **(Enter an option, or press Enter to exit the command)**

- When LIGHTINGUNITS system variable is 1 (American lighting units) or 2 (international lighting units), **the following prompt is displayed next**:

Enter an option to change [Name/Intensity factor/Status/ Photometry/ Hotspot/ Falloff/ shadoW/ Attenuation/filterColor/eXi
<eXit>: **(Enter an option, or press Enter to exit the command)**

Command Options

Option	Description
Specify source position	Specifies the location of the light in 3D space: • Pick a point in the drawing to position of the light • Enter x,y,z coordinates • Press **Enter** to accept the default location

Specify target position	Specifies the location of the target, the point at which the spotlight is focussed: • Pick a point in the drawing to position of the target • Enter x,y,z coordinates • Press **Enter** to accept the default location
Name	Specifies a name for the spotlight; prompts you: **Enter light name <Spotlight1>** - **(enter a name or press Enter to accept the default name.)**
Intensity **or** Intensity factor	Specifies the intensity of the light; prompts you: **Enter intensity (0.00 - max float) <1.0>** - **(enter an option:)** • Enter an intensity values between 0.00 and the maximum value supported by your system (max float = maximum value of a floating point number) • Press **Enter** to accept the default value When LightingUnits variable is 0, this option is named **Intensity**; when 1 or 2, **Intensity factor**.
Status	Toggles the use of this light; prompts you: **Enter status [ON/OFf] <ON>** - **(enter an option:)** • **ON** - light is included when calculating renderings • **OFf** - light is excluded
Hotspot	**Enter hotspot angle (0.00-160.00) <45.0>: (Enter a value between 0.00 degrees and 160.00 degrees). Enter falloff angle (0.00-160.00) <50.0>: (Enter a value between 0.00 degrees and 160.00 degrees).** If yout enter a Falloff angle that is smaller than the Hotspot angle, the latter is set equal to the Falloff angle. When a surface is illuminated by a spotlight, there is an area of maximum illumination (hotspot) that is surrounded by an area of lesser intensity (falloff). • Hotspot angle: angle of the central light cone (defines the hotspot) • Falloff angle: angle of the full light cone The difference between the hotspot angle and the falloff angle defines the area of lesser light intensity. If the falloff angle and the hotspot angle are almost equal the edge of light cone is rather sharp. The greater the difference between both angles, the softer the edge of the light cone.

Photometry

(This option is available only when LightingUnits is 1 or 2.) Specifies the photometric properties of the light; prompts you: **Enter a photometric option to change [Intensity/Color/eXit] <Intensity>** - **(enter an option:)**

- **Enter intensity (Cd) or enter an option [Flux/Illuminance] <1500.0>**: - **(enter the intensity expressed in candela or an option:) Enter Flux (Lm)** - **(enter the luminous flux expressed in lumens.) Enter Illuminance (Lx or Fc) or enter an option [Distance] <9424.8>** - **(enter the illuminance expressed in lux or foot-candles.) Enter Distance** - **(Enter a distance expressed in drawing units.)**
- **Enter color name or enter an option [?/Kelvin] <D65>** - **(enter a color name .) ?** - lists the names of available colors, such as: D65 Fluorescent Coolwhite Whitefluorescent daylightfluorescenT Incandescent Xenon Halogen Quartz Metalhalide mErcury Phosphormercury highpressureSodium Lowpressuresodium **Enter Kelvin temperature <3600.0>** - **(enter a color temperature expressed in degrees Kelvin.)**

Hotspot

Specifies the angle of the hotspot, the area of light concentration; the angle determines the size of the hotspot, irregardless the distance of target. Prompts you: **Enter hotspot angle (0.00-160.00) <45>** - **(enter an angle, or press Enter to accept the default)**

Falloff

Specifies the the angle of weaker illuminations surrounding the hotspot; out side of the falloff, there is no light. Prompts you: **Enter falloff angle (0.00-160.00) <50>** - **(enter an angle, or press Enter to accept the default.)**

shadoW

Specifies the look of shadows cast by this light; prompts you: **Enter shadow settings [Off/Sharp/soFt mapped/soft sAmpled] <Sharp>** - **(enter an option:)**

- **Off** - disables the calculation of shadows for the light.
- **Sharp** - displays shadows with sharp edges. Use this option to increase performance.
- **Soft mapped** - displays realistic shadows with soft edges. Prompts you: **Enter map size [64/128/256/512/1024/2048/4096] <256>:**
- **Soft sampled** : Displays realistic shadows with softer shadows based on extended light sources; prompts you: **Enter an option to change Shape/sAmples/Visible/<eXit>** - **(enter an option:) Enter shape [Disk/Rect] <Disk>** - **(type D or R) Enter radius <0.0>** - **(enter the radius of the disk) Enter Width <0.0>** - **(enter width of the rectangle) Enter Length <0.0>** - **(enter length of the rectangle)**
- **Enter Shadow Sample <16>** - **(specify the sampling size of the shadow)**; larger numbers are more accurate but take longer to render.
- **Enter Shape Visibility [Yes/No] <No>** - **(type Y or N to cast a shadow that represents shapes (more accurate) or is rectangular (faster to render).)**

Attenuation	Specifies how the illumination falls off with distance from the light: **Enter an option to change [attenuation Type/Use limits/attenuation start Limit/attenuation End limit/eXit] <eXit>** - **(enter an option:)** • **Enter attenuation type [None/Inverse linear/inverse Squared] <None>** - specifies the type of attenuation: **None** - No attenuation so that the distance to the light source has no influence **Inverse linear** - attenuation is the inverse of the linear distance from the light: at a distance of 2 units from the light source, light is half as strong; at a distance of 4 units, light is one quarter as strong **Inverse squared** - attenuation is the inverse of the square of the distance from the light: at a distance of 2 units, light is one quarter as strong; at a distance of 4 units, light is one sixteenth as strong • **Use limits** - toggles whether the extent of the illumination is limited; prompts you: **Limits [OFf/ON]** - **(enter an option:) ON** - limit the extent **OFf** - do not limit it • **attenuation start Limit** - defines the point where the light starts to shine, measured from the center of the light; prompts you: **Specify start limit offset <1.0>** - **(enter a distance.)** • **attenuation End limit** - defines the point where the light stops to shine, measured from the center of the light; prompts you: **Specify end limit offset <10.0>** - **(enter a distance.)**
Color **or** filterColor	Specifies the color of the light; prompts you: **Enter true color (R,G,B) or enter an option [Index color/Hsl]:<255,255,255>** - **(enter an option:)** • **Enter true color** - the RGB color model is an additive color model in which red, green, and blue light are added together in various ways to reproduce a broad array of colors. The name of the model comes from the initials of the three additive primary colors, red, green, and blue. The component values are stored as integer numbers in the range 0 to 255, the range that a single 8-bit byte can offer (by encoding 256 distinct values). • **Index color** - specifies an AutoCAD Color Index color. • **Hsl** - specifies the color using three parameters Hue, Saturation and Lightness When LightingUnits variable is 0, this option is named **Color**; when 1 or 2, **filterColor**.
Exit	Concludes the command and creates the light.

Related Commands

Distantlight (6.10.34) - creates a distant light. Light (6.20.30) - creates a new light in the drawing. Lightlist (6.20.36) - displays the Drawing Explorer - Lights dialog window. Pointlight (6.24.47) - creates a point light. Render (6.26.21) - calculates a photorealistic image of the 3D model. Sunproperties (6.27.70) - displays the Sun Properties of the Active Viewport editor in the Drawing Explorer - Lights dialog. Weblight (6.33.4) - creates a web light.

Figure 6.2393

6.27.48 Singleton

(6.2981 on page 6079) Determines whether (or not) multiple copies of BricsCAD can run at the same time.

Accessing the Command

command bar: **singleton** transparent: **'singleton : Singleton Prompts you in the command bar:** Allow only single BricsCAD application instance? [Yes/No] <No>: **(Press Y or N)** When set to no, only a single instance of BricsCAD can run. When set to yes, you can launch two or more copies of BricsCAD at the same time.

Command Options

Option	Description
Allow only single BricsCAD application instance	Toggles single instance mode of BricsCAD: • **Yes** - allows only one copy of BricsCAD to run • **No** - allows two or more copies of BricsCAD to run Some third-party applications run only in a single instance of BricsCAD.

Related Commands

None.

6.27.49 Start

Run another application.

Accessing the Command

command bar: **start** transparent: **'start** : **Start Prompts you in the command bar:** Application to start: **(Enter the name of a program, such as 'otepad).** For a list of operating system commands, enter Help. To exit the window, enter Exit.

Command Options

Option	Description
Application to start	Specifies the name of the Windows program to run. Or, press **Enter** to open the Windows command prompt window. (6.2394)

Related Commands

Shell (6.27.33) - opens the operating system command prompt window; runs other applications. Sh (6.27.53) - opens the operating system command prompt window; runs other applications. Files (6.14.4) - displays the operating system's File Manager.

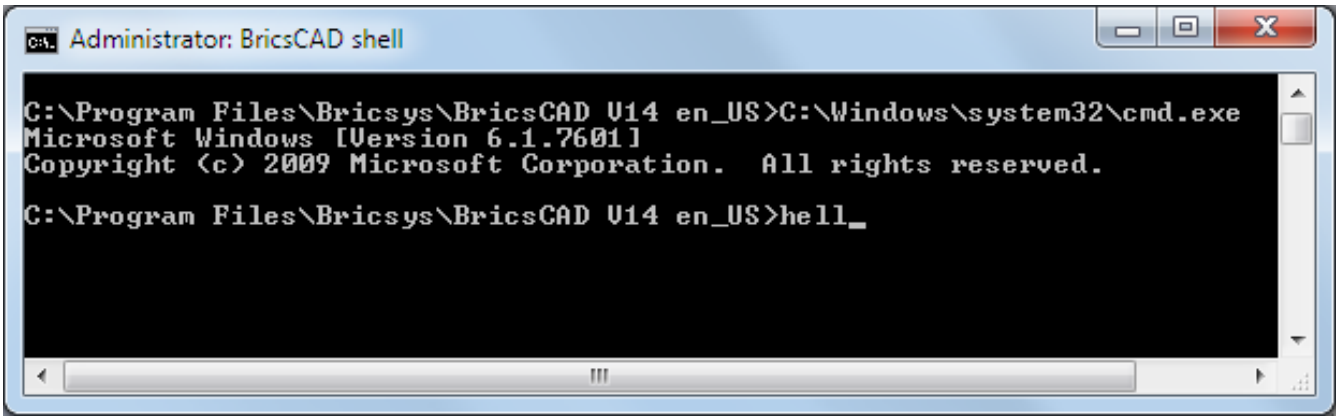

Figure 6.2395

6.27.50 Sphere

(7.3 on page 6132) Draws 3D spheres:

- Classic: sphere is drawn from a 3D polyface mesh.
- Other license levels: sphere is drawn as a 3D solid.

Accessing the Command

 command bar: **sphere** menu bar: **Model | 3D Solids | Sphere** ribbon: **Solid | Create | Primitive | Sphere** toolbar: **3D Solids |**  **: Sphere Prompts you in the command bar:** Center of sphere: **(Pick a point, or enter coordinates)** Set radius of sphere or [Diameter]: **(Specify a distance, or press D)** (6.2396 on the next page) If Dynamic Dimensions (1.21.9) are active, you can enter the radius in the dynamic dimension entry field. (6.2397 on the following page)

Figure 6.2396

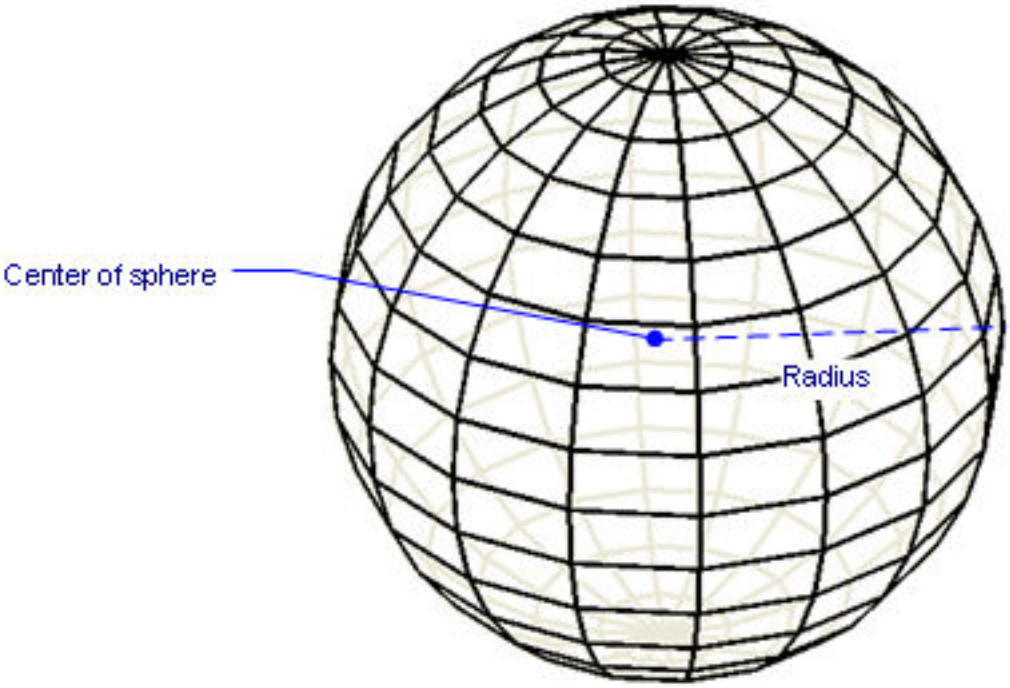

Figure 6.2397

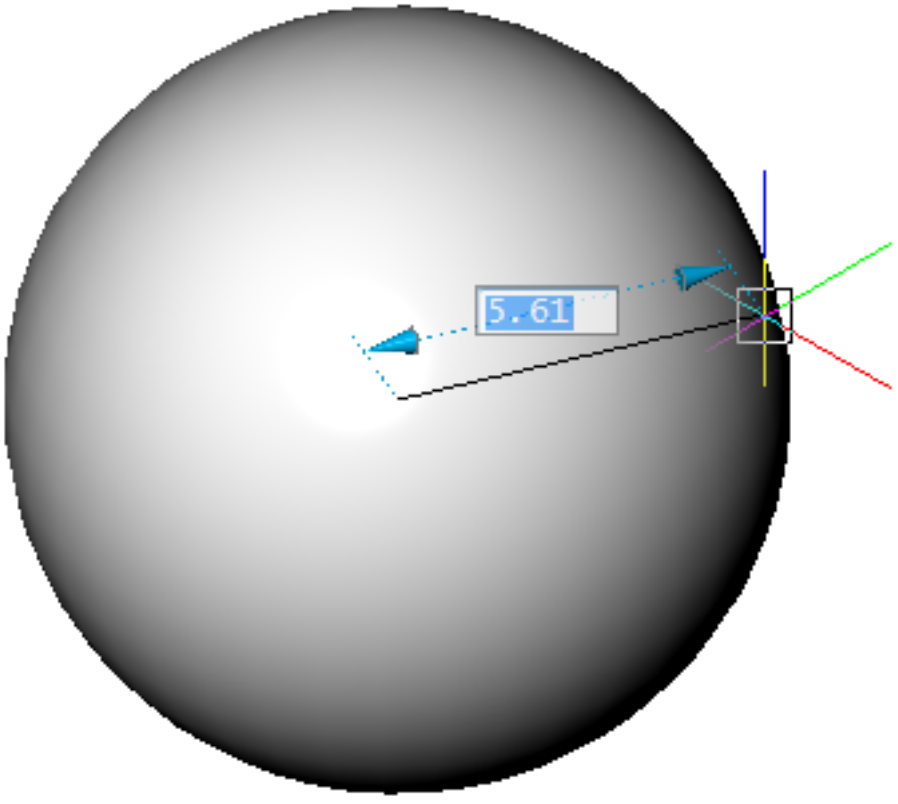


Command Options

Option	Description
Center of sphere	Specifies the center point of the sphere; enter x,y- or x,y,z-coordinates, or pick a point in the drawing.
Radius of sphere	Specifies the radius.
Diameter	Specifies the diameter.

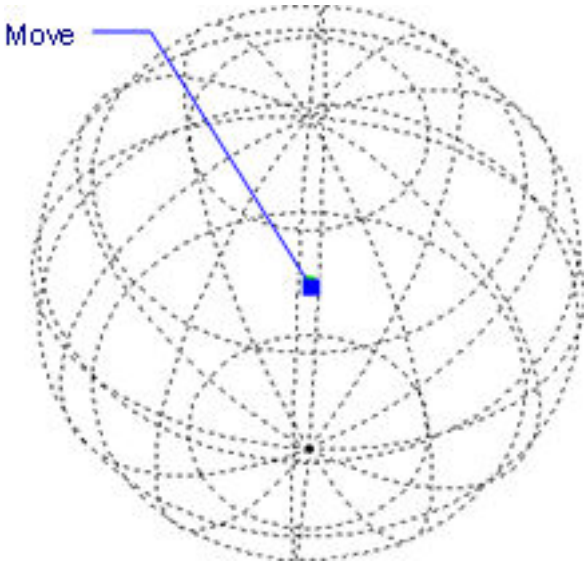
Grips Editing

Spheres can be edited directly through grips:

1. Select the sphere. Notice that it has one grip.
2. Drag the grip to move the sphere.

(6.2398 on the next page)

Figure 6.2398



Related Commands

Box (6.6.18) - creates 3D boxes as solid models. Cone (6.9.46) - creates 3D cones as solid models. Cylinder (6.9.49) - creates 3D cylinders as solid models. Dish (6.10.42) - creates the lower half of 3D balls as solid models. Dome (6.10.35) - creates the upper half of 3D balls as solid models. Extrude (6.13.25) - extrudes 2D entities into 3D solid models. Interfere (6.17.17) - creates 3D volumes of intersecting 3D solid models. Intersect (6.17.20) - removes volumes not in common between two solid models. MassProp (6.21.2) - reports the mass properties of 3D solid models and 2D regions. Pyramid (6.24.64) - creates a pyramid as a 3D solid (Pro and Platinum). Creates a pyramid as a polygon mesh (Classic) Revolve (6.26.45) - revolves 2D entities into 3D solid models. Slice (6.27.40) - cuts 3D solids into two parts. SolidEdit (6.27.42) - edits the bodies, faces, and edges of 3D models. **Subtract (6.27.58)** - removes one solid model from a second. Torus (6.29.29) - creates 3D donuts as solid models. Union (6.30.6) - joins two or more solid models into a single entity. Wedge (6.33.6) - creates 3D wedges as solid models.

Figure 6.2399

6.27.51 StatBar

(7.3 on page 6132) Toggles the display of the status bar (short for "status bar").

Accessing the Command

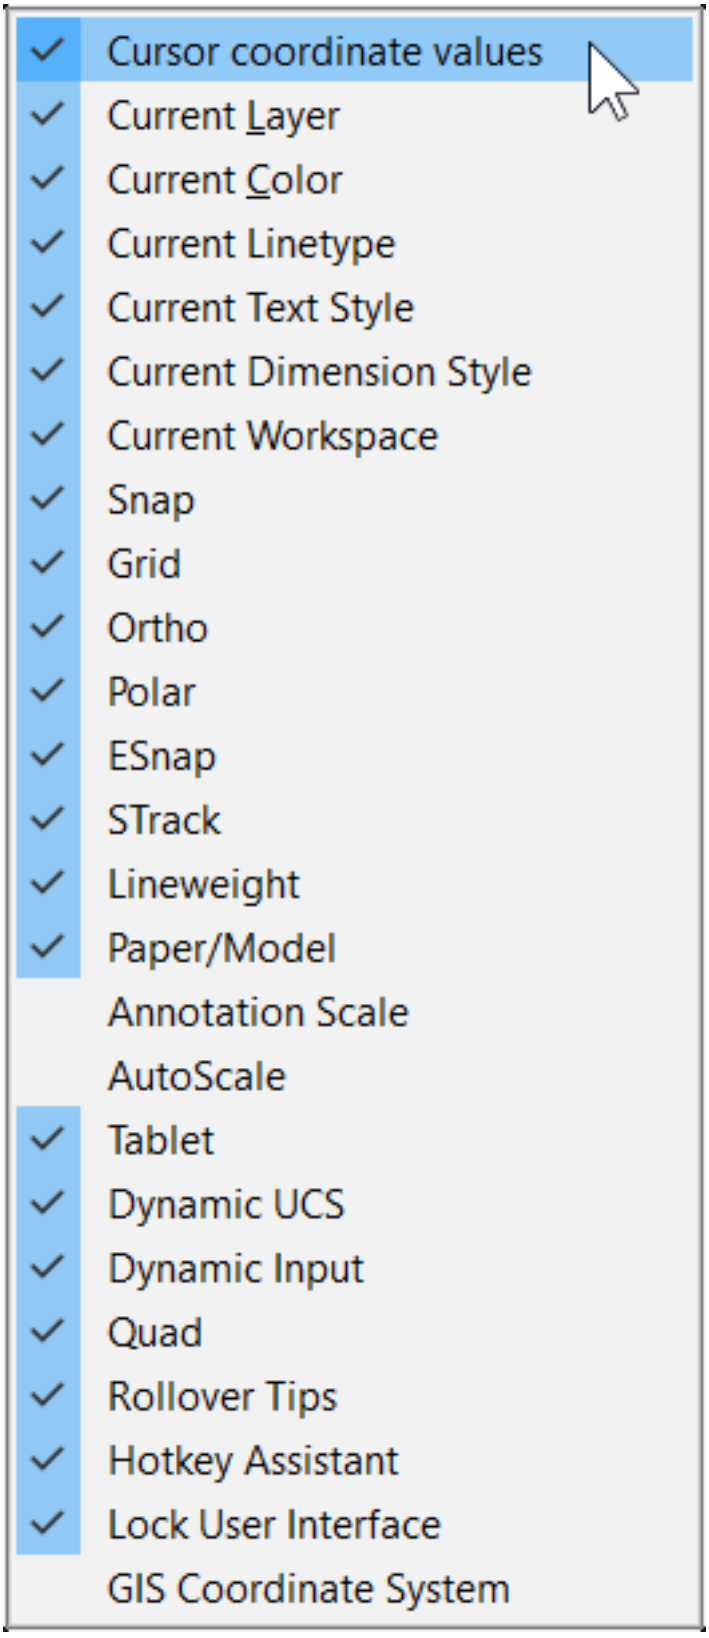
command bar: **statbar** transparent: **'statbar** shortcut: **Shift + F3** menu bar: **View | Status Bar** : **StatBar Prompts you in the command bar:** STATUSBAR is currently on [ON/OFf/Toggle] <On>: **(Enter an option)** (6.2400) The status bar provides quick access to information about the drawing and controls for toggling tools:

1. Status field displays a tooltip when hovering over a tool button, or displays command prompts when the command bar is closed; double click the status field to toggle the command bar on/off
2. Coordinates field
3. Drawing properties
4. Drawing aid fields
5. Status bar option button: click an option to toggle the corresponding field on and off:

(6.2401 on the following page) The only reason to turn off the status bar is to gain a bit more drawing area. It is far more useful to leave it on.

Figure 6.2400

Figure 6.2401



Command Options

Option	Description
STATUSBAR is currently on	Enter an option: • **ON** - turns on the status bar, when it is off • **OFf** - turns on the status bar, when it is on • **Toggle** - switches it from on to off to on STATUSBAR is the name of the variable that stores the current status of the status bar.

Procedures

- Working with the status bar (1.15.2)

Related Commands

CleanScreenOff (6.9.14) - displays user interface elements that were hidden by the CleanScreenOn (6.9.17) command. CleanScreenOn (6.9.17) - hides elements of the user interface. Scrollbar (6.27.10) - toggles the display of the scroll bars. TextScr (6.29.16) - brings the text window to the foreground. Toolbar (6.29.33) - toggle the display of toolbars.

Figure 6.2402

6.27.52 Stretch

(6.2981 on page 6079) Stretches entities. **Note:** This command requires that you select entities with the Crossing or CPolygon methods.

Accessing the Command

 command bar: **stretch** alias: **s** menu bar: **Modify | Stretch** ribbon: **Change | Modify | Stretch** toolbar: **Modify |**  **: Stretch Prompts you in the command bar:** Select entities to stretch by crossing-window or crossing-polygon: **(Enter C or CP)** Opposite Corner: **(Pick another point)** Entities in set: 1 Select entities to stretch by crossing-window or crossing-polygon: **(Choose more entities, or press Enter to continue)** Base point of displacement: **(Pick a point, or enter x,y coordinates)** Second point of displacement: **(Pick another point.)** This command does not stretch text, shapes, and 3D solids.

Command Options

Option	Description
Select entities	Selects the entities to stretch; you must use Crossing or Crossing Polygon mode: • **C** - crossing mode. • **CP** - crossing polygon mode. When using the cursor, pick the second point to the left of the first: (6.2403 on the facing page) The selection rectangle (or polygon) determines how this command affects entities: • Entities crossing the selection rectangle are stretched. • Entities within the rectangle are moved. • Entities outside the rectangle remain in place. (6.2404 on the next page)
Base point of displacement	Specifies the starting point of the stretch.
Second point of displacement	Specifies the stretch distance by the distance between two points, base and second point. (6.2405 on the facing page)

Procedures

- To stretch entities (1.32.24)
- To stretch entities using grips (1.32.24)

Related Commands

Lengthen (6.20.24) - changes the length of open entities. Extend (6.13.21) - extends open entities. Scale (6.27.6) - changes the size of entities. Properties (6.24.54) - changes the geometry of entities.

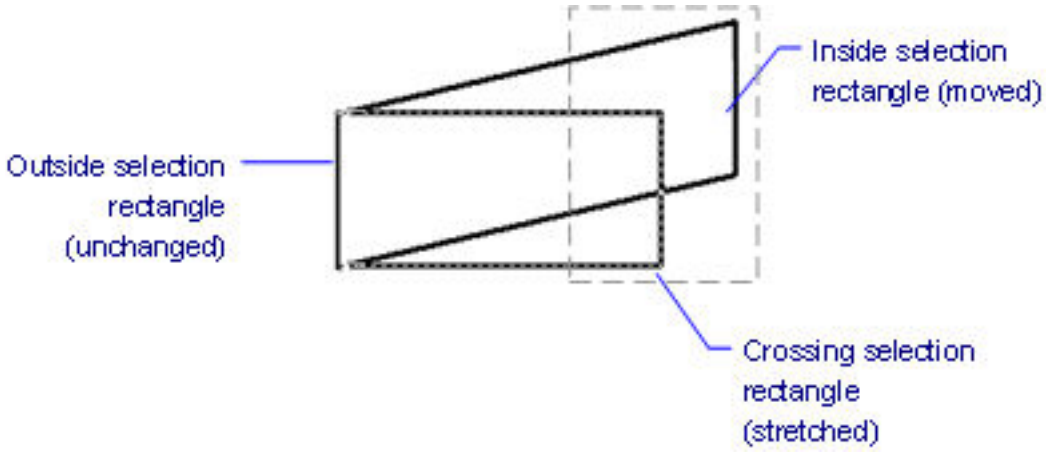

Figure 6.2405

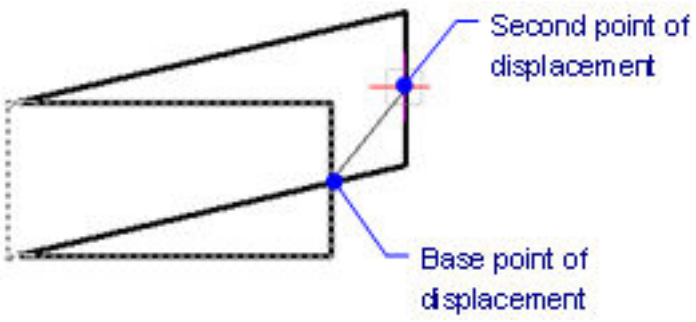


6.27.53 Sh

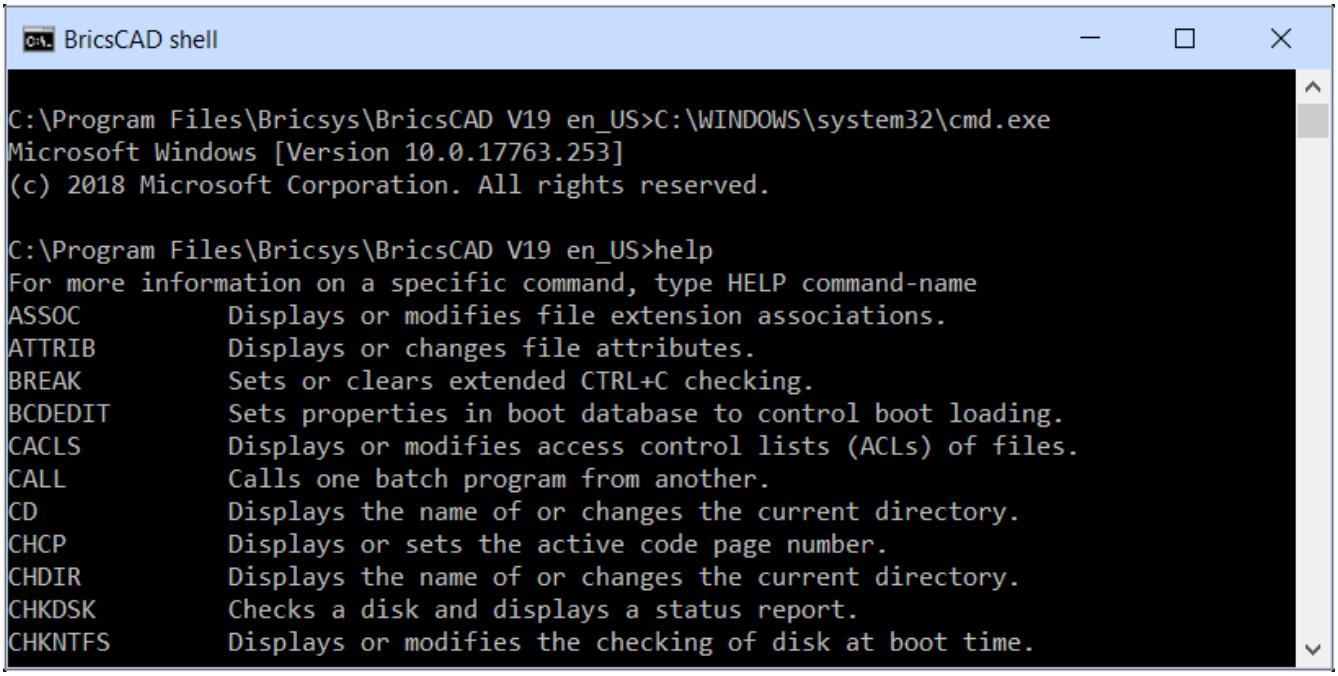
  Opens operating system's command prompt window so that you can run other applications (short for "shell").

Accessing the Command

command bar: **sh** transparent: **'sh** alias: **shell : Sh Prompts you in the command bar:** OS Command: **(Enter the name of a program, or press Enter for the command prompt window)** (6.2406 on the next page)

1. Enter commands or names of programs, such as 'Notepad'.
2. For a list of operating system commands, enter **Help**.
3. To exit the operating system window, enter **Exit**.

Figure 6.2406



Command Options

Option	Description
OS Command	Specifies the name of the Windows program to run. Press operating systemto open the Windows command prompt window.

Procedures

- Use the Customize (6.9.47) command to create custom shell commands.

Related Commands

Start (6.27.49) - starts other applications. Shell (6.27.33) - opens the operating system command prompt window; runs other applications. Files (6.14.4) - displays the operating system's File Manager.

Figure 6.2407

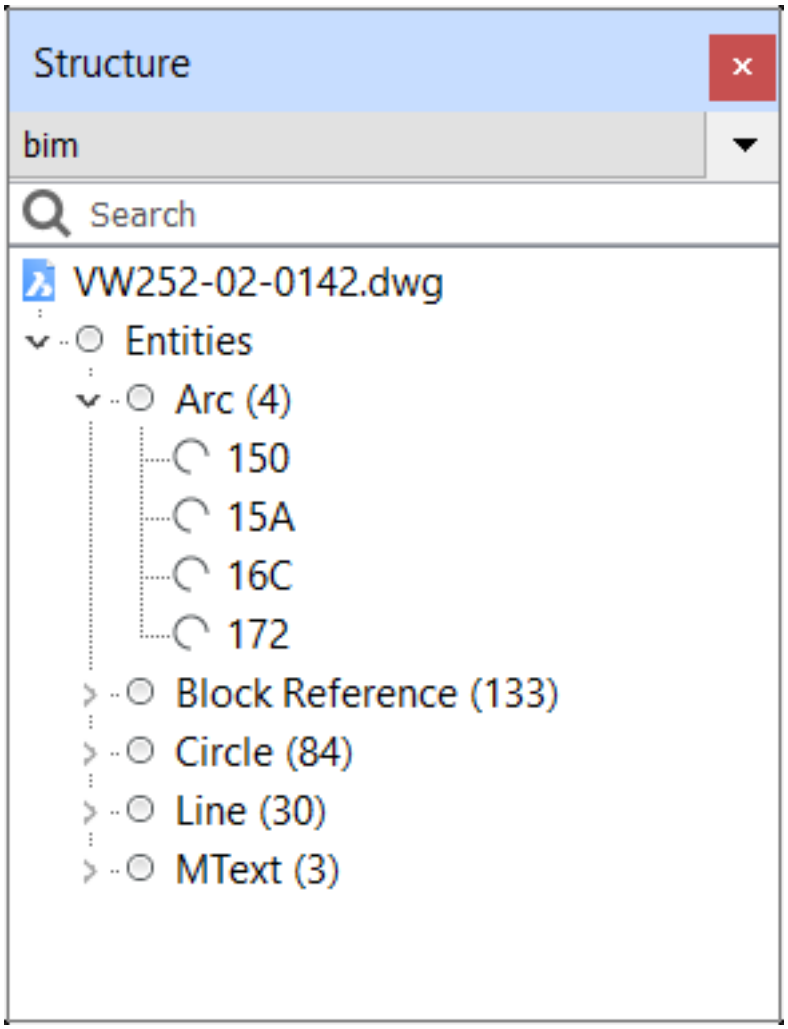
6.27.54 StructurePanel

(6.2981 on page 6079) Opens the Structure panel, which lists entities in the drawing in a structured manner.

Accessing the Command

command bar: **structurepanel** context menu: right click any toolbar or the ribbon, then choose **Structure : StructurePanel** Displays a panel: (6.2408 on the next page)

Figure 6.2408

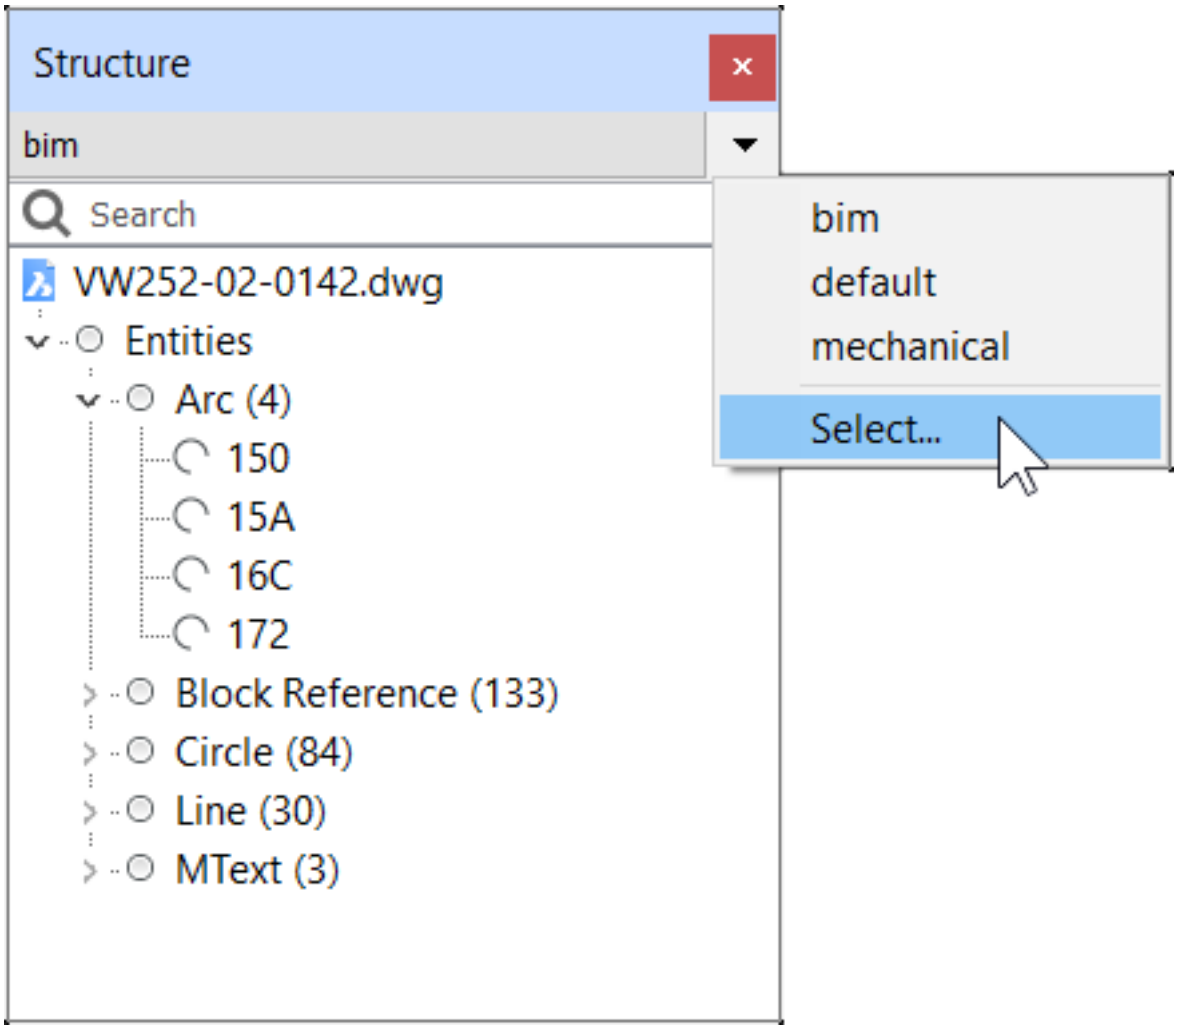


Context Menu Options

Click the down arrow to reveal the menu: (6.2409 on the facing page)

Option	Description
BIM, default, **or** mechanical	Displays the drawing's structure in a format amenable to BIM (architecture) or mechanical drawings, or in the default format. Choose one: • bim • default • mechanical
Select	Loads a structure tree configuration file (*.cst) to change the way the content of of the Structure panel is arranged: 1. Opens the Select Structure Tree Configuration File dialog box; **(choose a *.cst configuration file from the file dialog box.)** 2. Click **OK** to open it Notice that the arrangement of information in the panel changes.

Figure 6.2409

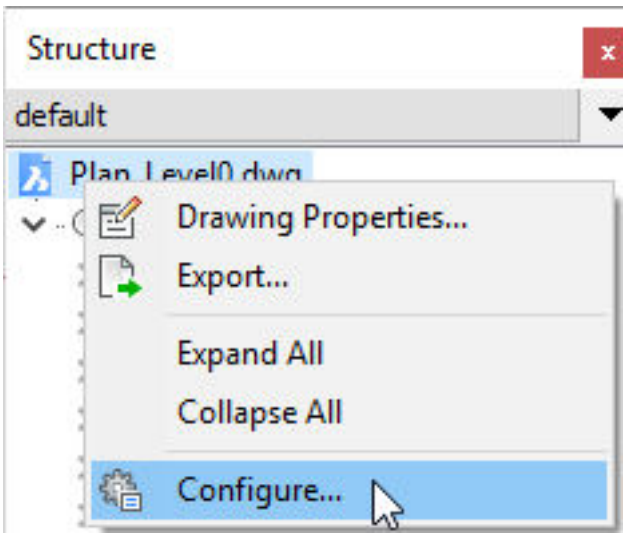


Drawing Menu Options

Right-click a drawing name to see this context menu: (6.2410)

Option	Description
Drawing Properties	Displays the Drawing Properties dialog box; see the DwgProps (6.10.46) command.
Export	Exports the structure and the entities in an XML file; displays the Export Structure Tree dialog box: 1. (Optional) Enter a name or accept the default 2. (Optional) Choose a folder or drive in which to save the file 3. Click **Save**. The first few lines of the XML file look like this: `<?xml version="1.0"?> <Structure config="default.cst">`
Expand All	Expands all nodes in the structure.
Collapse All	Collapses all nodes in the structure.
Configure	Opens the Configure Structure Tree dialog box for customizing the way the data is displayed; see below

Figure 6.2410

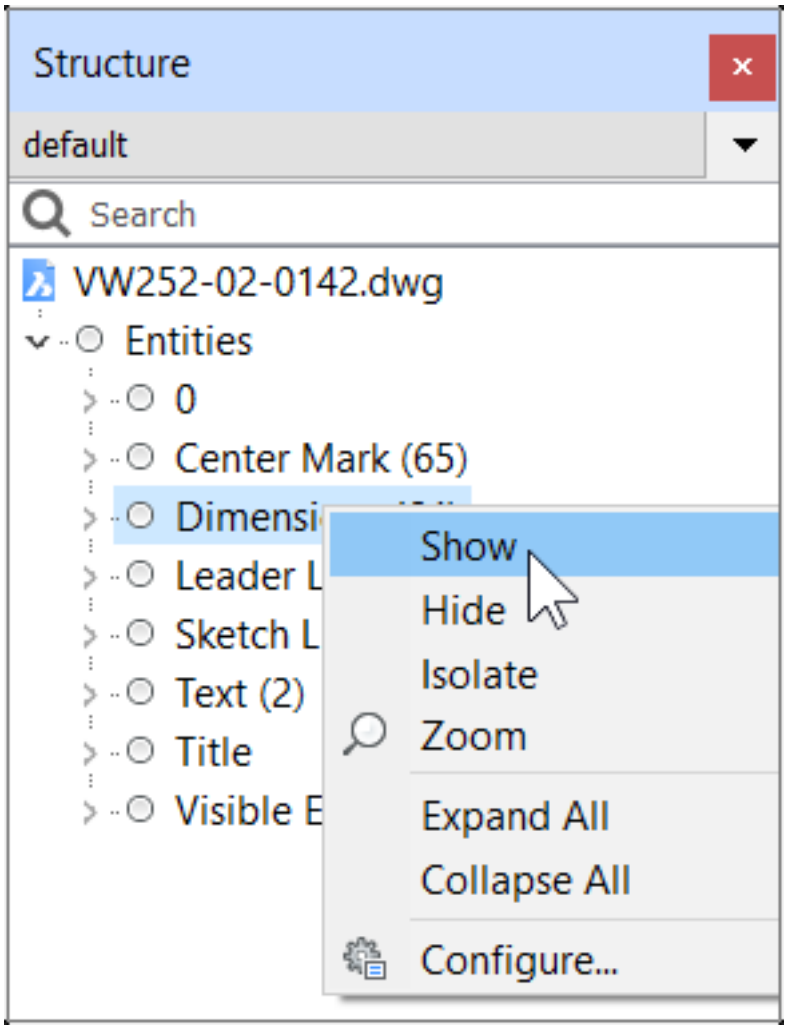


Entity Menu Options

Right-click an entity name to see this context menu: (6.2411 on the following page)

Show	Shows the selection set, when it was previously hidden
Hide	Hides the selection set, and keeps all other drawing entities visible
Isolate	Hides all other entities in the drawing, except the selection set
Zoom	Zooms the view to the extents of the selected entities

Figure 6.2411

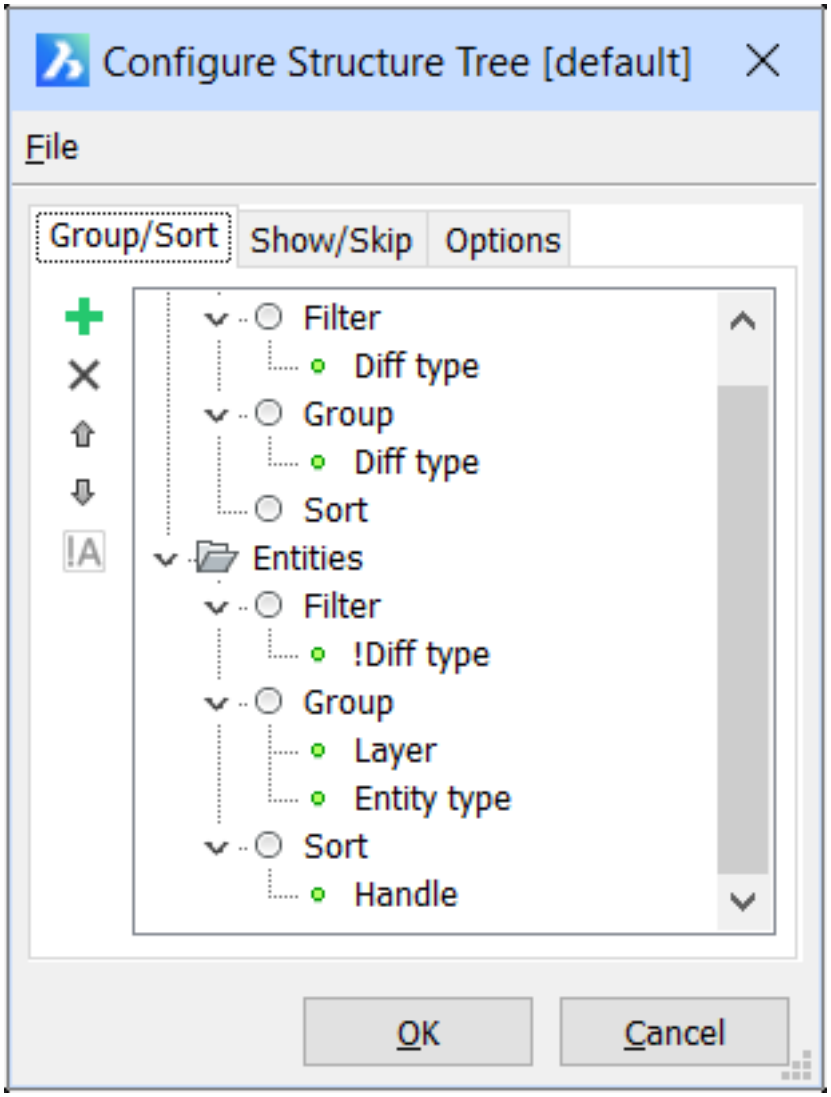


Configure Structure Tree Dialog Box

Click **Configure** option to see this dialog box: (6.2412 on the next page)

Group/Sort Tab Option	Description
Add Rule or Property	Adds rules and properties to display in the Structure panel. • To add a rule: 1. Select an existing rule. 2. Click **Add Rule or Property** 3. Rename the rule: right-click the new name, and then choose **Rename** 4. Create the rules: • Right-click **Filter** to add filters; see below • Right-click **Group** to add groups; see below • Right-click **Sort** to add a sorting property; see below 5. Click **OK**.
Delete Rule or Property	Removes a rule or property from the structure definition
Move Property Up	Moves the property up the list
Move Property Down	Moves the property down the list
Toggle Negation	(Applies only to filters) Switches the value of filters: • Include • Do not include
Add Filter Property, Add Group Property, **and** Add Sort Property	Filters, groups, and sorts the properties, entities, and extensions to be shown by a rule; displays the Select Property dialog box: (6.2415 on page 5580)(6.2416 on page 5580)(6.2417 on page 5581) 1. Choose one. 2. Click **OK**.

Figure 6.2412

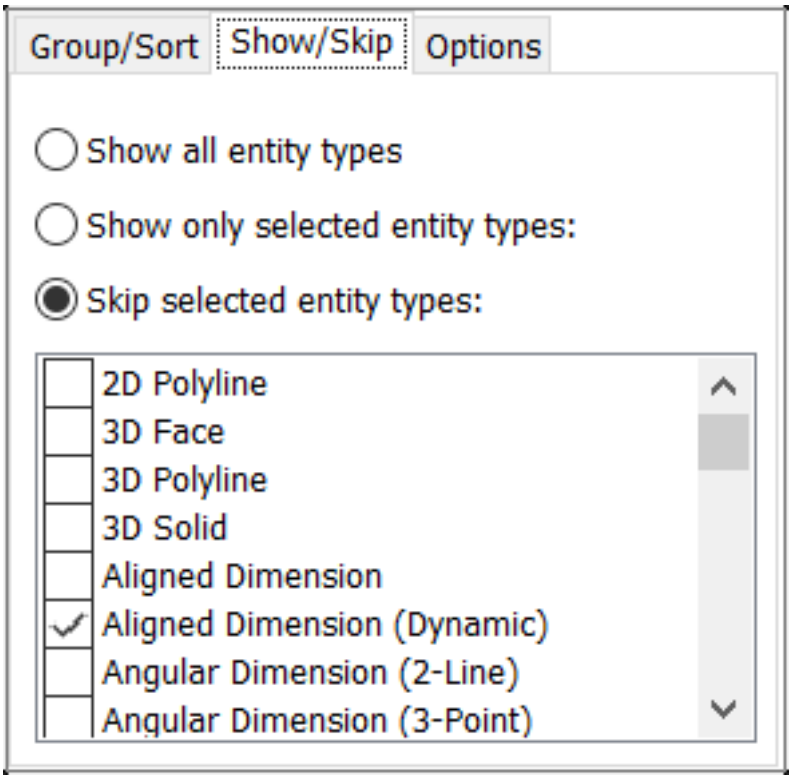


Show/Skip Tab

In the Configure Structure Tree dialog box, click the **Show/Skip** tab to see this tab: (6.2413 on the next page)

Show/Skip Tab Option	Description
Show entity types	Determines which entities are displayed by the Structure panel • **Show all entity types** - show all entities in the Structure panel • **Show only selected entity types** - show only those checked in the list • **Skip selected entity types** - don't show those checked in the list
Entity types	Toggles whether entities are listed or not listed or not-not listed: • **Yes** - entity type is listed or not listed, depending on the choice made above • **No** - entity type is not listed or listed, depending on the choice made above

Figure 6.2413

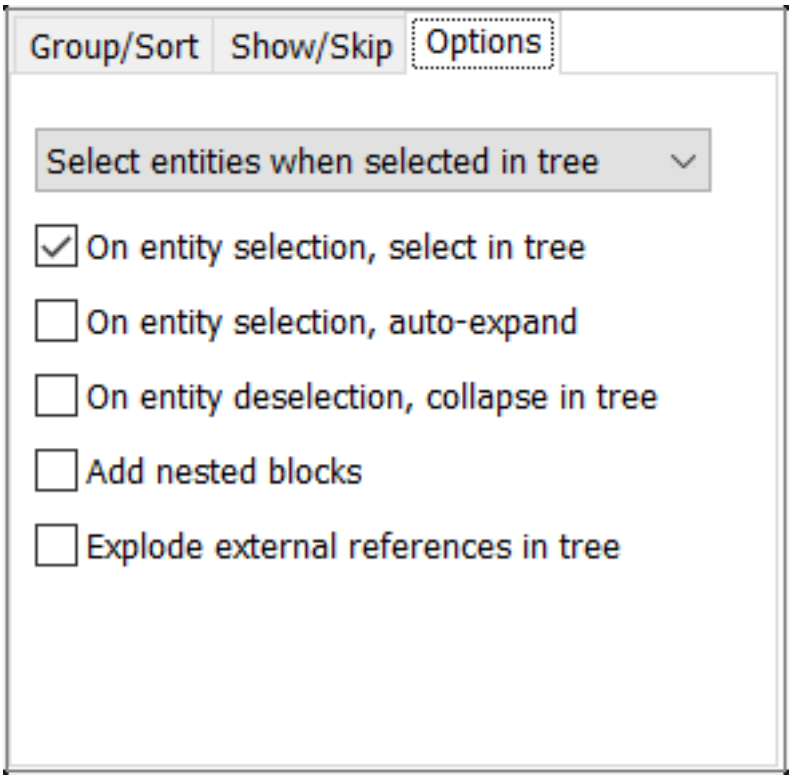


Options Tab

In the Configure Structure Tree dialog box, click the **Options** tab to see this tab: (6.2414 on the facing page)

Options Tab Option	Description
Select Entities	Determines how entities are selected in the drawing when selected in the Structure panel: • **Ignore tree selection** - entities are not selected in the drawing • **Highlight entities when selected in tree** - entities in the drawing are highlighted, but not selected • **Select entities when selected in tree** - matching entities are selected in the drawing
On entity selection, select in tree	When on, selects matching entity(ies) in the structure tree when you select them in the drawing
On entity selection, auto-expand	When on, expands the node related to the entity(ies) selected in the drawing
On entity selection, collapse in tree	When on, collapses the node related to the entity(ies) selected in the drawing
Add nested blocks	When on, lists the contents of nest blocks in the structure tree
Explode external references in tree	When on, lists the contents of externally-referenced drawings in the structure tree

Figure 6.2414



Procedures

- To open the Structure panel (1.32.15)
- To configure the tree-structure on the Structure panel (1.32.15)
- To open or close a panel (1.15.7)
- To dock a panel (1.15.7)

Related Commands

StructurePanelClose (6.27.66) - closes the Structure panel. +StructurePanel (6.27.64) - opens a *.cst structure tree configuration file, and then loads it into the Structure panel.

Figure 6.2415

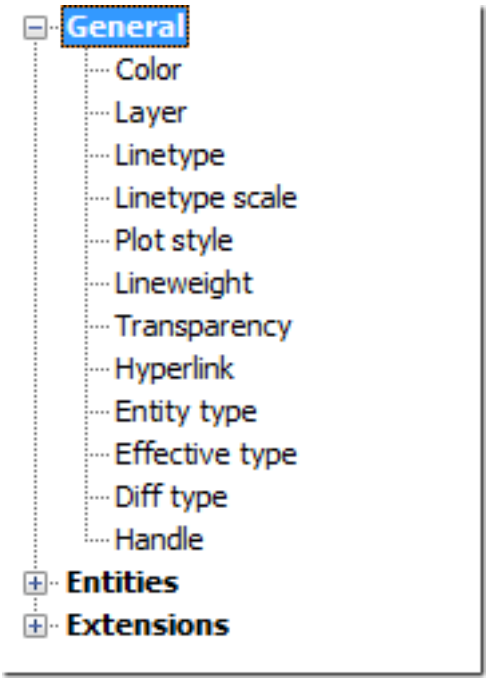


Figure 6.2416

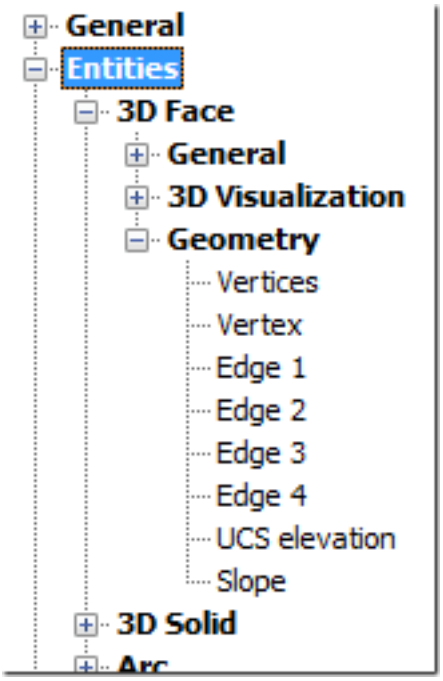

Figure 6.2417

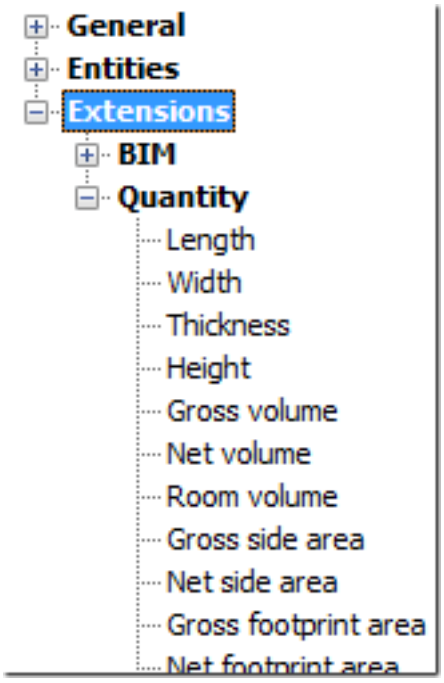

Figure 6.2418

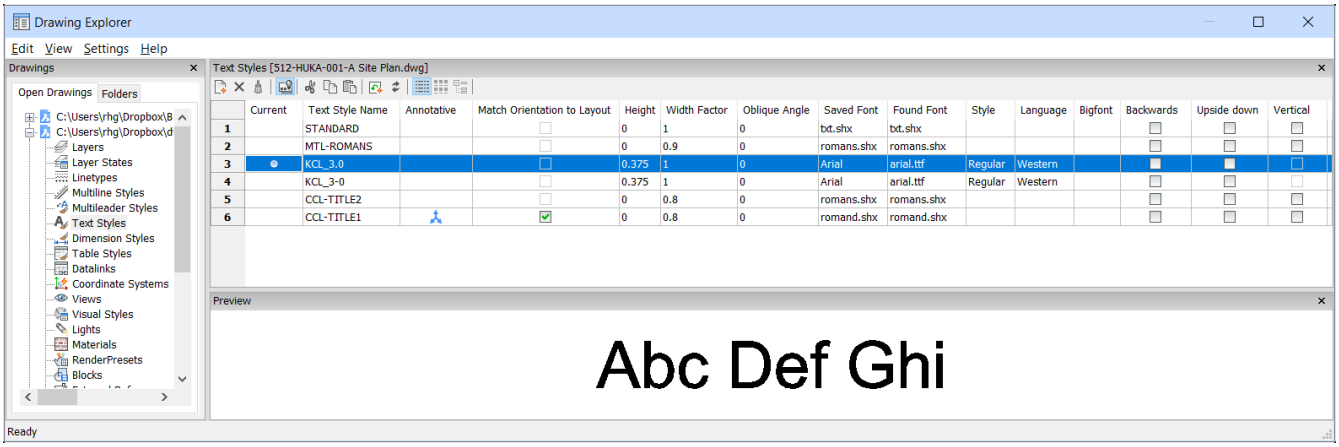
6.27.55 Style

(6.2981 on page 6079) Creates and modifies text style with the Drawing Explorer, for use by text-related commands. **Note:** Styles preset the look of text, such as the font to use, its height, and whether it uses an annotative scale factor.

Accessing the Command

command bar: **style** aliases: **ddstyle expfonts expstyle expstyles st** menu bar: **Tools | Drawing Explorer | Text Styles** ribbon: **Home | Settings | Drawing Explorer | Text Styles** status bar: **Standard : Styles** Displays the Text Styles section of the Drawing Explorer: (6.2419) Make changes to styles, or create new ones, and then click **X** to exit. Press **F1** to access help.

Figure 6.2419

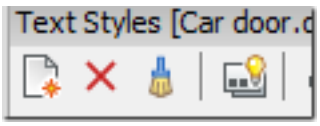


Toolbar Options

(6.2420)

Toolbar Option	Description
New	Creates a new text style with the generic name New-Styl1; to rename it, click the name twice, slowly.
Delete	Erases the selected text style(s). The current style and the Standard style cannot be deleted. When the style is in use, a dialog box displays: (6.2425 on page 5589) Choose an option. • **Delete** - **caution**! Erases the style, as well as all text that uses the style! • **Change** - selects another style before erasing it. Entities using the doomed style are given the alternative that you select. Displays list of available styles: (6.2426 on page 5589) 1. Choose style name 2. Click **Change** The style is erased and text takes on the selected style • **Cancel** - cancels the operation; the style is not erased
Purge	Removes unused styles from the drawing. The following styles cannot be purged: • Standard text style • The current style • Styles used in the drawing
Hide Xref Symbols On/Off	Toggles the display of text styles used by xrefs.

Figure 6.2420



Text Style Options

(6.2421)

Option	Description
Current	Designates the current text style. This is the style used by default by the Text (6.29.12) and MText (6.21.38) commands.
Text Style Name	Specifies the style name: • To rename, click the name twice, and then rename • To create a new text style, click the **New** button to create a new text style; the new text style takes on the properties of the current style.
Annotative	Sets the Annotative property of the text entities created with this style. When the text style is an annotative one, the Height property specifies the height in paper space, while in model space the height depends on the current annotation scale (specified by the CANNOSCALE and CANNOSCALEVALUE variables).
Match Orientation	(This option is for annotative text styles only.) Matches the orientation of the text to the orientation of the paperspace layout.
Height	Specifies the height of the text. Enter 0 or a number larger than 0: • **0** - does not set the height; TEXT command prompts for height. • Not 0 - specifies the height of text; TEXT command does not ask for height.
Width Factor	Specifies the width factor of the text. For example, entering 2 makes the text twice as wide. Enter a number larger or smaller than 1: • Less than 1 - text is squeezed narrower. (6.2441 on page 5595) • More than 1 - text is spread wider. (6.2442 on page 5596)
Oblique Angle	Specifies the obliquing angle for the text. For example, entering 15 slants the text forward by 15 degrees. Enter a positive or negative number: • Negative number - text slants to the left. (6.2443 on page 5596) • **0** - text is upright. • Positive number - text slants to the right. (6.2444 on page 5596)

Figure 6.2421

	Current	Text Style Name	Annotative	Match Orientation to Layout	Height	Width Factor	Oblique Angle	Saved Font	Found Font	Style	Language	Bigfont	Backwards	Upside down	Vertical
1	●	DYN_DIM			0	1	0	Arial	arial.ttf	Regular	Western				
2		Standard			0	1	0	Arial	arial.ttf	Regular	Western				
3		NewStyle1			0	1	0	Arial	arial.ttf	Regular	Western				

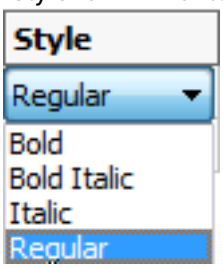
Saved Font
Specifies the SHX or TTF font file to use; choose a name from the droplist: (6.2431 on page 5590)

- **SHX** - compiled shape files created for AutoCAD and BricsCAD
- **TTF** - TrueType font files created for Windows and Macintosh

The program can use any SHX and TTF font found on your computer.

Found Font
Shows the name of the font file found. If the font defined in by **Saved Font** is not found .shx fonts are replaced by the font defined by the FONTALT (1.17.10) (Alternative font) system variable. TTF fonts are replaced according to the replacement table defined by the FONTMAP system variable. By default this is the **Default.fmp** file stored in the **Support** subfolder of the roamable root folder (e.g. **C:\Users\<UserName>\AppData\Roaming\Bricsys\BricsCAD\V18**
Fonts that have been replaced display in Red .
(6.2432 on page 5590)

Style
Specifies style for TTF fonts; choose a style from the droplist:



- **Regular** - applies neither bold nor italics
- **Bold** - applies boldface
- **Italic** - applies italics
- **Bold Italic** - applies bold and italics

This property is not available for SHX fonts.

Language
Specifies the language for TTF fonts; choose one from the droplist: (6.2433 on page 5590) Available languages may vary for each font. This property affects accents and other attributes specific to languages. This property is not available for SHX fonts; use Bigfont property instead.

Bigfont
Lists the names of SHX bigfont files; choose one from the droplist: (6.2434 on page 5591) "Bigfonts" is the name given to large SHX files that contain characters for multiple languages. This property is not available for TTF fonts; use Language property instead.

Backwards*
Toggles backwards text. Backwards text is useful when text is plotted on the back of mylar or other clear media.

- **Yes** - text is drawn backwards

(6.2445 on page 5596)

- **No** - text is drawn forwards

Upside down*	Toggles upside-down text. • **Yes** - text is drawn upside down (6.2446 on page 5596) • **No** - text is drawn rightside up
Vertical	Toggles vertical text. Only some SHX fonts support vertical text; this option is not available for TTF fonts. • **Yes** - draws text vertically. The Text command sets the rotation angle to 270 degrees automatically (6.2447 on page 5596) • **No** - draws text horizontally
Preview	Shows what the current style looks like: the font with the properties applied.

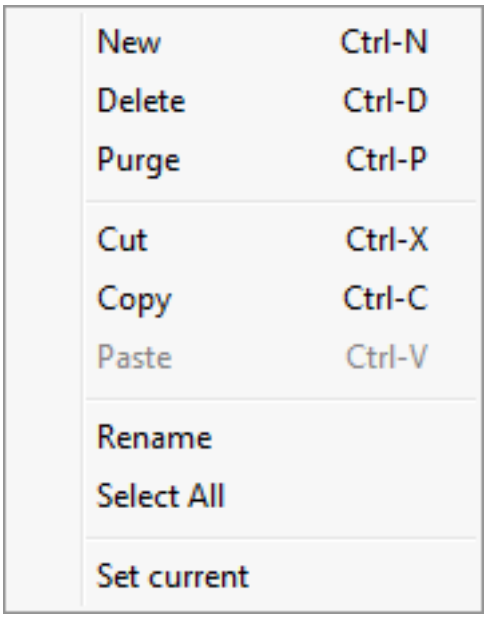
* This setting applies to Text entities only, not to MText (6.21.38) entities.

Shortcut Menu Options

Right-click a layer name to see this shortcut menu: (6.2422 on the facing page)

Option	Keystroke	Description
New	Ctrl+N	Creates new text styles.
Delete	Ctrl+D	Deletes styles from Drawing Explorer. The following styles cannot be deleted: • Standard • Current style
Purge	Ctrl+P	Purges styles from the current drawing. The following styles cannot be purged: • Standard • Current style • Any style used by text
Cut	Ctrl+X	Cuts the style and its properties to the Clipboard.
Copy	Ctrl+C	Copies the style and its properties to the Clipboard.
Paste	Ctrl+V	Pastes the style from the Clipboard into Drawing Explorer.
Rename		Renames the selected style.
Select All		Selects all styles.
Set Current		Specifies the current working style. Only one style can be current at a time.

Figure 6.2422



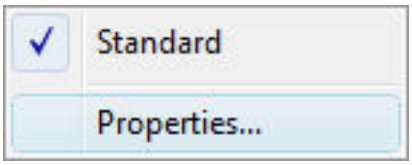
Status Bar Menu

Right-click Standard (or other style name) on the status bar for the shortcut menu: (6.2741 on page 5846) (6.2440 on page 5595)

Shortcut Menu	Description
Standard	Chooses the default text style. When the drawing contains additional text styles, their names are listed here.
Properties	Opens the Text Styles section of the Drawing Explorer.

Figure 6.2423

Figure 6.2424



Procedures

- To open the Text Style Explorer dialog (1.29.19)
- To create a text style (1.29.20)
- To edit a text style (1.29.19)
- To make a text style current (1.29.19)
- To delete a text style (1.29.19)

Related Commands

-Style (6.27.56) - creates and modifies text styles through the command bar. Text (6.29.12) - places single-lines of text in drawings. -Text (6.29.12) - places text and evaluates LISP expressions. MText (6.21.38) and -MText (6.21.40) - places paragraph text. AttDef (6.4.31) - defines attribute text. DdEdit (6.10.13) - edits text. Change (6.9.10) - changes the position of text. TxtExp (6.29.36) - explodes text into polylines. Spell (6.27.44) - checks the spelling of text in drawings. Properties (6.24.54) - modifies the properties of text. Explorer (6.13.15) - Opens the Drawing Explorer dialog box.

6.27.56 -Style

(6.2981 on page 6079) Creates and modifies text styles in the command bar, for use by text-related commands. **Note:** Styles preset the look of text, such as the font to use, its height, and whether it uses an annotative scale factor.

Accessing the Command

command bar: **-style** transparent: **'-style** alias: **font** : **-Style Prompts you in the command bar:** ? to list existing styles/<Text style to create or modify> <STANDARD>: **(Enter a name, or press ?)** Font <arial.ttf>: **(Enter the name of a SHX or TTF font file, or else press Enter to accept the default file name.)** font: arial.ttf bigfont: is selected Text height or [Annotative] <0">: **(Enter a number, press A, or else press Enter to accept the default height)** Width factor <1.0000>: **(Enter a number, or else press Enter to accept the default width)** Obliquing angle <0">: **(Enter a number, or else press Enter to accept the default angle)** Draw text backwards? [Yes-backwards text/No-normal text] <No>: **(Press Y or N)** Draw text upside-down? [Yes-upside-down text/No-right side up] <No>: **(Press Y or N)** The additional prompt appears when an SHX font file was specified: Draw text vertically? <No>: **(Press Y or N)**

Command Options

Option	Description
Text style to create or modify	Specifies the style name: • **Create** - to create a a new text style, enter a new name, such as 'MyNewStyle' • **Modify** - to modify an existing text style, enter its name, such as 'Standard'

? to list existing styles	Lists style names in the drawing; prompts you: **Text style(s) to list** - **(specifies which styles to list; enter an option:)**
	• ***** - to list all style names in the drawing
	• **name*** - to list style names that begin with 'name'
	• **name** - lists information about the text style named 'name'
	The list for the 'Standard' text style looks like this:
	`Text styles:`
	`Style name: Standard Font typeface: Arial Height: 0`
	`Current text style: Standard`

Font	Specifies the SHX or TTF font file the style should use: • **SHX** - font files created for AutoCAD and BricsCAD • **TTF** - font files created for Windows and Macintosh BricsCAD can use any SHX and TTF font found on your computer.

Text height	Specifies the height of the text; enter 0 or a number larger than 0: • **0** - has a special meaning in that it does not set the height of text; the Text (6.29.12) command will prompt you for for height • Not 0 - sets the text height, such as 0.25 units; Text command will not ask you for a height as it will use this one
Annotative	Sets the Annotative property of the text entities created with this style. Prompts you: 1. **Create annotative text style[Yes/No] <Yes>** - **(enter an option:)** • **Yes** - makes the text style annotative, so that its height matches the current annotation scale factor automatically • **No** - keeps the text height fixed **Match text orientation to layout?[Yes/No] <No>** - **(enter an option:)** • **Yes** - makes the text rotate automatically to make the rotation angle of the layout (in paper space) • **No** - keeps the text angle fixed 3. **Text height or [Annotative] <0>** - **(press Enter to continue.)** When the text style is an annotative one, the Height property specifies the height in paper space, while in model space the height depends on the current annotation scale (specified by the CANNOSCALE and CANNOSCALEVALUE variables).
Width factor	Specifies the width factor of the text. For example, entering 2 makes the text twice as wide. Enter a number larger or smaller than 1: • Less than 1 - squeezes text narrower (6.2441 on page 5595) • More than 1 - spreads text wider (6.2442 on page 5596)
Obliquing angle	Specifies the obliquing angle for the text. For example, entering 15 slants the text forward by 15 degrees. Enter a positive or negative number: • Negative number - slants text to the left (6.2443 on page 5596) • **0** - text is upright • Positive number - slants text to the right (6.2444 on page 5596)

Draw text backwards?	Toggles backwards text. Backwards text is useful when text is plotted on the back of mylar or other clear media. **(Enter Y or N:)** • **Yes** - draws text backwards. (6.2445 on page 5596) • **No** - draws text forwards.
Draw text upside-down?	Toggles upside-down text. **(Enter Y or N:)** • **Yes** - draws text upside down. (6.2446 on page 5596) • **No** - draws text right side up.
Draw text vertically?	Toggles vertical text. Only some SHX fonts support vertical text; no TTF fonts can be drawn vertically, and so this prompt is not displayed for TTF fonts. The Text (6.29.12) command sets the rotation angle to 270 degrees automatically. **(Enter Y or N:)** • **Yes** - draws text vertically (6.2447 on page 5596) • **No** - draws text horizontally

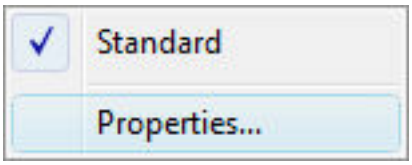
Status Bar Menu

Right-click Standard (or other style name) on the status bar for the shortcut menu: (6.2741 on page 5846) (6.2440 on the facing page)

Shortcut Menu	Description
Standard	Chooses the default text style. When the drawing contains additional text styles, their names are listed here.
Properties	Opens the Text Styles section of the Drawing Explorer. See **Style** command.

Figure 6.2439

Figure 6.2440



Procedures

To open the Text Style Explorer dialog (1.29.19) To create a text style (1.29.19) To edit a text style (1.29.19) To make a text style current (1.29.19) To delete a text style (1.29.19)

Related Commands

Style (6.27.55) - creates and modifies text styles through the Drawing Explorer. Text (6.29.12) - places single-lines of text in drawings. -Text (6.29.12) - places text and evaluates LISP expressions. MText (6.21.38) and -MText (6.21.40) - places paragraph text. AttDef (6.4.31) - defines attribute text. DdEdit (6.10.13) - edits text. Change (6.9.10) - changes the position of text. TxtExp (6.29.36) - explodes text into polylines. Spell (6.27.44) - checks the spelling of text in drawings. Properties (6.24.54) - modifies the properties of text.

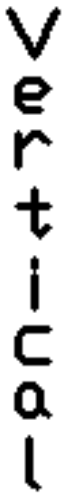

Figure 6.2448

6.27.57 StylesManager

(6.2981 on page 6079) Creates and edits plot style files. **Note:** Plot styles fine-tune how drawings are printed, but are not necessary for printing. The program supports two groups of plot style to control the printed output:

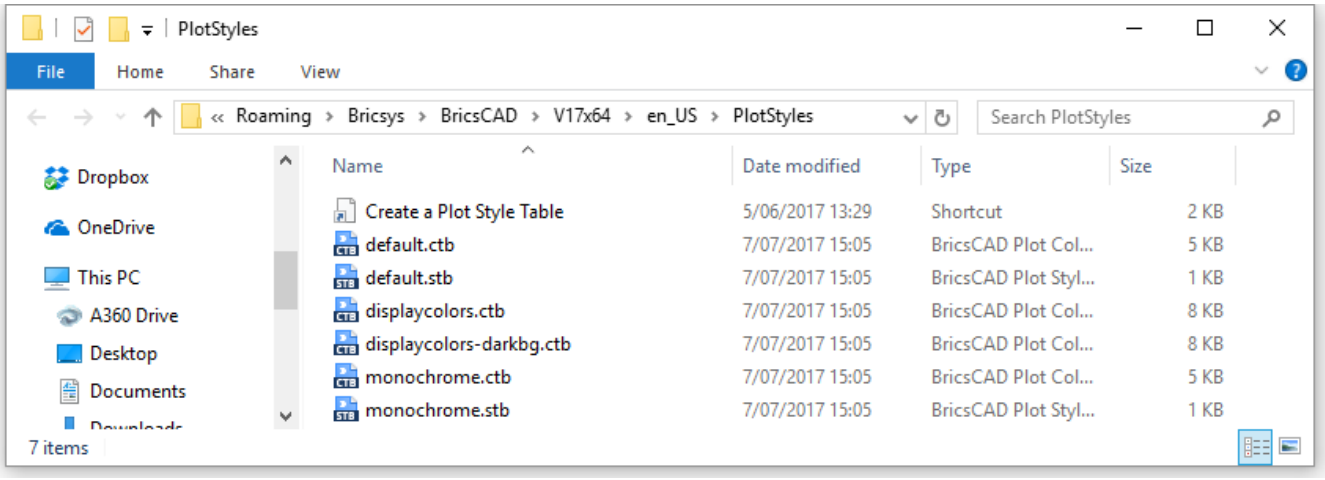
- CTB color tables simply use colors
- STB style tables use an extensive range of properties

Use the PageSetup (6.24.2) command to assign a plot style to a drawing's model and layout tabs.

Accessing the Command

command bar: **stylesmanager** menu bar: **File | Plotstyles Manager : StylesManager** Displays a window: (6.2449) Double-click a CTB or STB file to open the Plot Style Table Editor; see the PlotStyle (6.24.28) command. Double-click Create a Plot Style Table to launch the Add Plot Style Table wizard; the XXXXXXXXXXXXX command

Figure 6.2449

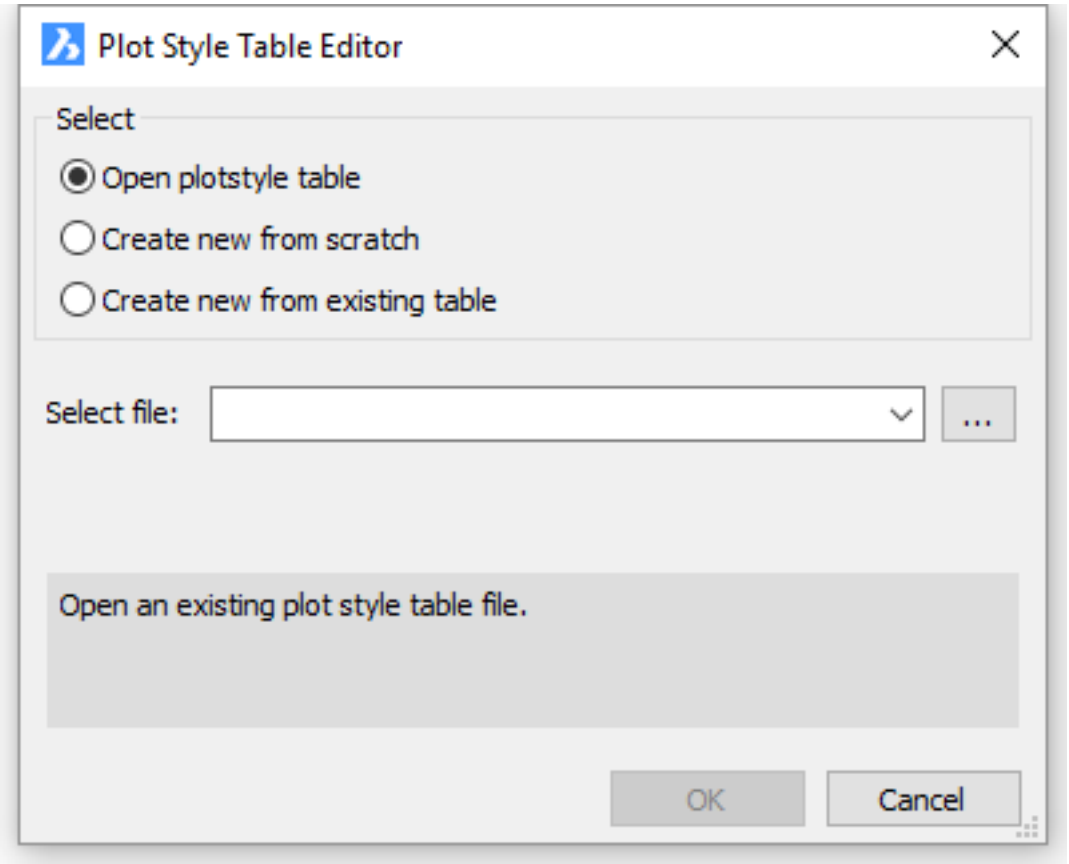


Plot Style Table Editor Dialog Box Options

Double-click **Create a Plot Style Table** to see this dialog box: (6.2450 on the next page)

Option	Description
Open plotstyle table	Opens an existing plot style table; to choose the table file: 1. Click **Browse**  2. Choose a CTB or STB file 3. Click **Open** 4. Click **OK** open the Plot Style Table Editor (1.33.3) dialog box.
Create from scratch	Creates a new plotstyle table: 1. Select a table type from the droplist: • **CTB** (color-dependent plot style table) - controls prints with entity colors. Plotting parameters, such as pen thickness and linetype, are matched to the color of entities. This system is older and less flexible than named plot styles, but is the default in all new drawings. Creates a CTB file. • **STB** (named plot style table) - controls prints with plot styles. Plotting parameters are given to every entity and every layer. This system is newer and more flexible, but may be incompatible with other software that reads DWG files. Creates an STB file. 2. Type a name in the **Table name** field. 3. Click **OK** to open the Plot Style Table Editor (1.33.3) dialog box.
Create new from existing table	Create a new plot style from an existing file: 1. Select an existing file from the **Select file** droplist or else click **Browse** , then choose an existing CTB or STB file and click **OK**. 2. Type a name for the new plot style in the **Table name** field. 3. Click **OK** to open the Plot Style Table Editor (1.33.3) dialog box.

Figure 6.2450



Procedures

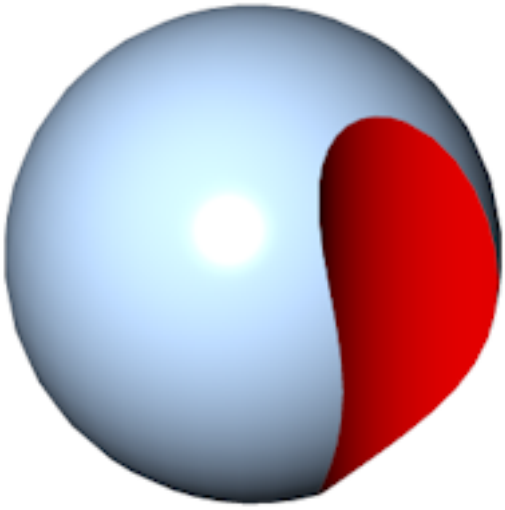
- To open the Plot Styles Manager (1.33.5)
- To create a new plot style table (1.33.5)
- To create a new plot style table in the Print dialog (1.33.5)
- To edit a plot style table (1.33.5)
- To edit a plot style table in the Print dialog (1.33.5)

Related Commands

ConvertCtb (6.9.28) - converts CTB plot style files to STB files. ConvertPStyles (6.9.38) - converts drawings from CTB to STB plot styles. Layer (6.13.17) - assigns plot styles to layers. PageSetup (6.24.2) - assigns plot style to drawings. PlotStyle (6.24.28) - sets the current plot style. Print (6.25.2) - plots drawings with plot styles. Properties (6.24.54) - changes plot styles assigned to entities.

Figure 6.2451

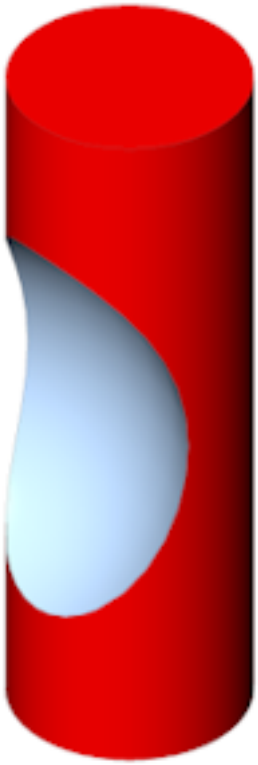
Figure 6.2452



6.27.58 Subtract

(6.2932 on page 6037) Performs Boolean subtraction operations on 3D solids and 2D regions by removing the overlapping portions of one from another. **Note:** This result of this command is sensitive to the order in which you select entities. Here, a cylinder was subtracted from a sphere (left) and vice versa (right). (6.2452) (6.2453 on the facing page)

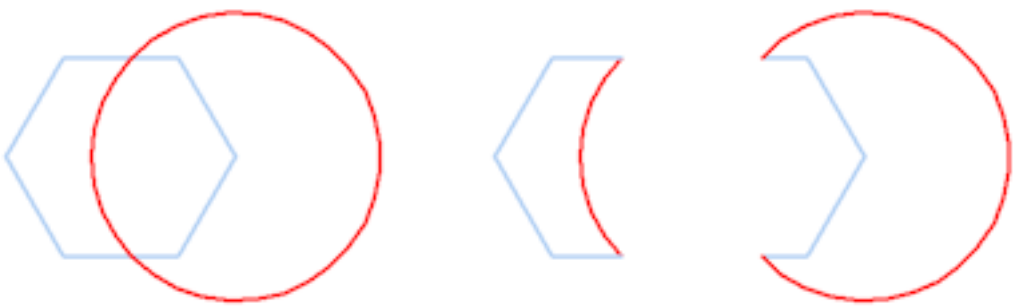
Figure 6.2453



Accessing the Command

 command bar: **subtract** alias: **su** menu bar: **Model | 3D Solid Editing | Subtract** ribbon: **Solid | Edit | Boolean | Subtract** toolbar: **Solid Editing |**  **: Subtract Prompts you in the command bar:** Select ACIS object to subtract from: **(Choose one or more 3D solids and/or 2D regions)** Entities in set: 1 Select ACIS object to subtract from: **(Choose more ACIS entities, or else press Enter to continue)** Select ACIS objects to subtract: **(Choose the second set of one or more 3D solids and/or 2D regions)** Entities in set: 1 Select ACIS objects to subtract: **(Choose more ACIS entities, or else press Enter to continue)** The DELETETOOL (1.17.10) variable determines whether the source entities are deleted or retained. The order in which you select entities also applies to regions: (6.2454)

Figure 6.2454



Command Options

Option	Description
Select ACIS object to subtract from	Specifies the ACIS entities that will have a portion removed: • Choose one or more 3D solids • Choose one or more 2D regions • Press **Enter** to continue
Select ACIS objects to subtract	Specifies the ACIS entities that will doe the removing: • Choose one or more 3D solids • Choose one or more 2D regions • Press **Enter** to perform the subtraction

Related Commands

Extrude (6.13.25) - extrudes 2D entities into 3D solid models. Interfere (6.17.17) - creates 3D volumes of intersecting 3D solid models. Intersect (6.17.20) - removes volumes not in common between two solid models. Revolve (6.26.45) - revolves 2D entities into 3D solid models. Slice (6.27.40) - cuts 3D solids into two parts. SolidEdit (6.27.42) - edits the bodies, faces, and edges of 3D models. Union (6.30.6) - performs Boolean union operations on 3D solids and 2D regions; adds one to another to form a single entity.

Figure 6.2455

6.27.59 SupportFolder

(7.3 on page 6132) Opens the operating system's file manager at the Support folder. **Note:** The support folder holds many files that drawings and commands need, such as linetype patterns and tool palette libraries.

Accessing the Command

command bar: **supportfolder**
: **SupportFolder** Displays a file manager dialog box showing the contents of the support folder: (6.2456 on the next page) Support folder paths are stored in the SRCHPATH (1.17.10) variable, and the default path is: **C:\Users\<user_name>\AppData\Roaming\Bricsys\BricsCAD\Vxx\en_US\Support**

Related Commands

TemplateFolder (6.29.11) - opens the Template folder in a File dialog box.

Figure 6.2457

6.27.60 Status

(7.3 on page 6132) Reports the status of the drawing.

Accessing the Command

 command bar: **status** transparent: **'status** menu bar: **Tools | Drawing Status** ribbon: **Tools | Inquiry | Drawing Status** toolbar: **Inquiry |**  : **Status** Displays no prompts, and displays the status report in the command bar. To view the full report, press **F2 (6.29.16)** to open the Prompt History window. A typical report looks like this: Status: Current drawing name: lsedit.dwg Drawing limits are: X= 0.0000 Y= 0.0000 X= 12.0000 Y= 9.0000 Paper space limits are: X= 0.0000 Y= 0.0000 X= 12.0000 Y= 9.0000 Screen width (pixels): 909 Screen height (pixels): 497 Insertion base is: X= 0.0000 Y= 0.0000 Z= 0.0000 Snap resolution is: X= 0.5000 Y= 0.5000 Grid spacing is: X= 0.5000 Y= 0.5000 Current layer: 0 Current color: BYLAYER Current linetype: ByLayer Current elevation: 0.0000 Current thickness: 0.0000 Fill: on Grid: off Ortho: off Snap: off Blips: off Drag: on Command echo: on Positive angle direction: Counterclockwise Angular units: Decimal degrees Dimension units: Decimal Pickbox height: 3 Entities in drawing: 136

Command Options

No options.

Figure 6.2458

6.27.61 StlOut

(7.3 on page 6132) Exports 3D solids and watertight meshes in a format that can be used for stereolithography (3D printing).

Accessing the Command

command bar: **stlout** : **stlout** Prompts you in the command bar: **Select 3d solids or meshes to export: (Select one or more 3D solids and/or 3D meshes) Select 3d solids or meshes to export: (Select more 3D entities, or else press Enter to continue) Create binary STL file? <Yes>/No: (Press Y or N)** Displays a Save File dialog: Type a name for the file, and click the **Save** button.

Command Options

Option	Description
Select 3d solids or meshes to export	Selects the 3D entities to be exported: • Pick one or more 3D solids and/or 3D meshes • Enter **all** to select all entities in the drawing; the program discards those not eligible for export • Press **Enter** to end entity selection
Create binary STL file?	Determines whether the output file is in binary or ASCII format: • **Yes** - writes a binary STL file, which is more compact • **No** - writes an ASCII text STL file, which is human-readable Some software might expect the file in either format.

When exporting 3D solids to STL, curved faces become faceted. Use the FACETRES variable to determine the size of the facets:

- Minimum = 0.01 for coarser curves but smaller file size
- Default = 0.5
- Maximum = 10 for very fine curves but larger file size

The MODELERPROPERTIES variable overrides Facetres to controlsmoothness by using different parameters, but I recommend you use FACETRES because it is simpler.

Related Commands

Export (6.13.18) - Exports drawings in a variety of vector and raster formats. -ModelerProperties (6.21.28) - controls the various settings of the Acis modeler through the command bar. ModelerProperties (6.21.27) - controls the various settings of the Acis modeler through the **Settings** dialog box.

Figure 6.2459

6.27.62 StopScript

(6.2981 on page 6079) Stops the recording of scripts begun by the RecScript (6.26.5) command.

Accessing the Command

command bar: **stopscript** menu bar: **Tools | Stop Recording** ribbon: **Tools | Action Recorder | Stop Recording** toolbar: **Tools |**  **: StopScript Displays no prompt in the command bar.** Use the RecScript (6.26.5) command to start recording scripts. For more information writing scripts, see **Customizing BricsCAD**.

Command Options

No options.

Related Commands

RecScript (6.26.5) - records scripts to SCR files. Script (6.27.9) - loads and runs a SCR script file. RScript (6.26.34) - reruns the script. Delay (6.10.29) - pauses the execution of the script for the specified number of milliseconds. Resume (6.26.26) - resumes a stopped script.

Figure 6.2460

Figure 6.2461

6.27.63 Spline

(6.2981 on page 6079) Draws open and closed splines in 2D and 3D. (6.2461)

Accessing the Command

 command bar: **spline** alias: **spl** menu bar: **Draw | Spline** toolbar: **Draw |** 
: Spline Prompts you in the command bar: First point for spline: **(Pick a point, or enter x,y,z coordinates)** Second point: **(Pick another point)** Set next point or [Close/Fit tolerance/Undo]: **(Pick another point, or enter an option)** Set next point or [Close/Fit tolerance/Undo]: **(Pick another point, enter an option, or press Enter to end drawing the spline and move on to specifying the tangent points)** Select starting tangent point: **(Pick a point, or press Enter for no starting tangent)** Enter tangent for ending point: **(Pick a point, or press Enter for no ending tangent)**

Command Options

Option	Description
First point for spline	Specifies the start of the tangent: • Pick a point • Enter x,y,z coordinates
Second point	Specifies the first vertex of the spline: • Pick another point • Enter x,y,z coordinates
Next point	Specifies the next vertex. (6.2465 on page 5610) This prompt repeats until you press **Enter**.

Close	Closes the spline; the end and start points are joined. (6.2466 on page 5611) To open or close an existing spline, follow these steps: 1. Select the spline 2. Change the **Close** property in the Properties (6.24.54) panel
Undo	Undraws the last portion drawn.
Fit tolerance	Specifies how closely the spline matches its vertices (also known as "fit points"); prompts you: **Enter fit tolerance (in drawing units)** - **(enter an value:)** • **0** - spline passes through fit points • More than 0 - spline passes further away from fit points
Select starting tangent point	Locates a tangency for the starting point; press **Enter** to ignore this option
Enter tangent for ending point	Locates a tangency for the ending point; press **Enter** to ignore this option

Grips Editing

Open and closed splines can be edited directly through grips. Splines can be grip edited either with fit points or control vertices. Choose either **Fit points** or **Control vertices** from the **Method** property options of a spline in the Properties Panel (6.24.54). The **CV Frame** property of the spline controls whether the control vertices frame displays or not. (6.2462) Method = Fit points (6.2463 on the following page) Method = Control Vertices; CV Frame = Off (6.2464 on the next page) Method = Control Vertices; CV Frame = ON

1. Select the spline. Notice that it has one grip at each fit point or control vertex.
2. Drag a grip to stretch the spline.

Figure 6.2462

Figure 6.2463

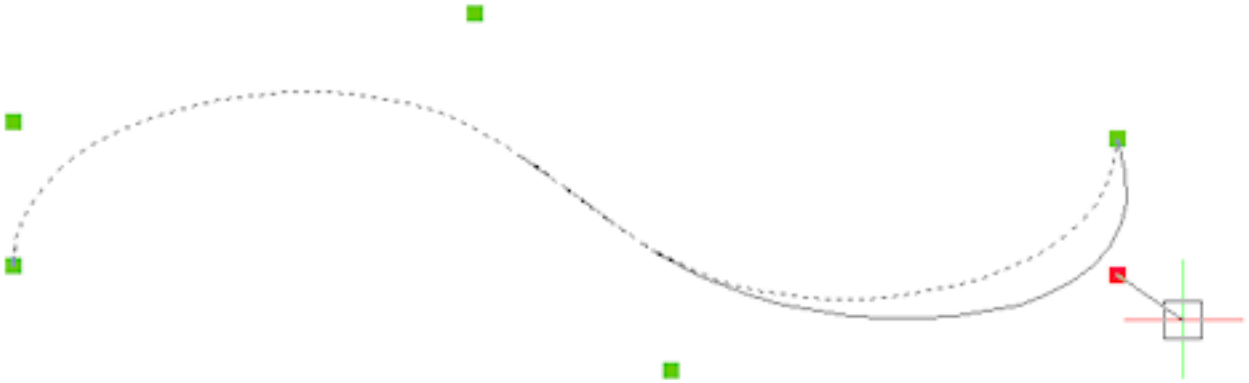

Figure 6.2464

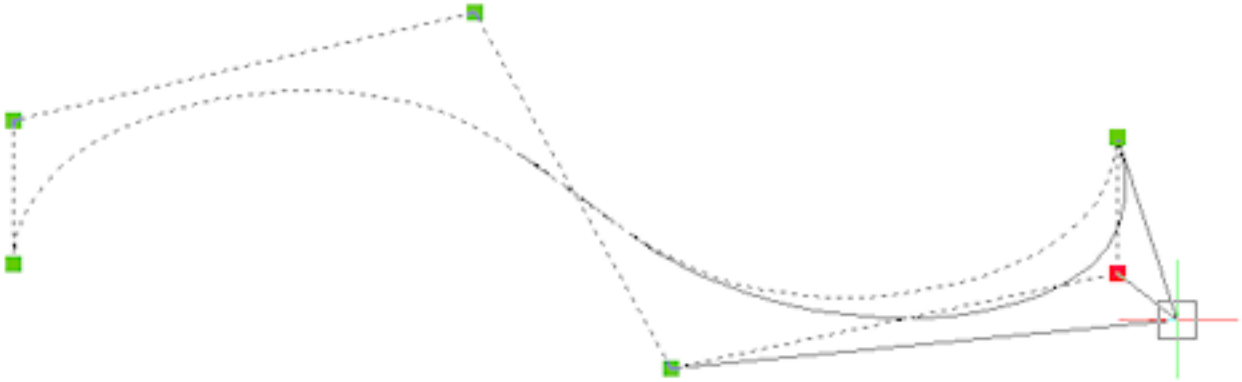

Procedures

- Drawing splines (1.25.19)

Related Command

PEdit (6.24.24) - turns polylines into splines. Splinedit (6.27.46) - modifies the properties of a spline or converses a spline to a polyline. Helix (6.16.7) - Creates a 2D spiral or a 3D helix.

Figure 6.2465

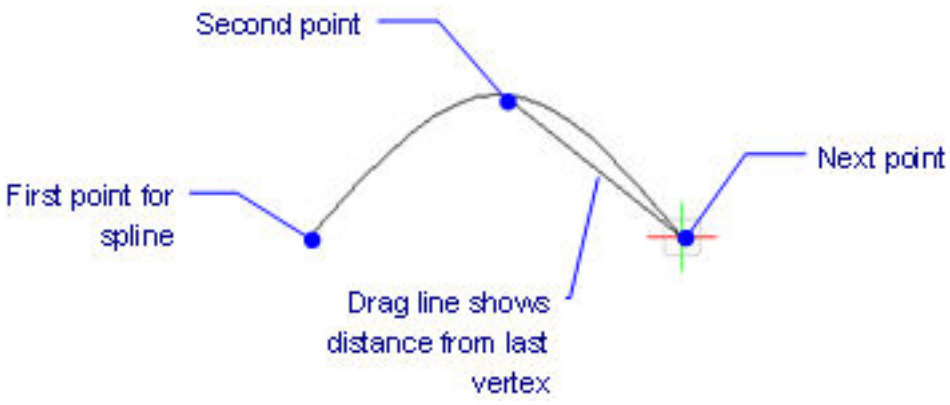

Figure 6.2466

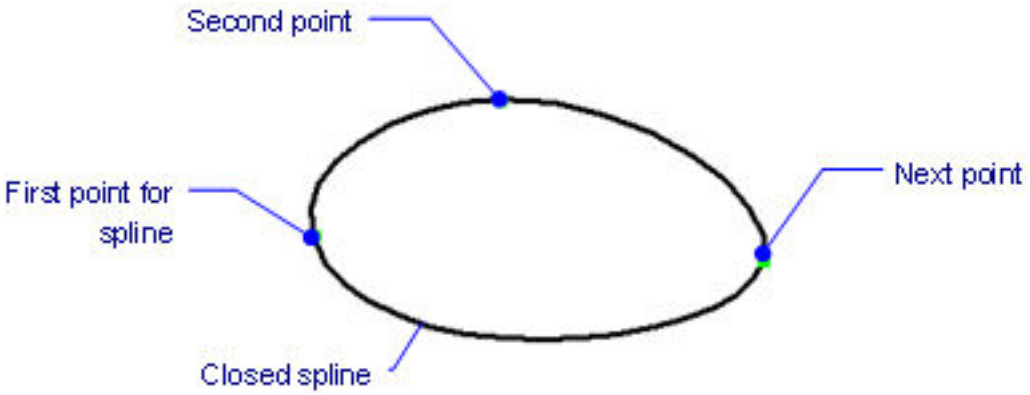

Figure 6.2467

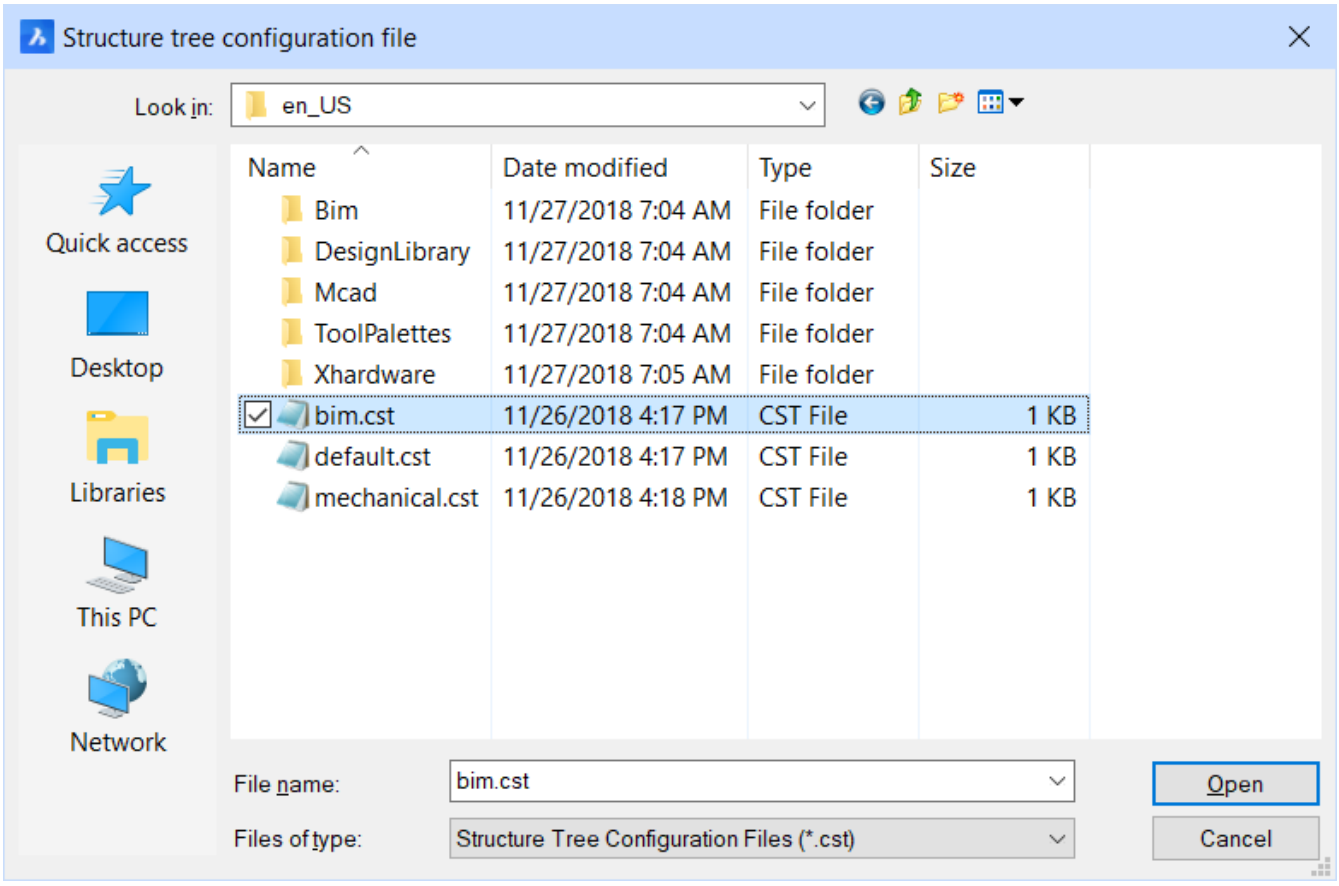
6.27.64 +StructurePanel

(6.2981 on page 6079) Loads a CST structure tree configuration file into the Structure panel. **Note:** Loading different CST files changes the way that the StructurePanel (6.27.54) command presents drawing data.

Accessing the Command

Keyboard: **+structurepanel :+StructurePanel** Displays a dialog box: (6.2468 on the next page)

Figure 6.2468



Dialog Box Options

Option	Description
File name	Specifies the name of the CST file to load. Loading different CST files changes the way that the Structure panel presents drawing data. The program includes three CST files (short for "configuration structure tree"): • **bim.cst** - meant for BIM drawings • **default.cst** - meant for all other kinds of drawings • **mechanical.cst** - meant for mechanical drawings The CST files are found in the C:\Program Files\Bricsys\BricsCAD V19en_US\UserDataCache\Support\en_US folder
Open	Opens the CST file and then loads it into the Structure panel
Cancel	Cancels the command

Related Commands

StructurePanel (6.27.54) - opens the Structure panel.

6.27.65 SysWindows

(6.2981 on page 6079) Arranges the program's windows in tiles or cascaded formations (short for "system windows"). (6.2470)

Accessing the Command

command bar: **syswindows** menu bar: **Window | Cascade Window | Tile Vertically Window | Tile Horizontally : SysWindows Prompts you in the command bar:** Arrange MDI windows [Cascade/tile Horizontally/tile Vertically/Arrange icons] <Cascade>: **(Enter an option)**

Command Options

Option	Description
Cascade	Overlaps windows in a cascading arrangements; see the WCascade (6.33.2) command
Horizontally	Arranges windows horizontally; see the WhTile (6.33.13) command.
Vertically	Arranges windows vertically; see the WvTile (6.33.16) command.
Arrange icons	Arranges icons of minimized windows at the bottom of the graphical screen; see the WiArrange (6.33.9) command.

Related Commands

WCascade (6.33.2) - cascades the windows. WClose (6.33.7) - closes the current window. WCloseAll (6.33.5) - closes all windows. WhTile (6.33.13) - tiles windows horizontally. WiArrange (6.33.9) - arranges iconized windows. WvTile (6.33.16) - tiles windows vertically.

Figure 6.2471

6.27.66 StructurePanelClose

(6.2981 on page 6079) Closes the Structure panel.

Accessing the Command

command bar: **structurepanelclose** context menu: right click any toolbar or the ribbon, then choose **Structure** : **structurepanelclose** The Structure panel is closed. If the Structure panel is currently docked, the Structure Panel tab is removed.

Command Options

No command options.

Related Commands

StructurePanel (6.27.54) - opens the Structure panel.

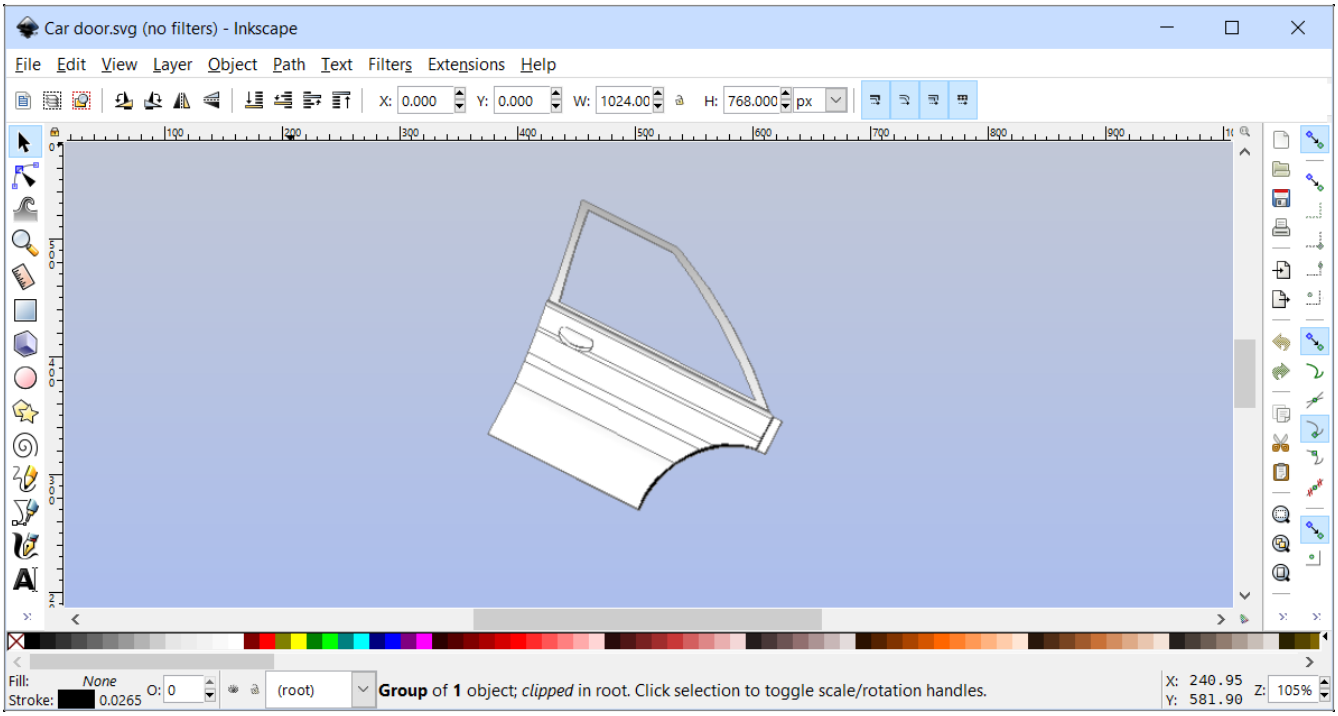
Figure 6.2473



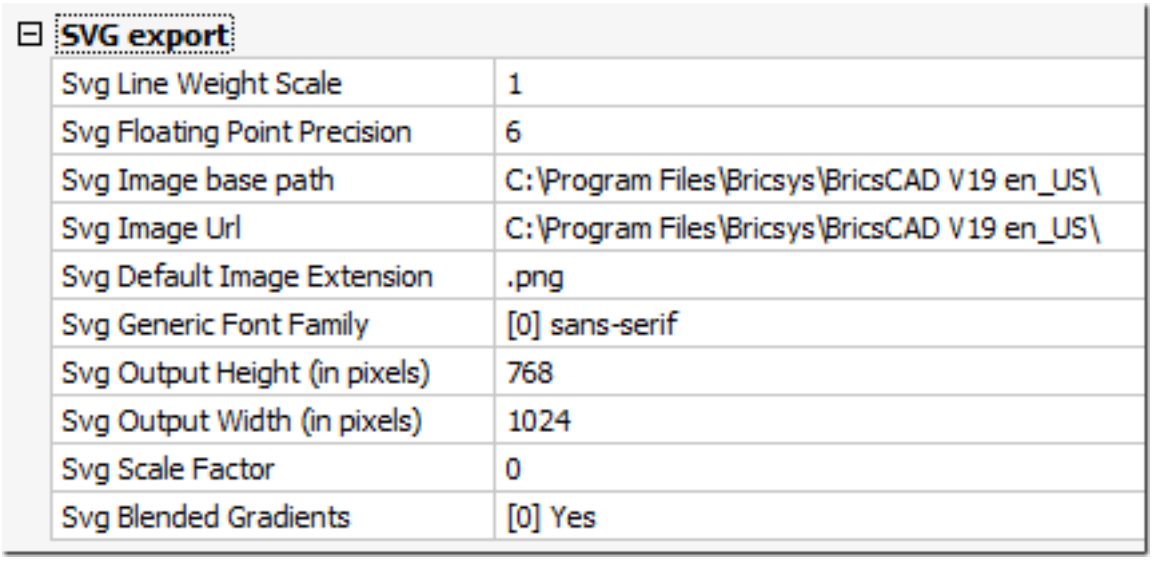
6.27.67 SvgOptions

(6.2981 on page 6079) Displays the SVG Export section of the Settings dialog box; short for "scalable vector graphics." **Note:** These options are used by the Export (6.13.18) command when you choose SVG as the file type. SVG files can be viewed and edited by the freeware Inkscape program, shown below: (6.2473)

Accessing the Command

command bar: **svgoptions** transparent: **'svgoptions** : **SvgOptions** Displays the SVG Options section of the Settings dialog box: (6.2474 on the next page)

Figure 6.2474



Settings Options

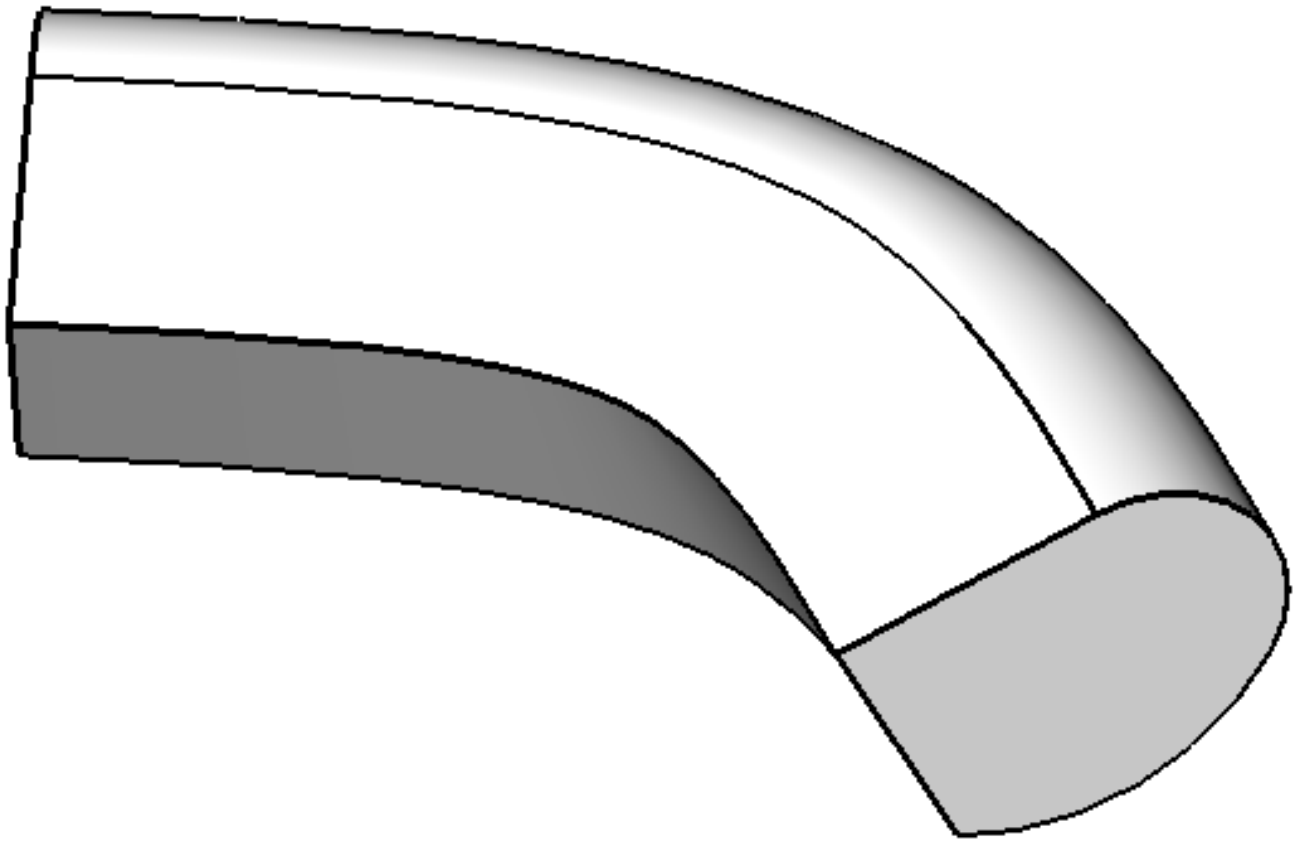
Option	Description
Svg Line Weight Scale	Specifies the scale factor at which to size of pixel widths of lines
Svg Floating Point Precision	Specifies the precision in terms of decimal places
Svg Image base path	Reports the path to where image files are kept; click Browse to choose another path
Svg Image Url	Specifies the prefix to append to images stored in SVG files
Svg Default Image Extension	Specifies the default extension for images
Svg Generic Font Family	Specifies the class of font to use; choose from: • **Sans-serif** - fonts without serifs, like Arial • **Serif** - fonts with serifs, like Times Roman • **Cursive** - fonts that look handwritten • **Fantasy** - unusual fonts • **Monospace** - fonts where each character takes up the same space (non-proportional spacing), such as Courier
Svg Output Height	Specifies the height of the SVG output file, in pixels
Svg Output Width	Specifies the width of the SVG output file, in pixels
Svg Scale Factor	Specifies the scale factor: • **0** - the current view is scaled to fit the page size specified by Svg Output Height and Width • Positive number - scales up the size of the output page
Svg Blended Gradients	Toggles the use of blended gradients in areas filled with gradients; choose from: • **Yes** - uses blended gradients; the file size may be larger • **No** - does not use blended gradients

Related Commands

Export (6.13.18) - exports drawings in a variety of vector and raster formats.

Figure 6.2475

Figure 6.2476



6.27.68 Sweep

(6.2932 on page 6037) Creates 3D solids or surfaces by sweeping profiles (open or closed 2D entities or 3D subentities) along an open or closed path. (6.2476)

Accessing the Command

 command bar: **sweep** menu bar: **Model| 3D Solids | Sweep** ribbon: **Solid | Create | Sweep** toolbar: **3D Solids|**  **: Sweep Prompts you in the command bar**: Select profile entities or [MOde/Interactive/selection options (?)]: **(Select one or more profile* entities, or choose an option.)** Entities in set: 1 Select profile entities or [MOde/Interactive/selection options (?)]: **(Select more profile* entities, or choose an option, or else press Enter to continue)** Select sweep path or [Alignment/Base point/Twist/Interactive/selection options (?)]: **(Select a path** entity, or else enter an option)** The selected 2D entities are swept along the path. Depending on the value of the DELOBJ (1.26.1) (Delete object) system variable, the defining entities are either retained or deleted or you are prompted whether to keep or delete the source entities. Delete defining entities? [Yes/No] <Yes>: **(Choose Yes or No)** * Entities accepted as profile entities: 2D splines, 3D splines, 2D polylines, 2D solids, 3D solid faces, 3D solid edges, arcs, circles, ellipses, elliptical arcs, lines, regions, surface and mesh edges, traces. ** Entities accepted as a path entity: 2D splines, 3D splines, 2D polylines, 3D polylines, edges of 3D solids, surfaces or meshes, helices, arcs, circles, ellipses, elliptical arcs, lines.

Command Options

Option	Description
Selection options (?)	Allows to select one or more entities through a variety of selection methods. Prompts you: **Select entities [add to set (+)/subtract from set (-)/Last entity in drawing/inside Window/Crossing window/Outside window/Window Polygon/Crossing Polygon/Outside Polygon/Window Circle/Crossing Circle/Outside Circle/Box/POint/Fence/AUto/Multiple/Single/selection methoDs.../Undo/Group]** - **(Choose an option)** See Select (6.27.16) command.
Select profile entities	Select one or more profile entities. (6.2477 on the following page) This command will take the profile entity and then sweep it along the path entity.
Mode	Sets the 3D entity type this command will create; prompts you: **Choose type of created entity [SOlid/SUrface] <SOlid>** - **(enter an option:)** • **Solid** - constructs 3D solids • **Surface** - constructs surfaces This option applies only to closed source entities; open entities always construct 3D surfaces.
Select sweep path	Selects an entity to define the path. This command will take the profile entity and sweep it along the path entity.
Alignment	Determines the angle at which the profile 2D entities are swept along the paths; see figures below. Prompts you: **Align sweep entity perpendicular to path before sweep? [Yes/No]** - **(enter an option:)** • **Yes** - aligns the sweep entity perpendicularly to the sweep path entity • **No** - the sweep entity maintains its original orientation, and so its not rotated along the path (6.2478 on page 5621) At left, the alignment is on and so the circle is placed perpendicularly to the sweep path. At right, the alignment is off and so the circle is not rotated.
Base point	Defines the point on the sweep entity that follows the path; prompts you: **Specify base point** - **(pick a point in the drawing.)** This option allows offset sweep paths.
Twist	Specifies a twist angle for the swept entity or entities. The twist angle is the amount of rotation along the entire length of the sweep path. Prompts you: **Enter twist angle or [allow Banking for a non-planar sweep path (Bank)]** <0> - **(enter an option:)** • Type a value for the angle • **Bank** determines whether the swept entities will bank (rotate) naturally along a 3D sweep path,such as those made from a 3D polyline, spline, or helix

Interactive	Allows to dynamically sweep profiles along a sequence of interconnected linear entities or along a portion of a path. You are prompted: **Select sweep path or [Alignment/Base point/Twist]** • Move the cursor over the start of the first path entity. The path entity or entity segment highlights. (6.2479 on the facing page) • Click to select the path entity. The Manipulator (6.21.3) displays at the start point of the sweep path. (6.2480 on page 5622) **Transform profile or press enter to accept <Accept>** • **Transform profile** - Use the Manipulator to move, rotate, mirror or scale the profile(s). • **Accept** - Press Enter to accept the current position of the profile(s). **Move cursor along last selected edge, select adjacent edge or [Undo]** • **Move cursor along selected edge** - The profile is swept dynamically along the path or path segment. • **Select adjacent edge -** Click when the next segment highlights to continue. To conclude the sweep operation: right click, press Enter or click away from the path. (6.2481 on page 5622) (6.2482 on page 5622) (6.2483 on page 5623) • **Undo** - Removes the last segment.

Grips Editing

Sweep solids can only be moved using grips.

Related Commands

dmExtrude (6.12.14) - creates a 3D solids or surfaces by extruding open or closed 2D entities or regions. dmRevolve (6.12.21) - creates 3D solids or surfaces by revolution of open or closed 2D entities or regions about an axis. dmThicken (6.12.30) - creates 3D solids by thickening (i.e. adding thickness to) surfaces, their faces, faces of 3D solids and wire entities such as lines, arcs, polylines, ... Extrude (6.13.25) - extrudes 2D entities to 3D solids or surfaces. Loft (6.20.37) - creates 3D solids passing through two or more cross sections. Revolve (6.26.45) - revolves open or closed 2D entities to turn them into 3D solids or surfaces. RevSurf (6.26.28) - creates a 3D mesh surface by revolving a linear entity around a line.

6.27.69 Sketch

(6.2981 on page 6079) Draws freehand sketches made of polylines or lines. (6.2485)

Accessing the Command

 command bar: **sketch** alias: **freehand** menu bar: **Draw | Sketch** ribbon: **Draw | Draw | Polylines | Sketch** toolbar: **Draw |**  **: Sketch Prompts you in the command bar:** Sketch: Length of segments <0.1000>: **(Enter a number, pick two points, or else press Enter to accept the default)** Press ENTER or click to toggle [Erase/Connect/save and eXit/Quit no save/Record (save)]: **(Click to start sketching, click again to toggle pen up/down)** Press ENTER or click to toggle [Erase/Connect/save and eXit/Quit no save/Record (save)]: **(Enter an option, or press X to exit the command)** During sketching, the lines are green until the sketch lines are saved: Saving sketch lines ... Depending of the status of the SKPOLY system variable sketches are made from lines or polylines.

Command Options

Option	Description
Length of segments	Specifies the length of segments. Enter a number. Too small a segment length results in large drawings.
Press ENTER or click to toggle	Allows you to move the pen without drawing: (6.2486)
Erase	Erases the sketch lines from their endpoints interactively. Click to stop erasing and restart sketching. (6.2487 on the facing page)
Connect	Connects cursor to end of the last segment; prompts you: **Point cursor to end of last sketch line** - **(move the cursor to the end of the last sketch.)** This option is meant for use after a pen up.
save and eXit	Saves the sketch; reports: **Saving sketch lines.** Exits the sketch command.
Quit no save	Exits the command without saving the sketch.
Record (save)	Saves the sketch; reports: **Saving sketch lines.** The green lines turns black. You can continue sketching.

Procedures

- Setting the Sketch Poly (SKPOLY) system variable (1.25.17)
- Creating a freehand sketch (1.25.17)

Related Commands

PLine (6.24.27) - draws polyline segments and arcs. RevCloud (6.26.33) - draws revision clouds.

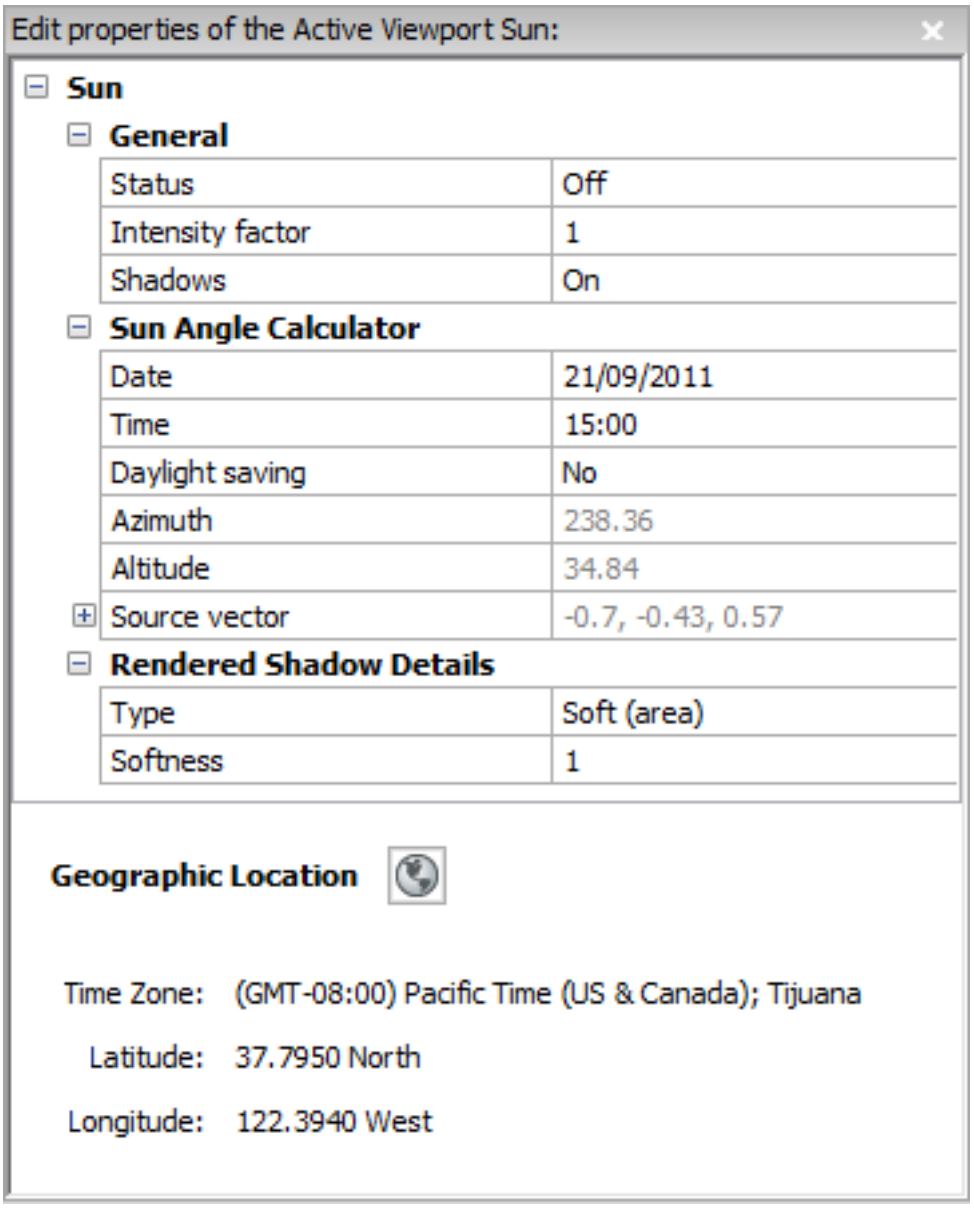
6.27.70 SunProperties

(6.2981 on page 6079) Edit the properties of the sun light through the Drawing Explorer. **Note:** Sun is a light that mimics the lighting effects of the sun, specifically according to the time and date. You do not realy place the sun, only turn it on and off.

Accessing the Command

command bar: **sunproperties** alias: **sun** menu bar: **Tools | Drawing Explorer | Lights View | Rendering | Lights | Sun Properties** ribbon: **View | Sun | Sun Properties** toolbar: **Lights |**  **: SunProperties** Displays the **Lights** section of the **Drawing Explorer** dialog box: (6.2489 on the facing page)

Figure 6.2489



Dialog Box Options

Options	Description
General	**Status** - toggles the sun on and off: • **On** - displays the sun as a light in the model • **Off** - does not display the light **Intensity factor** - specifies the intensity or brightness of the sun; the higher the number, the brighter the light. **Shadows** - toggles the display of shadows by the sun light: • **On** - displays shadows according to the properties in the **Rendered Shadow Details** section, below • **Off** - does not display shadows, which increases rendering speed Note: The color of the sunlight is hard-coded.
Sun Angle Calculator	**Date** - displays the current date; edit the date to show the sun at a different time of year **Time** - displays the current time; edit the time to show the sun at a different time of day **Daylight saving** - toggles the effect of daylight saving time on the time property **Azimuth** - reports the horizontal angle of the sun measured clockwise from the north; this setting cannot be changed as the program calculates it from the other settings in this section. (Read-only) **Altitude** - reports the vertical angle of the sun, measured from the horizon; this setting cannot be changed as the program calculates it from the other settings in this section. (Read-only) **Source vector** - reports the direction of the sunlight; this setting cannot be changed as the program calculates it from the other settings in this section.
Rendered Shadow Details	**Type** - **Soft (area)**- displays realistic shadows with softer shadows based on extended light sources, according to the Softness property. **Softness** - determines the sampling size of shadows; larger numbers are more accurate but take longer to render
Geographic Location	Reports location of the drawing on earth; to change the location, click the **Edit** button to access the Geographic Location dialog box; see GeographicLocation (6.15.15) command.

Related Commands

Light (6.20.30) - creates a new light. Geographiclocation (6.15.15) - sets the geographic location of the drawing. Lightlist (6.20.36) - opens the Drawing Explorer - Lights dialog. Render (6.26.21) - calculates a photorealistic image of the 3D model.

Figure 6.2490

6.27.71 Suppress

(6.2880 on page 5977) Creates a suppression feature (1.27.5) to temporarily remove a set of entities in a drawing.

Access the Command

 command bar: **suppress** menu bar: **Parametric | Suppress** toolbar: **Parameters | Suppress** ribbon (Mechanical workspace):

- **Home | Parametrize | Suppress**
- **Solid | Parametrize | Suppress**
- **Surface | Parametrize | Suppress**
- **Sheet Metal | Parametrize | Suppress**
- **Assembly | 3D Constraints | Suppress**

: SUPPRESS Prompts you in the command bar: Enter parameter option [New/Edit/Dissolve] <New>: **(Choose an option or hit Enter.)** Enter name for new suppression feature <Suppression_1>: **(Specify a name or hit Enter to accept the default name.)** Select entities: **(Select an entity.)** Entities in set: 1 Select entities: **(Select more entities or press Enter to confirm the current selection.)** The suppression feature is created. The selected entities are suppressed.

Command Options

Option	Description
New	Creates a new suppression feature. See above.
Edit	Allows to add or remove entities. Prompts you: **Enter name of suppression feature:** - Specify the name of a suppression feature. The currently selected entities highlight. **Select entities** - Do the following: • Select* the entities to be added. • Hold down the Shift key, to remove* entities. • Press Enter to conclude. *You can use any selection method: click, window inside, crossing or outside, fence, ...
Dissolve	Removes a suppression feature. Prompts you: **Enter name of suppression feature:** - Specify the name of a suppression feature.

Procedures

Creating a suppression feature (1.27.5) Managing suppression features (1.27.5) To set a condition for a suppression feature (1.27.5)

Related Commands

BmBom (6.8.3) - inserts a Bill of Materials (BOM) table in the current drawing. BmMassProp (6.8.18) - computes mass properties for the current model with the densities assigned its the components. MechanicalBrowserOpen (6.8.32) - displays the Mechanical Browser.

6.28 Sm (Sheet Metal)

6.28.1 SmAssemblyExport

(6.2582 on page 5709) SmAssemblyExport searches the Assembly Structure, of the current drawing, for 3D solids within a component and applies the SmConvert (6.28.4) and SmExport2d (6.28.6) commands. The result is a set of .dxf files with unfold information saved in a user-defined output folder and sorted by thickness. Parts processed with command warnings or errors are placed in a special folder. An HTML report listing all the solids in the assembly is generated. This indicates their status and links to the corresponding .dwg and .dxf files. Solid classifications:

- "Sheet Metal" – solid is a sheet metal part.
- "Poor Sheet Metal" – solid looks like a sheet metal design, user assistance, and rework are needed.
- "Not Sheet Metal" – solid is not recognized as a sheet metal design.

SmAssemblyExport can be applied to mixed assemblies containing both sheet metal and non-sheet metal parts. It quickly sorts out non-sheet metal parts from sheet metal parts. SmAssemblyExport can be applied to simple drawings with solids, to assemblies created in BricsCAD and to drawings imported with the Communicator for BricsCAD (4.1.2). For optimal processing set the ImportProductStructure (1.17.10) Communicator user preference to 2 (mechanical components) otherwise, mechanical components will be exploded to solids. This can result in a higher number of entities being processed by SmAssemblyExport, an increased processing time and multiple repeats in the output. For optimal performance set the Visual Style (6.31.15) to **2dWireframe**.

Figure 6.2491

Accessing the Command

command bar: **smassemblyexport** menu bar: **Sheet Metal | Unfold | Export Assembly to DXF** toolbar: **Sheet Metal | Export Assembly to DXF** ribbon: **Sheet Metal | Flatten | Export Assembly to DXF** : **SmAssemblyExport Prompts you in the command bar:** Select solids, component instances or [Output folder/bend Table/Dxf version] <Entire model>: **(Select the to be processed or press Enter to include all the entities in assembly. Note that a component will be skipped only if it is not referred by any instance.)** Unless defined differently in the command options, the results are saved in the folder of the processed drawing.

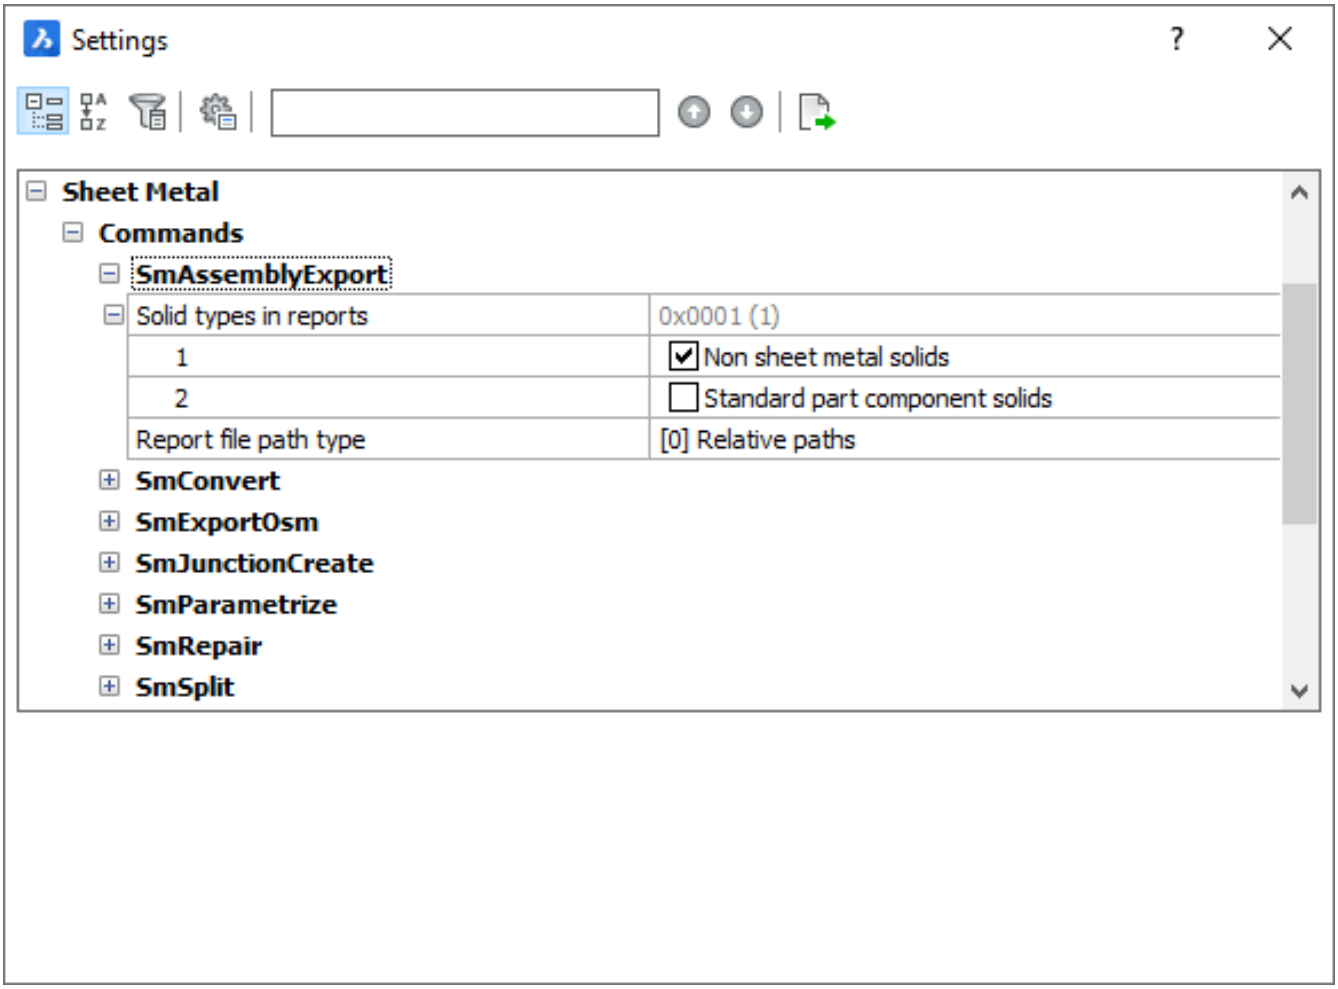
Command Options

Option	Description
Set Output Folder	Sets the output folder: Displays a File dialog to set the output folder.
Set Bend Table	Assigns a bend table Displays a File dialog to set the bend table used during SmExport2d (6.28.6) calls in the output process.
DXF version	Specifies the DXF version: Select DXF version [R11/R12/R13/LT2/R14/LT95/2000/2004/2007/2010/2013/2018] <2013> - choose a DXF versi

Command Settings

(6.2492 on the next page) The "Solid types in reports" setting determines what types of solids will be included in reports. By default 'Non-sheet metal solids' are included and 'Standard part component solids' are not included in the reports. The "Report file path type" setting determines what file path types will be used in reports: relative or absolute. By default, path type is relative.

Figure 6.2492



Related Commands

SmConvert (6.28.4) - automatically recognizes flanges and bends in a 3D solid. SmExport2d (6.28.6) - exports the unfolded representation of a sheet metal body as a 2D profile in .dxf / .dwg file format.

Figure 6.2493

6.28.2 SmBendSwitch

(6.2582 on page 5709) Converts bends to lofted bends.

Accessing the Command

command bar: **smbendswitch** menu bar: **Sheet Metal | Bend | Switch Bend** toolbar: **Sheet Metal | Switch Bend** ribbon: **Sheet Metal | Modify | Switch Bend** Quad cursor menu: **Sheet Metal | Switch Bend : SmBendSwitch Prompts you in the command bar:** Select bend faces/<Entire model>: **(Select a bend or press Enter to select all bends in the model.)** Entities in set: 1 Select bend faces/<Entire model>: **(Select a bend or press Enter to convert the selected bends.)**

Command Options

No options.

Related Commands

SmBendCreate (6.28.3) - converts hard edges (sharp edges between flange faces) into bends SmLoft (6.28.20) - creates sheet metal part with lofted bends and flanges from two non-coplanar curves. SmRepair (6.28.29) - restores the 3D solid model of a sheet metal part by thickening one of its sides: all thickness faces become perpendicular to flange faces. Fixes problems specific to parts with lofted bend features: merges adjacent bends and provides tangential connection with flanges.

Figure 6.2494

6.28.3 SmBendCreate

(6.2582 on page 5709) Converts hard edges (sharp edges between flange faces) or junctions into bends.

Accessing the Command

command bar: **smbendcreate** menu bar: **Sheet Metal | Bend | Create Bend** toolbar: **Sheet Metal | Create Bend** ribbon: **Sheet Metal | Modify | Create Bend** Quad cursor menu: **Sheet Metal | Create Bend : SmBendCreate Prompts you in the command bar:** Select hard edges or junctions or flanges or 3D solids or [Entire model] <Entire model>: **(Select a face or a hard edge or 3D solid or press Enter to include all sheet metal parts)** Entities in set: 1 Select hard edges or junctions or flanges or 3D solids or [Entire model] <Entire model>: **(Select another face or hard edge or 3D solid or press Enter)*** * All selected items must be of the same kind: faces or hard edges.

Related Commands

SmBendSwitch (6.28.2) - converts bends to lofted bends. SmConvert (6.28.4) - automatically recognizes flanges and bends in a 3D solid. SmDelete (6.28.5) - removes a bend or a junction by restoring a hard edge between two flanges; removes a flange with all the bends adjacent to it. The adjacent flanges are extended up to a junction configuration with the flange being deleted. Removes miter by restoring geometry being cut by the feature. SmDissolve (6.28.7) - removes sheet metal data from the selected faces. SmFlangeConnect (6.28.12) - closes gaps between two arbitrarily oriented flanges. SmJunctionCreate (6.28.21) - converts hard edges (sharp edges between flange faces) and bends into junctions. SmReliefCreate (6.28.22) - makes proper corner and bend reliefs. Corner reliefs are built on corners which have three or more adjacent flanges. Bend reliefs are built on the start and end of a flange edge .

Figure 6.2495

6.28.4 SmConvert

(6.2582 on page 5709) Automatically recognizes flanges, bends, lofted bends, ribs, form features and holes for selected 3D solids.

Access the Command

command bar: **smconvert** menu bar: **Sheet Metal | Convert to Sheet Metal** toolbar: **Sheet Metal | Convert to Sheet Metal** ribbon: **Sheet Metal | Create | Convert to Sheet Metal** Quad cursor menu: **Sheet Metal | Convert to Sheet Metal : SmConvert Prompts you in the command bar:** Select 3D solids or [Entire model] <Entire model>: **(Select a 3D solid or press Enter to include the entire model.)** Entities in set: 1 Select 3D solids or [Entire model] <Entire model>: **(Select more 3D solids or right click.)**

Command Options

Option	Description
Entire Model	All the solids in the model are analyzed and if possible, converted to Sheet Metal bodies. The command recognizes sheet metal features (such as flanges and bends) in the input geometry. The body thickness of the sheet metal drawing is the criterium in case multiple solids are selected. Therefore selected bodies must have the same thickness, otherwise an error message displays in the command window: "Could not convert the 3D solid to sheet metal. Recognized thickness is not equal the thickness of document: 5.000000 != 7.000000."

Command Settings

===ERROR WITH DOWNLOADED IMAGE===

- Prefer form features: Controls how ambiguous geometry is recognized (a single form feature or a set of flanges and bends).
- Prefer hem features: If enabled, hems will be recognized as features.
- Recognize holes: If enabled, holes will be recognized as features.
- Recognize rib control curves: Controls how the control curve of a rib feature is recognized.
- Deviation value of wrong feature thickness: Determines the deviation between model thickness and thickness of a given incorrect feature.
- Type of deviation of wrong feature thickness: Deviation can be treated as an absolute value or a ratio to model thickness.

Related Commands

SmAssemblyExport (6.28.1) - analyzes the assembly structure of the current drawing, executes the SmConvert (6.28.4) and SmExport2d (6.28.6) commands, and saves the resulting .dxf files with unfold information in an output folder. SmDelete (6.28.5) - restores a hard edge between two flanges to remove a bend or a junction; removes a flange and all the bends adjacent to it. The adjacent flanges are extended up to a junction configuration and the flange is deleted. SmDissolve (6.28.7) - removes sheet metal data from the selected faces. SmFlangeBase (6.28.10) - creates a base (initial) flange, of a sheet metal part, from a closed planar profile. SmForm (6.28.17) - converts a selected set of faces to a form feature. SmParametrize (6.28.23) - creates a consistent set of 3D constraints for a selected sheet metal part. SmRepair (6.28.29) - restores the 3D solid model of a sheet metal part by thickening one of its sides (all thickness faces become perpendicular to flange faces).

Figure 6.2496

6.28.5 SmDelete

(6.2582 on page 5709) Removes a bend or a junction by restoring a hard edge between two flanges; removes a flange with all the bends adjacent to it. The adjacent flanges are extended up to a junction configuration with the flange being deleted. Removes miter by restoring geometry being cut by the feature.

Accessing the Command

 command bar: **smdelete** menu bar: **Sheet Metal | Delete Feature** toolbar: **Sheet Metal | Delete Feature** ribbon: **Sheet Metal | Modify | Delete Feature** Quad cursor menu: **Sheet Metal | Delete Feature : SmDelete Prompts you in the command bar:** Select feature faces or thickness faces: **(Select an item.)** Entities in set: 1 Select feature faces or thickness faces: **(Select another item or right click.)** Example of bend feature deletion:

(6.2497)	(6.2498 on the next page)
Selected bend faces	The selected bends are replaced by hard edges

Example of deletion by using thickness faces without junction feature:

(6.2499 on the following page)	(6.2500 on the next page)
Selected thickness faces	The selected faces are replaced by hard edge

Command Options

No options.

(6.2582 on page 5709) Allows to bend an existing flange along a line, obeying k-factor for given bend radius.

Accessing the Command

 command bar: **smflangebend** menu bar: **Sheet Metal | Bend | Flange Bend** toolbar: **Sheet Metal | Bend | Flange Bend** ribbon: **Sheet Metal | Modify | Bend | Flange Bend** Quad: **Sheet Metal | Flange Bend : SmFlangeBend Prompts you in the command bar:** Select a flange face: **(Select a major face of flange.)** Select line or edge to bend the solid or draw a [New line] <New line>: **(Select a line or an edge.)** Pick a point on the side that will be moved: **(Pick a point on the side of the line that will be moved.)** Select flange position [Angle/Radius/Switch side/ACcept] <Accept>: **(Choose an option or press Enter.)**

Command Options

Option	Description
New line	Allows to draw a line to define the bend location; prompts you: **Start point of the line** - **(Pick a point.)** **End point of the line** - **(Pick a point.)**
Angle	Allows to set the bend angle; prompts you: **Enter bend angle [Back] <Back>: - (Do one of the following:)** • Type a value. • Press Enter to go back without changing the bend angle.
Radius	The default bend radius is defined by the **Modeling/Bend Radius** property in the Mechanical Browser for Sheet Metal (3.9.6). Allows to define the bend radius; prompts you: **Enter bend radius [Back] <Back>:** - **(Do one of the following:)** • Type a value. • Press Enter to go back without changing the bend radius.
Switch side	Allows to move the part of the flange on the other side of the line or edge.
Accept	Creates the bend at the current angle and radius.

Procedures

To bend multiple flanges simultaneously (**??**)

Related Commands

SmExtrude (6.28.9) - creates sheet metal part from a planar polyline by extruding it orthogonally to the plane of the polyline. SmFlangeBase (6.28.10) - creates a base (initial) flange of a sheet metal part from a closed planar profile. SmFlangeEdge (6.28.14) - creates one or more flanges to a sheet metal part by pulling one or more edges of an existing flange. SmFlangeRotate (6.28.15) - rotates a selected flange of a sheet metal part with automatic selection of the rotation axis depending on the design intent

Figure 6.2513

6.28.12 SmFlangeConnect

(6.2582 on page 5709) Closes gaps between two arbitrarily oriented non-coplanar flanges.

Accessing the Command

 command bar: **smflangeconnect** menu bar: **Sheet Metal | Connect Flanges** toolbar: **Sheet Metal | Connect Flanges** ribbon: **Sheet Metal | Modify | Connect Flanges** Quad cursor menu: **Sheet Metal | Connect Flanges : SmFlangeConnect Prompts you in the command bar:** Select planar thickness faces of two flanges: **(Select the face on the first flange.)** Entities/subentities in set: 1 Select planar thickness faces of two flanges: **(Select the face on the second flange.)** The flanges are connected. If SELECTIONPREVIEW (1.17.10) is 2 or 3, thickness faces of flanges are highlighted. Press the TAB key to select obscured faces.

Quad cursor menu

Select the planar thickness faces of two flanges, then choose **Connect Flanges** () in the **Sheet Metal** command group. Select the thickness faces (6.2514 on the next page) A junction is created (6.2515 on the following page)

Figure 6.2514

Command Options

No command options.

Related Commands

SmDelete (6.28.5) - removes a bend or a junction by restoring a hard edge between two flanges; removes a flange with all the bends adjacent to it. The adjacent flanges are extended up to a junction configuration with the flange being deleted. Removes miter by restoring geometry being cut by the feature. SmFlangeEdge (6.28.14) - creates one or more flanges to a sheet metal part by pulling one or more edges of an existing flange. SmFlangeRotate (6.28.15) - rotates a selected flange of a sheet metal part with automatic selection of the rotation axis depending on the design intent. SmSplit (6.28.30) - splits a flange along a line drawn on its face. SmJunctionCreate (6.28.21) - converts hard edges (sharp edges between flange faces) and bends into junctions. SmParametrize (6.28.23) - creates a consistent set of 3D constraints for a selected sheet metal part. SmReliefCreate (6.28.22) - makes proper corner and bend reliefs. Corner reliefs are built on corners which have three or more adjacent flanges. Bend reliefs are built on the start and end of a flange edge.

Figure 6.2516

6.28.13 SmFlangeContour

(6.2582 on page 5709) Creates a new flange from a closed contour and attaches it to an existing sheet metal part.

Accessing the Command

command bar: **smflangecontour** menu bar: **Sheet Metal | Create Flange from a Closed Contour** toolbar: **Sheet Metal | Create Flange from a Closed Contour** ribbon: **Sheet Metal | Flange from Closed Contour** Quad cursor menu: **Sheet Metal | Create Flange from Contour : SmFlangeContour Prompts you in the command bar: Select flange face(s) and a closed contour:: (Select at least single flange and planar closed contour to finish input.)** The command extrudes a flange from a contour and connects it with selected flanges via bends.

Related Commands

SmFlangeConnect (6.28.12) - closes gaps between two arbitrarily oriented flanges. SmFlangeEdge (6.28.14) - creates one or more flanges to a sheet metal part by pulling one or more edges of an existing flange. SmJunction-Create (6.28.21) - converts hard edges (sharp edges between flange faces) and bends into junctions. SmDelete (6.28.5) - removes a bend or a junction by restoring a hard edge between two flanges; removes a flange with all the bends adjacent to it. The adjacent flanges are extended up to a junction configuration with the flange being deleted. Removes miter by restoring geometry being cut by the feature. SmDissolve (6.28.7) - removes sheet metal data from the selected faces or entities.

Figure 6.2517

6.28.14 SmFlangeEdge

(6.2582 on page 5709) Creates one or more flanges to a sheet metal part by pulling one or more edges of an existing flange.

Accessing the Command

command bar: **smflangeedge** menu bar: **Sheet Metal | Create Edge Flange** toolbar: **Sheet Metal | Create Edge Flange** ribbon: **Sheet Metal | Modify | Create Edge Flange** Quad cursor menu: **Sheet Metal | Create Edge Flange : SmFlangeEdge Prompts you in the command bar.** Select edges on flanges: **(Select edges, then right click to proceed.)** Entities/subentities in set: 1 Position the end of the flange [Angle/Length/Radius/Taper angle/Width]: **(Specify a point in 3D space or type a value in the dynamic height and angle fields)**

Command Options

Option	Description
Dynamic dimensions	Define the height and angle of the flange by typing values in the dynamic height (1) and angle (2) entry fields: (6.2518 on page 5658) Enter a value in the height field, then press the TAB key to jump to the angle field. (6.2519 on page 5658) Type a value in the angle field, then do one of the following: • Press Enter twice to accept the current values. • Press the TAB key to enter a different value in the height field, then press Enter to accept the current values. • Keep pressing the TAB key to switch between the height and angle field to enter a different value, then press Enter to accept the current values. (6.2520 on page 5659)
Angle	Allows to first define the angle, then the height of the flange.
Length	Allows to first define the length, then the angle of the flange.
Radius	Allows to define the radius of the bend connected to the new flange.

Taper Angle(*)	Allows to create a flange with one or two tapered side faces. Prompts you: **Enter first taper angle [Back/Skip] <Skip>: - (Do one of the following:)** • Type a value in the taper angle entry field to define the taper angle for the first side face. • Select the **Skip** option to keep the first side face orthogonal. • Select the **Back** option to undo the current **Taper angle** procedure. **Enter second taper angle [Back/Skip] <Skip>: - (Do one of the following:)** • Type a value in the taper angle entry field to define the taper angle for the second side face. • Select the **Skip** option to keep the second side face orthogonal. • Select the **Back** option to undo the current **Taper angle** procedure. **Position the end of the flange [Angle/Length/Taper angle/Width]: - (Do one of the following:)** • Click a point or use the Dynamic Dimensions procedure to define the flange height and angle. • Choose the Width option to define a width different from the length of the selected edge. • Choose the **Taper angle** option again to define different taper angles.

Width(*)	By default the flange width equals the length of the selected edge. The Width option allows to define a different width. Prompts you: **Enter first offset [Back/Skip] <Skip>:** - **(Do one of the following:)** • Type a value in the dynamic field to define the offset from the start point of the edge. • Select the **Skip** option to keep the first side edge of the flange at the start point of the edge. • Select the **Back** option to undo the current **Width** procedure. **Enter second offset [Back/Skip] <Skip>: - (Do one of the following:)** • Type a value in the dynamic field to define the offset from the end point of the edge. • Select the **Skip** option to keep the second side edge of the flange at the end point of the edge. • Select the **Back** option to undo the current **Width** procedure. **Position the end of the flange [Angle/Length/Taper angle/Width]:** - **(Do one of the following:)** • Click a point or use the Dynamic Dimensions procedure to define the flange height and angle. • Choose the Taper angle option to define tapered side faces • Choose the **Width** option again to define different offsets.
Toggle connection(**)	Toggle connection helps to avoid material conflict when creating several flanges simultaneously: No connection (6.2521 on page 5659) Pull outside with connection (6.2522 on page 5659) Pull inside with connection (6.2523 on page 5660) Use Ctrl-key to cycle the options, then press Enter to accept the current flanges connection. If TIPS (1.15.2) = ON, the currently selected option is indicated in the Tips widget at the bottom of the screen.

(*) The **Taper Angle** and **Width** options are not available if multiple edges are selected. (**) The **Toggle connection** available when selected at least two neighbor edges.

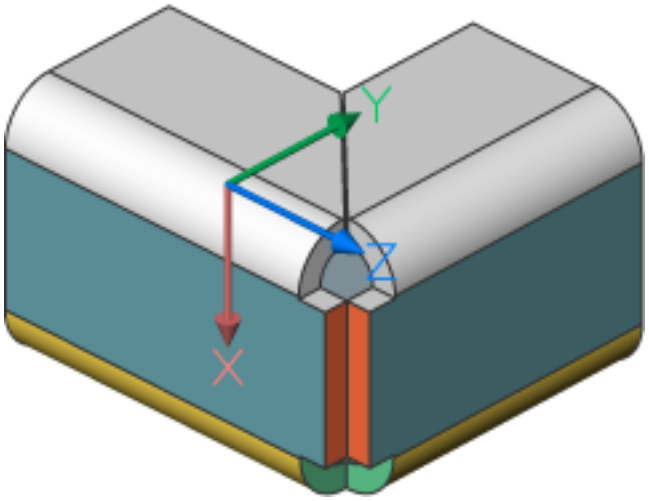

Figure 6.2524

6.28.15 SmFlangeRotate

(6.2582 on page 5709) Rotates a selected flange of a sheet metal part with automatic selection of the rotation axis depending on the design intent.

Accessing the Command

command bar: **smflangerotate** menu bar: **Sheet Metal | Rotate Flange** toolbar: **Sheet Metal | Rotate Flange** ribbon: **Sheet Metal | Edit | Rotate Flange** Quad cursor menu: **Sheet Metal | Rotate Flange : SmFlangeRotate Prompts you in the command bar:** Select a flange face to rotate: **(Select the face of a flange.)** A dynamic angle field displays the angle between the selected flange and the base flange. Press the TAB key to display the absolute rotation angle. **(Type a value in the dynamic angle field and press Enter to confirm.)**

Command Options

No options.

Related Commands

SmConvert (6.28.4) - automatically recognizes flanges, bends and lofted bends in a 3D solid. SmExtrude (6.28.9) - creates sheet metal part from a planar polyline by extruding it orthogonally to the plane of the polyline. SmFlangeConnect (6.28.12) - closes gaps between two arbitrarily oriented flanges. SmFlangeBend (6.28.11) - allows to bend an existing flange along a line, obeying k-factor for given bend radius. SmFlangeEdge (6.28.14) - creates one or more flanges to a sheet metal part by pulling one or more edges of an existing flange. SmFlip (6.28.25) - swaps sides of a selected flange so that reference faces are on the other geometric side of the flange.

Figure 6.2525

6.28.16 SmHemCreate

(6.2582 on page 5709) Creates one or more hem features on a sheet metal part by pulling one or more edges of an existing flange.

Accessing the Command

 or **Create open Hem** or **Create Teardrop Hem** or **Create Round Hem** toolbar: **Sheet Metal | Create closed Hem** or **Create open Hem** or **Create Teardrop Hem** or **Create Round Hem** ribbon: **Sheet Metal | Modify | Create closed Hem** or **Create open Hem** or **Create Teardrop Hem** or **Create Round Hem** Quad cursor menu: **Sheet Metal | Create closed Hem** or **Create open Hem** or **Create Teardrop Hem** or **Create Round Hem : SmHemCreate Prompts you in the command bar: Select edges on flanges to create closed hem or [open Hem/Teardrop/Round]: (Select edges, then right-click to proceed.)** Entities/subentities in set: 1 **Position the end of the closed hem [Length/Width/Toggle tapering]: (Specify a point in 3D space or type a value in the dynamic length field)**

Command Options

Command options vary upon your choice of hem type.

Option	Description
Dynamic dimensions	Define the length of the hem by typing values in the dynamic dimension fields: (6.2526 on page 5664)
Length	Input the length of the hem.
Width(*)	By default, the hem width is equal to the length of the selected edge. The Width option defines a different width. Prompts you: **Enter first offset [Back/Skip] <Skip>: - (Do one of the following:)** • Type a value in the dynamic field to define the offset distance from the start point of the edge. • Select the **Skip** option to keep the first side edge of the flange at the start point of the edge. • Select the **Back** option to undo the current **Width** procedure. **Enter second offset [Back/Skip] <Skip>: - (Do one of the following:)** • Type a value in the dynamic dymention field to define the offset from the endpoint of the edge. • Select the **Skip** option to keep the second side edge of the flange at the endpoint of the edge. • Select the **Back** option to undo the current **Width** procedure.
Toggle tapering	Toggle how a new hem fits the border of an existing flange. Two variants are possible: (6.2527 on page 5664)(6.2528 on page 5665) The option only works if the edges of a flange at the corner are not at 90°.

Command options for Closed hem (*) The **Width** option is not available if multiple edges are selected.

Command options for Open hem and Teardrop Options are the same as for Closed hem. A Radius option is added

Dynamic dimensions	The same as for Closed hem.
Length	The same as for Closed hem.
Width	The same as for Closed hem.
Toggle tapering	The same as for Closed hem.
Radius	Define the radius of the hem.

Option	Description
Width	The same as for Closed hem.
Radius	The same as for Teardrop hem.

Command options for Round

Figure 6.2526

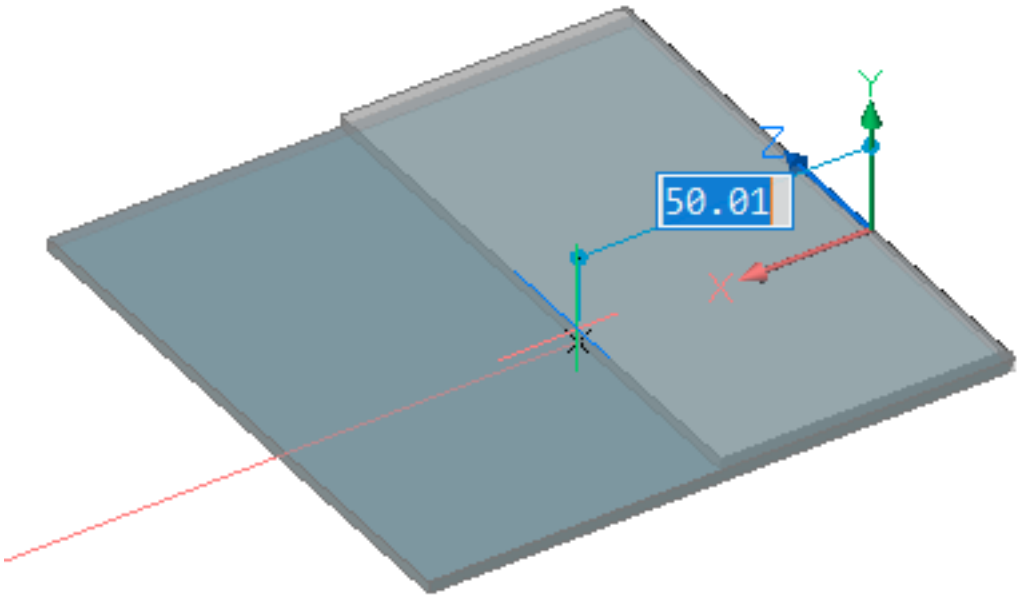

Figure 6.2527

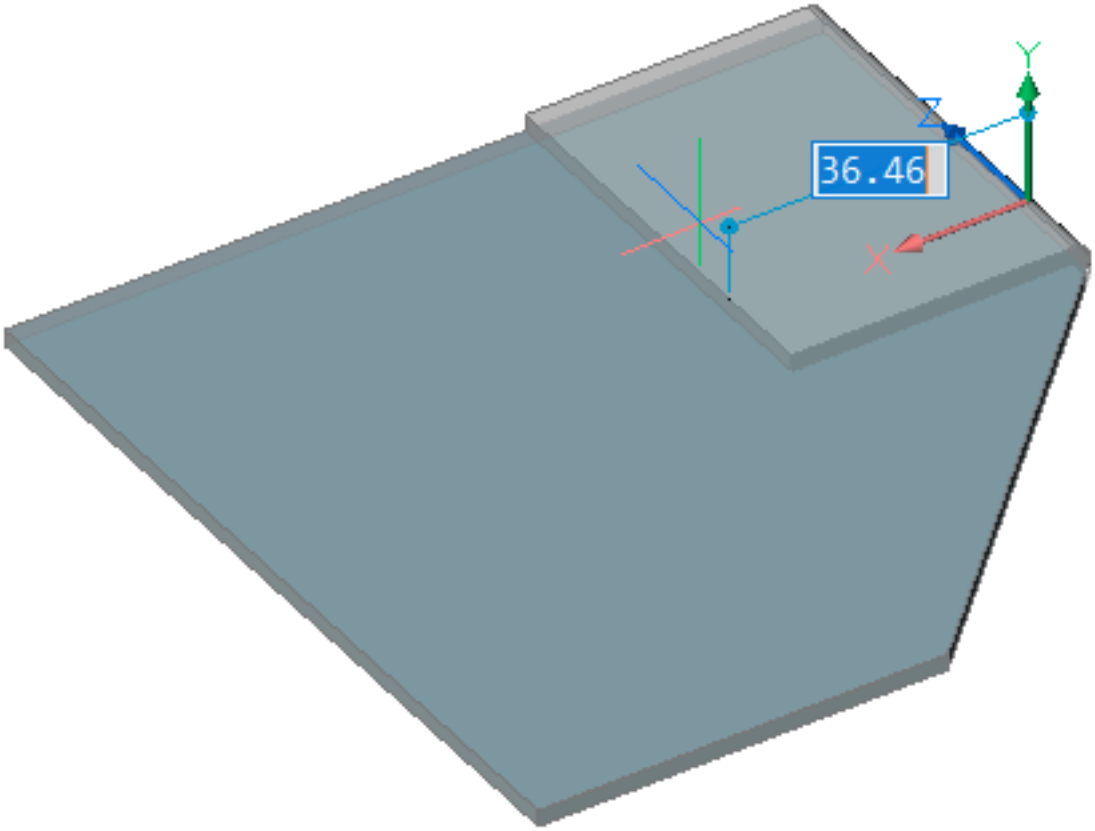

Figure 6.2528

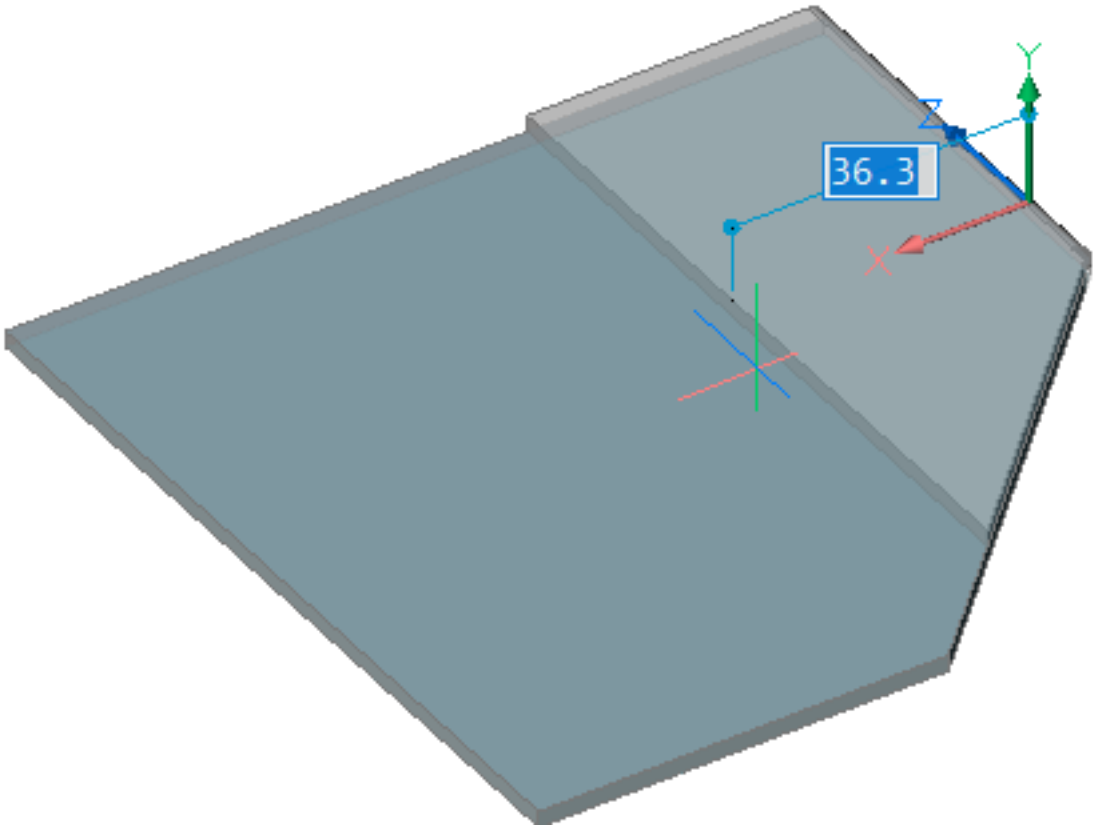

Figure 6.2529

6.28.17 SmForm

(6.2582 on page 5709) Converts a selected set of faces to a form feature or explodes form feature into flanges and bends. In **Create** mode the command allows to define a form feature by selecting the faces manually, which can be necessary if automatic recognition by SmConvert (6.28.4) does not produce the expected result. E.g.: if you insert and dissolve the **Cardguide** form feature from the library, SmConvert (6.28.4) recognizes two forms features, because their geometry is separated. Manual selection of the form feature faces when executing SmForm solves the problem. Form features created by SmForm have the same set of basic operations as if they were created by BmInsert (6.8.16) or recognized by SmConvert (6.28.4). In **Explode** mode the command dissolves the form feature and tries to recognize its geometry as flanges and bends. This can be helpful if SmConvert (6.28.4) incorrectly recognizes the design as a form feature.

Accessing the Command

 command bar: **smform** menu bar: Sheet Metal | Form | Define form Faces toolbar: Sheet Metal | **Define form Faces>** ribbon: **Sheet Metal | Modify | Define Form : SmForm Prompts you in the command bar:** Select form feature faces [Create new form feature/Explode form feature] <Create new form feature>: **(Select faces or choose an option to switch the command mode to Create or Explode.)**

Command Options

Option	Description
Create new form feature	Sets the command in **Create** mode, which creates new form features. Prompts you to select faces which do not belong to any existing feature.
Explode form feature	Sets the command in **Explode** mode, which explodes existing form features into flanges and bends. Prompts you to select faces of existing form features. At least one face of each form feature to be exploded must be selected.

Procedures

Working with form features (3.9.25)

Related Commands

BmInsert (6.8.16) - inserts an existing mechanical component or sheet metal form feature into the current drawing. SmConvert (6.28.4) - automatically recognizes flanges and bends in a 3D solid. SmDelete (6.28.5) - removes a bend or a junction by restoring a hard edge between two flanges; removes a flange with all the bends adjacent to it. The adjacent flanges are extended up to a junction configuration with the flange being deleted. Removes miter by restoring geometry being cut by the feature. SmDissolve (6.28.7) - removes sheet metal data from the selected features.

6.28.21 SmJunctionCreate

(6.2582 on page 5709) SmJunctionCreate creates a junction feature on hard edges (sharp edges between flange faces) and bends or curved hard edges between two bends (or lofts).

Accessing the Command

command bar: **smjunctioncreate** menu bar: **Sheet Metal | Create Junction** toolbar: **Sheet Metal | Create Junction** ribbon: **Sheet Metal | Modify | Create Junction** Quad cursor menu: **Sheet Metal | Create Junction : SmJunctionCreate Prompts you in the command bar:** Select hard edges or bends or flanges or 3D solids [Entire model] <Entire model>: **(Select flanges, hard edges, bends or solids. You can also select "curved" edges between flanges and bends; between flanges and lofted bends; between two bends, or between two lofts.)** Entities in set: 1 Select hard edges or bends or flanges or 3D solids [Entire model] <Entire model>: **(Select more items or right click.)**

Command Options

Option	Description
Entire model	Analyzes the entire model to detect hard edges.

Command Settings

===ERROR WITH DOWNLOADED IMAGE=== The "Heal coincident junction" setting controls how BricsCAD recognizes junction designs with coincident faces and how they are converted to regular junctions.

Related Commands

SmBendCreate (6.28.3) - converts junctions and hard edges (sharp edges between flange faces) into bends. SmDelete (6.28.5) - removes a bend or a junction by restoring a hard edge between two flanges: removes a flange with all the bends adjacent to it. The adjacent flanges are extended up to a junction configuration and the flange is deleted. Removes miter by restoring the geometry cutaway by a feature. SmDissolve (6.28.7) - removes sheet metal data from the selected faces or entities. SmFlangeConnect (6.28.12) - closes gaps between two arbitrarily oriented flanges. SmImprint (6.28.18) - splits thickness faces of sheet metal parts with imprinted edges, according to adjacent flanges and bends. SmJunctionSwitch (6.28.19) - changes symmetrical junction features with overlapping faces. SmReliefCreate (6.28.22) - makes proper corner and bend reliefs. Corner reliefs are built on corners with three, or more, adjacent flanges. Bend reliefs are built on the start and end of a flange edge.

Figure 6.2544

6.28.22 SmReliefCreate

(6.2582 on page 5709) Makes proper corner and bend reliefs. Corner reliefs are built on corners which have three or more adjacent flanges. Bend reliefs are built at the start and end of a flange edge. Command supports the creation of reliefs on wrong bends. The command automatically decides whether a relief has to be created for given bend. The size is either automatically chosen by default from the Mechanical Browser for Sheet Metal (3.9.6) in the drawing or can be entered by user. In order to force the creation of a bend relief for the given bend, the user has to select the face of desired bend. In this case a bend relief will be created, even if the command decides a bend relief is not needed (i.e. it detects there are no clashes or stretches of the material).

Accessing the Command

 command bar: **smreliefcreate** menu bar: **Sheet Metal | Create Relief** toolbar: **Sheet Metal | Create Relief** ribbon: **Sheet Metal | Modify | Create Relief** Quad cursor menu: **Sheet Metal | Create Relief : SmReliefCreate Prompts you in the command bar:** Select a hard edge, bend face, flange face or 3D solid [Entire model]: <Entire model>: **(Select an item.)** Enter relief size by bend radius ratio or [force Bend reliefs/Auto] <Auto>: **(Type a value or choose an option.)**

Command Options

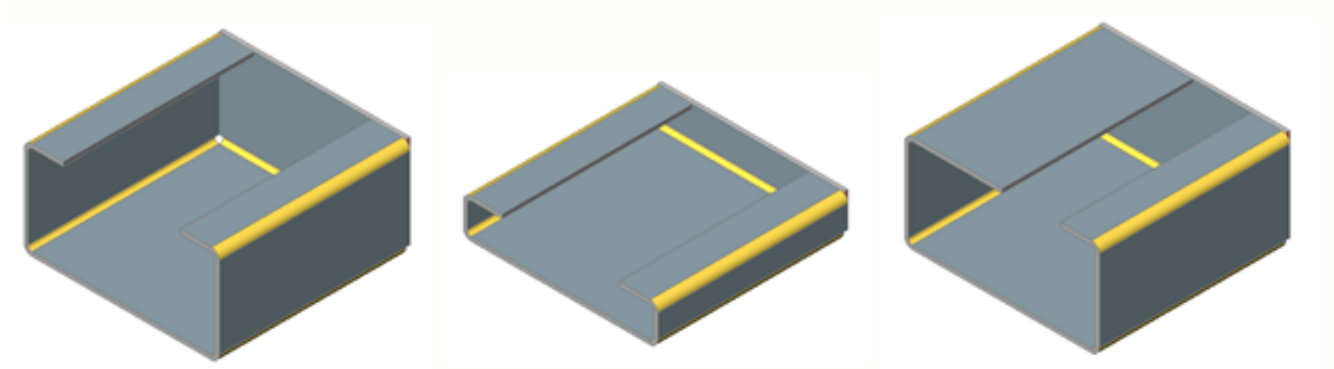
Option	Description
Entire model	Creates reliefs on all hard edges, bends, and corners in the entire model.
Force bend reliefs	**Force bend reliefs [ON/OFF/Back] <Back>:** • **ON**: Forces bend relief creation on bends. Bend reliefs will be created on any bend that does not have orthogonal side faces. • **OFF**: Bend reliefs on bends will be created only when a torn edge is found. • **Back**: Returns to the default command prompt
Auto	The command automatically detects bend radii and adjusts the relief size accordingly.

Related Commands

SmBendCreate (6.28.3) - converts hard edges (sharp edges between flange faces) and junctions into bends. SmConvert (6.28.4) - automatically recognizes flanges, bends and lofted bends in a 3D solid. SmDelete (6.28.5) - removes a bend or a junction by restoring a hard edge between two flanges; removes a flange with all the bends adjacent to it. The adjacent flanges are extended up to a junction configuration with the flange being deleted. Removes miter by restoring geometry being cut by the feature. SmDissolve (6.28.7) - removes sheet metal data from the selected faces or entities. SmFlangeEdge (6.28.14) - creates one or more flanges to a sheet metal part by pulling one or more edges of an existing flange. SmJunctionCreate (6.28.21) - converts hard edges (sharp edges between flange faces) and bends into junctions. SmReliefSwitch (6.28.24) - converts corner reliefs to circular, rectangular or V-type reliefs. Converts bend reliefs to smooth, round, rip or rectangular bend reliefs. Allows to change the parameters of existing corner reliefs. SmSplit (6.28.30) - splits a flange along a line drawn on its face.

Figure 6.2545

Figure 6.2546



6.28.23 SmParametrize

(6.2582 on page 5709) SmParametrize creates a consistent set of 3D constraints for a selected sheet metal part and recognizes a rectangular array of holes on flanges. SmParametrize takes into account implicit constraints from sheet metal features and ensures that the constraint system is not overdefined. **Note** for best results, the sheet metal part should have a complete set of features, including flanges, bends, junctions, and bend & corner reliefs. You can obtain a series of similar sheet metal parts with different dimensions if you edit constraints: (6.2546) Example of a fully parametrized sheet metal part (left) with different sets of parameters applied (center and right):

Access the Command

===ERROR WITH DOWNLOADED IMAGE=== command bar: **smparametrize** menu bar: **Sheet Metal | Parametrize** toolbar: **Sheet Metal | Parametrize** ribbon: **Sheet Metal | 3D Constraints | Parametrize** Quad cursor menu: **Sheet Metal | Parametrize : SmParametrize Prompts you in the command bar:** Select 3D solids to parametrize or [Entire model] <Entire model>: **(Select a sheet metal part or press Enter to parametrize all sheet metal parts in the drawing.)** Created 6 distance constraints Created 3 fix constraints Created 3 coincident constraints Created 0 tangent constraints Created 0 rigid set constraints Total: 12 constraints and 0 array(s) created You can edit the constraints in the Mechanical Browser (3.3.2) panel.

Command Settings

===ERROR WITH DOWNLOADED IMAGE=== Hole parametrization.

- Parametrize holes: Toggles creation of rigid set constraints for internal holes on flanges.
- Convert holes to an array: Toggles a check for possible groups of holes and converts to a parametric, rectangular array.

Related Commands

MechanicalBrowserOpen (6.8.32) - opens the Mechanical Browser panel. SmConvert (6.28.4) - automatically recognizes flanges, bends and lofted bends in a 3D solid. SmExtrude (6.28.9) - extrudes a planar polyline orthogonally to create a sheet metal part. SmFlangeBase (6.28.10) - creates a base (initial) flange, of a sheet metal part, from a closed 2D entity. SmFlangeConnect (6.28.12) - closes gaps between two arbitrarily oriented flanges. SmFlangeEdge (6.28.14) - pulls one or more edges of an existing flange to create one or more flanges on a sheet metal part. SmFlip (6.28.25) - Swaps the sides of a selected flange so that the reference faces are on the other geometric side of the flange. SmReliefCreate (6.28.22) - creates proper corner and bend reliefs.

Figure 6.2547

6.28.24 SmReliefSwitch

(6.2582 on page 5709) Converts corner reliefs to circular, rectangular or V-type reliefs. Converts bend reliefs to smooth, round, rip or rectangular bend reliefs. Allows to change the parameters of existing corner reliefs.

Accessing the Command

===ERROR WITH DOWNLOADED IMAGE===

command bar: **smreliefswitch** menu bar: **Sheet Metal | Relief | Switch to ...** toolbar: **Sheet Metal | Relief | Switch to ...** ribbon: **Sheet Metal | Modify | Switch to ...** Quad cursor menu: **Sheet Metal | Switch to ... : SmReliefSwitch Prompts you in the command bar:** Select faces, 3d solids to switch reliefs to V-type [RECtangular/CIrcular/V-type/SMooth/RIp/ROund/relief EXtension/Entire model] <Entire model>: **(Select a relief face, bend face, flange face or a 3D Solid or press Enter to apply the V-type relief to the entire model; or choose an option.)** Entities in set: 1 Select faces, 3d solids to switch reliefs to V-type [RECtangular/CIrcular/V-type/SMooth/RIp/ROund/relief EXtension/Entire model] <Entire model>: **(Select a relief face, bend face, flange face or a 3D Solid or choose an option or press Enter.)**

Command Options

Option	Description
Rectangular (Corner)	Switches the selected corner reliefs to rectangular. (6.2551 on page 5685) Prompts you: **Select faces, 3d solids to switch reliefs to V-type [RECtangular/CIrcular/V-type/SMooth/RIp/ROund/relief EXtension/Entire model] <Entire model>: - (Do the following:)** • (option) Choose relief extension: You are prompted: **Enter the extension [Auto] <Auto>: - (Do one of the following:)** • Type a value • Select Auto to keep the current extension. • Select the reliefs to be switched or press Enter to select the entire model.
Rectangular (Bend)	Switches the selected bend reliefs to rectangular: (6.2552 on page 5686)

Circular 

Switches the selected corner reliefs to circular. Only corner reliefs which are related to exactly two bends can be switched to circular reliefs. (6.2553 on page 5686) Prompts you: **Select faces, 3d solids to switch reliefs to circular [RECtangular/CIrcular/V-type/SMooth/RIp/ROund/relief EXtension/relief Diameter/REference point/Entire model] <Entire model>: - (Do the following:)**

- (option) Choose relief Extension :sets the relief extension. Prompts you: **Enter the extension [Auto] <Auto>: - (Type a value or select Auto to keep the current extension of the selected reliefs.)**
- (option) Choose relief Diameter :sets the relief diameter. Prompts you: **Enter the desired diameter [Auto] <Auto>: - (Type a value or select Auto to use the minimal diameter.)**
- (option) Choose Reference point :sets the reference for the relief. Prompts you: **Select the reference of the relief [Middle/Corner/from Global settings] <from Global settings>:**
  - Middle : the intersection of the bend lines.
  - Corner : the circular arc through the base points of the corresponding rectangular reliefs.
  - From global settings : Take value from global sheet metal settings of document.
- Select the reliefs to be switched or press Enter to select the entire model.

V-type 

Switches the selected corner reliefs to V-type. Only corner reliefs which are related to exactly two bends can be switched to v-type. (6.2554 on page 5686) **Select faces, 3d solids to switch reliefs to V-type [RECtangular/CIrcular/V-type/SMooth/RIp/ROund/relief EXtension/Entire model] <Entire model>: - (Do the following:)**

- (option) Choose relief extension: You are prompted: **Enter the extension [Auto] <Auto>: - (Do one of the following:)**
- Type a value
- Select Auto to keep the current extension.
- Select the reliefs to be switched or press Enter to select the entire model.

Smooth 

Switches the selected bend reliefs to smooth. (6.2555 on page 5686) Prompts you: **Select faces, 3d solids to switch reliefs to smooth [RECtangular/CIrcular/V-type/SMooth/RIp/ROund/Entire model] <Entire model>: - (Select the bend reliefs to be switched or press Enter to select the entire model.) Smooth** bend relief can be applied only if the current relief type is Rectangular. If not, BricsCAD responds: Unable to build relief geometry for this configuration.

Rip 	Switches the selected bend reliefs to rip. (6.2556 on page 5687) **Select faces, 3d solids to switch reliefs to rip [RECtangular/CIrcular/V-type/SMooth/RIp/ROund/Entire model] <Entire model>: - (Select the bend reliefs to be switched or press Enter to select the entire model.) Rip** bend relief can be applied only if the current relief type is Rectangular. If not, BricsCAD responds: Unable to build relief geometry for this configuration.
Round 	Switches the selected bend reliefs to round. (6.2557 on page 5687) **Select face(s), 3d solid(s) to switch relief(s) to round [RECtangular/CIrcular/V-type/SMooth/RIp/ROund/Entire model] <Entire model>: - (Select the bend reliefs to be switched or press Enter to select the entire model.) Round** bend relief can be applied only if the current relief type is Rectangular. If not, BricsCAD responds: Unable to build relief geometry for this configuration.
Entire Model	All corner or bend reliefs in all sheet metal parts in the model will be switched to the specified type using the specified parameters. If this option is chosen as the response to the initial prompt, all corner reliefs switch to V-type.

Relief extension illustration:

rectangular and v-type reliefs: extension (6.2548 on the following page) • circular reliefs: minimal extension, diameter of the relief in the unfolded representation, reference to determine the center of the relief in the unfolded representation (6.2549 on the next page) • V-type reliefs: extension (6.2550 on page 5685)

Procedures

Switching relief type (3.9.22)

Related Commands

SmDelete (6.28.5) - removes a bend or a junction by restoring a hard edge between two flanges; removes a flange with all the bends adjacent to it. The adjacent flanges are extended up to a junction configuration with the flange being deleted. Removes miter by restoring geometry being cut by the feature. SmFlangeEdge (6.28.14) - creates one or more flanges to a sheet metal part by pulling one or more edges of an existing flange. SmJunctionSwitch (6.28.19) - allows changing a symmetrical junction feature to one with overlapping faces. SmReliefCreate (6.28.22) - makes proper corner and bend reliefs. Corner reliefs are built on corners which have three or more adjacent flanges. Bend reliefs are built at the start and end of a flange edge.

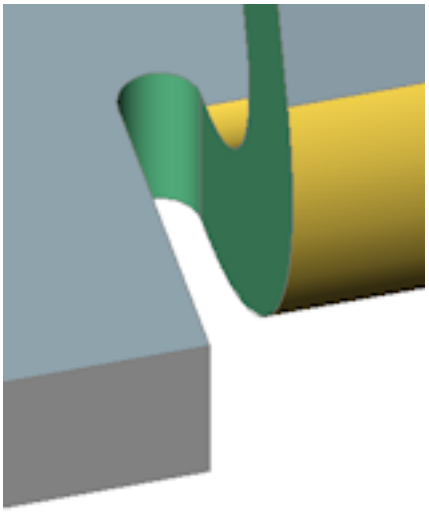

Figure 6.2558

6.28.25 SmFlip

(6.2582 on page 5709) Swaps sides of a selected flange so that reference faces are on the other geometric side of the flange. Optionally shifts the flange over the thickness of the sheet metal part.

Accessing the Command

command bar: **smflip** menu bar: Sheet Metal | Flange | **Flip flange** toolbar: **Flange | Flip Flange Feature** ribbon: **Sheet Metal | Modify | Flip Flange** Quad cursor menu: **Sheet Metal | Flip Flange Feature : SmFlip Prompts you in the command bar:** Select solids or flange faces to flip flange(s) [Flip reference side only/Entire model] <Entire model>: **(Select a solid body or a flange faces or press Enter to flip sides for all flanges.)** Entities in set: 1 Select solids or flange faces to flip flange(s) [Flip reference side only/Entire model]: **(Select more faces or press Enter.)**

Command Options

Option	Description
Flip reference side only	Turns OFF the shift of flanges by thickness, in this mode reference sides for selected flanges are just swapped. The command prompt now reads: **Select solids or flange faces to flip reference side of flange(s) [Flip flange/Entire model] <Entire model>:**
Entire Model	Applies flip operation to all flanges in the drawing.

Changing reference faces with shift by thickness might be necessary if SmExtrude (6.28.9) creates flanges which collide with another part:

(6.2559 on the facing page) Collisions between a solid and sheet metal flanges	(6.2560 on page 5690) Collisions solved after applying SmFlip.

Related Commands

SmConvert (6.28.4) - automatically recognizes flanges and bends in a 3D solid. SmFlangeBase (6.28.10) - creates a base (initial) flange of a sheet metal part from a closed planar profile. SmFlangeEdge (6.28.14) - creates one or more flanges to a sheet metal part by pulling one or more edges of an existing flange. SmParametrize (6.28.23) - creates a consistent set of 3D constraints for a selected sheet metal part.

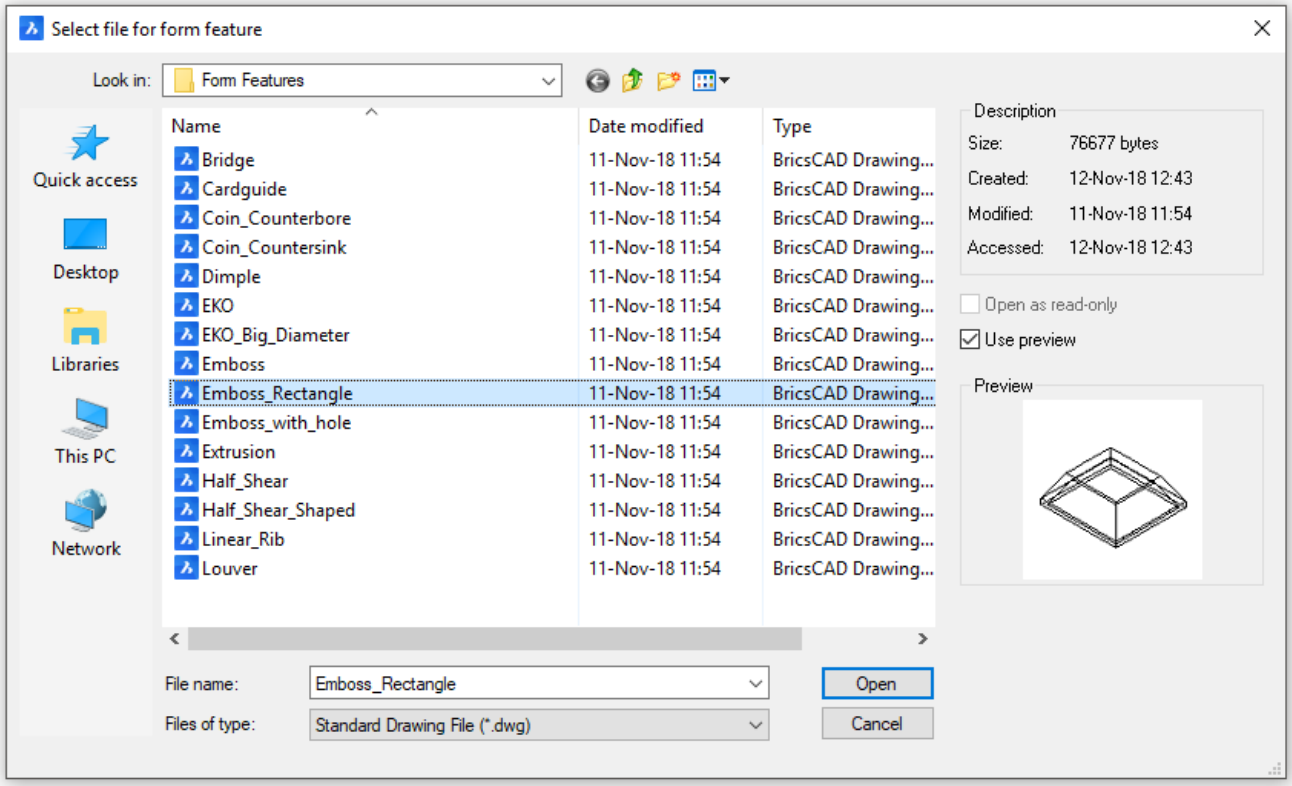
Figure 6.2562



6.28.26 SmReplace

(6.2582 on page 5709) Replaces form features (including recognized ones) in sheet metal parts with form features from the built-in or user library. Accessing the Command  command bar: **smreplace** menu bar: **SheetMetal | Form | Replace Form Features** toolbar: **Sheet Metal | Replace Form Features** ribbon: **Sheet Metal | Modify | Replace Form Features** Quad cursor menu: **Sheet Metal | Replace Form Features : SmReplace Prompts you in the command bar:** Select several entities/subentities: **(Select a form feature.)** Entities in set: 1 Select several entities/subentities: **(Select more form features or press Enter to stop selecting.)** A dialog box displays: (6.2562) **(Select a form feature, then press the Open button.) Prompts you:** Replace all similar form features [Yes/No/parametersMode] <Yes>: **(Press Enter to replace all similar form features in the model or select an option.)**

Command Options

Option	Description
Yes	Replaces all form features of the same type as selected feature(s).
No	Repaces the selected form feature(s) only.

Parameters Mode	Allows to control whether parameter values are inherited from the form features being replaced or not. Prompts you: **Select mode of replacement [component Defaults/Inherit from replaced feature/Edit parameters] <Inherit from replaced feature>:** • Component Defaults: Parameter values are copied anyway. • Inherit from Replaced Feature: If possible parameter values are copied from the form feature(s) being replaced. • Edit parameters: Allows to edit all parameters. Prompts you: **Enter parameter name or press Enter to finish** - **(Type a parameter name.)** **Enter Expression** - **(Enter an expression.)**

Related Commands

BmInsert (6.8.16) - inserts an existing mechanical component or sheet metal form feature into the current drawing.

Figure 6.2563

6.28.27 SmRibCreate

(6.2582 on page 5709) Creates associative Rib form features on sheet metal parts from 2D profiles. The feature is updated automatically when its defining profile is changed. The difference with linear rib features inserted from the library by BmInsert (6.8.16) is that rib features created by **SmRibCreate** can have an arbitrary trajectory.

Accessing the Command

command bar: **smribcreate** menu bar: **Sheet Metal | Form | Create Rib Feature** toolbar: **Sheet Metal | Create Rib Feature** ribbon: **Sheet Metal | Modify | Create Rib Feature : SmRibCreate Prompts you in the command bar:** Select flange face: **(Select a flange face.)** Select control curve [Profile radius/Round radius]: (Select a curve entity or choose an option.) Entities in set: 1 Select curve or [Profile radius/Round radius]: **(Select more curve entities or press Enter.)**

Command Options

Option	Description
Select a curve	Select one or more 2D entities: lines, polylines, circles, arcs, ellipses, elliptical arcs, and splines are accepted. The 2D curves can be open or closed but cannot intersect itself or other form features.
Profile Radius	Sets the radius of the rib profile (blue face in the image below). The initial value of the Profile Radius is taken from the Mechanical Browser for Sheet Metal (3.9.6). (6.2564)
Round Radius	Sets the radius of the smoothing fillets (green faces in the image below). The initial value of the Round Radius is taken from the Mechanical Browser for Sheet Metal (3.9.6). (6.2565 on the following page)

Related Commands

BmInsert (6.8.16) - inserts an existing mechanical component or sheet metal form feature into the current drawing. SmConvert (6.28.4) - automatically recognizes flanges and bends in a 3D solid.

Figure 6.2564

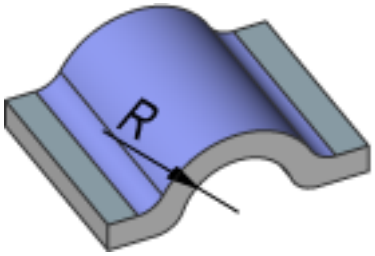


Figure 6.2565

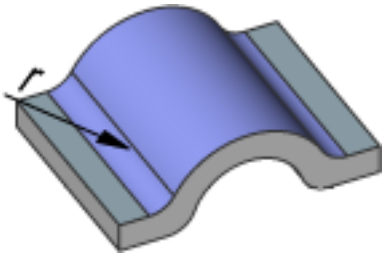

Figure 6.2566

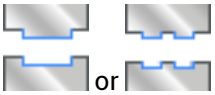
6.28.28 SmTabCreate

(6.2582 on page 5709) Creates tab features on sheet metal parts. There are two main workflows:

- Convert a junction into tabbed junction (in either Single tab or Array tab mode)
- Convert a curved hard edge into a curved tabbed connection of a flange and a bend (or lofted bend)

Accessing the Command



or command bar: **smtabcreate** menu bar: **Sheet Metal | Tab | Create single Tab** or **Create array Tab** toolbar: **Sheet Metal | Create single Tab** or **Create array Tab** ribbon: **Sheet Metal | Create single Tab** or **Create array Tab** Quad cursor menu: **Sheet Metal | Create single tab feature** or **Create array tab feature : SmTabCreate Prompts you in the command bar (Single tab mode):** Select junction to create single tab or [Array tab/selection options (?)]: **(Select junction face, then right click.)** Entities/subentities in set: 1 Enter the length of the tab or [select the Central point]: **(Specify a point or type a value in the dynamic length field.) Prompts you in the command bar (Array tab mode):** Select junction or curved hard edge to create array tab or [Single tab/selection options (?)]: **(Select junction face or a curved hard edge, then right click or choose an option.)** Entities/subentities in set: 1 Accept tab configuration or [Flip tab/slot Number/Distance/Length/Round radius/CHamfer distance/Accept] <Accept>**: (Right click to accept or choose an option.)**

Command Options

Option	Description
Length	Defines the length of the tab. The tab is placed symmetrically with respect to the center point. To define the length of the tab, type a value in the dynamic length field: (6.2567 on the following page)
Central point	Positions the tab along the junction. The dynamic dimension fields show the distance to the end points of the junction. Type a value in the dynamic length fields, then press Enter or right click. Press the TAB key to switch between the dynamic fields: (6.2568 on page 5697)

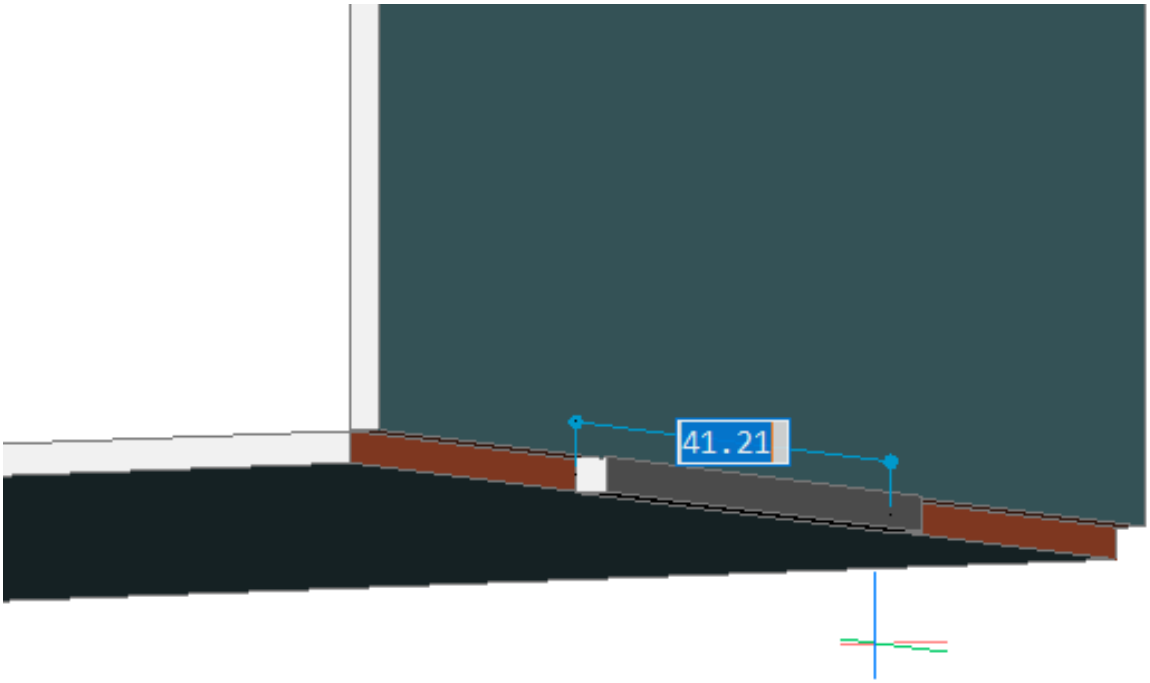
Single tab options

Option	Description
Flip Tab	Allows to to toggle between two possible configurations when the tab feature is not symmetrical with respect to the junction sides.
Slot Number	Defines the number of slots.
Distance	Defines the distance between the tabs.
Length	Defines the length of a tab.
Round Radius	Creates a filleted tab with a given fillet radius.
Chamfer Distance	Creates a chamfered tab with a given chamfer parameter.

Array tab options when a junction is selected

Array tab options when a curved hard edge is selected	No command options.

Figure 6.2567



Related Commands

SmJunctionCreate (6.28.21) - converts bends and hard edges (sharp edges between flange faces) into junctions. SmDelete (6.28.5) - removes a bend or a junction by restoring a hard edge between two flanges - removes a flange and all adjacent bends. The adjacent flanges are extended up to a junction configuration and the flange is deleted. Restores geometry removed by miter. SmDissolve (6.28.7) - removes sheet metal data from the selected faces or entities.

Figure 6.2568

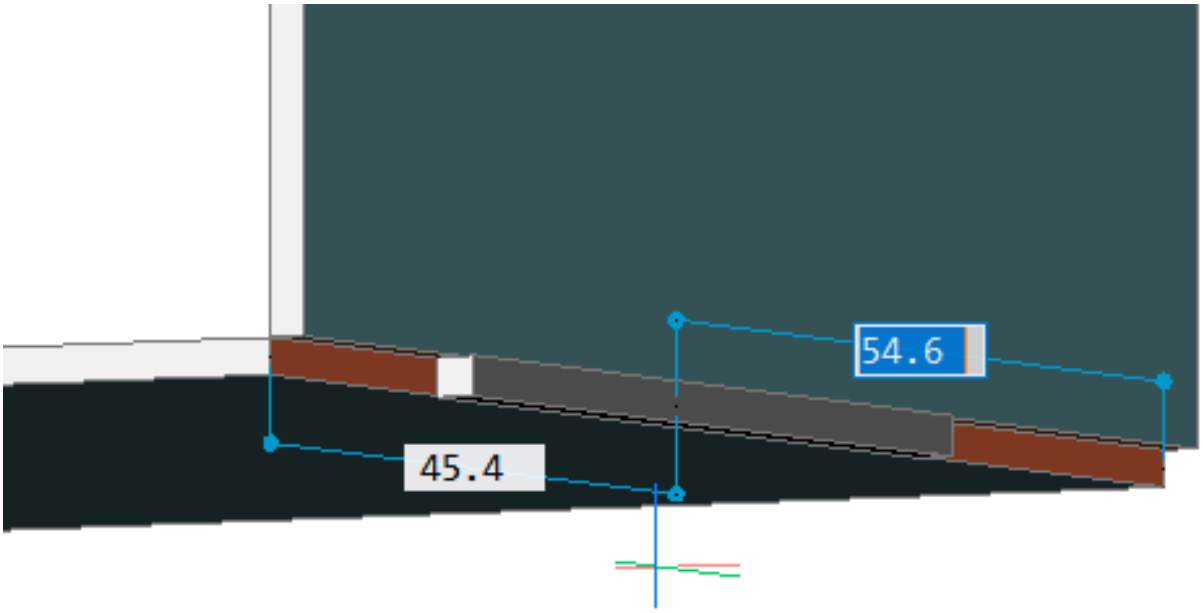


Figure 6.2569

6.28.29 SmRepair

(6.2582 on page 5709) SmRepair restores the 3D solid model of a sheet metal part by thickening one of its sides: all thickness faces become perpendicular to flange faces. Fixes problems specific to parts with lofted bend features: merges adjacent bends and provides tangential connections with flanges. It also converts incorrect bends to regular bends. If a single, incorrect bend is selected, it will be repaired. If a 3D solid is selected, then all incorrect bends will be converted to regular bends.

Access the Command

command bar: **smrepair** menu bar: **Sheet Metal | Repair Sheet Metal** toolbar: **Sheet Metal | Repair Sheet Metal** ribbon: **Sheet Metal | Heal | Repair Sheet Metal** Quad cursor menu: **Sheet Metal | Repair Sheet Metal : SmRepair Prompts you in the command bar:** Select flange face or lofted bend face to repair or [switch on Local repairing/Scan for lost details]: Switch on Local repairing: Select one wrong bend face, thickness faces, flange faces or side edges to repair or [switch on Global repairing]: Scan for lost details: Enter scan tolerance <0.01>: **(Press Enter or specify tolerance value.)** A body with thickness faces perpendicular to the selected face and without adjacent lofted bends will be created. Notice that the size and position of the opening on the selected face is preserved and the size and position of the opening on the opposite face is adjusted. **Global repair** (6.2570 on page 5700) (6.2571 on page 5700) before after **Local repair (flange)** (6.2572 on page 5701) (6.2573 on page 5701) before (flange face is selected) after **Local repair (incorrect bend)** (6.2574 on page 5702) (6.2575 on page 5702) before (incorrect bend face is selected) after

Command Options

Option	Description
Scan for lost details	Searches and retains model parts that remain after repair as separated bodies. Prompts you: **Enter scan tolerance <0.01>:** - **(Type a value or press enter to accept the default value.)** Scan tolerance: The fraction of the initial model volume, will be ignored and only larger bodies will be retained. E.g. if the scan tolerance = 0.25, only parts with a volume that is larger than 25% of the initial body will be retained. (6.2576 on page 5702) From left to right: • Initial model with an unrecognized form feature. • Model after SmRepair without scanning for lost details: the circular feature is removed. • Model after SmRepair with scan. Two bodies are created: a horizontal flange with a hole and a separate body (highlighted in green color). Bodies can be unified with the **Union** command if required.

Settings	Merge lofted bends: ===ERROR WITH DOWNLOADED IMAGE=== If switched on, adjacent lofted bends with tangential connections will be merged to a single, lofted bend. (6.2577 on page 5703) From left to right: • Initial model with two lofted bend features • Model after SmRepair without lofted bend repair: the hole is perpendicular to the features' faces. • Model after SmRepair with lofted bend repair: the two lofted bend features have been united to a single bend.

Procedures

To repair a sheet metal body (3.9.28)

Related Commands

SmConvert (6.28.4) - automatically recognizes flanges, bends and lofted bends in a 3D solid. SmDelete (6.28.5) - restores a hard edge between two flanges to remove a bend or a junction: removes a flange with all the bends adjacent to it. The adjacent flanges are extended up to a junction configuration and the flange is deleted. Restores geometry removed by a miter. SmDissolve (6.28.7) - removes sheet metal data from the selected faces or entities.

6.28.30 SmSplit

(6.2582 on page 5709) SmSplit splits a flange along a polyline drawn along a face. It splits lofted bends along the line on the ruled surface.

Accessing the Command

 **Split**  **Smart Split**  **Smart Split Propagate** command bar: **smsplit** menu bar: **Sheet Metal | Split | Split**, **Smart Split**, and **Smart Split Propagate** toolbar: **Sheet Metal | Split**, **Smart Split**, and **Smart Split Propagate** ribbon: **Sheet Metal | Modify | Split**, **Smart Split**, and **Smart Split Propagate** Quad cursor menu: **Sheet Metal | Split**, **Smart Split**, and **Smart Split Propagate : SmSplit Prompts you in the command bar:** Select lines or edges to split the flange or [SMart split/draw a New line] <draw a New line>: **(Select a polyline or edge on the flange or choose an option. Press Enter to accept the current selection.)** Make split [Center/Left/Right/Accept] <Accept>: **(Choose an option or repeatedly hit the Ctrl-key to cycle the options, then press Enter to accept the current split.)**

NOTE	If TIPS (1.15.2) = ON, the currently selected option is indicated in the Tips widget at the bottom of the screen.

Command Options

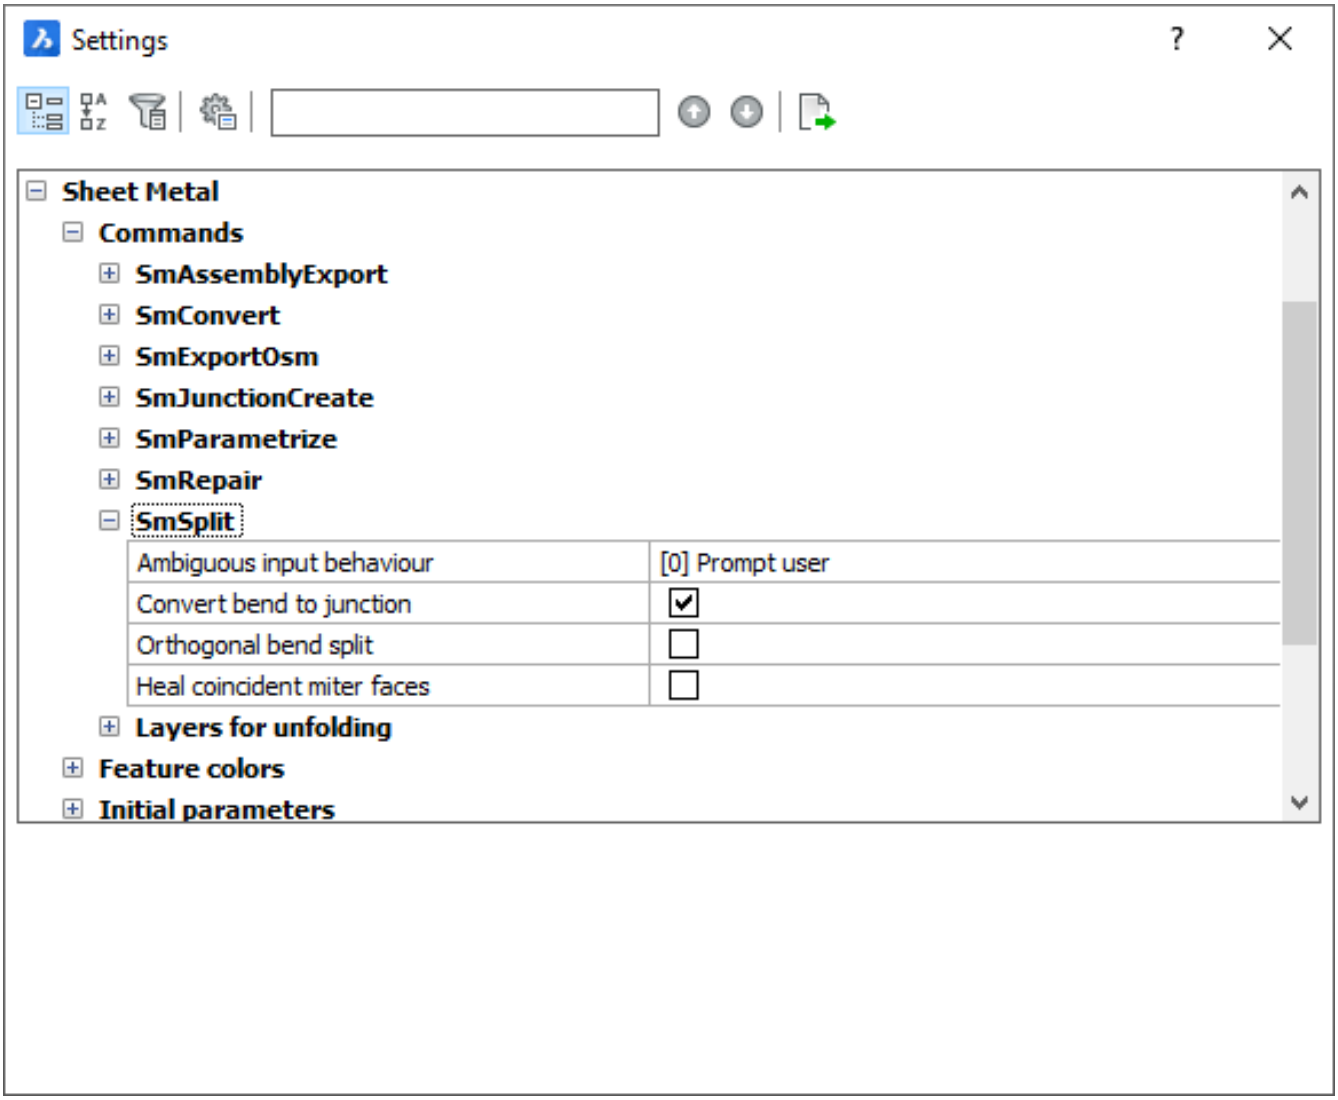
Option	Description
Smart split	Gives the option to split a flange at a specified point; prompts you: **Select point on flange or lofted bend border for smart split or [Propagate] <Propagate>: - (Select a point on the flange or lofted bend border or choose an option)** • **Propagate -** automatically suggests multiple splits of a similar type; Prompts you: **Choose next action [Apply] <Apply>: - Press Enter to apply the selected suggestions.** Applying all xx visible suggestions. : Selected suggestion. Click to switch to not selected. : Not selected suggestion. Click to switch to selected.
New Line	Gives the option to draw a line on a selected flange. Prompts you: **Start point of the line: - (Specify the start point of the line.) End point of the line: - (Specify the end point of the line.)**

Command Settings

(6.2579 on the facing page)

- Ambiguous input behavior: Controls the command behavior used to resolve situations when a command can't unequivocally deduce a face or entity to which the input point or 2D curve relates. By default, the command will ask the user to select the feature.
- Convert bend to junction: Gives the option to recognize an L-corner on a flange and automatically convert part of the split bend into a junction.
- Make orthogonal bend split: Determines whether a bend will be split orthogonally to the bend axis if the bend line crosses the bend at an angle.
- Treat coincident miter faces: Switches the mode for the recognition of a miter-like design made of coincident faces; OFF = keep, ON = convert to regular miters.

Figure 6.2579



Related Commands

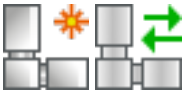
SmConvert (6.28.4) - automatically recognizes flanges, bends, and lofted bends in a 3D solid. SmDelete (6.28.5) - removes a bend or a junction by restoring a hard edge between two flanges - removes a flange with all the bends adjacent to it. The adjacent flanges are extended up to a junction configuration and the flange is deleted. Restoring geometry removed by a miter. SmFlangeConnect (6.28.12) - closes gaps between two arbitrarily oriented flanges. SmFlangeEdge (6.28.14) - pulls one or more edges of an existing flange to create one or more flanges to a sheet metal part. SmReliefCreate (6.28.22) - creates proper corner and bend reliefs. Corner reliefs are built on corners which have three or more adjacent flanges. Bend reliefs are built at the start and end of a flange edge.

Figure 6.2580

6.28.31 SmUnfold

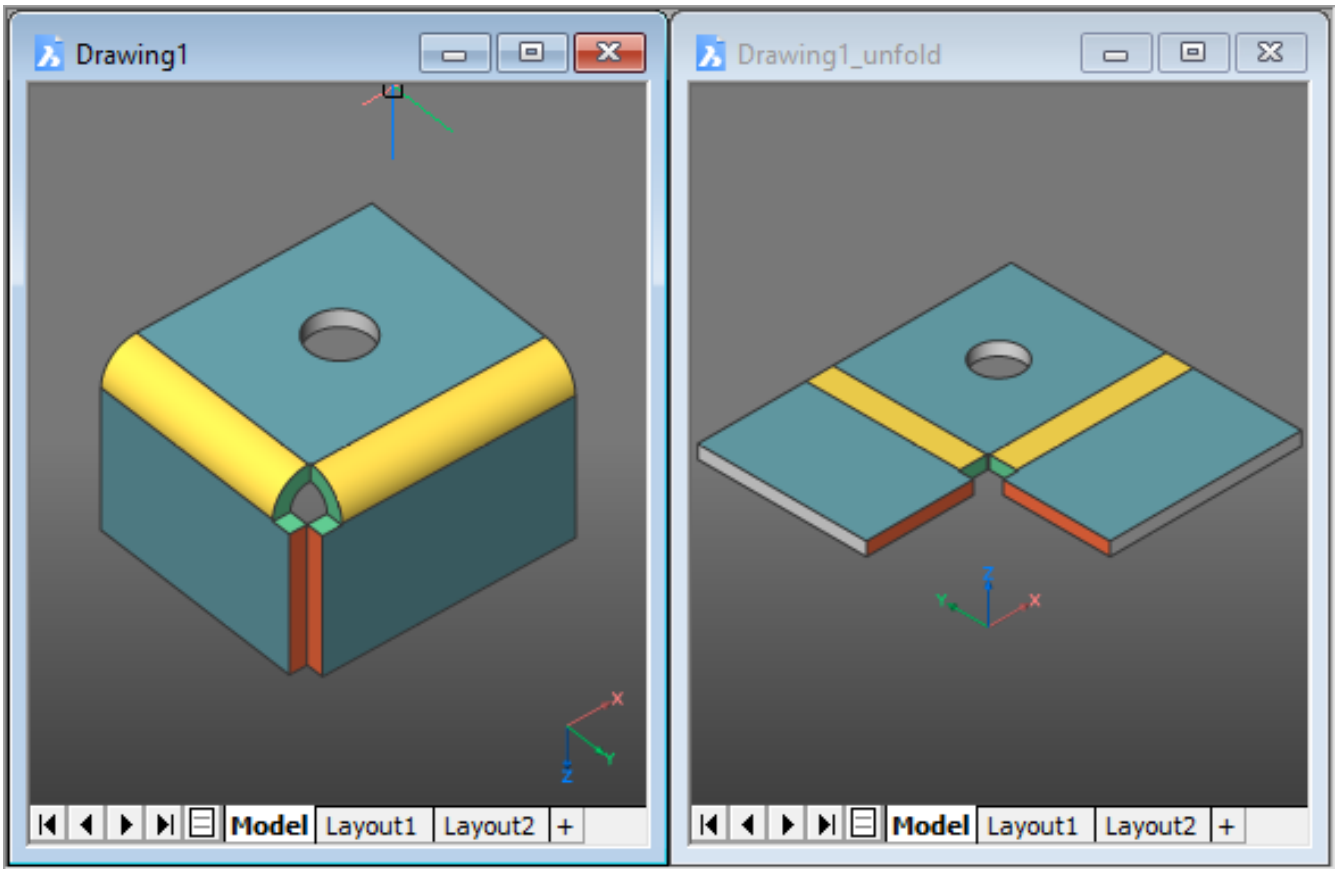
(6.2582 on page 5709) Creates an unfolded 2D or 3D representation of a sheet metal part.

Accessing the Command



command bar: **smunfold** menu bar: **Sheet Metal | Unfold | Unfold Body** and **Associatively Unfold Body** toolbar: **Sheet Metal | Unfold Body** and **Associatively Unfold Body** ribbon: **Sheet Metal | Flatten | Unfold Body** and **Associatively Unfold Body** Quad cursor menu: **Sheet Metal | Unfold Body : SmUnfold Prompts you in the command bar:** Select a flange or lofted bend face to start unfolding [Associative]: **(Select the base flange of the sheet metal part.)** Select position of the unfolded body: **(Specify a point in the drawing.)** Validate the unfolded body and select an option [save 2D geometry/save 3D geometry/Optimize bend annotations/Keep] <Keep>: **(Press Enter to keep the unfolded body in the drawing or choose an option.) Associative mode:** opens an additional window with model's unfolded representation. Both folded (left) and unfolded (right) representations have bidirectional associativity which allows transferring modifications to neighbor model automatically when changing window focus. (6.2581 on the following page)

Figure 6.2581



Command Options

Option	Description
Keep	Places the unfolded 3D solid in the current drawing.
Save 2D geometry	Saves the 2D geometry of the unfolded metal part as a separate drawing file. Displays a Save File dialog window. • Select a folder. • Type a name in the **File Name** field. • Select either **Drawing Exchange Format (*.dxf)** or **Standard Drawing File (*.dwg)** from the **Save as type** list button. • Click the **Save** button to create the file.
Save 3D geometry	Saves the 3D solid of the unfolded metal part as a separate drawing file. Displays a Save File dialog window. • Select a folder. • Type a name in the **File Name** field. • Select either **Drawing Exchange Format (*.dxf)** or **Standard Drawing File (*.dwg)** from the **Save as type** list button. • Click the **Save** button to create the file.
Optimize Bend Annotations	Optimizes the bend annotations in the exported geometry.

6.28.32 SmSelect

(6.2582) SmSelect is oriented to work on solids with sheet metal features. It selects hard edges, same form features, non-orthogonal thickness edges, flat edges, and the side of a sheet metal part.

Access the Command

 **Select Same Form Features**  **Select Hard Edges**  **Select Non-orthogonal thickness edges ===ERROR WITH DOWNLOADED IMAGE=== Select Flat edges ===ERROR WITH DOWNLOADED IMAGE=== Select Side of sheet metal part** command bar: **smselect** menu bar: **Sheet Metal | Select Same Form Features**, **Select Hard Edges, Select Non-orthogonal thickness edges, Select Flat edges,** and **Select Side of sheet metal part** toolbar: **Sheet Metal | Select Same Form Features, Select Hard Edges, Select Non-orthogonal thickness edges, Select Flat edges,** and **Select Side of sheet metal part** ribbon: **Sheet Metal | Select Same Form Features, Select Hard Edges, Select Non-orthogonal thickness edges, Select Flat edges,** and **Select Side of sheet metal part** Quad cursor menu: **Select | Select Same Form Features**, **Select Hard Edges, Select Non-orthogonal thickness edges, Select Flat edges,** and **Select Side of sheet metal part : SmSelect Prompts you:** Select the option [Hard edges/Same form features/SImilar form features/Non-orthogonal thickness faces/SIDe of sheet metal part/Flat edges]:

Command Options

Option	Description
===ERROR WITH DOWNLOADED IMAGE=== Hard edges	Selects all hard edges in the model.
===ERROR WITH DOWNLOADED IMAGE=== Same form features	Selects all form features identical to the selected feature(s). Prompts you: **Select form feature faces - (select a form feature face.)** Entities in set: 1 **Select form feature faces - (select more form feature faces or press Enter.)**
Similar form features	Selects all form features similar (the same type, but with different parameter values) to the selected feature(s). Prompts you: **Select form feature faces - (select a form feature face.)** Entities in set: 1 **Select form feature faces - (select more form feature faces or press Enter.)**
 Non-orthogonal thickness edges	Selects all edges of a specified flange common with non-orthogonal thickness faces. Requires flange, regular or lofted bend face to start.
===ERROR WITH DOWNLOADED IMAGE=== Side of sheet metal part	Selects faces on the same side of a sheet metal part within a selected face. Prompts you: **Select side face of sheet metal part: (select side face.)**
===ERROR WITH DOWNLOADED IMAGE=== Flat edges	Selects all flat edges on a specified solid. Prompts you: **Select free flange edge: - (select a free flange edge.)**

Related Commands

DmSelect (6.12.28) - selects edges and faces of 3D solids or surfaces based on their geometric properties. DmSelectEdges (6.12.26) - selects the edges of faces and solids. SmBendCreate (6.28.3) - converts junctions and hard edges (sharp edges between flange faces) into bends. SmDelete (6.28.5) - restores a hard edge between two flanges to remove a bend or a junction - removes a flange and all adjacent bends. The adjacent flanges are extended up to a junction configuration and the flange is deleted. Restores geometry removed by miters. SmJunctionCreate (6.28.21) - converts hard edges (sharp edges between flange faces) and bends into junctions.

.26	ACD	2.0
.37	BEF	3.4
.48	CGH	4.5
.59	DIJ	5.6

Accessing the Command

command bar: **-table : -Table Prompts you in the command bar:** Enter number of columns or [Auto] <4>: **(Specify the number of columns, press Enter to accept the default columns, or else press A)** Enter number of rows or [Auto] <4>: **(Specify the number of rows, press Enter to accept the default columns, or else press A)** Specify insertion point or [Style/Width/Height]: **(Specify the insertion point, or else choose an option)** Specify first corner: **(Pick a point for the top left corner of the table, or enter x,y coordinates)** Specify second corner: **Pick a point for the bottom right corner of the table, or enter x,y coordinates)**

Command Options

Option	Description
Enter number of columns	Specifies the number of columns: • Enter a number • Press **Enter** to accept the default number of columns • Press **A** for the program to insert one column
Enter number of rows	Specifies the number of rows: • Enter a number • Press **Enter** to accept the default number of rows • Press **A** for the program to automatically determine the number of rows when you insert the table in the drawing
Auto	Defines the number of columns and/or rows dynamically when inserting the table; prompts you in the command bar: 1. **Specify first corner** - **(enter the position of the top left corner of the table.)** 2. **Specify second corner** - **(enter the position of the bottom right corner of the table)** As you move the cursor, the program adds more or less rows.
Style	Specifies the table style; prompts you: **Enter table style name <Standard>** - **(type the name of the table style, or press Enter to accept the default style.)**
Width	Specifies the column width; prompts you: **Enter cell width <6.0000>** - **(type the column width or press Enter to accept the default width)**

Height	Specifies the minimum row height; prompts you: **Enter minimum cell height <4>** - **(type the height or press Enter to accept the default.)**
Specify insertion point	Specify the position of the top left corner of the table. The TablEdit (6.29.3) command immediately launches so that you can begin filling in the cells.

Procedures

- To create an empty table (1.29.24)
- To create a table from data (1.29.24)
- To create a table from an Excel spreadsheet (1.29.24)
- General procedure to create fields (1.29.23)

Related Commands

Table (6.29.2) - creates a table entity in the drawing through a dialog box. Tablemod (6.29.5) - modifies the properties of a selection of table cells. Tabledit (6.29.3) - edits the cell content. TableExport (6.29.4) - exports the content of a table entity in CSV file format. TableStyle (6.29.6) - creates and edits table styles through the Drawing Explorer - Table Styles dialog box.

Figure 6.2585

Figure 6.2586

Automotive Electrical System - Bill of Materials					
Component	Description	Stock No	Total	Price	Part
BSWITCH	Single-pole Brak	200-0510	1	6.78	DOMESW	Single-pole Dome	200-0020	2	2.54	
FUSE40	40 Amp Fuse	300-0040	1	1.23	

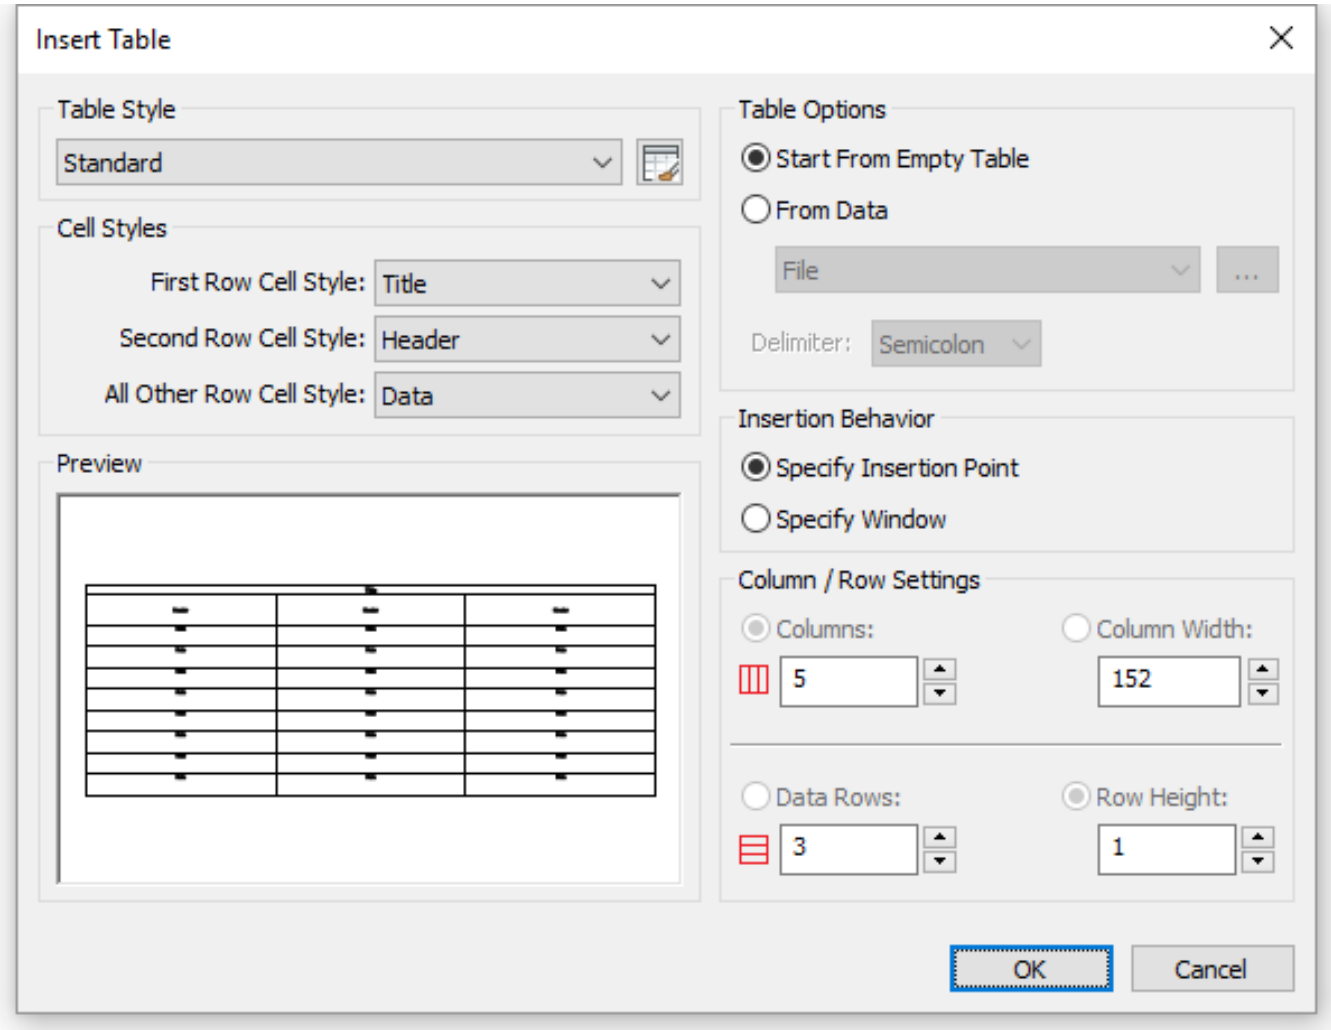
6.29.2 Table

(6.2981 on page 6079) Creates a table entity in the drawing through a dialog box, either from scratch or from data in an external file or a data link. (6.2586) **Note:** To place blocks in cells, use the TableMod (6.29.5) command.

Accessing the Command

 command bar: **table** menu bar: **Draw | Table** ribbon: **Draw | Tables | Table toolbar: Draw |**  **: Table** Displays a dialog box: (6.2587 on the following page) Choose options, and then click OK .

Figure 6.2587



Dialog Box Options

Option	Description
Table Style	Chooses an existing style or else creates a new one: • Click the droplist, then select an existing table style. • Click  **Table Styles Explorer** to access the Table section of the Drawing Explorer and create or edit table styles; see the TableStyle (6.29.6) command.
Cell Styles	A table style can have different sub-styles for the first two rows; these sub-styles are named Title, Header, and Data: • **First Row Cell Style** - choose a sub-style from the droplist, which by default is Title; a title row is the topmost row of the table • **Second Row Cell Style** - choose a sub-style from the droplist, which by default is Header; a header row is the first row of a column • **All Other Row Cell Styles** - choose a sub-style from the droplist, which by default is Cell; a cell is all other rows in the table The properties of the Header, Border, and Cell sub-styles are defined by the table style.
Table Options	Determines the source of the new table: **Start From Empty Table** - creates a new, empty table with the parameters listed below **From Data** - reads data from a file or a datalink, and then constructs a table to fit the data; click the droplist to chose the source of the data: • - click Browse  and then from the file dialog box choose a data files in CSV (comma separate value) or a spreadsheet file in XLS, XLSX, and XLM format • **DataLink** - displays the DataLink Manager dialog box to choose a named data link; see the DataLink (6.10.1) command (Available only with the File option) **Delimiter** - specifies the delimiter character used to separate fields in CSV data files; click the droplist and then choose a delimiter: • **Semicolon** - ; • **Comma** - , • **Space** - • **Tab** -

Insertion Behavior	**Specify Insertion Point** - specifies where the upper-left corner of the table will be inserted in the drawing; you will be prompted for the location after you click **OK** to close the dialog box. **Specify Window** - specifies the area that the table should consume in the drawing; this is useful when you need the table to fit a specific area, such as in a revision table or title block. After you click OK, the program will prompt you for the two corners of the window: 1. **Specify first corner** - **(enter a point for top left corner of the table.)** 2. **Specify second corner** - **(enter a point for the bottom right corner of the table.)** As you move the mouse, a ghosted table dynamically resizes itself.
Columns / Rows Settings	(Available only with the Specify Insertion Point option) Specifies the number of columns or rows and the cell width or height. Choose one of • **Columns** - specifies the number of columns in the table • **Column Width** - specifies the initial width of all columns And choose one of • **Data Rows** - specifies the number of data rows in the table; the title and header rows are added automatically by the program • **Row Height**- specifies the initial height of all rows The number of columns and rows, and size of cells can be adjusted later, after the table is inserted.
OK	Closes the dialog box, and then prompts you to inserts the table in the drawing. The TablEdit (6.29.3) command immediately launches so that you can begin filling in the cells.

Procedures

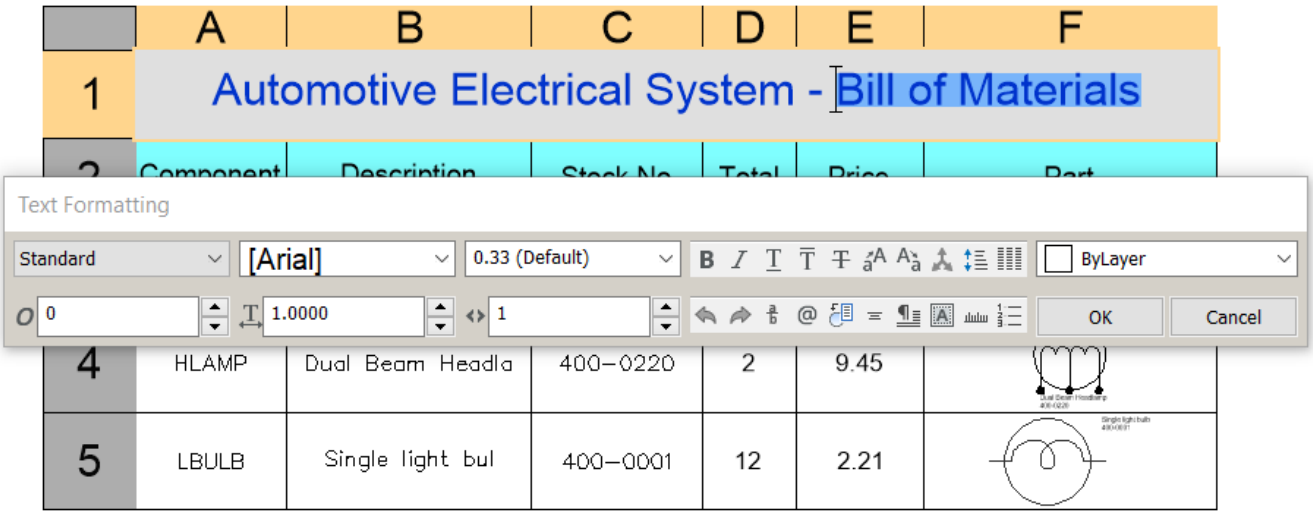
- To create an empty table (1.29.24)
- To create a table from data (1.29.24)
- To create a table from an Excel spreadsheet (1.29.24)
- General procedure to create fields (1.29.23)

Related Commands

DataLink (6.10.1) - Links data from an Excel spreadsheet directly into drawing tables for bi-directional updating. -Table (6.29.1) - creates a table entity in the drawing through the command bar. Tablemod (6.29.5) - modifies the properties of a selection of table cells. Tabledit (6.29.3) - edits the cell content. TableExport (6.29.4) - exports the content of a table entity in CSV file format. TableStyle (6.29.6) - creates and edits table styles through the Drawing Explorer - Table Styles dialog box. Field (6.14.7) - inserts a field in a multiline text, table cell or attribute.

Figure 6.2588

Figure 6.2589



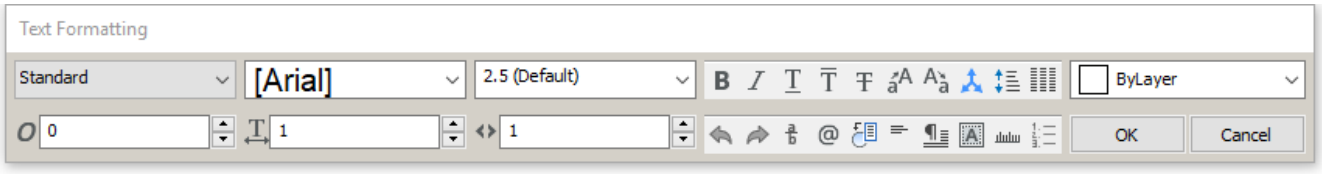
6.29.3 Tabledit

(6.2981 on page 6079) Edits text in a table cell. (6.2589) **Note:** To edit the format of cells, use the TableMod (6.29.5) command.

Accessing the Command

command bar: **tabledit** mouse: double click a cell to open the Text Formatting bar. **: Tabledit Prompts you in the command bar:** Pick table cell to edit: **(Click a table cell)** Highlights the cell, and then displays a dialog box: (6.2590) The Text Formatting dialog box operates exactly like the one from the MText command.

Figure 6.2590



Dialog Box Options

See the Mtext (6.21.38) command.

Procedures

- To edit the table content (1.29.24)
- Editing a table in the Properties bar (1.29.24)
- Editing a cell in the Properties bar (1.29.24)

Related Commands

Table (6.29.2) - creates a table entity in the drawing through a dialog box. -Table (6.29.1) - creates a table entity in the drawing through the command bar. Tablemod (6.29.5) - modifies the properties of a selection of table cells. TableExport (6.29.4) - exports the content of a table entity in CSV file format. TableStyle (6.29.6) - creates and edits table styles through the Drawing Explorer - Table Styles dialog box. Mtext (6.21.38) - places multi-line text in drawings through a dialog box. Ddedit (6.10.13) - edits single-line text, multi-line text, attribute definitions, and attribute text.

Figure 6.2591

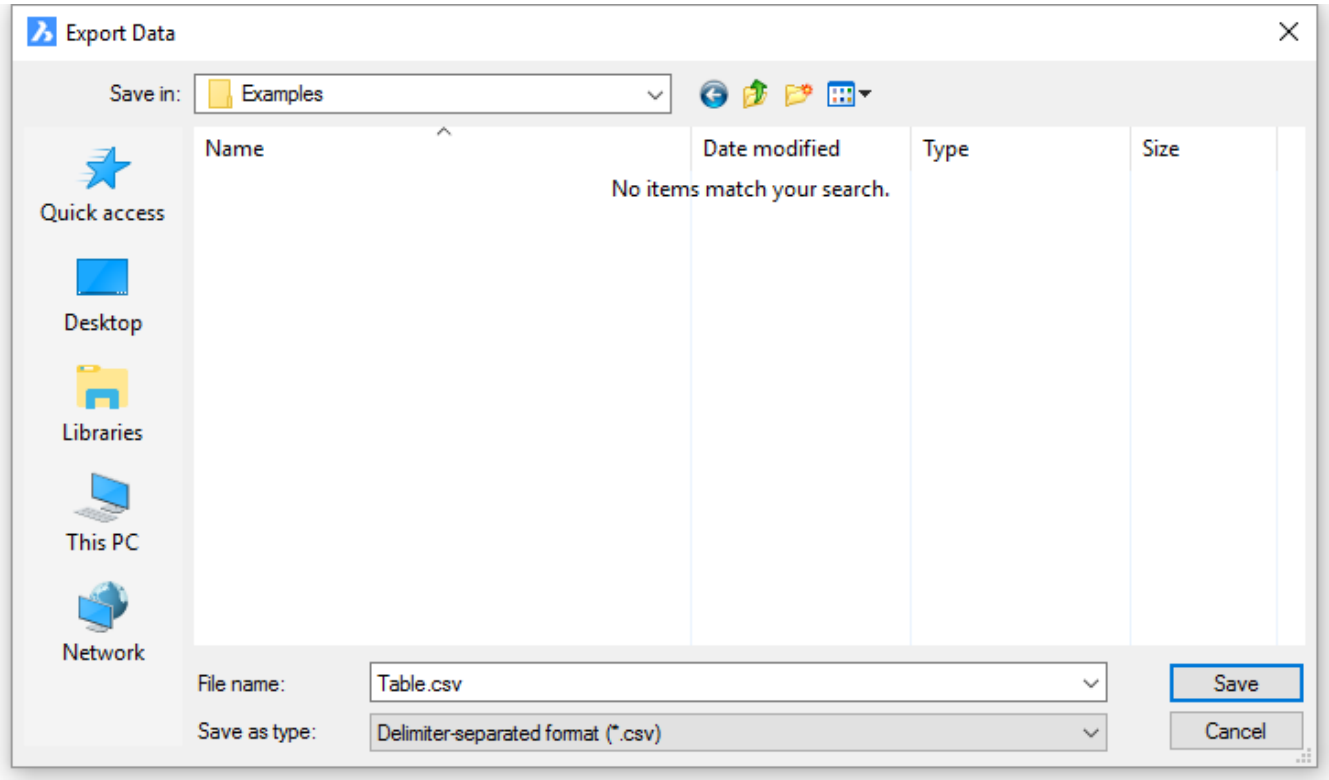
6.29.4 TableExport

(6.2981 on page 6079) Exports the contents of a table to a CSV or XML file. **Note:** The CSV file can be imported into spreadsheet and database programs to format and further process the data.

Accessing the Command

command bar: **tableexport** context menu: **Export Table : TableExport Prompts you in the command bar:** Select Table to export: **(Select a table)** Displays the Export Data dialog box: (6.2592 on the next page)

Figure 6.2592



Command Options

Option	Description
Save in	Select a folder in which to save the file
File name:	Type a name for the file; the default is **Table.csv**
Save as type	Choose the format of the file: • Delimiter-separated format (*.csv) • XML Spreadsheet format (*.xml)
Save	Exports the cell data and creates the export file.
Cancel	Cancels the TableExport command and so does not export the data.

Procedures

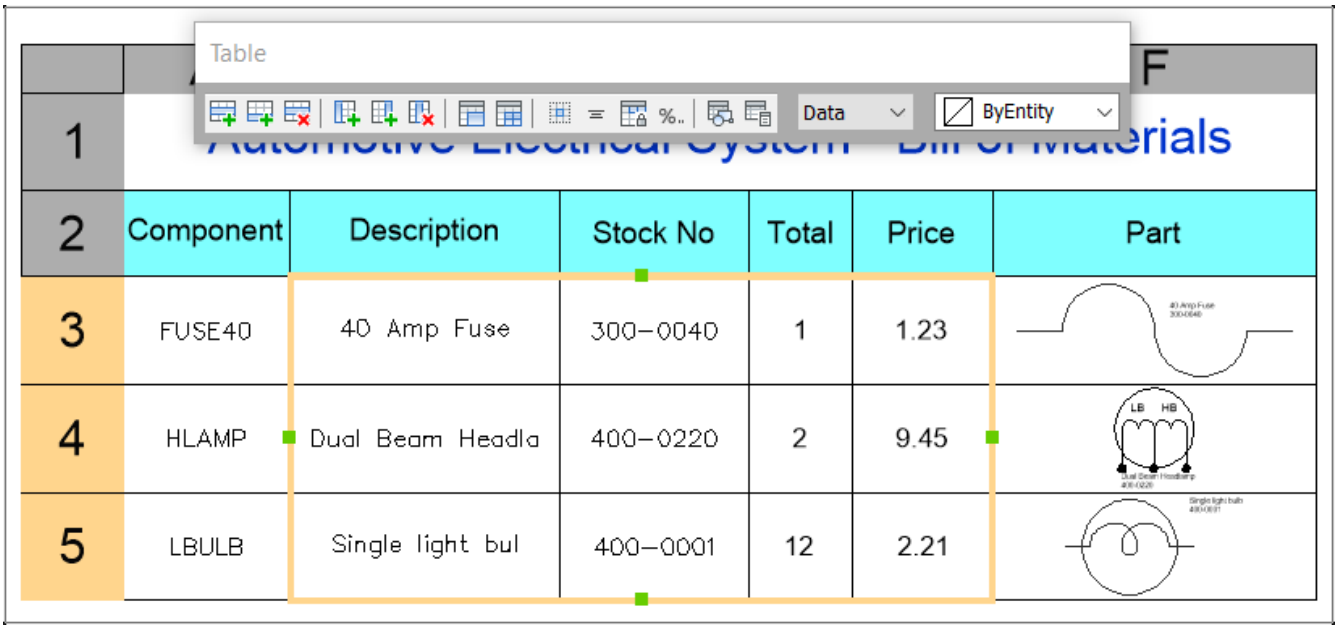
- To export a table (1.29.24)
- Defining the list separator character (1.29.24)

Related Commands

Table (6.29.2) - creates a table entity in the drawing through a dialog box. -Table (6.29.1) - creates a table entity in the drawing through the command bar. Tablemod (6.29.5) - modifies the properties of a selection of table cells. Tabledit (6.29.3) - edits the cell content. TableStyle (6.29.6) - creates and edits table styles through the Drawing Explorer - Table Styles dialog box.

Figure 6.2593

Figure 6.2594



6.29.5 TableMod

(6.2981 on page 6079) Formats the properties of table cells, and inserts blocks. (6.2594) **Note:** To edit and format text in cells, use the TablEdit (6.29.3) command.

Accessing the Command

command bar: **tablemod** mouse: click a cell in a table menu bar: **Modify | Modify Table : TableMod Prompts you in the command bar:** Pick table cell to edit: **(Click the cell you want to modify or press and hold the left mouse button then define a rectangle to select multiple cells)** Displays a toolbar: (6.2595) To exit the command, click the drawing outside of the table or press **Esc**.

Figure 6.2595

Toolbar Options

Option	Description
 Insert row above	Inserts an empty row above the selected cell
 Insert row below	Inserts an empty row below the selected cell
 Delete row	Deletes the row(s) of the selected cell(s) without warning; use the U command to reserve the change
 Insert column left	Inserts an empty column at the left of the selected cell
 Insert column right	Inserts an empty column at the right of the selected cell
 Delete column	Deletes the column(s) of the selected cell(s) without warning; use the U command to reserve the change
 Merge cells	Merges the selected cells; click the icon and then choose an option: (6.2600 on page 5732) • **Merge All** - merges all selected cells into a single cell • **Merge by Row** - merges the selected cells into rows, each with one cell • **Merge by Column** - merges the selected cells into columns, each with one cell **Caution**: When cells are merged, all the their contents are erased, except for that of the first cell.
 Unmerge cells	Splits previously merged cells by rows and columns; the program uses the row numbers (1, 2, 3, etc) and column letters numbers (A, B, C, etc)to know how to split the merged cells into the original set. When cells are unmerged, the content erased by the Merge Cells option is not returned.
 Border style	Sets the border style of the selection; displays the Cell Border Properties dialog box: see below
 Text alignment	Sets the text alignment of text in the selected cells; click the icon and then choose option: (6.2601 on page 5733) The content of each selected cell is aligned inside the cell. For instance, select four cells, and then choose Bottom Right, the content in each of the four cells is justified bottom-right.

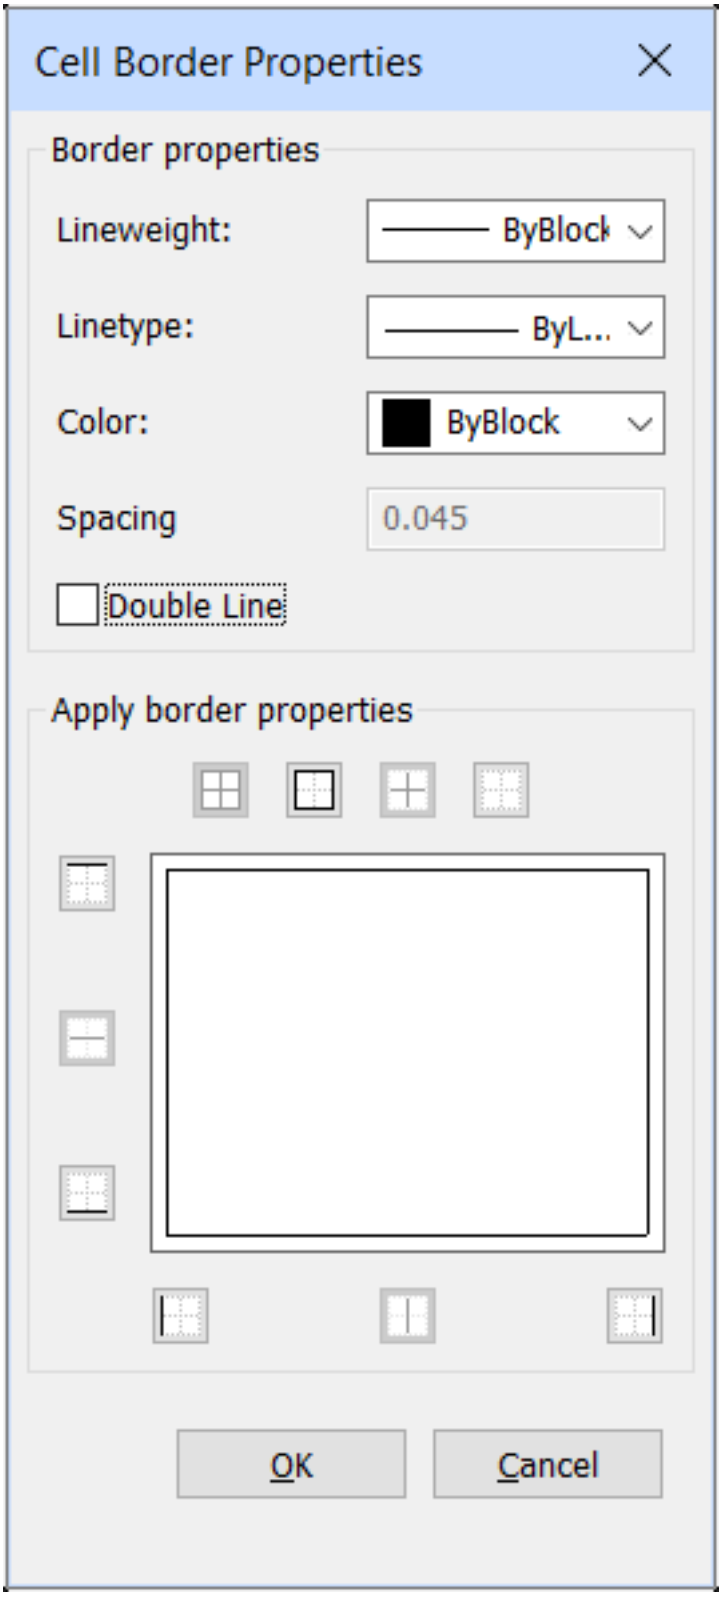
Lock / unlock	Locks and unlocks the content and/or the format of selected cells; click the icon and then choose and option: (6.2602 on page 5733) • **Unlocked** - the selected cells are unlocked, which means that they can be edited; the program responds in the command line, 'Cell contents unlocked' • **Locked Content** - the content of the the selected cells is locked, but the format of the cells can still be modified; the program responds in the command line, 'Cell contents locked' • **Locked Format** - the format of the the selected cells is locked, but the content of the cells can still be edited; the program responds in the command line, 'Cell format locked' • **Locked Format and Content** - the content and the format of the the selected cells are locked; the program responds in the command line, 'Cell contents and format locked' It is common to lock header cells.
Cell format	(Not implemented) Sets the cell format of the selection
Inert block reference	Inserts a block or a drawing in the selected cell; click the icon to display the Insert Block in Cell dialog box: see below **Caution**: placing a large drawing in a small cell can lead to program instability, never mind that you can't even see the drawing. You can have both text and blocks in a single cell: (6.2603 on page 5733) Use the Manage Cell Content dialog box to arrange the text and blocks; see below.
Manage cell content	Manages blocks and drawings in cells; click the icon to display the Manage Cell Content dialog box: see below
Cell style	Sets the sub-style of the selected cells; click the droplist, and then choose an sub-style name:  • **Title** - the title style is usually applied to the topmost row of the table, but doesn't need to be! • **Header** - the Header style is usually applied to the first row of a column • **Data** - the Data style is usually applied to all other rows in the table The properties of the Header, Border, and Cell sub-styles are defined by the table style; see the TableStyle (6.29.6) command.
Cell background	Sets the background color of the selected cell(s): 1. Click the droplist 2. Choose a color. (6.2604 on page 5733) Or in the droplist click **Select Color** to open the Color (6.9.19) dialog box.
Esc	Press **Esc** to exit this command.

Cell Border Properties Dialog Box

To access this dialog box, click the **Border Style** button: (6.2596 on the facing page)

Option	Description
Border Properties	Determines the look of the borders that surround each cell: **Lineweight** - changes the lineweight of the cell border(s); click the droplist and then choose a different lineweight **Linetype** -changes the line type of the cell border(s); click the droplist and then choose a different one, or else click **Load** to access additional line types **Color** - changes the color of the cell border(s); click the droplist, and then choose a different color, or else click **Select Color** to access all colors (Not implemented) **Spacing** - changes the spacing between the cell borders and the content of the cell; enter a number in drawing units **Double Line** - doubles the lines make up the borders of the cell(s)
Apply Border Properties	Applies the properties to only certain borders: click a button to see the effect in the preview window; going counter clockwise: • **No borders** - the properties are applied to no borders (strange but true) • **Inside borders** - the properties are applied only to the inner borders (you have to have selected more than one cell for this one to work) • **Outside borders** - and so on • **All borders** • **Top borders** • **Middle borders** • **Bottom borders** • **Left borders** • **Center borders** • **Right borders** (6.2605 on page 5734) Although the preview window shows only the double-line effect, the other properties are applied to the specified cell border lines.
OK	Exits the dialog box, applies the properties, and returns to the Table toolbar.

Figure 6.2596

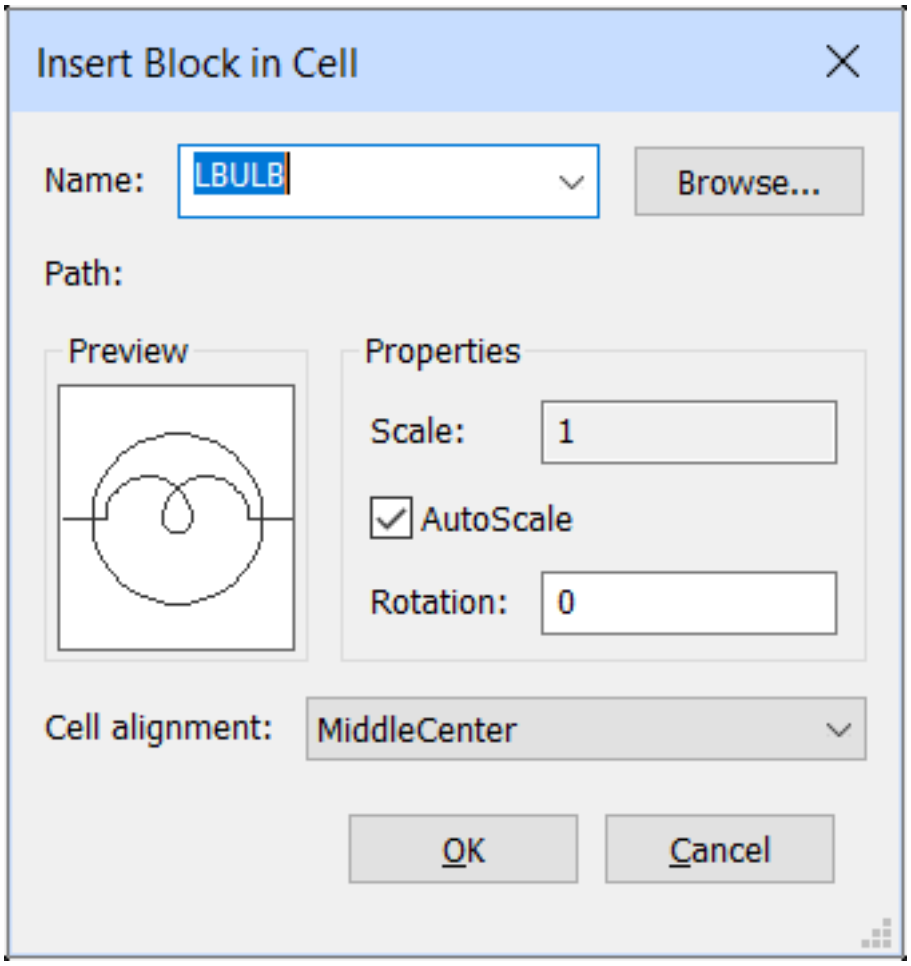


Insert Block in Cell Dialog Box

To access this dialog box, click the **Insert Block Reference** button: (6.2597 on the facing page)

Option	Description
Name	Specifies the name of the block or drawing to insert. • To insert a block: 1. Click the droplist 2. Choose the name of a block already defined in the drawing • To insert a drawing: 1. Click **Browse**. 2. In the Open Drawing File dialog box, choose a folder 3. From the **Files of Type** droplist, choose the file format, DWG or DXF 4. Select a drawing file 5. Click **Open**
Properties	When the cell is small, the block or drawing may be barely perceptible. You may need to increase the size of the row or column to accommodate the blocks. A cell can hold text and one or more blocks. When a 3D model is pasted into the cell, the 2D planview is displayed: (6.2667 on page 5778) Determines the size of the block in the cell: **Scale** - specifies the size of the block (unavailable when AutoScale is turned on): • Numbers larger than 1.0 make the block larger • **1** - inserts the block at its actual size • Numbers smaller than 1.0 make the block smaller • Negative numbers flip the block upside down **AutoScale** - size the block to fit the cell: • **On** - the block is resized to fit the cell • **Off** - the cell is resized to fit the block **Rotation** - rotate the block about its center point (and not its insertion point); enter an angle: • Positive numbers rotate the block counter clockwise • **0** - does not rotate the block • Negative numbers rotate the block clockwise
Cell Alignment	Aligns the block in the cell: (6.2668 on page 5779) 1. Click the droplist 2. Choose a justification mode
OK	Exits the dialog box, inserts the block, and returns to the Table toolbar

Figure 6.2597

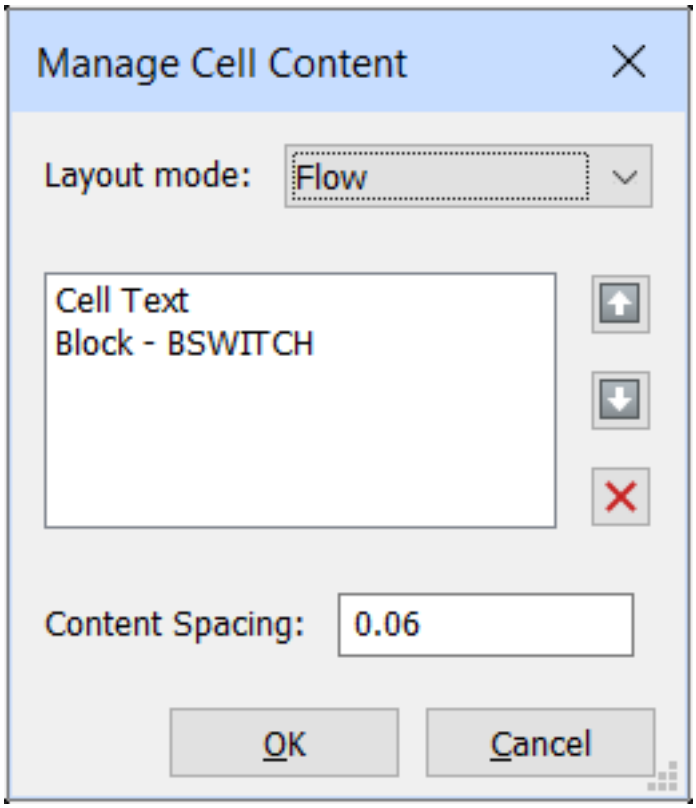


Manage Cell Content Dialog Box

To access this dialog box, click the **Manage Cell Content** button: (6.2598 on the next page)

Option	Description
Layout Mode	When a cell contains more than one element, this option determines how they relate to each other; click the droplist and then choose an option: (6.2608 on page 5734) • **Flow** - arranges the elements to fit the cell • **Stacked horizontal** - forces the elements to be arranged horizontally • **Stacked vertical** - forces the elements to be arranged vertically
Move Up	Moves the selected element up the list, so that it appears above other elements in the cell
Move Down	Moves the selected element down the list, so that it's below other elements in the cell
Delete	Deletes the selected element from the cell
Content Spacing	(This option is inoperable) Specifies the distance between elements in the cell; enter a number in drawing units
OK	Exits the dialog box, changes the arrangement of the cell's contents, and then returns to the Table toolbar

Figure 6.2598



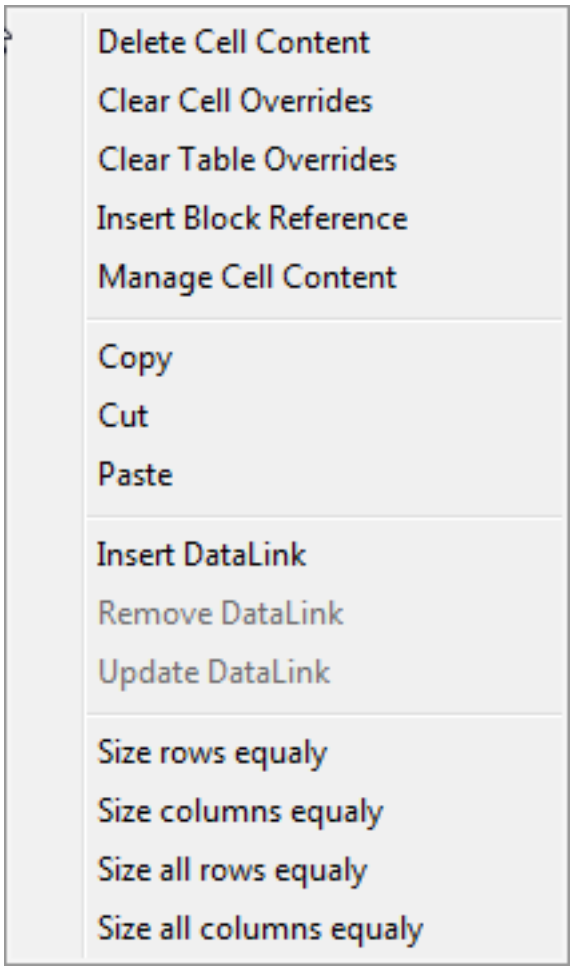
Context Menu

While the TableMod command is running, right-click a cell to see this context menu: (6.2599 on page 5731)

Option	Description
Delete Cell Content	Deletes the text and blocks in cells
Clear Cell Overrides	Resets the properties of cells to the Cell sub-style settings defined in the table style
Clear Table Overrides	Resets the table properties to those defined in the table style
Insert Block Reference	Inserts blocks and drawings; see Insert Block in Cell dialog box
Manage Cell Content	Manages the text and blocks in cells; see Manage Cell Content dialog box
Copy	Copies the content of the cell(s) to the Clipboard for pasting into other cell(s)
Cut	Cuts the content of the cell(s) to the Clipboard for pasting into other cell(s); existing content is erased
Paste	Pastes cell content from the Clipboard into cell(s), with these caveats: • All content in the cell is replaced by the pasted item • When more than one cell is selected for pasting, content is pasted only in the first cell • Non-cell data is not pasted, such as entities from the drawing or text from another application

Insert DataLink	Adds data from an external file to the end of the table; see the DataLink (6.10.1) command. Acceptable file formats are • **CSV** - ASCII files in which fields are separated by a deliminter character, such as a comma or tab • **XLS** - older Excel spreadsheet files • **XLSX** - new Excel spreadsheet files
Remove DataLink	(Available only when the table has a datalink) Removes the linked to the table; the data remains in the table
Update DataLink	(Available only when the table has a datalink) Updates the data in the table from the external file
Size Rows Evenly	Sizes the selected rows to match the size of the tallest cell in the selection set
Size Columns Evenly	Sizes the selected columns match the size of the widest cell in the selection set
Size All Rows Evenly	Sizes all rows in the table to match the tallest row
Size All Columns Evenly	Sizes all columns in the table to match the widest column

Figure 6.2599



Procedures

- Editing a table using grips (1.29.24)
- Editing a table using the Table toolbar (1.29.24)
- Editing a table in the Properties bar (1.29.24)
- Editing a cell in the Properties bar (1.29.24)

Related Commands

Table (6.29.2) - creates a table entity in the drawing through a dialog box. -Table (6.29.1) - creates a table entity in the drawing through the command bar. Tabledit (6.29.3) - edits the cell content. TableExport (6.29.4) - exports the content of a table entity in CSV file format. TableStyle (6.29.6) - creates and edits table styles through the Drawing Explorer - Table Styles dialog box.

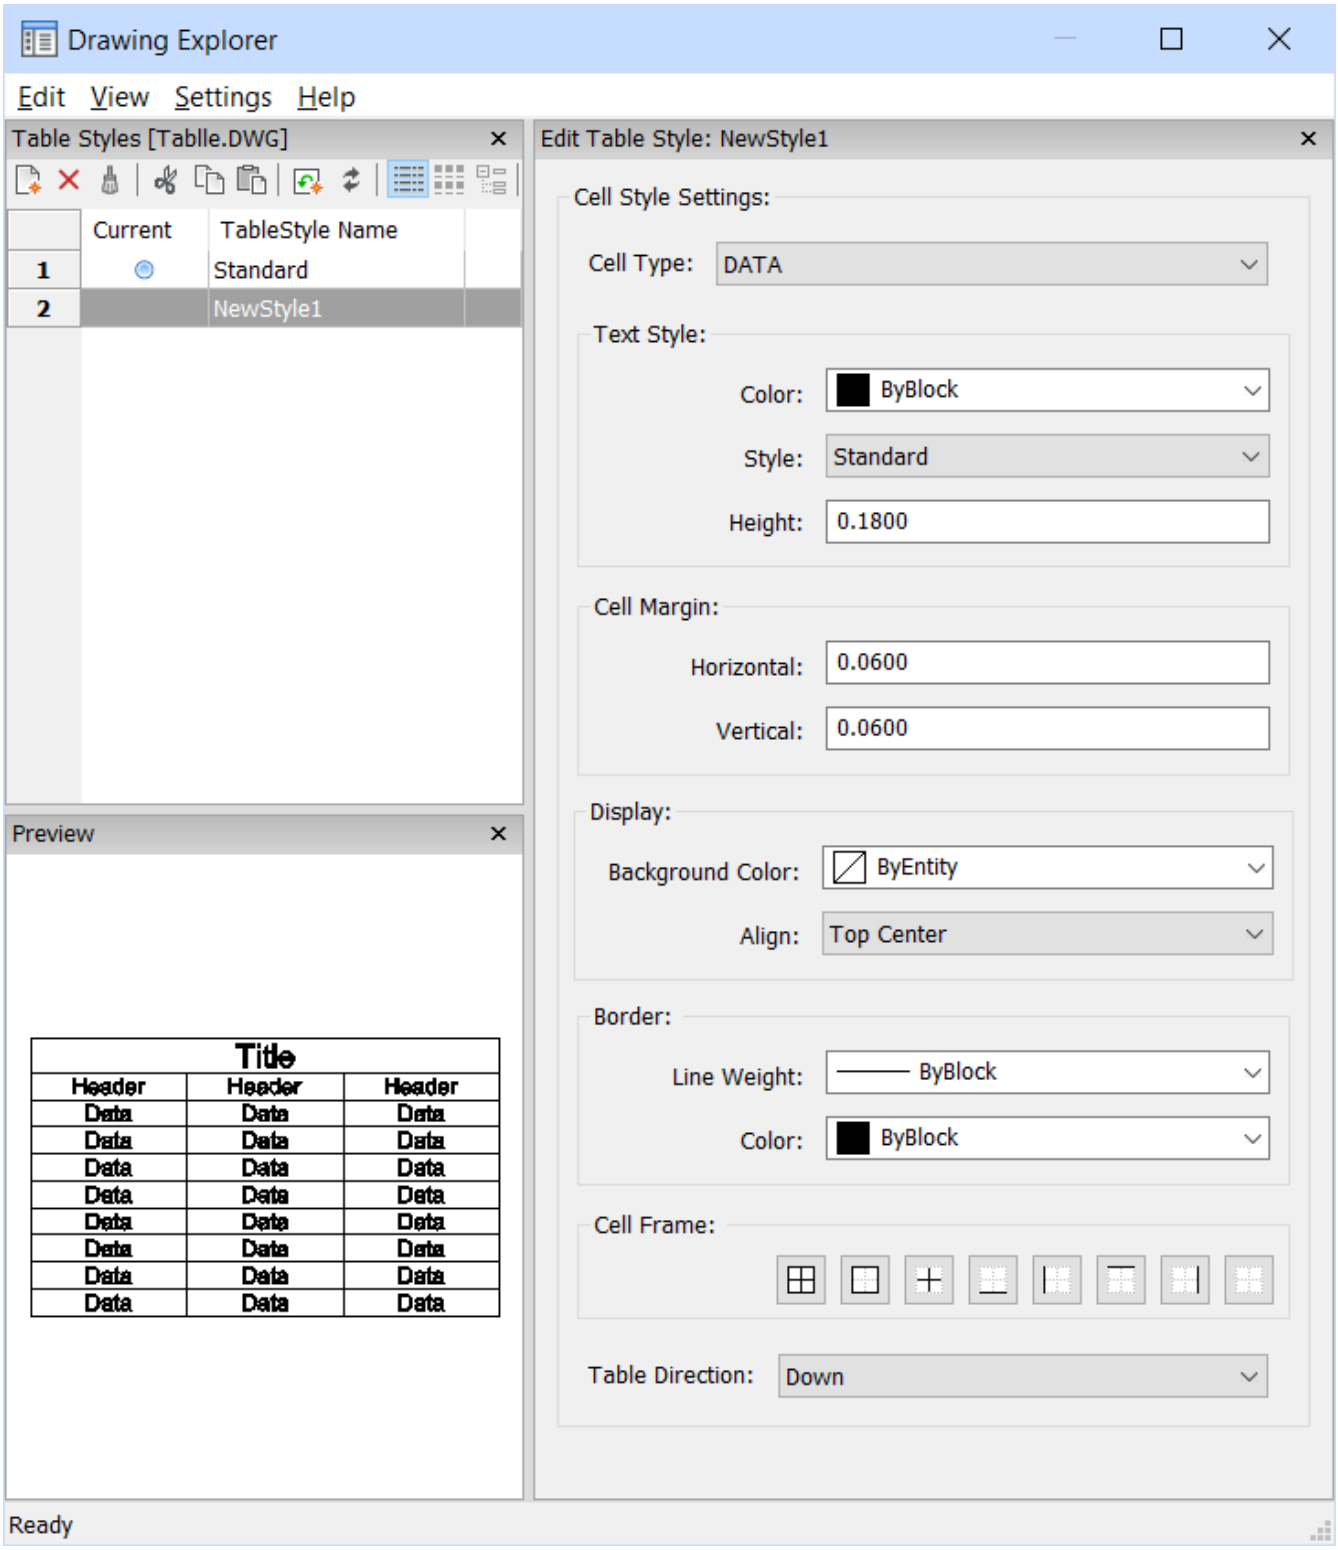
6.29.6 TableStyle

(6.2981 on page 6079) Creates and edits table styles through the Drawing Explorer.

Accessing the Command

command bar: **tablestyle** menu bar: **Tools | Drawing Explorer | Table Styles : TableStyle** Displays the Table Styles section of the a Drawing Explorer dialog box: (6.2610 on the next page) Makes changes to a style, or else create a new one, and then click **X** to close the dialog box.

Figure 6.2610



Toolbar Options

Option	Description
 New	Creates a new table style, edit the default name 'NewStyle1' to make it your own. (6.2611 on the following page)
 Delete	Deletes the currently selected table style without warning. You cannot deleted these style: • Table styles in use • 'Standard' stable style

Edit Table Style Options

Option	Description
Cell Style Settings	Defines the cell style settings for each cell style: Title, Header, and Data: **Cell Type** - click the droplist, and hen choose a cell style: (6.2612 on page 5739)
Text Style	Sets the **Color** , **Style** and **Height** for the selected cell style: • **Color** - specifies the color of the text in the cell • **Style** - selects the text style for the text • **Height** - specifies the initial height for text in the cell
Cell Margin	Defines the spacing between the cell border and the content of the cell. • **Horizontal** - specifies the distance between the cell content and the vertical cell borders • **Vertical** - specifies the distance between the cell content and the horizontal cell borders
Display	Defines the background color and the text alignment: • **Background Color** - pick a background color from the droplist, or else choose **Select Color** to display the **Color** dialog bop • **Align** - click the droplist, and then choose an alignment: (6.2613 on page 5739)
Border	Sets the lineweight and color of the cell borders. • **Line Weight** - click the droplist, and then choose a line weight; line wights are displayed only when the **LWT** option is active on the status bar • Color - pick a border color from the droplist, or else choose **Select Color** to display the **Color** dialog bop.

Cell Frame	Applies the border properties to specific lines that make up the cell frames. Click a button to choose an option, and then view the effect in the Preview window: (6.2614 on the next page)
Table Direction	Determines the direction in which the table grows when you add and remove rows: • **Down** - the title and header cells at the top, and the table grows downwards • **Up** - the title and header cells at the bottom, and the table grows upwards

Procedures

- To open the Table Styles Explorer (1.29.26)
- To create a table style (1.29.26)
- To edit a table style (1.29.26)
- To apply a style to a table (1.29.26)
- To delete a table style (1.29.26)

Related Commands

-Table (6.29.1) - creates a table entity in the drawing through the command bar. Table (6.29.2) - creates a table entity in the drawing through a dialog box. Tablemod (6.29.5) - modifies the properties of a selection of table cells. Tabledit (6.29.3) - edits the cell content. TableExport (6.29.4) - exports the content of a table entity in CSV file format. Color (6.9.19) - specifies the current color, through a dialog box. Style (6.27.55) - creates and modifies text styles with the Drawing Explorer. -Style (6.27.56) - creates and modifies text styles in the command bar. Explorer (6.13.15) - Opens the Drawing Explorer dialog box.

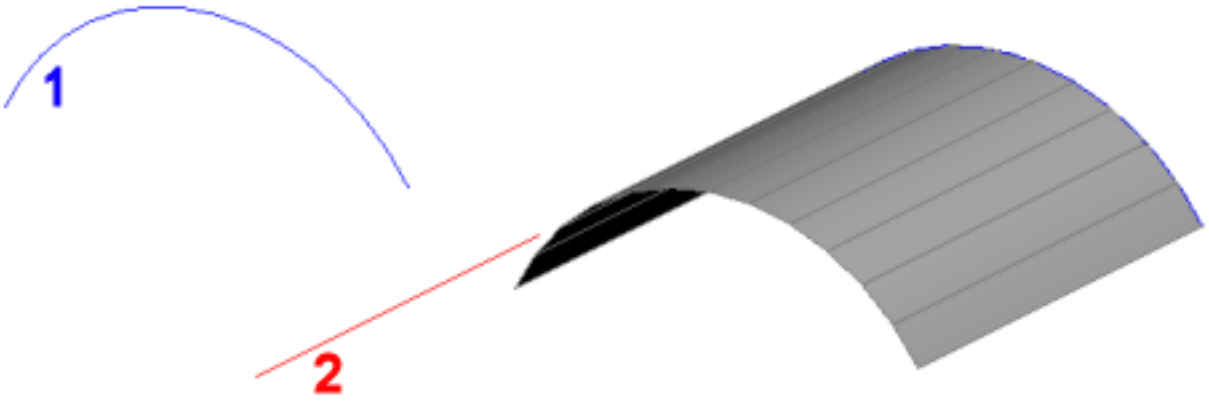
6.29.7 TabSurf

(6.2981 on page 6079) Creates a 3D mesh surface by extruding an 2D entity along a straight path entity. (6.2616)

Accessing the Command

 command bar: **tabsurf** menu bar: **Model | Meshes | Extruded Surface** ribbon: **Meshes | 3D Mesh Surfaces** toolbar: **Meshes | 3D Surfaces |**  **: TabSurf Prompts you in the command bar:** Select entity to extrude: **(Choose a single open entity, such as #1 in the figure below)** Select line or open polyline for extrusion path: **(Pick a line or polyline, such as #2)** (6.2617) Arc segments of the extruded entity are divided in a number of equal length intervals defined by the SURFTAB1 variable.

Figure 6.2617



Command Options

Option	Description
Select entity to extrude	Specifies the cross-section shape of the extrusion. The entity to be extruded must be open and must be a single entity.
Select line or open polyline for extrusion path	Specifies the length and direction of the extrusion. The extrusion path can be a line or open polyline. The polyline need not be a line segment; if a polyarc or multisegment polyline, the extrusion, however, is always "straight," going from the start to the endpoint of the polyline. The path is a vector, which means its length specifies the length of the surface; its direction specifies the direction of extrusion. The extrusion starts at the entity to be extruded, but goes in the direction indicated by the path. The end selected on the polyline or line defines the direction of the extrusion.

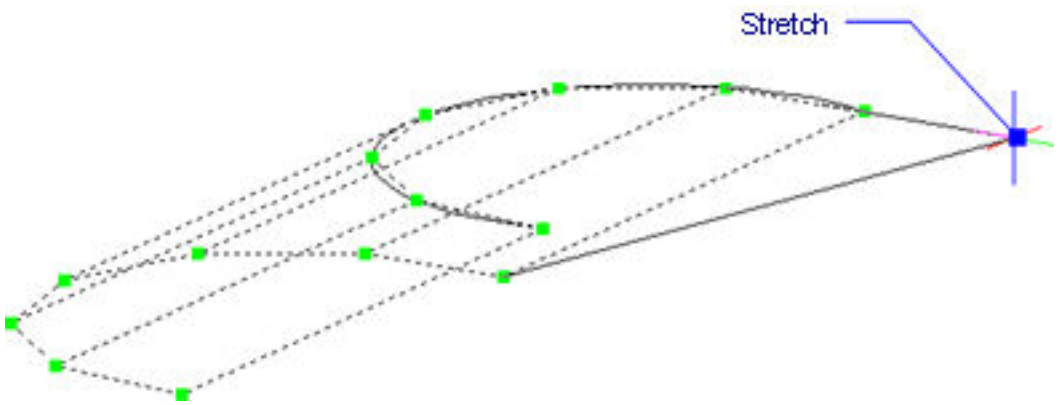
Grips Editing

Mesh-formed tabulated surfaces can be edited directly through grips:

1. Select the tabsurf. Notice that it has one grip at each vertex.
2. Drag the grip to move the adjacent faces.

(6.2618)

Figure 6.2618



Related Commands

Procedures

- To use a digitizing tablet in BricsCAD (1.15.8)
- To download the tablet overlay and CUI files (1.15.8)
- To load the overlay CUI file (1.15.8)
- To switch the tablet ON / OFF (1.15.8)
- To configure the tablet (1.15.8)
- To calibrate the tablet (1.15.8)

Related Commands

None.

Figure 6.2623

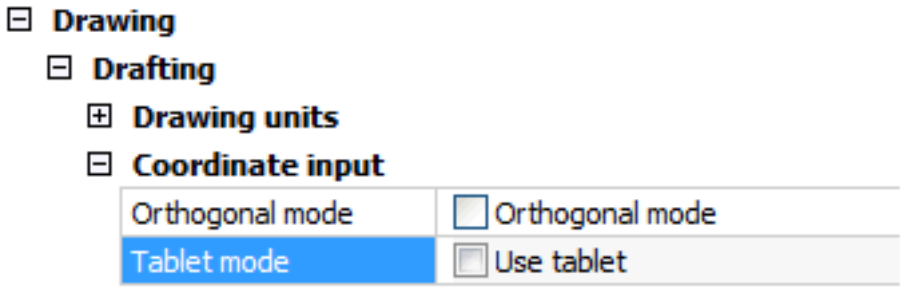

Figure 6.2624

6.29.9 TConnect

(6.2932 on page 6037) Connects solid faces and edges of planar surfaces to other solids, planar surfaces or regions. If the DELETEINTERFERENCE system variable is ON, the connected solid is subtracted from interfering solids.

Accessing the Command

Keyboard: **tconnect** Menu: **BIM | BimConnect | TConnect** Toolbar: **BIM Connect** Quad Tab: **Model** Ribbon Tab | Panel: **Model | Modify 3D - Connect : TConnect Prompts you:** (6.2625) Select entities to connect [selection options (?)]: **(Select solid faces or edges of planar surfaces.)** Entities in set: 1 **Select entities to connect [selection options (?)]: (Select more solid faces or edges of planar surfaces. or press Enter.)** (6.2629 on page 5750) Select entities to connect to or [Connect to nearest/Disconnect/selection options (?)] <Connect to nearest>: **(Select a solid face, planar surface or a region, or press Enter to connect to the nearest solid.)** Entities in set: 1 (6.2626 on the following page) Select entities to connect to or [Connect to nearest/Disconnect/selection options (?)] <Connect to nearest>: **(Select more solid faces, planar surfaces or a regions, or choose an option, or press Enter to create the connection(s).)** (6.2627 on the next page)

Figure 6.2625

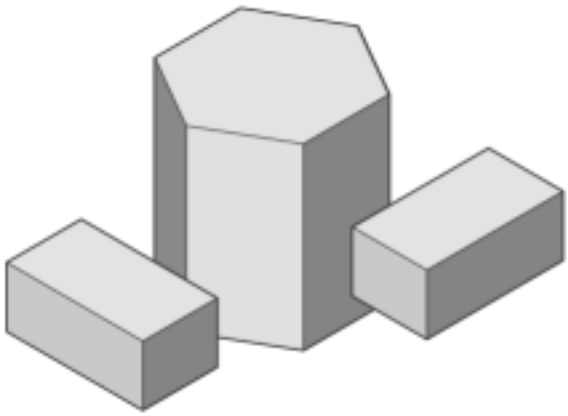

Figure 6.2626

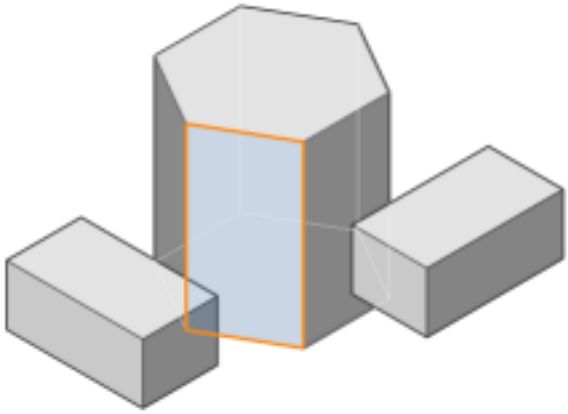

Figure 6.2627

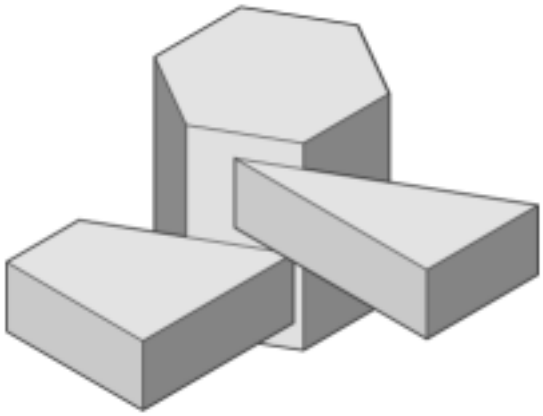

Command Options

Option	Description
Connect to nearest 	Connects the selected face(s) or edges of planar surfaces to the nearest regions, planar surfaces or face(s) of other solid(s). Select the faces or edges of planar surfaces. (6.2629 on the following page) (6.2630 on the next page) Right-click or press Enter to create the connections. (6.2631 on the following page) (6.2632 on page 5751)
Disconnect	This option applies to solid faces only. The face is disconnected and made perpendicular to the adjacent faces, which results in a single edge or vertex connection. Before: (6.2633 on page 5751) or (6.2634 on page 5751) Disconnected result: (6.2635 on page 5752) Prompts you: Select entities to disconnect from or [Disconnect from nearest/Connect/selection options (?)] <Disconnect from nearest>: • **Select entities**: select a 3D solid face, planar surface or region to disconnect from. • **Disconnect from nearest**: the nearest face in the model (or the currently connected face) is selected. • **Connect**: switch to the connect face mode.

Related Commands

LConnect (6.20.19) - creates an L-connection between solids. DmPushPull (6.12.25) - adds or removes volume from a solid by moving/offsetting a face. BimStructuralConnect (6.7.61) - connects structural profile solids such as beams and columns. BimFlowConnect (6.7.19) - creates a connection between flow segments, such as pipes or HVAC ducts.

6.29.10 Tangent

(6.2981 on page 6079) Toggles tangent entity snap; snaps to the tangent points of circles, arcs, ellipses and elliptical arcs. (6.2637)

Accessing the Command

 command bar: **tangent** transparent: **tan** toolbar: **Entity Snaps |**  **: Tangent Displays no prompts in the command bar.** When tangent entity snap is on, the cursor snaps to points of tangency along curved entities, such as circles, arcs, ellipses and elliptical arcs.

Command Options

Option	Description
Tangent	Entering the command toggles Tangent entity snap. It snaps to points of tangency. This command can be entered transparently during commands, but must be entered without the apostrophe prefix (').

Related Commands

OSnap (6.23.16) - toggles entity snap modes in the Settings dialog box. -OSnap (6.23.13) - toggles entity snap modes in the command bar. Aperture (6.4.14) - sizes the aperture cursor for entity snaps. 2dIntersection (6.2.1) - toggles apparent intersection snap mode. 3dIntersection (6.3.7) - toggles intersection snap mode. Apparent (6.4.16) - toggles apparent intersection snap mode. Center (6.9.3) - toggles center snap mode. Endpoint (6.13.7) - toggles endpoint snap mode. **Extension (6.13.22)** - toggles extension snap mode. From (6.14.13) - allows to enter relative coordinates with respect to a reference point. GCenter (6.15.5) - toggles Geometric Center (GCenter) entity snap. Insertion (6.17.18) - toggles insertion snap mode. Intersection (6.17.19) - toggles intersection snap mode. Midpoint (6.21.16) - toggles midpoint snap mode. Mtp (6.21.35) - allows to specify a point as the midpoint between two points. Nearest (6.22.2) - toggles nearest snap mode. Node (6.22.7) - toggles node (point) snap mode. None (6.22.8) - turns off all entity snap modes. Parallel (6.24.5) - toggles parallel snap mode. Perpendicular (6.24.25) - toggles perpendicular snap mode. Quadrant (6.25.7) - toggles quadrant snap mode.

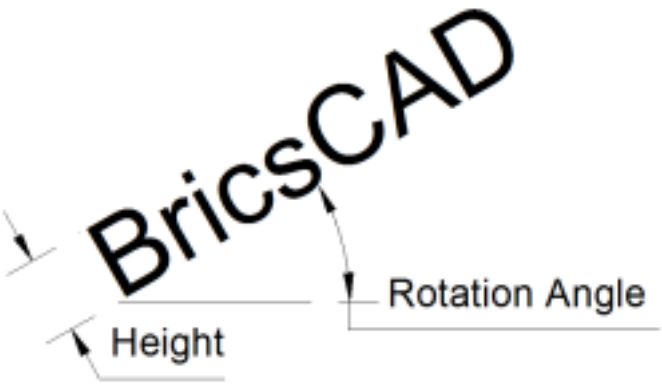
Related Commands

SupportFolder (6.27.59) - opens the main Support folder in a File dialog box.

Figure 6.2640

Figure 6.2641



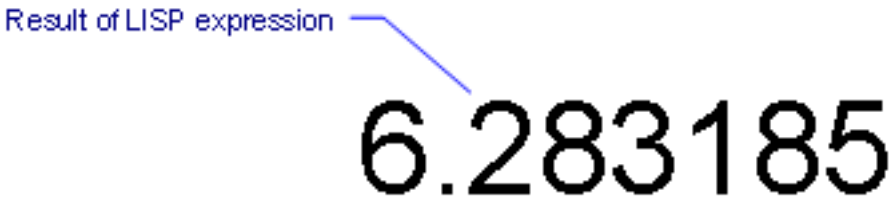
6.29.12 Text

(7.3 on page 6132) Places single lines of text in the drawing; optionally evaluates LISP expressions. (6.2641) **Note:** To enter paragraph text that can be extensively formatted, use the MText (6.21.38) command.

Accessing the Command

A command bar: **text** aliases: **-t, text, tx** menu bar: **Draw | Text** ribbon: **Home | Annotations | Text** toolbar: **Draw : Text Prompts you in the command bar:** Text start point or [use defined Style/Align on line/Fit between points/Center horizontally/Middle (hor/vert)/Right justify/Justification options...]: **(Pick a point, or enter an option)** Height of text <0.2000>: **(Specify a height, or press Enter to accept the default)** Rotation angle of text <0>: **(Specify an angle, or press Enter to accept the default) (Enter text, and then press Enter.) (Enter more text, and else press Enter twice to end the command)** When the TextEval variable is set to 1, this command evaluates LISP expressions: Text: (* pi 2) The result of the equation (pi x 2) is placed as text: (6.2642)

Figure 6.2642



Command Options

Option	Description
Start point	Specifies the starting point of the text: • Pick a point • Enter x,y coordinates This actually is the text insertion point; the actual starting point is affected by the justification.
Use defined style	Changes the text style to use for the text; prompts you: **Text style to use (or '?') <Standard>** - **(enter an option:)** • Enter the name of a text style • Press **?** to see a list of style names stored in the drawing • Press **Enter** to accept the default style See the Style (6.27.55) command.

?	Lists the names of styles found in the drawing; prompts you: T**ext style(s) to list** - **(specifies the styles to list:)**
	• ***** - lists all styles
	• **name*** - lists all names that begin with name
	• **name** - lists the style named name
	`Text styles:`
	`Style name: Standard Font typeface: Arial  Height: 0 Wid`
	`Current text style: Standard`

Align on line	Specifies align justification: aligns text between two points; prompts you: 1. **Text start point** - **(specify the staring point of the text.)** 2. **Text end point** - **(specify the end point for the text.)** (6.2645 on page 5760) This option suppress the height and angle prompts, because the height and angle are determined by the two pick points: • Rotation angle of text is determined by the angle between the two points • Height of text is determined proportions More characters in the same distance make the text shorter. (6.2646 on page 5761)

Fit between points

Specifies fit justification: fits text between two points and prompts for the height; prompts you:

1. **Text start point - (specify the staring point of the text.)**
2. **Text end point - (specify the end point for the text.)**
3. **Height of text - (specify the text height.)**

(6.2647 on page 5761) This option suppresses the angle prompt, because the angle is determined by the two pick points. Entering certain heights can cause the text to be excessively elongated or squeezed. (6.2648 on page 5761) Use this justification to force text to fit in an area, such as a closet.

Center horizontally

Specifies center justification: centers text in the middle of the baseline; prompts you: **Center point of text - (specify the center point on the baseline.)** (6.2649 on page 5761)

Middle (hor/vert)

Specifies middle justification: centers text on the middle of the text; prompts you: **Middle point of text - (specify the middle point.)** (6.2650 on page 5761)

Right justify

Specifies right justification: right-justifies each line of text; prompts you: **Right point of text - (specify the right point on the baseline.)** (6.2651 on page 5761)

Justification options...

Displays all justification modes; prompts you: **Text: Style/ Align/ Fit/ Center/ Middle/ Right/ TL/ TC/ TR/ ML/ MC/ MR/ BL/ BC/ BR/<Start point> - (enter an option:)** (6.2652 on page 5762)

- TL - top left
- TC - top center
- TR - top right
- ML - middle left
- MC - middle center (equivalent to Middle)
- MR - middle right
- BL - bottom left (equivalent to Start Point)
- BC - bottom center (equivalent to Center)
- BR - bottom right (equivalent to Right)

Height of text

Specifies the height of the text: enter a number or pick two points. This prompt is not displayed under the following conditions:

- Style has set the text to a height other than 0
- Justification mode is Align

If the text style is annotative the height value defines the paper space height of the text; the model space height depends on the current annotation scale as defined by the CANNOSCALE and CANNOSCALEVALUE system variables.

Rotation angle of text

Specifies the angle of the text:

- Enter a number
- Pick two points

This prompt is not displayed when the justification is set to Align or Fit.

Text	Specifies the text: 1. Enter a line of text, and then press **Enter**. 2. The prompt repeats; enter more text; each additional line of text is positioned under the previous line. 3. Move the cursor to another location in the drawing, and then enter more text 4. Press **Enter** twice to end the command (6.2653 on page 5762)

Grips Editing

Text can be moved directly through grips:

1. Select the text face. Notice that it has one grip at its insertion point.
2. Drag the grip to move the text.

(6.2643) Aligned and fitted text have two grips:

- One grip moves the text.
- The second grip stretches and rotates the text. Aligned text also changes its height.

(6.2644 on the following page)

6.29.13 TextToFront

(6.2981 on page 6079) Sets the draw order of all text and/or dimensions in the drawing to display on top of all other entities. **Note:** To bring hatches to the back, use the HatchToBack (6.16.6) command; to bring any other entity to the front or back, use the DrawOrder (6.10.40) command.

Accessing the Command

command bar: **texttofront** menu bar: **Tools | Draw Order | Bring Text to Front Tools | Draw Order | Bring Dimensions to Front Tools | Draw Order | Bring Text and Dimensions to Front** ribbon: **Draw | Dimensions | Bring Dimensions to Front Draw | Text | Bring Text and Dimensions to Front** toolbar: **Draw Order |**  **: TextToFront Prompts you in the command bar:** Bring to front [Text/Dimensions/Both] <Both>: **(Enter an option, or press Enter to bring both texts and dimensions to front)**

Command Options

Option	Description
Text	Brings text entities only to front
Dimensions	Brings dimension entities only to front
Both	Brings both texts and dimensions to front

Related Commands

DrawOrder (6.10.40) - changes the display order of overlapping entities. DrawOrderByLayer (6.10.41) - sets draw order of overlapping objects through layer names. HatchToBack (6.16.6) - sets the draw order of all hatch entities in the drawing to display behind all other entities.

Figure 6.2655

6.29.14 Tin

(6.2673 on page 5786) Creates a topographical surface from an imported points file or placing new points.

Accessing the Command

 Commandline: **TIN** Quad: **Model | Create TIN Surface** Ribbon: **Civil | Create | TIN Surface : Tin Prompts you:** Select entities to create TIN surface or [Import from file/Place points/Create from civil 3d surface/cLip polygon]: **(Select entities or choose an option.) Cancel** By default, the TIN surface tool is set to the "Select entities" option which allows you to create a toposurface from a selection set of points and polylines.

Command Options

Option	Description
Import from file	Allows creating a toposurface from an imported points file. Displays a dialog box: Users can select multiple point files to create a TIN surface. Choose the file(s) and click Open.
Place points	Creates a toposurface by placing points. **You are prompted: Pick point: (Specify a point)**. **Enter elevation <0.000>: (Type a value or press Enter to accept the default)**. **Pick point: (Specify a point or press Enter to stop adding points)**. At least three points are needed to create a TIN surface (Triangulated Irregular Network).
Create from civil 3d surface	Creates a toposurface from a Civil 3D surface. **You are prompted**: Select a Civil 3D surface: **(Select the wanted Civil 3D surface)**.
Clip Polygon	Creates a clipped toposurface based on the polygon bounadary **You are prompted**: Select clip polygon: **(Select the closed polyline to clip)**. **You are prompted**: Remove crossed breaklines if any [Yes/No] <Yes>:

Procedures

Creating a TIN Surface from a selection set of Points and Polylines (1.26.6) Creating a TIN Surface from an imported Points file (1.26.6) Creating a TIN Surface of a selected area using Clip polygon (1.26.6) Creating a TIN Surface by placing points (1.26.6) Creating a TIN Surface from Faces (1.26.6) Creating a TIN Surface from a Point cloud (1.26.6) Creating a TIN surface from a Civil 3D surface (1.26.6)

Related Commands

TinAssingImage (6.29.15) - Assigns a raster image as a TIN surface material. TinEdit (6.29.19) - Allows to add/remove boundaries, breaklines, and points to a surface. TinExtract (6.29.18) - Creates a mesh or 3D solid between TIN surfaces or between a TIN surface and elevation or vertical offset. TinMerge (6.29.22) - Combines two or more TIN surfaces (or gradings) into a new TIN surface. TinModify (6.29.23) - Easily deforms or smoothens a selected TIN surface. TinProject (6.29.21) - Projects point-based entities, including points, blocks, and text or linear entities, including lines, polylines, and circles to a TIN surface. TinVolume (6.29.24) - Creates a TIN volume surface between a base and comparison TIN surfaces or an elevation. TinWaterDrop (6.29.25) - Draws a water drop's path from a point on a TIN surface. Grading (6.15.25) - Creates a graded surface on existing toposurfaces.

TinVolume (6.29.24) - Creates a TIN volume surface between a base and comparison TIN surfaces or an elevation. TinWaterDrop (6.29.25) - Draws a water drop's path from a point on a TIN surface. Grading (6.15.25) - Creates a graded surface on existing toposurfaces.

Figure 6.2658

6.29.16 TextScr

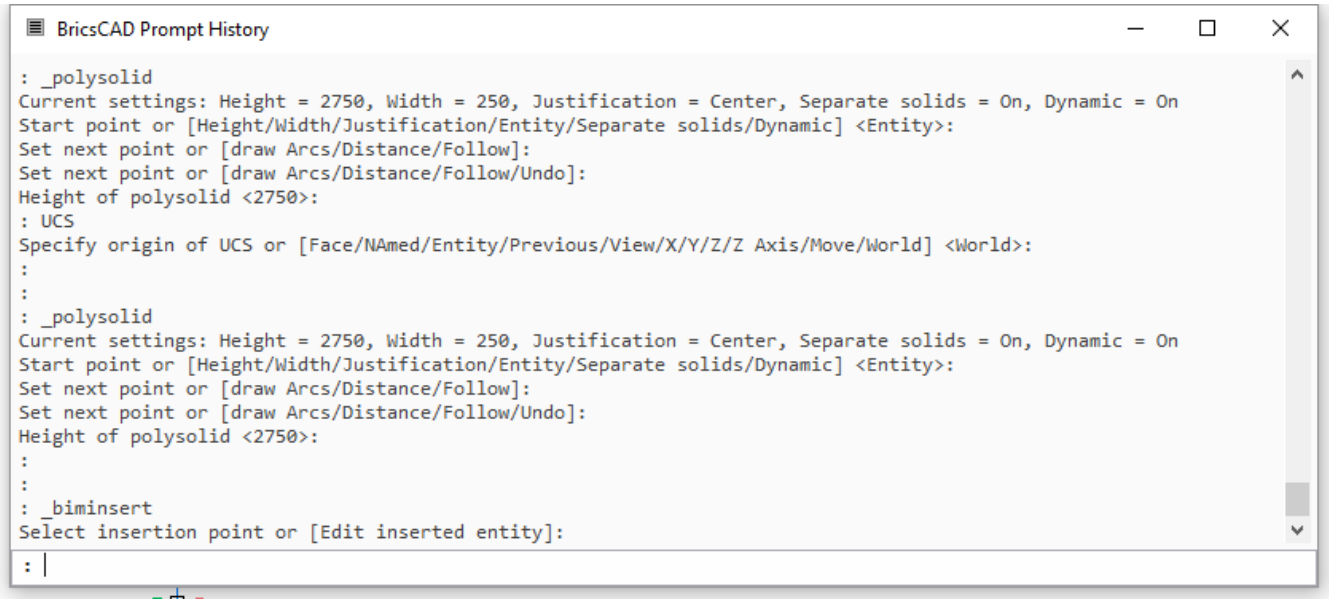
(7.3 on page 6132) Displays the Prompt History window (short for "text screen"); this window displays the last 256 lines of command and prompt text. **Note:** To display greater or fewer lines of command history, change the value of the ScrlHist variable.

Accessing the Command

command bar: **textscr** transparent: **'textscr** shortcut: **F2** menu bar: **View | Prompt History Window : TextScr** Displays window: (6.2659 on the following page) To close the window:

- Click the **X** in upper right corner
- Press the **F2** function key
- Enter the GraphScr (6.15.22) command

Figure 6.2659

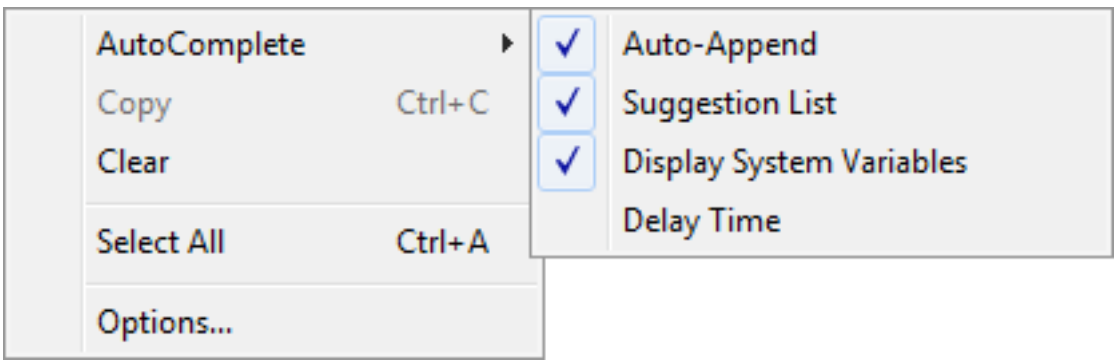


Shortcut Menu Options

Right-click the Prompt History window for the following shortcut menu: (6.2660)

Option	Description
AutoComplete	Sets the autocomplete options; see the AutoComplete (6.4.39) command
Copy	Copies selected text to the Clipboard: 1. Select text by highlighting with the mouse, or else using the **Select All** option 2. Choose the **Copy** option
Clear	Clears the history, after you answer **Yes** to the warning dialog box. **Caution**: this option clears the history from all open drawings.
Select All	Selects all of the text in the history window; useful before using teh Copy command
Paste	Pastes text in the Command Bar. This option is available only when the Clipboard contains text.
Options	Displays the Display Section of the Options dialog box: **Scroll History** - specifies the number of lines of text to remember

Figure 6.2660



Related Commands

AutoComplete (6.4.39) - sets the command line autocomplete mode. CommandLine (6.9.25) - displays the command bar. CommandLineHide (6.9.21) - hides the command bar. GraphScr (6.15.22) - brings the graphics window to the foreground.

Figure 6.2661

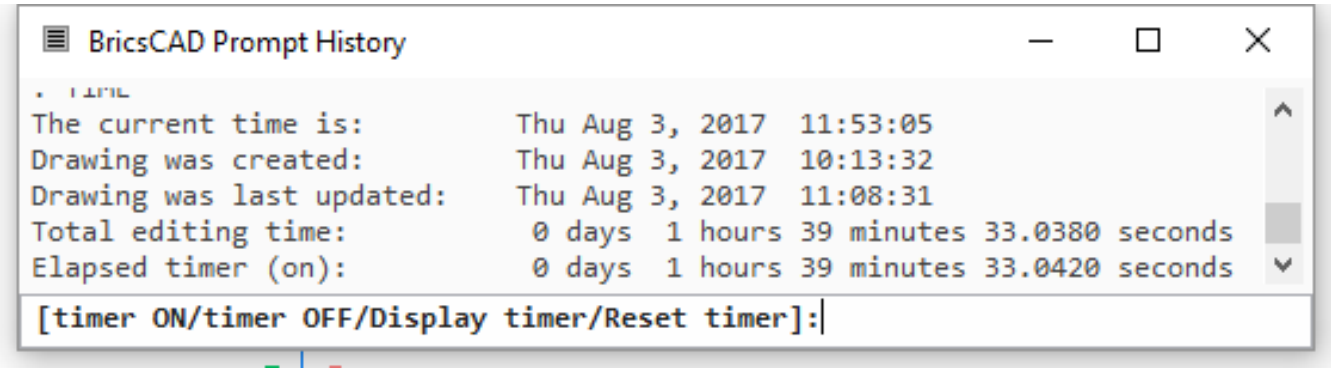
6.29.17 Time

(6.2981 on page 6079) Reports on time in the drawing.

Accessing the Command

command bar: **time** transparent: **'time** alias: **ti** menu bar: **Tools | Time Variables** ribbon: **Tools | Inquiry | Time Variables** toolbar: **Inquiry |**  **: Time** Reports the time in the Prompt History window: (6.2662) **Then prompts you:** [timer ON/timer OFF/Display timer/Reset timer]: **(Enter an option, or else press Enter to exit the command)** Press the F2 function key to close the Prompt History window. This command relies on the accuracy of the computer's built-in clock.

Figure 6.2662



Command Options

Option	Description
timer ON	Turns on the user timer. This can be used to time operations in BricsCAD.
timer OFF	Turns off the user timer.
Display timer	Displays the time again. Updates the time.
Reset timer	Sets the user timer to zero.

Related Command

Status (6.27.60) - reports the status of the drawing.

Figure 6.2663

6.29.18 TinExtract

(6.2673 on page 5786) Creates a mesh or 3D solid between TIN surfaces or between a TIN surface and elevation or vertical offset.

Accessing the Command

Commandline: **TINEXTRACT** Ribbon: **Civil | Utilities | Extract from TIN : TinExtract Prompts you:** Select TIN surface: **(Select the topo surface.)** Enter vertical offset or select [between Surfaces/Elevation] <1>: **(Enter an offset or choose an option)** Extract [Mesh/Solid/Points/Faces/Contours/Border] <Mesh>: **(Choose what you want to extract)**

Command Options

Option	Description
Mesh	It creates a mesh as an offset, between surfaces or as an elevation. You are prompted: **Enter vertical offset or select [between Surfaces/Elevation] <1>: (Enter an offset or choose an option.)** • **Vertical offset:** Creates a mesh as a vertical offset above the TIN surface • **Between Surfaces:** Creates a mesh between the TIN surfaces • **Elevation:** Creates a mesh vertically from a TIN surface to a fixed elevation height.
Solid	It creates a solid as an offset, between surfaces or as an elevation. You are prompted: **Enter vertical offset or select [between Surfaces/Elevation] <1>: (Enter an offset or choose an option.)** • **Vertical offset:** Creates a solid as a vertical offset above the TIN surface • **Between Surfaces:** Creates a solid between the TIN surfaces • **Elevation:** Creates a solid vertically from a TIN surface to a fixed elevation height.
Points	It creates points on the surface.
Faces	It creates the triangular faces of the surface.
Contours	It creates the contours of the surface. You are prompted: **Enter contour elevation or [Minor/Major/All] <0>: (Choose the elevation of the contours.)**
Border	It creates the outer boundary of the surface.

Procedures

Creating a solid from a TIN surface using option Elevation (1.26.9) Creating Points from a TIN surface (1.26.9) Creating Faces from a TIN surface (1.26.9) Creating Contours from a TIN surface (1.26.9) Creating a Border from a TIN surface (1.26.9)

Related Commands

Tin (6.29.14) - Creates a topographical surface from an imported points file, or placing new points. TinAssignImage (6.29.15) - Assigns a raster image as a TIN surface material. TinEdit (6.29.19) - Allows adding/remove boundaries, breaklines, and points to a surface. TinMerge (6.29.22) - Combines two or more TIN surfaces (or gradings) into a new TIN surface. TinModify (6.29.23) - Easily deforms or smoothens a selected TIN surface. TinProject (6.29.21) - Projects point-based entities, including points, blocks, and text or linear entities, including lines, polylines, and circles to a TIN surface. TinVolume (6.29.24) - Creates a TIN volume surface between a base and comparison TIN surfaces or an elevation. TinWaterDrop (6.29.25) - Draws a water drop's path from a point on a TIN surface. Grading (6.15.25) - Creates a graded surface on existing toposurfaces.

Shape Classic Pro Platinum Mechanical BIM

6.29.19 TinEdit

(6.2673 on page 5786) Allows adding/remove boundaries, breaklines, and points to a surface.

Accessing the Command

 Commandline: **TINEDIT** Ribbon: **Civil | Modify | Edit TIN Surface : TinEdit Prompts you:** Select TIN surface: **(Select the toposurface.)** Pick points to add to the TIN surface or [Add Points/Add Breaklines/Add bOundaries/Remove Points/Remove Breaklines/Remove bOundaries/CLip]: **(Pick points manually or choose an option.)**

Command Options

Option	Description
Add Points	Sets points to a toposurface. **You are prompted:** Select entities: **(Select the entities and press Enter.)**
Add Breaklines	Sets breaklines to a toposurface. **You are prompted:** Select entities: **(Select the entities and press Enter.)**
Add bOundaries	Sets boundaries to a toposurface. **You are prompted:** Select entities for boundary of type: [Outer/Show/Hide] <Outer>: **(Choose an option)** select the bounding entity, and press Enter. • **Outer:** Creates an outer surface boundary. • **Show:** Shows the surface boundary. • **Hide:** Hides the surface boundary.
Remove Points	Deletes points from a surface.
Remove Breaklines	Deletes breaklines from a surface.
Remove bOundaries	Deletes boundaries from a surface.
CLip	Clips existing TIN Surface in the drawing. You are prompted: **Select clip polygon [selection options (?)]: (select a polygon as clipping boundary for the surface.)** You are prompted: **Remove crossed breaklines if any [Yes/No] <Yes>: (choose if you want the polygonal breaklines to be removed or not.)**

Procedures

Adding points to a Toposurface (1.26.8) Adding breaklines to a Toposurface (1.26.8) Adding boundaries to a Toposurface (1.26.8)

Related Commands

Tin (6.29.14) - Creates a topographical surface from an imported points file or placing new points. TinAssingImage (6.29.15) - Assigns a raster image as a TIN surface material. TinExtract (6.29.18) - Creates a mesh or 3D solid between TIN surfaces or between a TIN surface and elevation or vertical offset. TinVolume (6.29.24) - Creates a TIN volume surface between a base and comparison TIN surfaces or an elevation. TinWaterDrop (6.29.25) - Draws a water drop's path from a point on a TIN surface. Grading (6.15.25) - Creates a graded surface on existing toposurfaces.

Figure 6.2665

6.29.20 TInsert

(6.2981 on page 6079) Inserts blocks into the cell of a table (short for "table insert").

Accessing the Command

command bar: **tinsert** menu bar: **Insert | Insert block in cell : TInsert Prompts you in the command bar:** Pick table cell: **(Chose a cell in a table)** Displays a dialog box see below.

1. Choose a block.
2. Click **OK**. The program displays the Table toolbar; see the TableMod (6.29.5) command.
3. Choose options in the toolbar, such as inserting more blocks in the same and other cells.
4. Press **Esc** twice to end the command.

Command Options

Option	Description
Pick table cell	Choose any cell in a table.

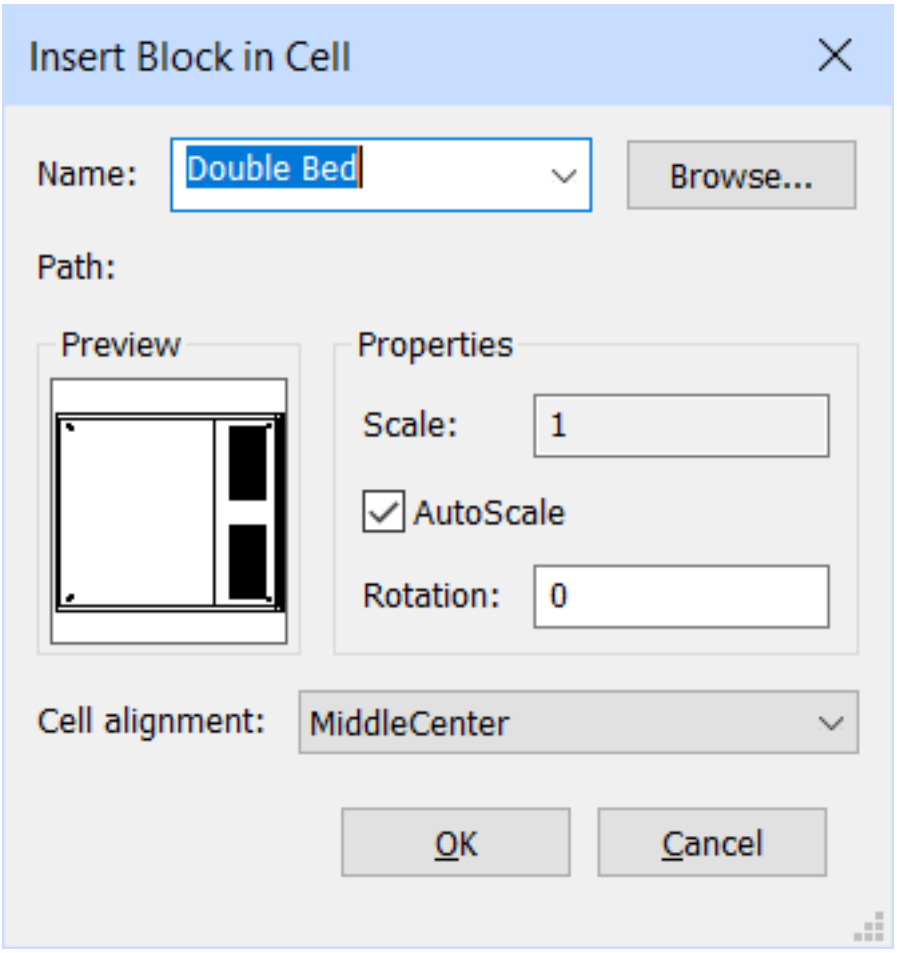
Dialog Box Options

(6.2666 on page 5777)

Option	Description
Name	Specifies the name of the block or drawing to insert. • To insert a block: 1. Click the droplist 2. Choose the name of a block already defined in the drawing • To insert a drawing: 1. Click **Browse**. 2. In the Open Drawing File dialog box, choose a folder 3. From the **Files of Type** droplist, choose the file format, DWG or DXF 4. Select a drawing file 5. Click **Open** When the cell is small, the block or drawing may be barely perceptible. You may need to increase the size of the row or column to accommodate the blocks. A cell can hold text and one or more blocks. When a 3D model is pasted into the cell, the 2D planview is displayed: (6.2667 on page 5778)

Properties	Determines the size of the block in the cell: **Scale** - specifies the size of the block (unavailable when AutoScale is turned on): • Numbers larger than 1.0 make the block larger • **1** - inserts the block at its actual size • Numbers smaller than 1.0 make the block smaller • Negative numbers flip the block upside down **AutoScale** - size the block to fit the cell: • **On** - the block is resized to fit the cell • **Off** - the cell is resized to fit the block **Rotation** - rotate the block about its center point (and not its insertion point); enter an angle: • Positive numbers rotate the block counter clockwise • **0** - does not rotate the block • Negative numbers rotate the block clockwise
Cell Alignment	Aligns the block in the cell: (6.2668 on page 5779) 1. Click the droplist 2. Choose a justification mode
OK	Exits the dialog box, inserts the block, and returns to the Table toolbar

Figure 6.2666



Related Commands

Table (6.29.2) - creates a table entity in the drawing through a dialog box. Tablemod (6.29.5) - modifies the properties of a selection of table cells. Tabledit (6.29.3) - edits the cell content. TableExport (6.29.4) - exports the content of a table entity in CSV file format. TableStyle (6.29.6) - creates and edits table styles through the Drawing Explorer - Table Styles dialog box.

Procedures

Projecting entities to TIN surface (1.26.6)

Related Commands

Tin (6.29.14) - Creates a topographical surface from an imported points file or placing new points. TinAssingImage (6.29.15) - Assigns a raster image as a TIN surface material. TinEdit (6.29.19) - Allows to add/remove boundaries, breaklines, and points to a surface. TinExtract (6.29.18) - Creates a mesh or 3D solid between TIN surfaces or between a TIN surface and elevation or vertical offset. TinMerge (6.29.22) - Combines two or more TIN surfaces (or gradings) into a new TIN surface. TinModify (6.29.23) - Easily deforms or smoothens a selected TIN surface. TinVolume (6.29.24) - Creates a TIN volume surface between a base and comparison TIN surfaces or an elevation. TinWaterDrop (6.29.25) - Draws a water drop's path from a point on a TIN surface. Grading (6.15.25) - Creates a graded surface on existing toposurfaces.

Figure 6.2671

6.29.22 TinMerge

(6.2673 on page 5786) Combines two or more TIN surfaces (or gradings) into a new TIN surface.

Accessing the Command

Commandline: **TINMERGE** Ribbon: **Civil | Modify | Merge TIN Surfaces : TinMerge Prompts you:** Select base TIN surface: **(Select the base topo surface.)** Select TIN surfaces to merge: **(Select the top surfaces you want to merge with the base topo surface.)** Remove merged TIN surfaces [Yes/No] <No>: **(Press ENTER to merge the surfaces without removing the original surfaces, Press Y to remove the original entities)**

Procedures

Merging TIN Surfaces (1.26.9)

Related Commands

Tin (6.29.14) - Creates a topographical surface from an imported points file or placing new points. TinAssingImage (6.29.15) - Assigns a raster image as a TIN surface material. TinEdit (6.29.19) - Allows to add/remove boundaries, breaklines, and points to a surface. TinExtract (6.29.18) - Creates a mesh or 3D solid between TIN surfaces or between a TIN surface and elevation or vertical offset. TinModify (6.29.23) - Easily deforms or smoothens a selected TIN surface. TinProject (6.29.21) - Projects point-based entities, including points, blocks, and text or linear entities, including lines, polylines, and circles to a TIN surface. TinVolume (6.29.24) - Creates a TIN volume surface between a base and comparison TIN surfaces or an elevation. TinWaterDrop (6.29.25) - Draws a water drop's path from a point on a TIN surface. Grading (6.15.25) - Creates a graded surface on existing toposurfaces.

Figure 6.2672

6.29.23 TinModify

(6.2673 on page 5786) Easily deforms or smoothens a selected TIN surface.

Accessing the Command

 Commandline: **TINMODIFY** Ribbon: **Civil | Modify | Modify TIN Surface : TinModify Prompts you:** Select TIN surface: **(Select the topo surface.)** Select modification method [Deform/Smoothen] <Deform>: **(Choose an option.)**

Command Options

Option	Description

Deform	Modifies the selected TIN surface or creates the deformable part as a new TIN surface. You are prompted: Enter radius or [specify Contour/select Entity/draw Polygon] <10>: **(Choose an option.)** • **Enter radius: (Enter a radius for the deformation.)** You are Prompted: Specify the location to deform or [Radius]: **(Choose a location where you want the deformation.)** Set elevation or select deformation method [Cosine/Sine] <Cosine>: **(Enter the wanted elevation or enter C or S for respectively a cosine or a sine deformation method.)** Modify existing or [create New/Existing] <Existing>: **(Press ENTER to modify the surface or press N to first add a new modification)** • **specify Contour:** Creates a deformation with a contour. You are prompted: Pick contour location: **(Pick a contour for the deformation.)** Modify existing or [create New/Existing] <Existing>: **(Press ENTER to modify the surface or press N to first add a new modification)** • **select Entity:** Creates a deformation with an elevated entity. You are prompted: Select closed entity: **(Select a closed entity for the deformation.)** Enter offset distance <1>: **(Enter an offset distance.)** Specify the location to deform: **(Choose a location where you want the deformation.)** Set elevation or [Balanced]: **(Enter the wanted elevation or enter B to specify net volume (net volume=fill-cut) when creating surface deformation.)** Modify existing or [create New/Existing] <Existing>: **(Press ENTER to modify the surface or press N to first add a new modification)** • **draw Polygon:** Creates a deformation with an elevated polygon. You are prompted: Pick point <ENTER to close polygon>: **(Pick points for a polygon and press ENTER to close the polygon.)** Enter offset distance: **(Enter an offset distance.)** Specify the location to deform: **(Choose a location where you want the deformation.)** Set elevation or [Balanced]: **(Enter the wanted elevation or enter B to specify net volume (net volume=fill-cut) when creating surface deformation.)** Modify existing or [create New/Existing] <Existing>: **(Press ENTER to modify the surface or press N to first add a new modification)**

Smoothen	You are prompted: Enter radius or [select Entity/draw Polygon] <10>: **(Choose an option.)** • **Enter radius: (Enter a radius for the smoothening.)** You are prompted: Select location to smoothen or [Radius]: **(Choose a location where you want the smoothening.)** • **select Entity:** Smoothens the surface part between the boundaries of an entity. You are prompted: Select closed entity: **(Select a closed entity for the smoothening.)** Select location to smoothen: **(Choose a location where you want the smoothening.)** • **draw Polygon:** Smoothens the surface part between the boundaries of a polygon. You are prompted: Pick point <ENTER to close polygon>: **(Pick points for a polygon and press ENTER to close the polygon.)** Select location to smoothen: **(Choose a location where you want the smoothening.)**

Procedures

Adding deformations on a TIN Surface using Radius (1.26.9) Adding deformations on a TIN Surface using specify Contour (1.26.9) Adding deformations on a TIN Surface using select Entity (1.26.9) Adding deformations on a TIN Surface using draw Polygon (1.26.9) Smoothening a TIN Surface (1.26.9)

Related Commands

Tin (6.29.14) - Creates a topographical surface from an imported points file, or placing new points. TinAssignImage (6.29.15) - Assigns a raster image as a TIN surface material. TinEdit (6.29.19) - Allows to add/remove boundaries, breaklines, and points to a surface. TinExtract (6.29.18) - Creates a mesh or 3D solid between TIN surfaces or between a TIN surface and elevation or vertical offset. TinMerge (6.29.22) - Combines two or more TIN surfaces (or gradings) into a new TIN surface. TinProject (6.29.21) - Projects point-based entities, including points, blocks, and text or linear entities, including lines, polylines, and circles to a TIN surface. TinVolume (6.29.24) - Creates a TIN volume surface between a base and comparison TIN surfaces or an elevation. TinWaterDrop (6.29.25) - Draws a water drop's path from a point on a TIN surface. Grading (6.15.25) - Creates a graded surface on existing toposurfaces.

Figure 6.2673

6.29.24 TinVolume

(6.2673) It creates a TIN volume surface between a base and comparison TIN surfaces or an elevation.

Accessing the Command

Commandline: **TINVOLUME** Ribbon: **Civil | Create | TIN Volume Surface : TinVolume Prompts you:** Select base TIN surface: **(Select the base topo surface.)** Select comparison TIN surface or [Elevation]: **(Choose an option.)**

Command Options

Option	Description
Select comparison TIN surface	It creates a TIN volume surface between a base and comparison TIN surfaces. **You are prompted:** Select bounding area: **(Select a bounding area for the Tin volume surface.)**
Elevation	It creates a TIN volume surface between a base and an elevation. **You are prompted:** Enter elevation <0.000000>: **(Enter the wanted elevation.)** Select bounding area: **(Select a bounding area for the TIN volume surface.)**

Settings

When the **TIN Volume Surface associativity** option of the **Civil / Associativity** user preference is set, TIN volume surfaces automatically rebuild when their source surfaces change.

Procedures

Creating a TIN Volume (1.26.11)

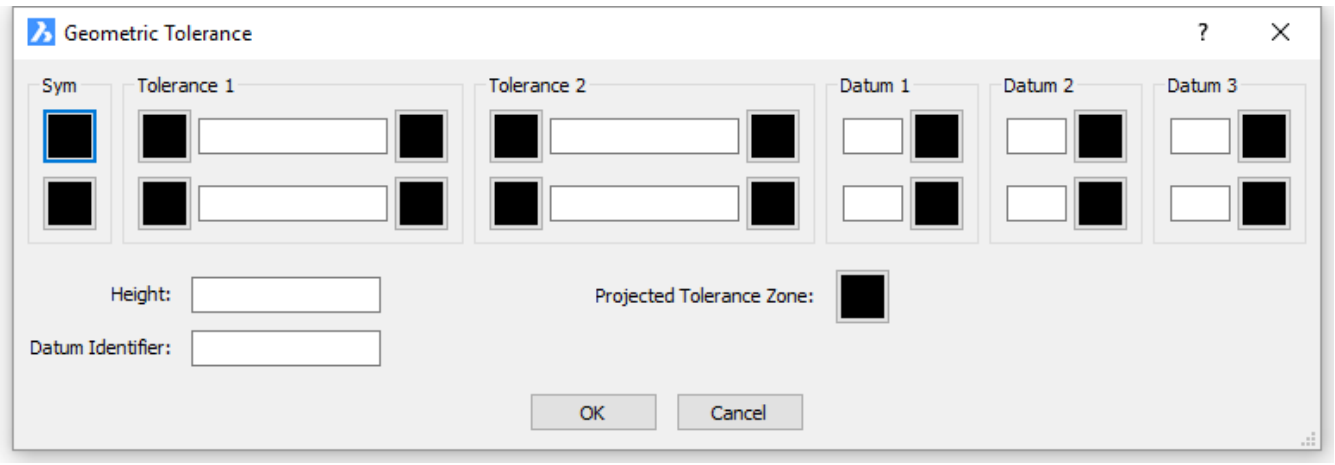
6.29.26 Tolerance

(6.2981 on page 6079) Places tolerance symbols in drawings. (6.2676) **Note:** Tolerance symbols are also placed by the QLeader (6.25.3) command.

Accessing the Command

command bar: **tolerance** alias: **tol** menu bar: **Dimensions | Tolerance** ribbon: **Draw | Dimensions | Tolerance** toolbar: **Dimensions |** **: Tolerance** Displays a dialog box: (6.2677) Select one or more tolerance symbols and enter values, and then click OK. Prompts you in the command bar: Select location for tolerance: **(Specifies the insertion point for the tolerance symbol)**

Figure 6.2677



Geometric Tolerance Dialog Box Options

Option	Description
Symbol	Inserts a tolerance symbol; displays dialog box: (6.2679 on page 5791) 1. Choose a symbol 2. Click **OK** 3. Repeat to add more symbols
Tolerance 1 **and** Tolerance 2	Specifies tolerance specification: (6.2680 on page 5792) • **Diameter** - toggles the diameter symbol • **Value** - specifies the tolerance value • **Material condition** - displays dialog box when clicked: (6.2681 on page 5792)
Datum 1, Datum 2, **and** Datum 3	Specifies the datum reference: (6.2682 on page 5792) • **Value** - specifies the datum value. • **Material condition** - click to display the Material Condition dialog box.
Height	Specifies the height of the tolerance symbols.
Datum Identifier	Specifies datum indentifier, such as Datum A.
 Projected Tolerance Zone	Toggles the projected tolerance zone symbol

Tolerance Symbols

Symbol	Characteristic	Type
	Position	Location
	Concentricity or Coaxiality	Location
	Symmetry	Location
	Parallelism	Orientation
	Perpendicularity	Orientation
	Angularity	Orientation
	Cylindricity	Form
	Flatness	Form

	Circularity or Roundness	Form
	Straightness	Form
	Profile of a surface	Profile
	Profile of a line	Profile
	Circular Run-out	Run-out
	Total Run-out	Run-out

Material Condition Symbols

Symbol	Definition
	At maximum material condition (MMC), a feature contains the maximum amount of material stated in the limits.
	At least material condition (LMC), a feature contains the minimum amount of material stated in the limits.
	Regardless of feature size (RFS) indicates that the feature can be any size within the stated limits.

Grips Editing

Tolerances can be edited directly through grips:

1. Select the tolerance. Notice that it has one grip.
2. Drag the grip to move the tolerance.

(6.2678)

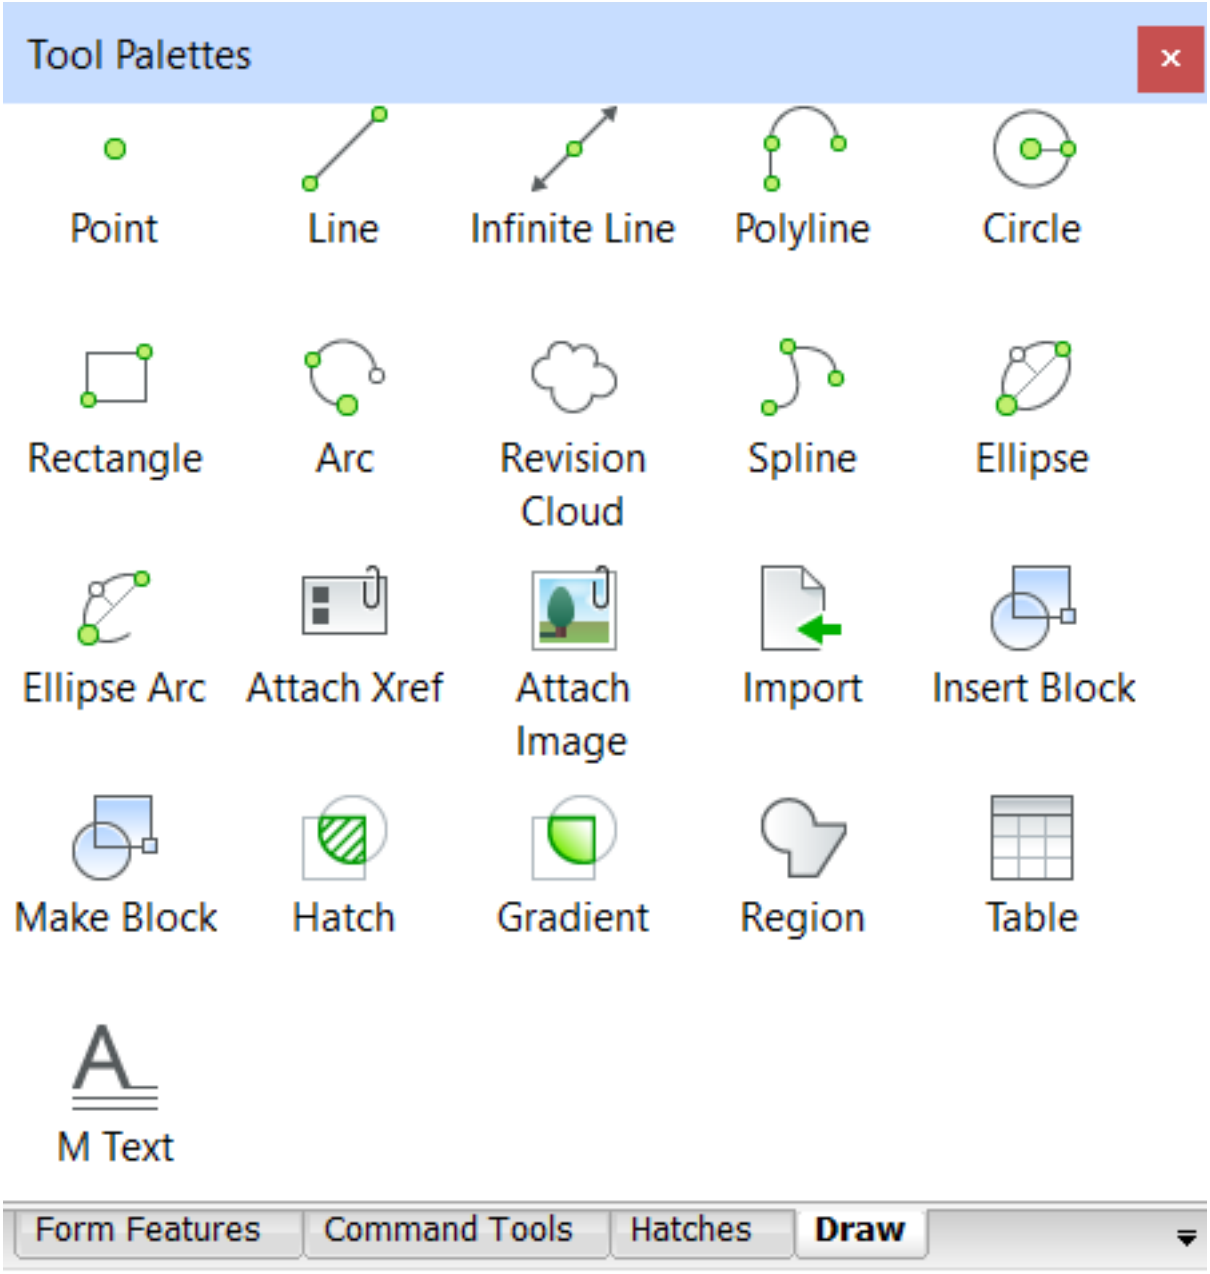
6.29.28 ToolPalettes

(6.2981 on page 6079) Opens the Tool Palettes panel.

Accessing the Command

command bar: **toolpalettes** context menu: right-click a toolbar or the ribbon, and then choose **Tool Palettes : ToolPalettes** Displays the Tool Palettes panel: (6.2686 on the next page) Drag an icon from the panel into the drawing.

Figure 6.2686

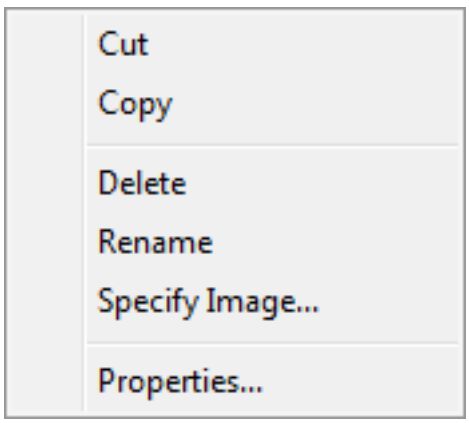


Icon Context Menu Options

Right-click an icon to see this context menu: (6.2687)

Option	Description
Cut	Removes the icon and places it in the Clipboard; to paste, right-click a blank area of a palette
Copy	Copies the icon and places it in the Clipboard; to paste, right-click a blank area of a palette
Delete	Removes the icon and its content from the palette
Rename	Renames the icon
Specify Image	Replaces the icon with a raster image in one of the following formats: • BMP • GIF • JPEG and JPG • PNG • TIFF 1. Opens the Select Image File dialog box; choose a file 2. Click **Open**
Properties	Displays the Tool Properties dialog box; the content varies according to the type of tool selected; see below

Figure 6.2687

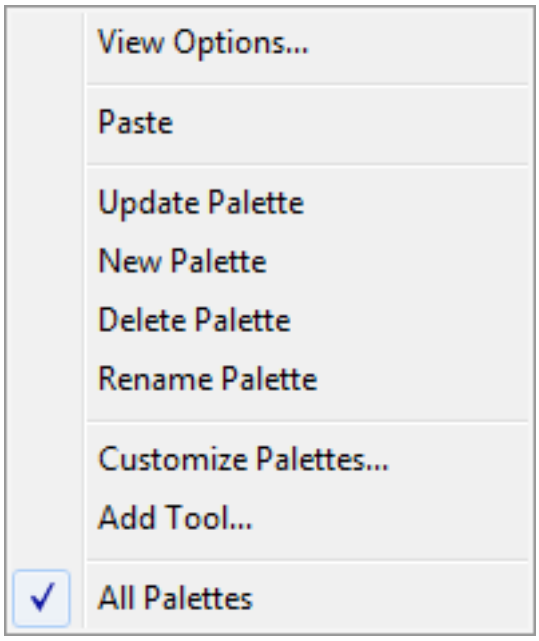


Palette Context Menu Options

Right-click a blank part of a palette to see this context menu: (6.2688 on the next page)

Option	Description
View Options	Displays the View Options dialog box for determining how the icons are displayed by the palette; see below
Paste	Pastes the content of the Clipboard, when the Cut or Copy options were used previously to copy an icon and its content to the Clipboard; does not paste any other kind of content
Update Palette	Refreshes icons
New Palette	Creates a new, blank palette
Delete Palette	Removes the current palette, after you acquiesce to a warning dialog box
Rename Palette	Renames the current palette; enter a new name: (6.2692 on page 5806)
Customize Palettes	Determines which palettes are loaded into the program, and which ones are part of a group; displays the Customize dialog box, which has nothing to do with the other Customize dialog box; see below.
Add Tool	Displays the Workspaces tab of the real Customize dialog box
All Palettes	Toggles the display of all palettes: • **On** - displays all palettes • **Off** - displays only those palettes that are part of a group

Figure 6.2688

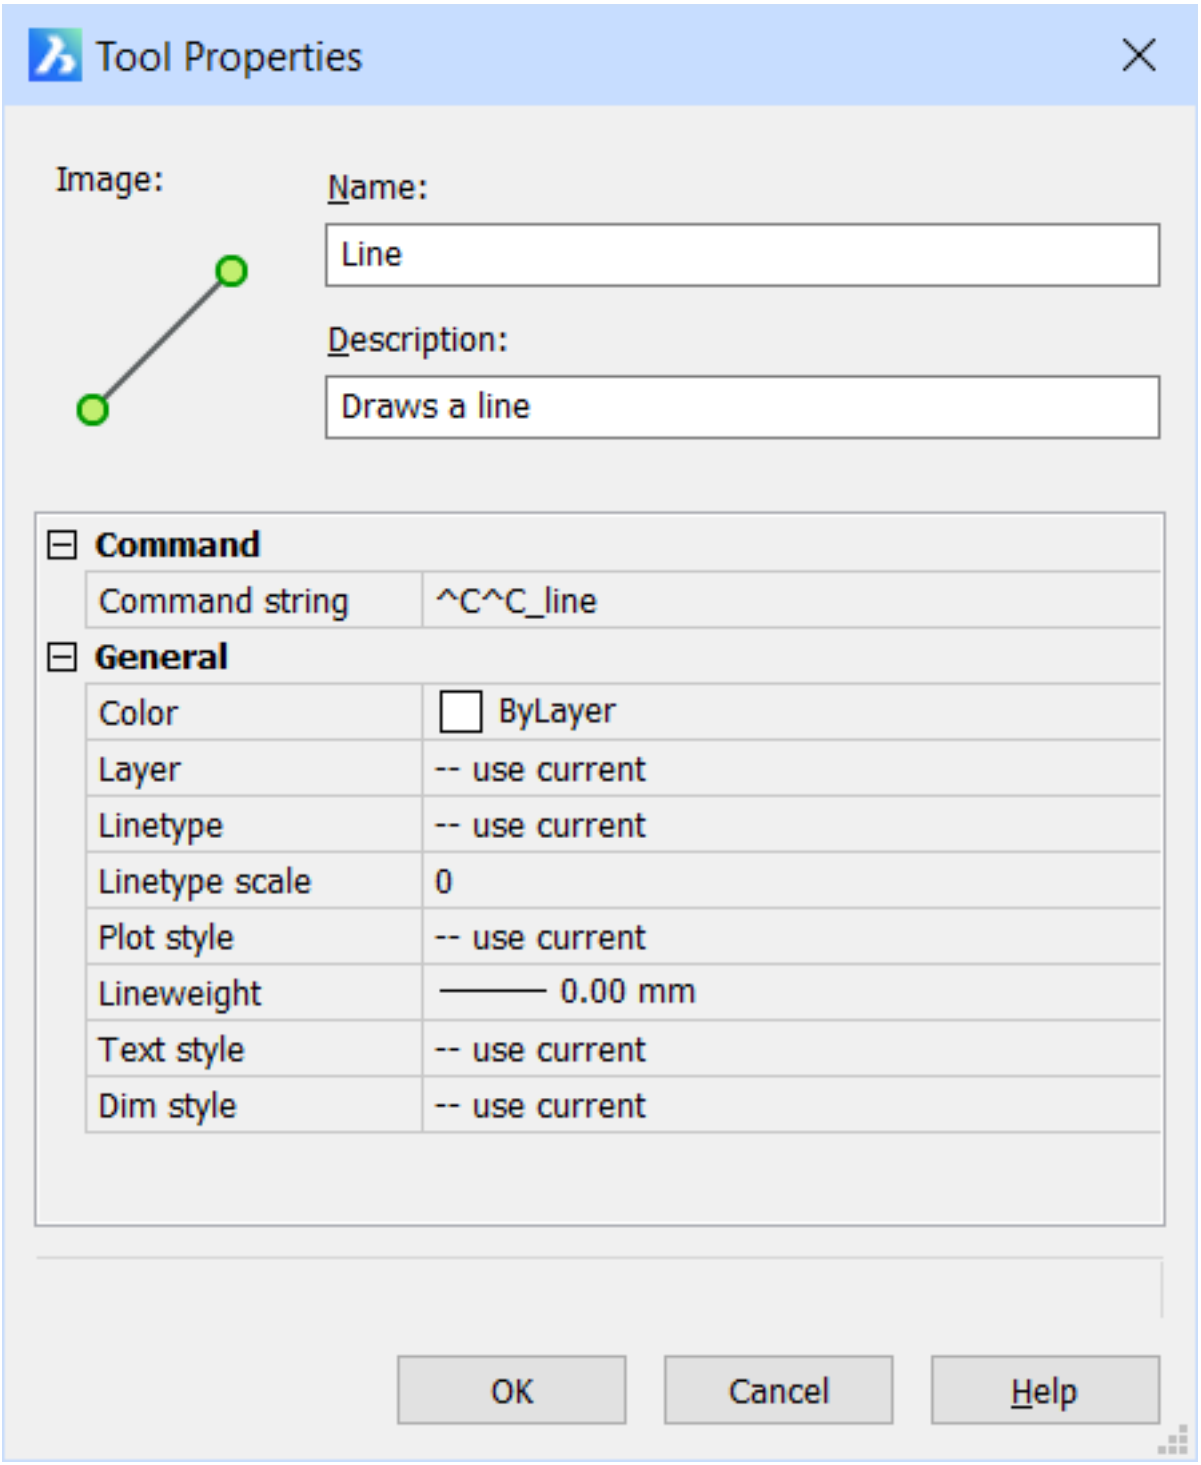


Properties Dialog Box

To access this dialog box, right-click an icon and then choose **Properties**: (6.2689 on the next page)

Option	Description
Name	Names the icon
Description	Describes the function of the icon
Command String	Specifies the macro to run when you click the icon; you can use any macro characters used for menus and toolbar buttons
General	Specifies the properties of the entity; the properties vary, depending on the tool

Figure 6.2689

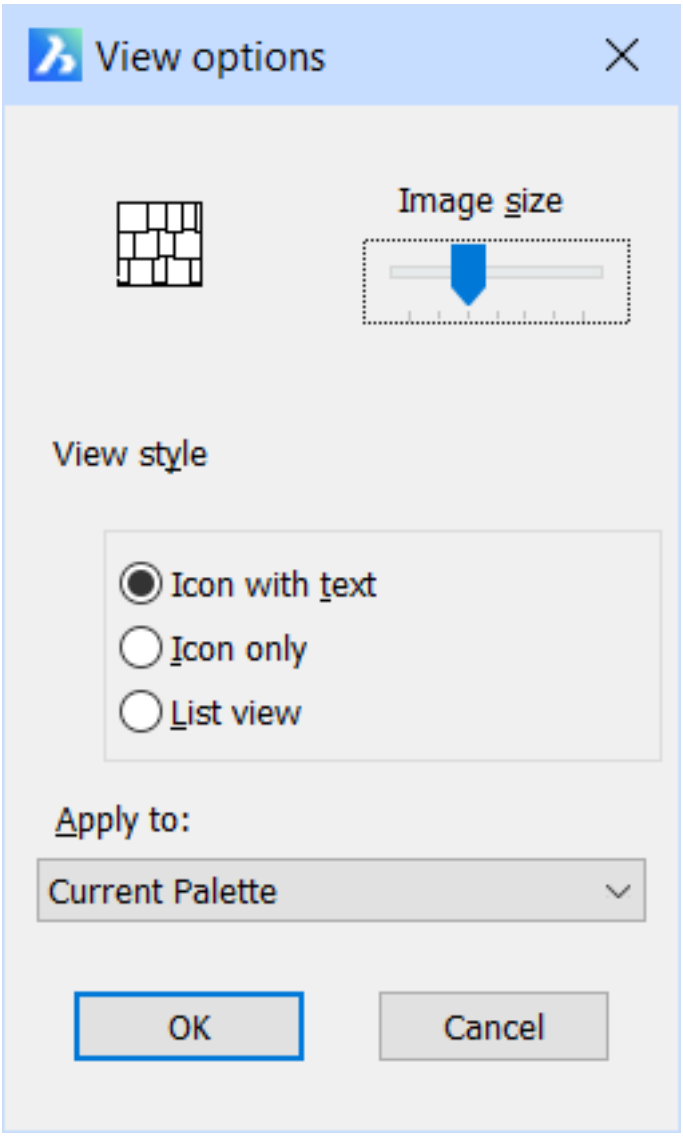


View Options Dialog Box

To access this dialog box, right-click a blank area and then choose **View Options**: (6.2690 on the following page)

Option	Description
Image Size	Specifies the size of the icons; drag the slider to make them larger and smaller
View Style	Determines how the icons and accompanying text are displayed • **Icon with text** - display icons with text • **Icon only** - display only icons, to save space • **List view** - display small icons with text in a list, as shown below: (6.2693 on page 5807)
Apply To	Determines which palettes the changes should apply to: • **Current palette** - applies the change(s) to all icon on the current palette • **All palettes** - applies the changes to all palettes

Figure 6.2690

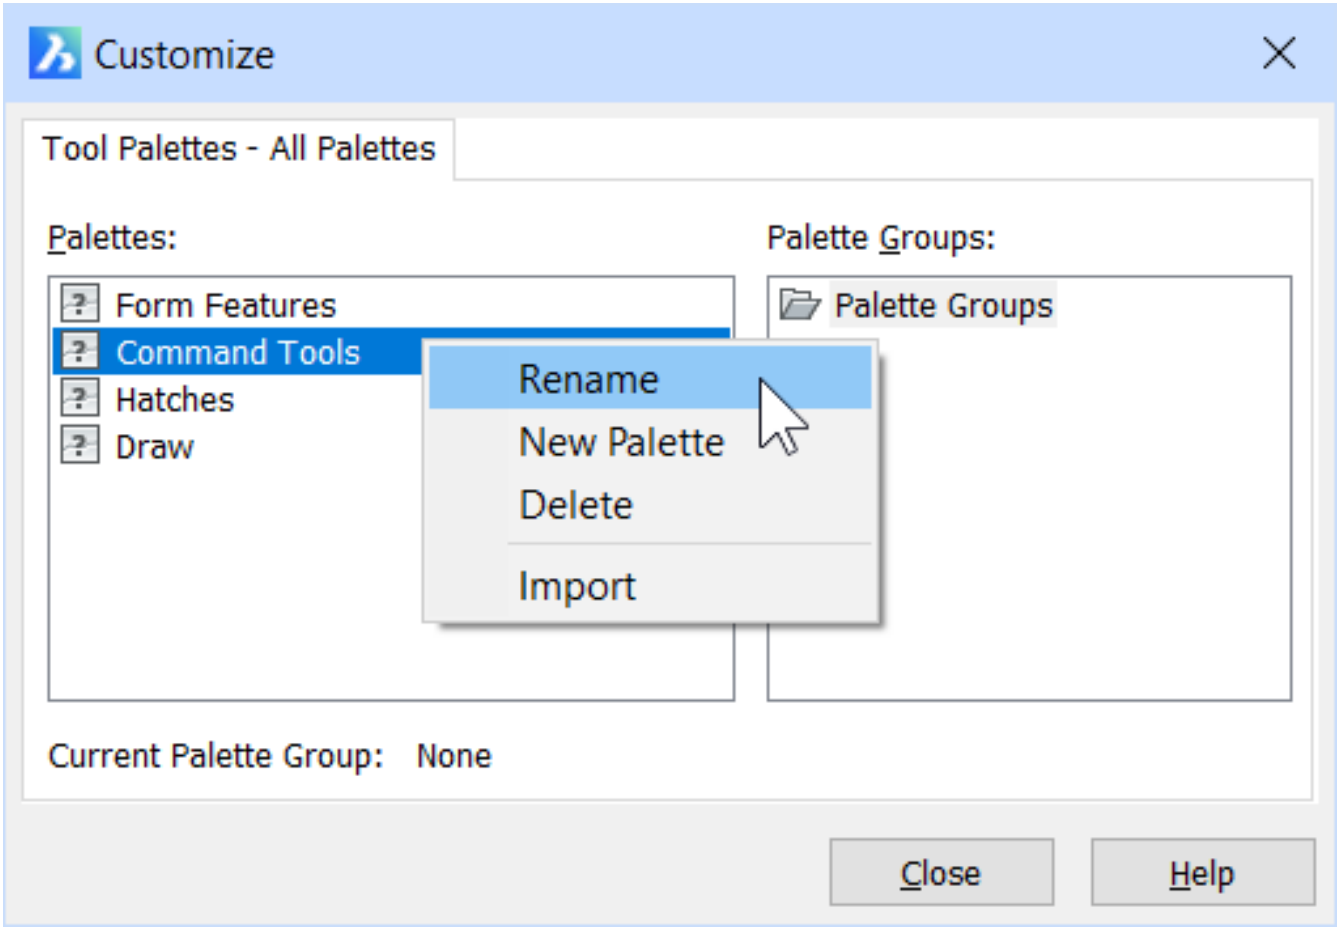


Customize Dialog Box

To access this dialog box, right-click a blank area and then choose **Customize**: (6.2691 on the following page) To add a palette to a group, drag it form the Palettes pane to the Palette Groups pane. Once in a group, you can turn groups of palettes on and off by turning the associated group on and off.

Option	Description
Rename	Renames the palette
New Palette	Creates a new, blank palette
Delete	Removes the palette
Import	Imports tool palettes in the following formats: • **XTP** - XML-format files • **BTC** - BricsCAD tool palette format • **ATC** - AutoCAD tool palette format To export a palette, follow these steps: 1. Create a new group 2. Add one or more palettes to a group 3. You could rename the group "Export" 4. Right-click the group, and then choose **Export**

Figure 6.2691



Procedures

- To set the view options (1.17.7)
- Adding a new tool palette (1.17.7)
- To open the customize dialog box (1.17.7)
- Importing a tool palette (1.17.7)
- Working with tool palette groups (1.17.7)
- To rename a tool palette (1.17.7)
- To delete a tool palette (1.17.7)
- Adding a hatch pattern (1.17.7)
- Adding a block (1.17.7)
- Adding a command (1.17.7)

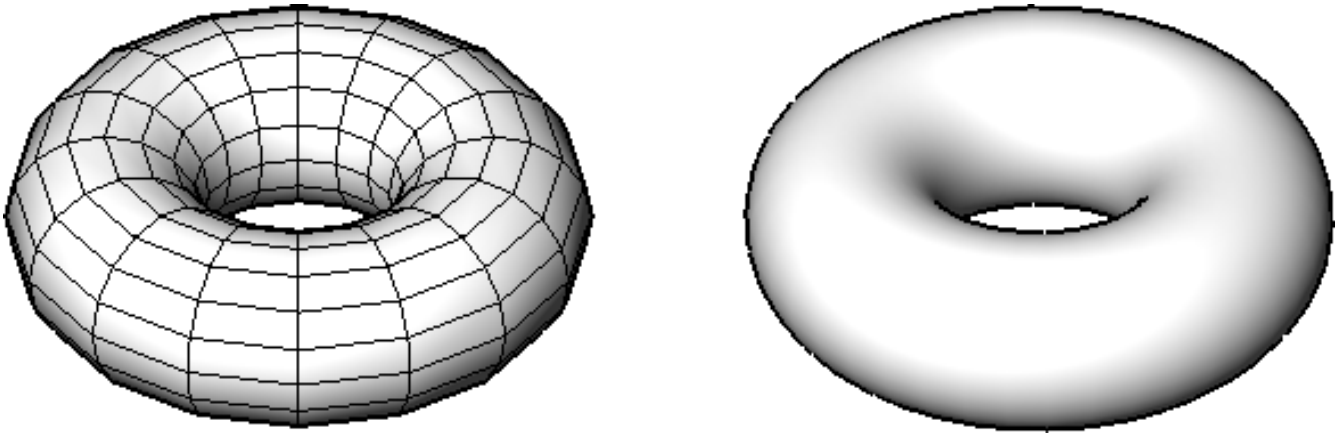
Figure 6.2695



6.29.29 Torus

(7.3 on page 6132) Draw a torus (donut shape):

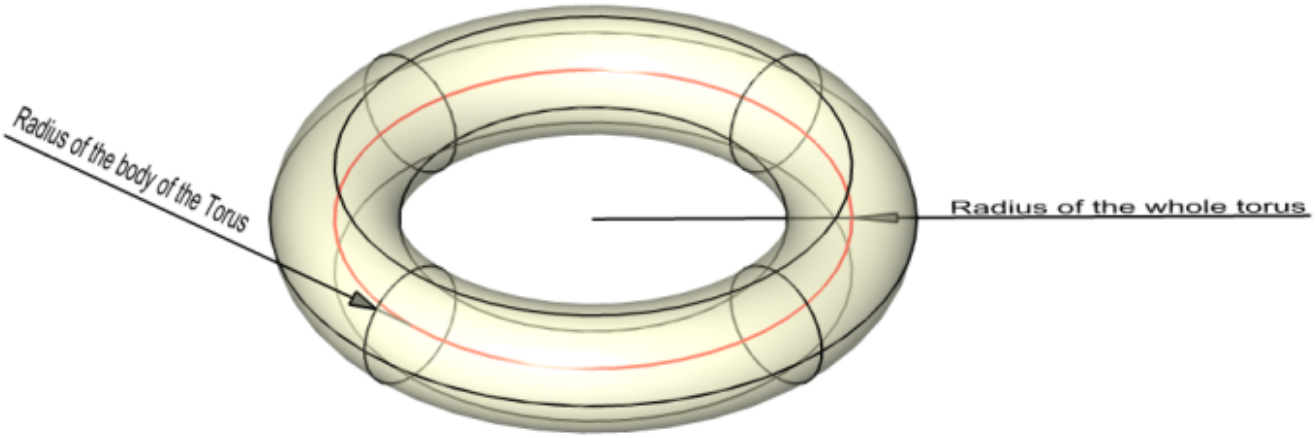
- Classic: torus is drawn from a 3D polyface mesh (left).
- Other license levels is drawn as a 3D solid (right).

(6.2695)

Accessing the Command

 command bar: **torus** menu bar: **Model| 3D Solids | Torus** ribbon: **Solid | Create | Primitive | Torus** toolbar: **3D Solids |**  **: Torus Prompts you in the command bar:** Center of whole torus: <0,0,0> **(Pick a point, or enter x,y,z coordinates.)** Set Radius of whole torus or [Diameter]: **(Specify the outer radius, or press D)** Set radius of body of torus [Diameter]: **(Specify the tube radius, or type D)** (6.2696)

Figure 6.2696



Command Options

Option	Description
Center of whole torus	Specifies the center of the torus: • Pick a point in the drawing • Enter x,y,z coordiantes • Press **Enter** to accept the default coordinates
Radius of whole torus	Specifies the overall radius of the torus; note that the distance is measured from the center of the tube (body).
Radius of body of torus	Specifies the radius of the torus body, or tube. It is not necessary for the body radius to be smaller than the whole radius.
Diameter	Specifies the diameters of the whole torus and/or body.

Related Commands

Box (6.6.18) - creates 3D boxes as solid models. Cone (6.9.46) - creates 3D cones as solid models. Cylinder (6.9.49) - creates 3D cylinders as solid models. Dish (6.10.42) - creates the lower half of 3D balls as solid models. Dome (6.10.35) - creates the upper half of 3D balls as solid models. Extrude (6.13.25) - extrudes 2D entities into 3D solid models. Interfere (6.17.17) - creates 3D volumes of intersecting 3D solid models. Intersect (6.17.20) - removes volumes not in common between two solid models. MassProp (6.21.2) - reports the mass properties of 3D solid models and 2D regions. Pyramid (6.24.64) - creates a pyramid as a 3D solid (Pro and Platinum). Creates a pyramid as a polygon mesh (Classic) Revolve (6.26.45) - revolves 2D entities into 3D solid models. Slice (6.27.40) - cuts 3D solids into two parts. SolidEdit (6.27.42) - edits the bodies, faces, and edges of 3D models. Sphere (6.27.50) - creates 3D balls as solid models. Subtract (6.27.58) - removes one solid model from a second. Union (6.30.6) - joins two or more solid models into a single entity. Wedge (6.33.6) - creates 3D wedges as solid models.

Figure 6.2697

6.29.30 ToolPalettesClose

(6.2981 on page 6079) Closes the Tool Palettes panel.

Accessing the Command

command bar: **toolpalettesclose : ToolPalettesClose** Closes the Tool Palette panel. Use the ToolPalettes (6.29.28) command to open it again.

Command Options

No Options

Related Commands

ToolPalettes (6.29.28) - opens the Tool Palettes panel. -ToolPanel (6.29.37) - allows to control the display of tool panels, such as the Properties Bar, the Ribbon or the Sheet Sets panel from the command line.

Figure 6.2698

6.29.31 TpNavigate

(6.2981 on page 6079) Loads a tool palette or palette group by name. If not already open, displays the Tool Palettes panel (short for "tool palette navigation").

Accessing the Command

command bar: **tpnavigate : Tpnavigate Prompts you in the command bar:** Specify tool palette to display or [palette Group]: **(Type the name of a tool palette or group)**

Command Options

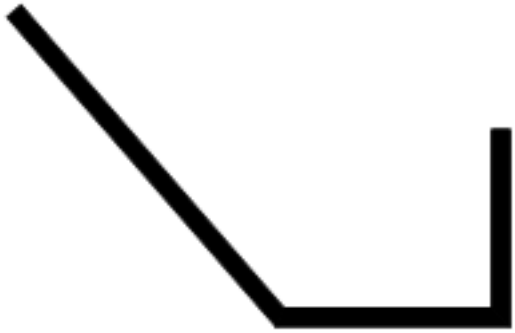
Option	Description
Specify tool palette to display	Specifies the tool palette to load: enter the name of a palette. When you enter the wrong name, the program responds: **Unable to find a palette or group by that name**
palette Group	Load a palette group; prompts you: **Specify palette group to display - (type the name of a palette group.)**

Related Commands

ToolPalettes (6.29.28) - opens the Tool Palettes panel.

Figure 6.2699

Figure 6.2700



6.29.32 Trace

(6.2981 on page 6079) Draws traces (like wide lines) with mitered vertices. **Note:** This command is rarely used as the PLine (6.24.27) command is more convenient. (6.2701)

Accessing the Command

 command bar: **trace** menu bar: **Draw | Trace** ribbon: **Draw | Draw | Polygons | Trace** toolbar: **Draw | Polygons |  : Trace Prompts you in the command bar:** Width of trace <0.5000>: **(Enter a number, pick two points, or press Enter to accept the default)** Start of trace: **(Pick a point, or enter x,y coordinates)** Next point: **(Pick another point)** Next point: **(Pick another point, or else press Enter to exit the command)** This command draws the trace segments in an unusual manner: The trace is not drawn until the second pick point. The delay allows BricsCAD to determine the mitering needed at vertices, which this command does automatically. The FillMode variable affects the look of traces: (left) on and (right) off. (6.2701) (6.2702 on the next page)

Figure 6.2701

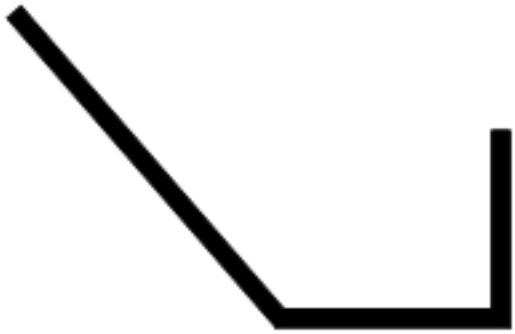


Figure 6.2702

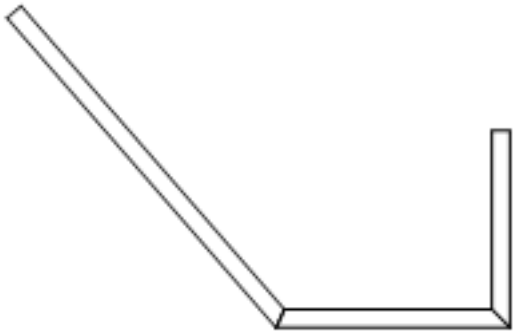


Command Options

Option	Description
Width of trace	Specifies the width of the trace: • Enter a number • Pick two points
Start of trace	Specifies the start of the trace: • Pick a point • Enter x,y coordinates
Next point	Specifies the subsequent end points. • Pick a point Enter x,y coordinates • Press **Enter** to exit the command

Procedures

- Drawing traces (1.25.22)

Related Commands

Line (6.20.31) - draws line segments. PLine (6.24.27) - draws polyline segments and arcs with constant and variable width. Solid (6.27.45) - draws 3- and 4-sided solid-filled areas. Donut (6.10.37) - draws wide and solid-filled circles. LWeight (6.20.42) - gives most entities visual width.

Figure 6.2703

6.29.33 Toolbar

(6.2981 on page 6079) Toggles the display of toolbars at the command line.

Accessing the Command

command bar: **toolbar** alias: **-toolbar : Toolbar Prompts you in the command bar:** Enter Toolbar name or [All] <All>: **(Enter the name of a toolbar, or press Enter to turn all toolbars on or off)** Enter an option [Show/Hide] <Show>: **(Choose an option)**

Command Options

Option	Description
Enter toolbar name	Specifies the name of a toolbar.
ALL	Specifies all toolbars.
Show	Displays the specified toolbar(s).
Hide	Hides the specified toolbar(s).

Procedures

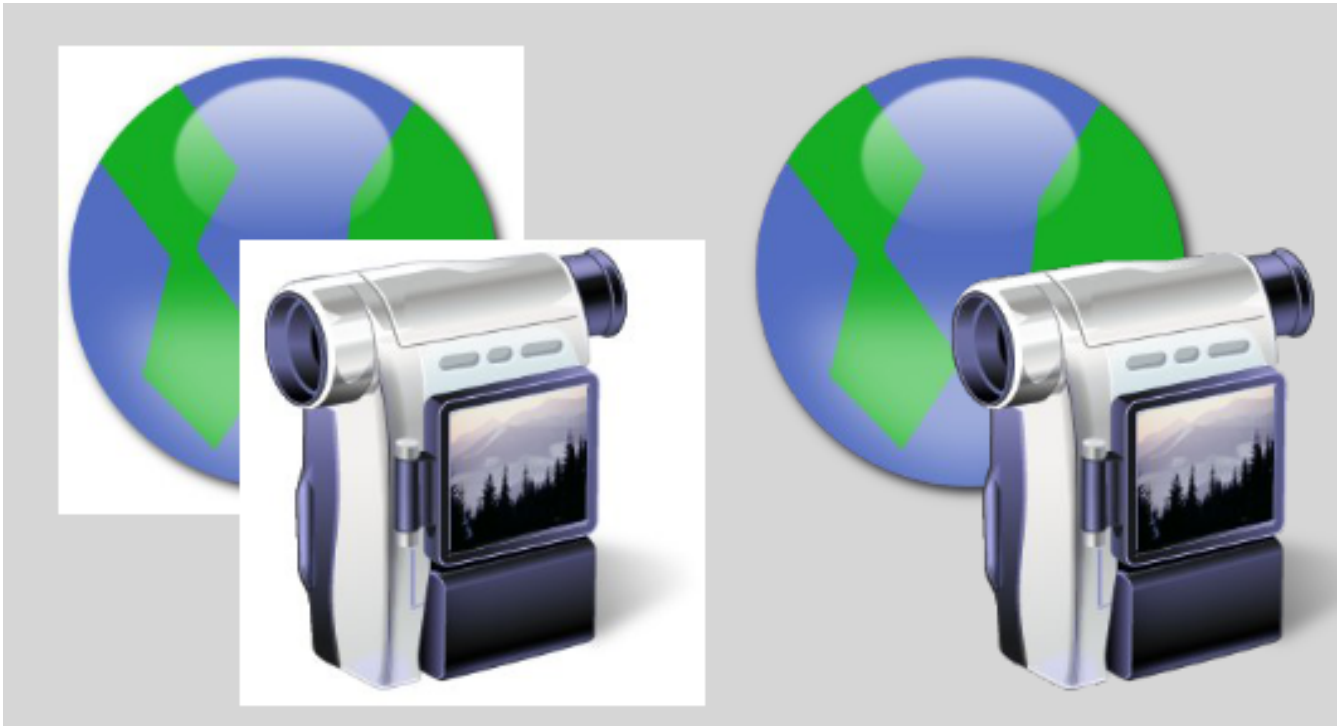
- Toolbars (1.15.3)
- Toolbar Flyouts (1.15.3)
- Opening a toolbar (1.15.3)
- Closing a toolbar (1.15.3)
- To restore the default toolbars (1.15.3)
- To set the icon size (1.15.3)
- To set the position and visibility property of a toolbar (1.15.3)

Related Commands

CommandLine (6.9.25) - shows the command line. CommandLineHide (6.9.21) - hides the command line. Customize (6.9.47) - customizes toolbars. CuiLoad (6.9.56) and MenuLoad (6.21.14) - load CUI files that define toolbars and other user interface elements. CuiUnload (6.9.51) and MenuUnload (6.21.13) - load CUI files that define toolbars and other user interface elements. GraphScr (6.15.22) - brings the graphics window to the foreground. Scrollbar (6.27.10) - toggles the display of the scroll bars. StatBar (6.27.51) - toggles the display of the status bar. TextScr (6.29.16) - brings the text window to the foreground.

Figure 6.2704

Figure 6.2705



6.29.34 Transparency

(7.3 on page 6132) Toggles the transparency of monotone images. **Note:** To change the transparency of entities, use the Transparency property in the Layer (6.20.3) and Properties (6.24.54) commands. (6.2705)

Accessing the Command

 command bar: **transparency** transparent: **'transparency** ribbon: **Insert | Images | Image Transparency** toolbar: **Image |**  **: Transparency Prompts you in the command bar:** Enter transparency mode [OPN/OFF] <OFF>: **(Type ON or OFF)** When transparency is on, the background color of the image is transparent. This command works only with raster images attached to the drawing that have a monochrome palette.

Command Options

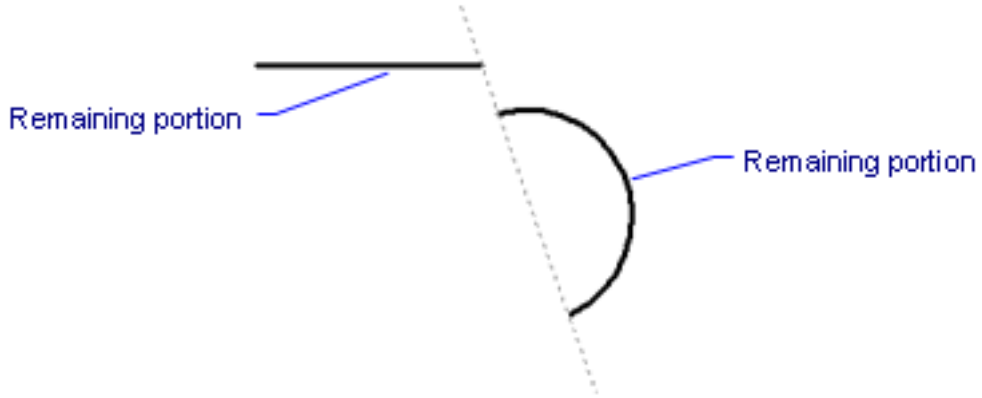
Option	Description
ON	Turns on transparency.
OFF	Turns off transparency.

Related Commands

Image (6.13.13) - controls the parameters of the image file. ImageAttach (6.17.6) - places raster images in drawings. -ImageAttach (6.17.5) - attaches raster images to the drawing; displays prompts in the command bar. ImageAdjust (6.17.3) - changes the properties of images through the Properties palette. ImageQuality (6.17.8) - toggles the quality of the image.

Figure 6.2706

Figure 6.2707



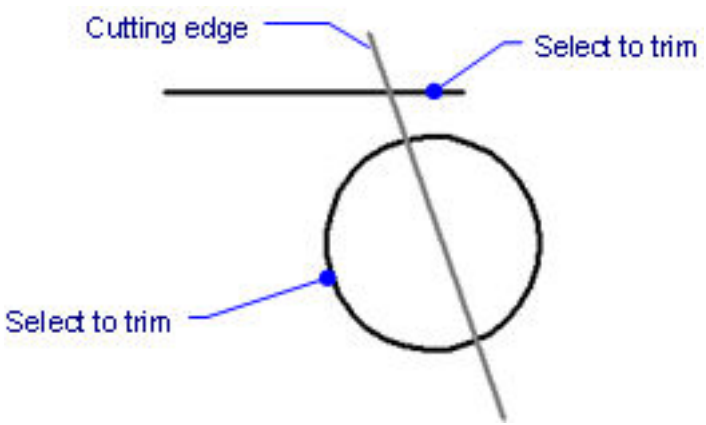
6.29.35 Trim

(7.3 on page 6132) Trims entities to a cutting line; extends entities when you hold down the **Shift** key. (6.2707)

Accessing the Command

command bar: **trim** alias: **tr** menu bar: **Modify | Trim** ribbon: **Change | Modify | Trim** toolbar: **Modify |** **: Trim Prompts you in the command bar:** Select cutting entities for trim <ENTER to select all>: **(Choose one or more entities, or press Enter to select all entities in the drawing)** Entities in set: 1 Select cutting entities for trim <ENTER to select all>: **(Choose more entities, or else press Enter to continue the command)** (6.2708) Select entity to trim or shift-select to extend or [Fence/Crossing/Edge mode/ Projection/ eRase]: **(Pick a single entity to be trimmed, or enter an option, or press Enter to end the command)**

Figure 6.2708



Command Options

Option	Description
Select cutting entities for trim	Selects the entities to use as trimmers: • Choose one or more entities; you can even select text • Press **Enter** to select all entities in the drawing; entities can both be cutlines and be cut These entities define where crossing entities are trimmed.
Shift-select to extend	Extends the picked entities instead of trimming them: Hold down the **Shift** key while selecting entities to be extended
Select entity to trim	Chooses the entity to be trimmed. Select a single entity; only one entity can be trimmed at a time. Your pick point defines the portion of the entity to be removed: (6.2709 on the following page)
Edge mode	Toggles edge mode; prompts you: **Extend/No extend - (type E or N.)** • **Extend** - trims entities that do not physically intersect the cutting entity. (6.2710 on page 5819) • **No extend** - trim only entities that intersect. (6.2711 on page 5819) This option is affected by the setting of the Projection option; see below.
Fence	Cuts entities interactively; prompts you: 1. **First point of fence - (specify the fence's starting point.)** 2. **Next fence point - (specify the next point; press Enter to exit this option.)** As you pick fence points in the drawing, BricsCAD immediately trims entities under the fence. (6.2712 on page 5819) The portion of each entity between other entities is trimmed. Use this option together with ALL (select all entities to trim).
Crossing	Cuts entities interactively; prompts you: 1. **First corner of crossing window - (specify the first corner.)** 2. **Second corner of crossing window - (specify the second corner.)** The portions of the entities that cross the specified rectangle are trimmed.
Projection	Defines how intersections are projected; prompts you: **None/Ucs/View - (enter an option:)** • **None** - entities are not projected • **Ucs** - entities are projected according to the current UCS • **View** - entities are projected according to the current viewpoint This option affects the operation of the Edge option.
Erase	Deletes selected entities; prompts you: **Select entities to delete - (select the entities.)**

Undo	Undoes the last trim action. Repeat this option undo earlier trim actions.

Procedures

- To trim entities (1.32.21)

Related Commands

Break (6.6.21) - cuts parts out of entities. Chamfer (6.9.9) - chamfers intersections. Extend (6.13.21) - Extends open entities to a boundary. Fillet (6.14.6) - fillets intersections. Settings (6.27.25) - specifies parameters for trims.

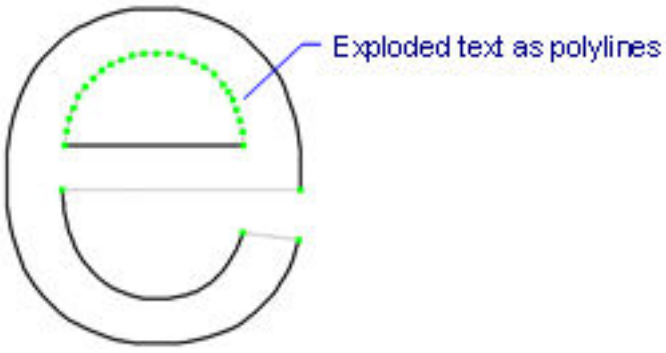
6.29.36 TxtExp

(6.2981 on page 6079) Explodes text into polylines (short for "text explode"). (6.2714)

Accessing the Command

command bar: **txtexp** menu: **Modify | Explode Text : TxtExp Prompts you in the command bar:** Select text to be exploded: **(Choose one or more text entities)** Select text to be exploded: **(Choose more text entities, or press Enter to end entity selection)** SHP and TTF fonts are exploded to individual polylines and polyarcs. (6.2715)

Figure 6.2715



Command Options

Option	Description
Select text to be exploded	Selects the text that you want exploded into polylines: • Choose more text entities • Enter **all** to select all text in the drawing; the program filters out non-eligible entities • Press **Enter** to end entity selection This command does not explode attributes in blocks or text in tables, or text in another space (model vs paper). Standalone attributes are, however, exploded.

Tutorial: Unlock BricsCAD's extra features Click here (1.24.1) to watch

Command Options

Option	Description
Select text to be exploded	Chooses the text to be exploded into polylines. Use any entity selection method. Press Enter to end entity selection.

Procedures

- To explode text (1.29.18)

Related Commands

Text (1.29.20) and -Text (6.29.12) - create text. MText (6.21.38) and -MText (6.21.40) - create paragraph text. Explode (6.13.16) - explodes non-text entities. U (6.30.3) - undoes the explosion.

Figure 6.2716

6.29.37 -ToolPanel

(6.2981 on page 6079) Toggle the display of panels -- Properties, Ribbon, Sheet Sets, and son --at the command line.

Accessing the Command

command bar: **-toolpanel : -ToolPanel Prompts you in the command bar:** Enter name of Tool Panel to show or hide or [? to list all panels]: **(Type the name of a tool panel, or press ? to list the names of panels)** Enter an option [Show/Hide/Toggle] <Show>: **(Choose an option, or else press Enter to accept the default option)**

Command Options

Option	Description
Enter name of Tool Panel to show or hide	Specifies the name(s) to panels to show or hide; enter the name of one panel.
? to list all panels	Lists the names in alphabetical order of the panels in this edition of the program: `Tool Panels: Mechanical Browser Attachments BIM Composi`
Show	Displays the tool panel
Hide	Hides the tool panel
Toggle	Toggles the display of the tool panel: if it is on, then this option turns it off -- and vice versa

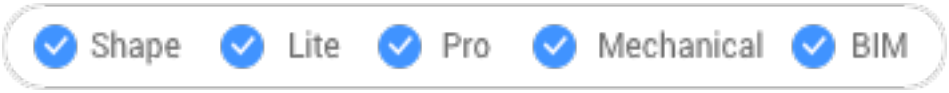
Procedures

- To open/close a panel (1.15.2)

Related Commands

AttachmentsPanelOpen (6.4.30) - opens the Attachments panel. AttachmentsPanelClose (6.4.29) - closes the Attachments panel. ComponentsPanelOpen (6.9.26) - opens the Components panel. ComponentsPanelClose (6.9.57) - closes the Components panel. ContentBrowserclose (6.9.39) - closes the Content Browser panel. ContentBrowserOpen (6.9.32) - opens the Content Browser panel. CommandLine (6.9.25) - displays the command line. CommandLineHide (6.9.21) - hides the command line. LayersPanelClose (6.20.4) - opens the Layers panel. LayersPanelOpen (6.20.5) - closes the Layers panel. MatBrowserClose (6.21.4) - closes the materials browser. MatBrowserOpen (6.21.6) - opens the materials browser, which shows an overview of available high-resolution render materials. MechanicalBrowserClose (6.8.36) - closes the Mechanical Browser panel. MechanicalBrowserOpen (6.8.32) - opens the Mechanical Browser panel. ParametersPanelOpen (6.24.10) - opens the Parameters panel. ParametersPanelClose (6.24.8) - closes the Parameters panel. Properties (6.24.54) - displays the Properties panel with properties of selected entities. PropertiesClose (6.24.56) - closes the Properties panel. ReportPanelClose (6.8.33) - closes the Report panel. ReportPanelOpen (6.8.35) - opens the Report panel. Ribbon (6.26.32) - displays the ribbon. RibbonClose (6.26.49) - hides the ribbon. SheetSet (6.27.38) - Opens the Sheet Sets panel. SheetSetHide (6.27.32) - closes the Sheet Set panel. StructurePanel (6.27.54) - opens the Structure panel. StructurePanelClose (6.27.66) - closes the Structure panel. ToolPalettes (6.29.28) - opens the Tool Palettes panel. ToolPalettesClose (6.29.30) - closes the Tool Palettes panel.

Figure 6.2717



6.29.38 TXT2MTXT

(6.2717) Combines a selection of Text and MText entities into a single MText entity.

Accessing the Command

Keyboard: **txt2mtxt** Alias: **combinetext** : **txt2mtxt Prompts you:** Select text objects to combine or [SEttings/selection options (?)]: **(Select the Text and/or MText entities to combine, then press Enter.)** 1 object created, 9 removed.

Command Options

Option	Description
Settings	Displays the options of the COMBINETEXTMODE system variable in a dialog box. The options are: • **Combine into a single MText**: Combines the selected text entities into a single MText entity. • **Sort top-down**: Specifies the order of the selected text entities by descending vertical position. • **Word-wrap text:** Combines all selected Text entities into a single line, and then wraps any text that exceeds the width of the MText entity to the next line. The MText width matches the width of the largest text entity in the selection. Paragraphs in selected MText entities are preserved. • **Uniform linespacing**: Applies consistent interline spacing.
Selection Options	Allows to choose a selection method. See the SELECT (6.27.16) command.

Related Commands

MText (6.21.38) - Places formatted, paragraph text in a bounding box that limits the extent of the text. -MText (6.21.40) - Places formatted, paragraph text in a bounding box that limits the extent of the text; uses the command bar to enter and format the text. Text (6.29.12) - Places single lines of text in the drawing; optionally evaluates LISP expressions.

6.30 U

6.30.1 Ucs

(7.3 on page 6132) Creates and displays UCSs through the command bar. UCS is short for **user-defined coordinate system**.

Figure 6.2718

Accessing the Command

command bar: **ucs** menu bar: **Model | Direct Modeling | Align UCS** ribbon: **Solid | Plane | Align UCS : Ucs Prompts you in the command bar:** Specify origin of UCS or [Face/NAmed/Entity/Previous/View/X/Y/Z/Z Axis/ Move/ World] <World>: **(Pick a point to specify the origin, enter an option, or else press Enter for the WCS.)**

Command Options

The UCS command options are available in the **UCS Options** toolbar: (6.2719)

Option	Description
Specify origin of UCS 	Specifies a new UCS through one, two or three points in the drawing. Prompts you: 1. **Specify origin of UCS** - **(pick a point, or enter x,y,z coordinates.)** 2. **Point on X-axis/<Accept>** - **(enter an option)** • **Point on X-axis**: Pick a point to show the direction of the x axis; the program ghosts a line between the origin and the cursor • **Accept**: Press **Enter** to keep the orientation of the x,y axes as they are; this moves the UCS to a new origin. 3. **Point on the XY-plane with positive Y value or <Accept>** - **(enter an option)** • **Point on the XY-plane with positive Y value:** Pick a point to show the direction of the y axis, which determines the angle of the x,y-plane • **Accept**: Press **Enter** to keep the x,y plane flat

Figure 6.2719

Face 

Aligns the UCS to a face of a 3D solid. This option works only with flat 3D faces, and not curved ones, such as on a sphere. Prompts you:

1. **Select entity - (click the face of a 3D solid; the x-axis of the UCS lies on the edge closest to you pick point.)**
2. **Enter an option [Flip/Xrotate/Yrotate] <accept> - (enter an option.)**
   - **Flip** - reverses the direction of the Z-axis
   - **Xrotate** - rotates the UCS 180° about the X-axis
   - **YRotate** - rotates the UCs 180° about the Y-axis
   - **Accept** - Press **Enter** to accept the UCS orientation picked by the program

NAmed

Creates, restores, and deletes named UCSs; prompts you: **Enter an option [Restore/Save/Delete/? for ucs list]** - **(enter an option:)**

- **Restore** - restores a named UCS; prompts you: **UCS name to restore** - **(enter the name of a UCS.)** As a shortcut, you can enter R directly at the 'Specify origin of UCS' prompt. or Select the name of the UCS in the drop down list box on the UCS toolbar. (6.2720 on page 5829)
- **Save** - saves the current UCS by a name; prompts you: **Enter name for saving UCS, or ? for list** - **(enter an option:)**
  - Enter a name by which to save the UCS. As a shortcut, you can enter S directly at the 'Specify origin of UCS' prompt.
  - Press **?** to list UCS names already saved in this drawing
- **Delete** - erases a named UCS from the drawing; prompts you: **UCS name(s) to delete, or ? for list** -
  - Enter one or more names of UCSs; separate the names with commas. As a shortcut, you can enter D directly at the 'Specify origin of UCS' prompt.
  - Press **?** to list UCS names already saved in this drawing
- **? for ucs list** - lists the names of UCSs in the drawing; prompts you: **Name(s) of UCS to list <* for all>** - **(specify the names to list:)**
  - ***** - lists all UCS names
  - **name*** - lists names of UCSs that begin with **name**
  - **name** - lists the UCS specified by name If necessary, press **F (6.29.16)**2 (6.29.16) to view the history prompt window. As a shortcut, you can enter ? directly at the 'Specify origin of UCS' prompt.

Entity 

Aligns the UCS to a selected entity; prompts you: **Select entity for UCS definition** - **(choose a single entity)**; the orientation and type of entity define the orientation of the UCS. (6.2721 on page 5829)

- The UCS origin is located to the end point, center point, or vertex closest to the pick point.
- The x-axis is aligned with the entity or an edge
- The x,y-plane is aligned to the entity's plane
- For ambiguous objects with obvious orientation, like a circle, the orientation is maintained

(6.2722 on page 5829)

Previous 

Changes the UCS to the previous one.

View 

Sets the UCS to the current viewpoint:

- The x axis and y axis are parallel to the view edges
- The z axis is perpendicular to the view, with positive Z-axis pointing to the viewer.
- The origin is copied from the previous coordinate system.

X 

Rotates the current UCS about the x axis; prompts you: **Enter angle of rotation about X axis - (specify an angle or pick two points.)**

Y 

Rotates the current UCS about the y axis; prompts you: **Enter angle of rotation about Y axis - (specify an angle or pick two points.)**

Z 

Rotates the current UCS about the z axis; prompts you: **Enter angle of rotation about Z axis - (specify an angle or pick two points.)**

ZAxis 

Sets the UCS relative to the z-axis; prompts you to define the Z-axis:

1. **Origin point - (pick a point, or enter x,y,z coordinates.)**
2. **Point on positive Z-axis - (pick another point, or enter x,y,z coordinates.)**
   - The second point defines the positive Z-axis.
   - The X
   - Y-plane is perpendicular to the Z-axis with the X-axis horizontal and the Y-axis pointing upwards.

Move 

Moves the origin of the current UCS, keeping the orientation of the axes; prompts you: **Origin point <0,0,0> - (pick point, or enter x,y,z coordinates.)**

World 

Switches to the WCS (world coordinate system).

Figure 6.2720

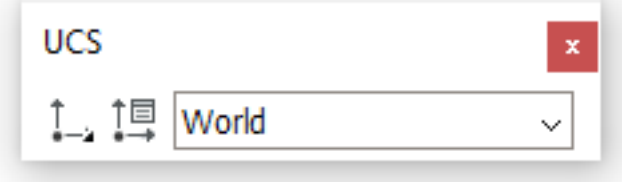


Figure 6.2721

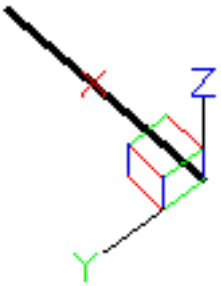

Related Commands

ExpUcs (6.13.24) - creates, modifies, and deletes named UCSs through the Drawing Explorer. UcsIcon (6.30.2) - controls the appearance of the UCS icon. SetUcs (6.27.26) - sets the UCS to a specified viewpoint. Plan (6.24.26) - changes the viewpoint to the plan view of the WCS or current UCS. DdVPoint (6.10.23) - changes the 3D viewpoint of the drawing through a dialog box. VPoint (6.31.21) - changes the 3D viewpoint of the drawing through the command bar. Settings (6.27.25) - sets parameters of UCSs.

Figure 6.2722

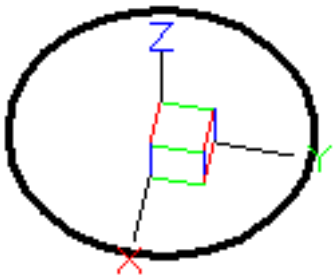

Figure 6.2723

6.30.2 UcsIcon

(7.3 on page 6132) Controls the display of the UCS icon (short for "user-defined coordinate system icon"). (6.2726 on the next page) **Note:** The colors denote the directions of the axes:

- **Red** - x axis
- **Green** - y axis
- **Blue** - z axis

Accessing the Command

command bar: **ucsicon : UcsIcon Prompts you in the command bar:** [ucs icon ON/ucs icon OFF/display in All views/display at ORigin/display in Corner] <ON>: **(Enter an option)** The properties of the UCS icon can be changed by the User Coordinate System section of the Settings (6.27.25) dialog box.

Command Options

Option	Description
ucs icon ON	Turns on the display of the UCS icon: • UCS icon in wireframe and hidden visual styles: (6.2725 on the facing page) • UCS icon in all other visual styles: (6.2726 on the next page) • UCS icon in paperspace layouts: (6.2727 on page 5832) The colors of the axes are controlled by the COLORX, COLORY and COLORZ system variables: (6.2728 on page 5832)
ucs icon OFf	Turns off the UCS icon. This option is viewport-specific, meaning it turns off the icon in the current viewport only.
display in All views	Applies the changes to all viewports; repeats prompts: **[ucs icon ON/ucs icon OFf/display at ORigin/display in Corner] <ON>** - **(enter an option to apply to all viewports.)** This command normally applies only to the current viewport; use this option to apply changes to all viewports.
display at ORigin	Displays the UCS icon at the origin (0,0), when possible: (6.2729 on page 5832) When the origin is outside of the viewport, the UCS icon is displayed at the corner defined by the UCSICONPOS (1.17.10) system variable; see the Corner option, below. (6.2730 on page 5833)
display in Corner	Displays the UCS icon in the viewport corner defined by the UCSICONPOS (1.17.10) system variable: • 0 - lower right corner (default) • 1 - lower left corner • 2 - upper right corner • 3 - upper left corner

6.30.3 U

(7.3 on page 6132) Undoes the last command that you entered.

Accessing the Command

 command bar: **u** shortcut: **Ctrl+Z** menu bar: **Edit | Undo** ribbon: **Home | Edit | Undo** toolbar: **Standard |** 
: **U Reports to you in the command bar:** Undo: **(name of command)**

Command Options

No options.

Related Commands

Undo (6.30.5) - undoes one or more commands. Redo (6.26.8) - redoes the last undone command. Oops (6.23.7) - unerases the last erased object, including newly created blocks. Zoom (6.35.7) - utilizes the Previous option to show the previous view.

Figure 6.2732

6.30.4 Undefine

(6.2981 on page 6079) Removes access to commands temporarily. **Note:** Use the Redefine (6.26.7) command to bring back undefined commands.

Accessing the Command

command bar: **undefine : Undefine Prompts you in the command bar:** Command to undefine: **(Enter the name of a command)** When you enter the name of an undefined command, BricsCAD responds: Unable to recognize command. Please try again. Undefined commands are accessed in these days:

- Prefix the command name with a dot, such as .CommandName
- Use the Redefine (6.26.7) command to recover the command name.

Command Options

Option	Description
Command to undefine	Enter the name of a command. Commands are undefined by developers who want to replace the command with a more extensive version they've written, or to prevent neophytes from using destructive commands, like Erase and Explode.

Related Commands

Commands (6.9.23) - lists the names of commands. Customize (6.9.47) - creates new commands through macros and LISP routines. Redefine (6.26.7) - activates commands that were deactivated with the Undefine command

Figure 6.2733

6.30.5 Undo

(7.3 on page 6132) Undoes one or more commands; some commands cannot be undone.

Accessing the Command

command bar: **undo : Undo Prompts you in the command bar:** Undo: Number of steps to undo or [Mark/Back to mark/BEgin set/End set/Control/Auto]: **(Enter the number of commands to undo, or enter an option)** BricsCAD reports the commands being undone. For example, enter the Customize and then the Units commands, followed by entering Undo 2: Undo: (UNITS) Undo: (CUSTOMIZE)

Command Options

Option	Description
Number of steps to undo	Specifies the number of commands to undo; snter a number. Commands are undone sequentially; you cannot skip over commands. Some commands cannot be undone, such as Save, Open, and Plot.
Mark	Sets a marker. The **Back to mark** option undoes all commands to the marker.
Back to mark	Undoes all commands back to when the marker was set.
BEgin set	Sets the start to a group that groups the following commands. The Undo command treats the commands in the set as a single undo.
End set	Ends the group.
Control	Specifies options; prompts you: **Set Undo control: None/One/<All>** - **(enter an option.)** • **None** - turns off the undo mechanism. This is useful when disk space is running low, because the undo mechanism uses disk space. • **One** - limits this command to a single undo. This option turns the Undo command into the U command. • **All** - turns on the undo mechanism
Auto	Considers all commands executed by a macro as a single undo.

Procedures

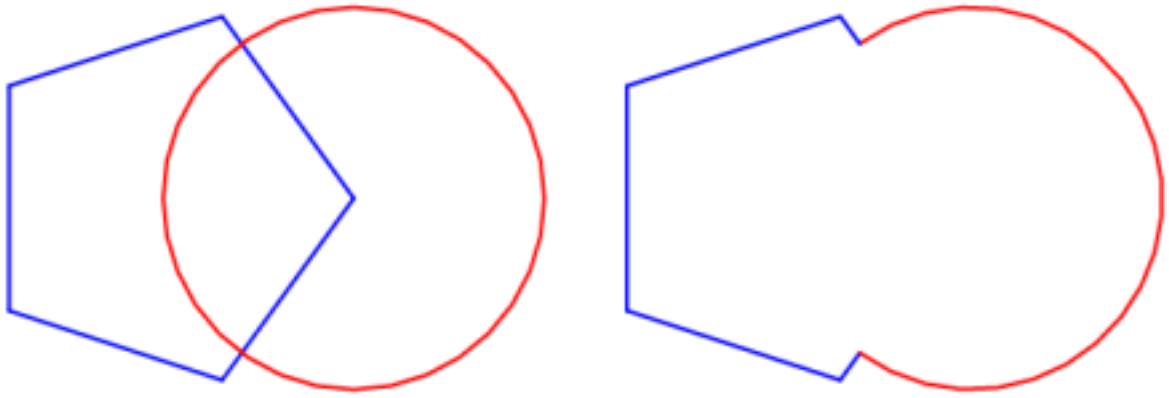
Restoring a previous state of an entity (1.15.4)

Related Commands

U (6.30.3) - undoes the last command. Redo (6.26.8) - redoes the last undone command. Oops (6.23.7) - unerases the last erased object, including newly created blocks. Zoom (6.35.7) - utilizes the Previous option to show the previous view.

Figure 6.2734

Figure 6.2735



6.30.6 Union

(6.2932 on page 6037) Performs Boolean union operations on 3D solids and 2D regions by adding set of entities to another set to form a single entity. (6.2737 on the following page)

Accessing the Command

 command bar: **union** alias: **uni** menu bar: **Model | 3D Solid Editing | Union** ribbon: **Solid | Edit | Boolean | Union** toolbar: **3D Solid Editing |**  **: Union Prompts you in the command bar:** Select ACIS objects to union: **(Choose one or more 3D solids and/or 2D regions)** Entities in set: 2 **Select ACIS objects to union: (Choose more ACIS entities, or press Enter to complete the command)** 3D solids that are joined through the Union command often look no different after the operation: (6.2736 on the next page) This command also applies to regions: (6.2737 on the following page)

Figure 6.2736

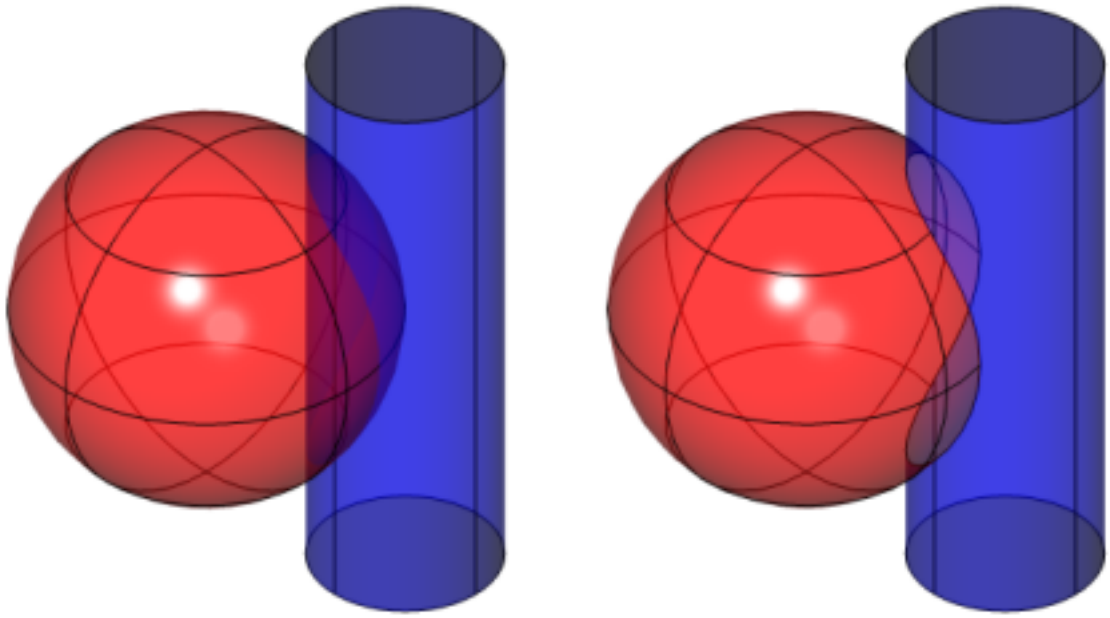


Figure 6.2737

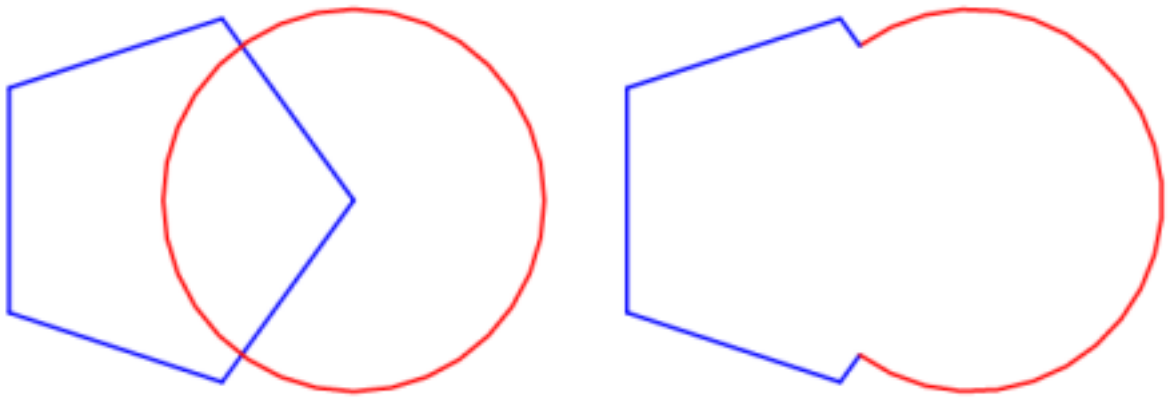


Command Options

Option	Description
Select ACIS objects to union	Specifies the ACIS entities to join into a single entity. Choose one or more 3D solids and/or 2D regions. The resulting entity takes on the properties of the ACIS entity selected first. This command also joins regions and 3D solids into a single entity.

Related Commands

BimSplit (6.7.52) - splits segments of wall-like solids into separated solids. Extrude (6.13.25) - extrudes 2D entities into 3D solid models. Interfere (6.17.17) - creates 3D volumes of intersecting 3D solid models. Intersect (6.17.20) - removes volumes not in common between two solid models. Revolve (6.26.45) - revolves 2D entities into 3D solid models. Slice (6.27.40) - cuts 3D solids into two parts. SolidEdit (6.27.42) - edits the bodies, faces, and edges of 3D models. Subtract (6.27.58) - removes one solid model from a second.

Figure 6.2738

6.30.7 UnisolateObjects

(7.3 on page 6132) Unhides entities that were hidden by the HideObjects (6.16.10) and IsolateObjects (6.17.22) commands.

Accessing the Command

command bar: **unisolateobjects** aliases: **unisolate**, **unhideobjects**, **unhide** ribbon: **Model | View | Show All** toolbar: **Hide/Show Entities** Quad: **Select : UnisolateObjects** The program displays entities that were previously hidden by the HideObjects and IsolateObjects commands.

Command Options

No options.

Related Commands

HideObjects (6.16.10) - hides the selected entities. IsolateObjects (6.17.22) - hides all but the selected entities. LayOn (6.20.13) - turns on all layers that were turned off in the drawing, except for frozen layer .

Figure 6.2739

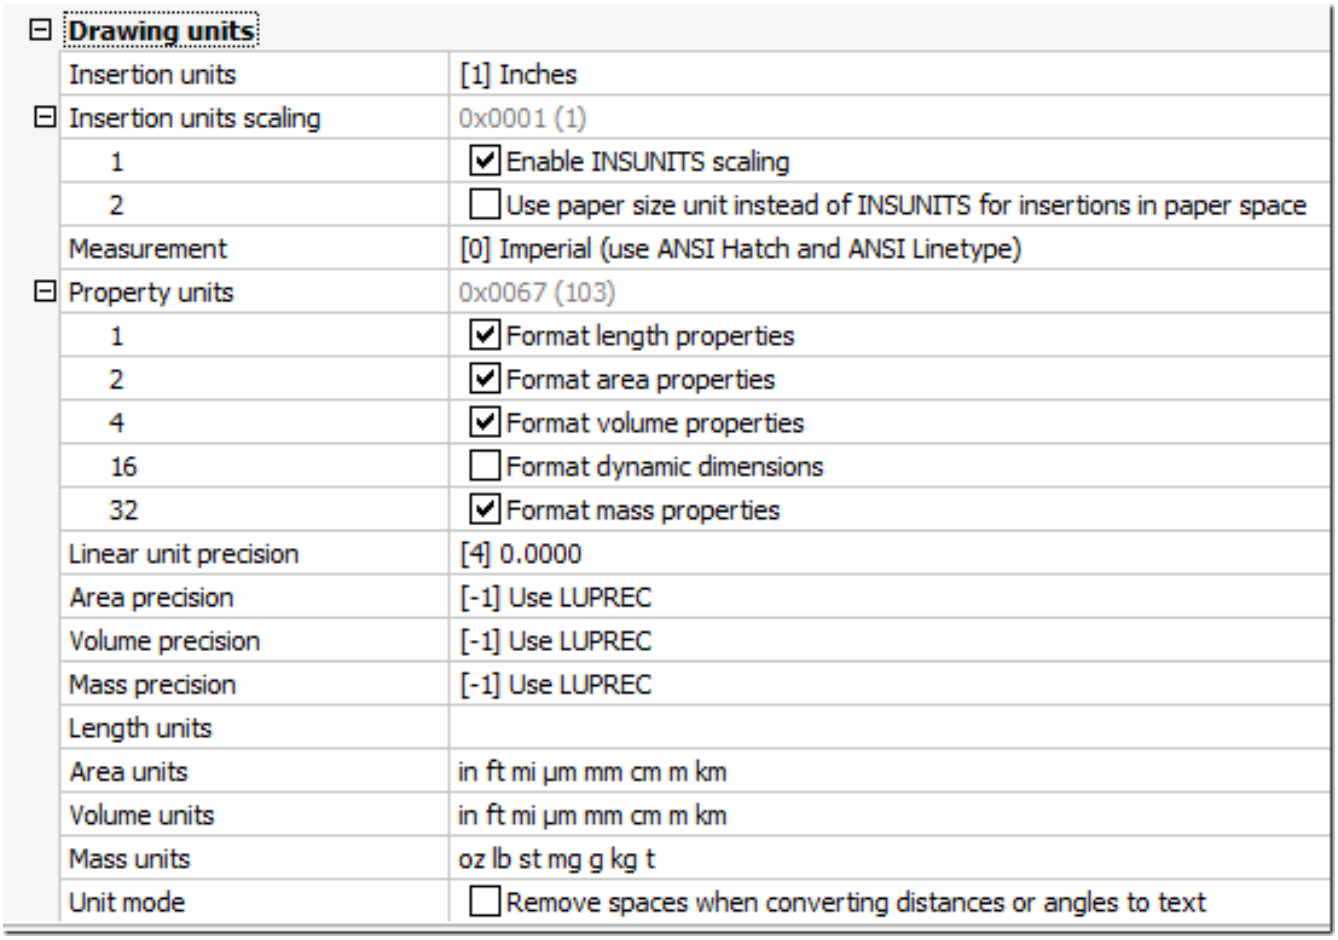
6.30.8 Units

(6.2981 on page 6079) Sets units of linear and angular measurements through the Settings dialog box.

Accessing the Command

command bar: **units** transparent: **'units** aliases: **un ddunits** status bar: **X,Y,Z : Units** Displays the Drawing Units section of the Settings dialog box: (6.2740 on the next page) Change settings, and then click the **X** button.

Figure 6.2740



Command Options

Option	Description
Insertion Units	Defines a real world value of 1 drawing unit, which is used for automatic scaling when inserting or attaching blocks, images, and xrefs. When both INSUNITS and PROPUNITS are on, the Length, Area, Volume and/or Inertia variables will be formatted with a dedicated unit. 1. Click the **Insertion Units** droplist 2. Select a unit: (6.2743 on page 5848)
Measurement	Determines which source files will be used when loading linetypes and predefined hatch patterns. 1. Click the **Measurement** droplist 2. Select an option: (6.2744 on page 5848) • Imperial - uses **default.lin** for linetypes and **default.pat** for hatch patterns • Metric - uses **iso.lin** and **iso.pat** BricsCAD searches for the default hatch and linetypes files in the folders which are defined by the SRCHPATH variable, which by default is **C:\Users\<username>\AppData\Roaming\Bricsys\Bricscad\V..\en**

Property Units	Defines whether measurement values are formatted automatically when INSUNITS is not 0 -- length, area, volume, and mass. The value is stored as a bitcode of the sum of selected options: • **1** - Formats length properties • **2** - Formats area properties • **4** - Formats volume properties • **16** - Formats dynamic dimensions • **32** - Formats mass properties
Linear unit precision	Specifies the number of decimal places displayed by linear measurements: 1. Click the **Linear Unit Precision** droplist 2. Select an option: (6.2754 on page 5852) Although the droplist shows decimal precision, the option you choose also affects the precision of fractions used by architectural and fractional units, as shown below: • **0** - 0 fractional precision, such as 1 • **1** - 1/2 • **2** - 1/4 • **3** - 1/8 • **4** - 1/16 • **5** - 1/32 • **6** - 1/64 • **7** - 1/128 • **8** - 1/256 The value of Linear unit precision (LUCPREC) applies also to AREAPREC, VOLUMEPREC and MASSPREC unless these system variables are specified explicitly; see below.
Area, Volume, **and** Mass Precision	Specifies the number of decimal places for the display accuracy of areas, volumes, and masses. The display precision comes into play when the corresponding bit of the PROPUNITS (Property Units) variable is on. When its value is negative, the program instead uses the value of LUPREC (Linear Unit Precision). 1. Click a **Precision** droplist 2. Select an option: (6.2746 on page 5849)

Length Units

Defines a list of units used for displaying lengths:

- When this field is empty, all quantities display in the drawing units defined by the INSUNITS variable.
- When one or more units are selected in the LengthUnits dialog box, the program uses the unit that is a best fit. The Format Unit Properties bit of the Property Units variable must be turned on.

1. Click the **Length Units** field.
2. Select one or more units in the dialog box.
3. Click **OK**.

(6.2747 on page 5849)

Area Units

Defines the units used for displaying areas:

- When this field is empty, all quantities display in the drawing units defined by the INSUNITS variable.
- When one or more units are selected in the AreaUnits dialog box, the program uses the unit that is a best fit. The Format Area Properties bit of the Property Units variable must be turned on.

1. Click the **Area Units** field.
2. Select one or more units in the dialog box.
3. Click **OK**.

(6.2748 on page 5850)

Volume Units

Defines a list of units used for displaying volumes:

- When this field is empty, all quantities display in the drawing units defined by the INSUNITS variable.
- When one or more units are selected in the VolumeUnits dialog box, the program uses the unit that is a best fit. The Format Volume Properties bit of the Property Units variable must be turned on.

1. Click the **Volume Units** field.
2. Select one or more units in the dialog box.
3. Click **OK**.

(6.2749 on page 5851)

Mass Units	Defines the units used for displaying mass properties (weights): • When this field is empty, all quantities display in the drawing units defined by the INSUNITS variable. • When one or more units are selected in the MassUnits dialog box, the program uses the unit that is a best fit. The Format Mass /Properties bit of the Property Units variable must be turned on. 1. Click the **AMass rea Units** field. 2. Select one or more units in the dialog box. 3. Click **OK**. (6.2750 on page 5851)
Unit mode	Specifies how imperial units are displayed by the program: • **0** - spaces: displays fractional, feet-and-inches, and surveyor's angles using spaces as delimiters • **1** - dashes: displays fractional, feet-and-inches, and surveyor's angles without spaces and in some cases substituting dashes for spaces
Suppress dim zeros	Suppress leading and trailing zeros in dimensions: (6.2751 on page 5851)
Linear unit type	Specifies the units for linear measurement: (6.2752 on page 5852) • **Scientific** - such as 4.225E+01 • **Decimal** - such as 42.25 • **Engineering** - such as 3'-6.25" • **Architectural** - such as 3'-6 1/4" • **Fractional** - such as 42 1/4 For metric units, choose 2 (decimal)
Angular unit type	Specifies the style of angular units: (6.2753 on page 5852) • **Decimal degrees** - such as 90.0 • **Degrees/minutes/seconds** - such as 90d0'0 • **Gradians** - such as 100.00g. There are 400 grads in a circle • **Radians** - such as 1.57r. There are 2*pi radians (approximately 6.282) in a circle • **Surveyor's units** - such as N 00d0'0"E. The N and E in Surveyor's units refer to North and east
Angular unit precision	Specifies the precision for angular units: (6.2754 on page 5852)
Angle base	Specifies the direction for 0 degrees: the default is the positive x axis. Enter an angle. You can rotate the drawing through the Snap (6.27.41) command's Rotate option. (6.2758 on page 5856)

Angle direction	Toggles the direction in which angles are measured: • **No** - measures angles counterclockwise (default) • **Yes** - measures angles clockwise

Status Bar Menu

Right-click 72',42',0" (or other x,y,z coordinates) on the status bar for the shortcut menu: (6.2741) (6.2742 on the facing page)

Shortcut Menu Option	Description
Scientific Linear Units	Chooses scientific as the working units
Decimal Linear Units	Chooses decimal (metric) as the working units
Engineering Linear Units	Chooses engineering as the working units
Architectural Linear Units	Chooses architectural as the working units
Fractional Linear Units	Chooses fractional as the working units.
Geographic	Displays geographic coordinates in the status bar
Relative	Displays relative coordinates in the status bar
Absolute	Displays absolute coordinates in the status bar
Off	Displays coordinates only when points are picked
Properties	Opens the Coordinates section of the Settings dialog box: (6.2756 on page 5853) • **Update coordinates only when selecting points** - equivalent to Off • **Coordinates always show pointer location** - equivalent to Absolute • **Coordinates in polar form for point, distance and angle selection** - equivalent to Relative

6.30.9 -Units

(6.2981 on page 6079) Sets units of linear and angular measurements in the command bar.

Accessing the Command

command bar: **-units** transparent: **'-units** alias: **-un** : **-Units Prompts you in the command bar:** Unit mode (LUNITS): 1. Scientific 4.225E+01 2. Decimal 42.25 3. Engineering 3'-6.25" 4. Architectural 3'-6 1/4" 5. Fractional 42 1/4 Unit mode 1-5 <2>: **(Enter a number, or press Enter for the default)** Number of decimal places for LUNITS 0-8 <4>: **(Enter a number, or press Enter for the default)** Angular unit mode (AUNITS): 1. Decimal degrees 90.0 2. Degrees/minutes/seconds 90d0'0 3. Grads 100.00g 4. Radians 1.57r 5. Surveyor's units N 00d0'0"E Angular unit mode 1-5 <1>: **(Enter a number, or press Enter for the default)** Number of decimal places for angular units 0-8 <0>: **(Enter a number, or press Enter for the default)** Angle 0 direction <0>: **(Enter a number, or press Enter for the default)** Do you want angles measured clockwise? <N>: **(Type Y or N)**

Command Options

Option	Description
Unit mode	Specifies the display style of linear measurement. Enter a number between 1 and 5 corresponding to the list: • **1** - Scientific, such as 4.225E+01 • **2** - Decimal, such as 42.25 • **3** - Engineering, such as 3'-6.25" • **4** - Architectural, such as 3'-6 1/4" • **5** - Fractional, such as 42 1/4 For metric units, choose 2 (decimal). LUNITS variable stores the style of linear units.
Number of decimal places for LUNITS	Specifies the display precision for decimal units. Enter a number between 0 and 8: • **0** - 0 decimal places, such as 0. • **1** - 1 decimal places, such as 0.0 • **2** - 2 decimal places, such as 0.00 • **3** - 3 decimal places, such as 0.000 • **4** - 4 decimal places, such as 0.0000 • **5** - 5 decimal places, such as 0.00000 • **6** - 6 decimal places, such as 0.000000 • **7** - 7 decimal places, such as 0.0000000 • **8** - 8 decimal places, such as 0.00000000 This option also affects the display precision of fractions used by architectural and fractional units: • **0** - 0 fractional precision, such as 1 • **1** - 1/2 • **2** - 1/4 • **3** - 1/8 • **4** - 1/16 • **5** - 1/32 • **6** - 1/64 • **7** - 1/128 • **8** - 1/256

Angular unit mode	Specifies the display style of angular units. Enter a number: • **1** - Decimal degrees, such as 90.0 • **2** - Degrees, minutes, and decimal seconds, such as 90d0'0 • **3** - Grads, such as 100.00g • **4** - Radians, such as 1.57r • **5** - Surveyor's units, such as N 00d0'0"E There are 400 grads in a circle. There are 2*pi radians (approximately 6.282) in a circle. The N and E in Surveyor's units refers to North and east. AUNITS variables stores the style of angular units.
Number of decimal places for angular units	Specifies the number of decimal places. Enter a number between 0 and 8.
Angle 0 direction	Specifies the direction for 0 degrees. Enter an angle, or pick two points in the drawing. The default is the positive x axis. You can also rotate the drawing through the Snap command's Rotate option. (6.2758 on the next page)
Do you want angles measured clockwise?	Specifies the direction in which to measure angles: • **Yes** - measures angles clockwise • **No** - measures angles counterclockwise (default)

Related Commands

Units (6.30.8) - sets units through the Settings dialog box. NewWiz (6.22.6) - sets units and other parameters for new drawings. New (6.22.5) - starts new drawing in Imperial or metric units.

6.30.10 UpdateField

(6.2981 on page 6079) Updates fields. **Note:** A field is text that update semi- and automatically, and is placed with Field (6.14.7) and other text-related commands. Fields are identified by their gray background color: (6.2760)

Accessing the Command

 command bar: **updatefield** menu bar: **Tools | Update Fields** ribbon: **Draw | Text | Fields | Update Fields** toolbar: **Redraw/Regen |**  **: UpdateField Prompts you in the command bar.** Select field(s) to update: **(Select one or more field entities)** Entities in set: 1 Select field(s) to update: **(Select more field entities, or else press Enter to end the command)** 1 field found, 1 updated. Command Options

Option	Description
Select field(s) to update	Select the field entities to update: • Select one or more field entities • Enter **all** to select all entities in the drawing; the program filters out non-eligible ones • Press **Enter** to finish the command

Procedures

- To update a field (1.29.23)

Related Commands

Mtext (6.21.38) - Places paragraph text. Field (6.14.7) - Inserts a field in a multiline text.

Figure 6.2761

6.30.11 Url

(7.3 on page 6132) Prompts for a location on the internet (short for "uniform resource locator").

Accessing the Command

command bar: **url** alias: **browser : Url Prompts you in the command bar:** Enter URL <http://bricsys.com>: **(Enter address of a Web page, or else press Enter to accept the default)**

Command Options

Option	Description
Enter URL	Specifies a location on the Internet: • Enter a URL, such as www.bricsys.com. • Press **Enter** to accept the default destination After you press **Enter**, your computer's default Web browser opens the page. URL is short for "universal resource locator."

Related Commands

Browser (6.6.19) - opens the default Web browser. OnWeb (6.23.6) - opens the Bricsys home page in your computer's default Web browser. Mail (6.21.1) - attaches the current drawing to a message in the default email client.

6.31 V

6.31.1 VersionControl (BETA)

(7.3 on page 6132) Allows multiple users to work on the same drawings, simultaneously. Drawings are stored in the cloud using Bricsys 24/7 and checked in and out from each user's local machine. This is Beta functionality and you must request access by submitting a support request following this procedure:

1. Log into your Bricsys account.
2. Choose **New Support Request**.
3. Open the BricsCAD menu and choose **BricsCAD** > **Version Control**.
4. In the Subject field enter: Access to VERSIONCONTROL Beta
5. Fill in the rest of the fields as needed.
6. Choose **Send Support Request**.

Figure 6.2762

Accessing the Command

command bar: **versioncontrol : versioncontrol You are prompted:** Version control **[Init/CheckOut/CheckIn/Update/Rename]: (Select an option)** The first time you launch VERSIONCONTROL in a new BricsCAD session and choose one of the options, it prompts you to log into your Bricsys account. (6.2763 on the facing page) If your account has not been granted access to the beta functionality, it directs you to a web page with instructions to request access. If your account has access to the beta functionality, your successful login is indicated in the Command window and it prompts you to enter the name of the project on which you want to work. (6.2764 on the next page) **Init** The **Init** option enables you to create a new multi-user project. Enter a new project name, keeping in mind project names are case-sensitive. If you enter a name that already exists, it prompts you to enter a different name. **Checkout** The **Checkout** option enables you to check out a drawing from your cloud-based projects. You must specify from which project you want to check out a drawing. Enter the project name, keeping in mind project names are case-sensitive. If you enter a project name that doesn't exist, BricsCAD displays a list of valid project names and prompts you to reenter the project name. After entering a valid project name, you must specify a version control folder for that project. The version control folder is the location on your local machine where your drawings are stored and synced with the cloud. The default location is **drive**:\Users**username**\Documents\Bricsys247**projectname**. However, you can specify any location. If the location doesn't exist, it's created and set under version control. If the location already exists it's set under version control. If the location is already under version control, you are prompted to specify a different location. **Checkin** The **Checkin** option enables you to check in drawings from your local, version control folder to the cloud-based project. You can check in all files in the version control folder or you can commit modified and untracked files. After specifying what to check in, you can enter a relevant Check In message. **Update** The Update option enables you to sync project drawings from your local folder with the cloud. **Rename** The Rename option enables you to rename a drawing that's under version control.

Figure 6.2763

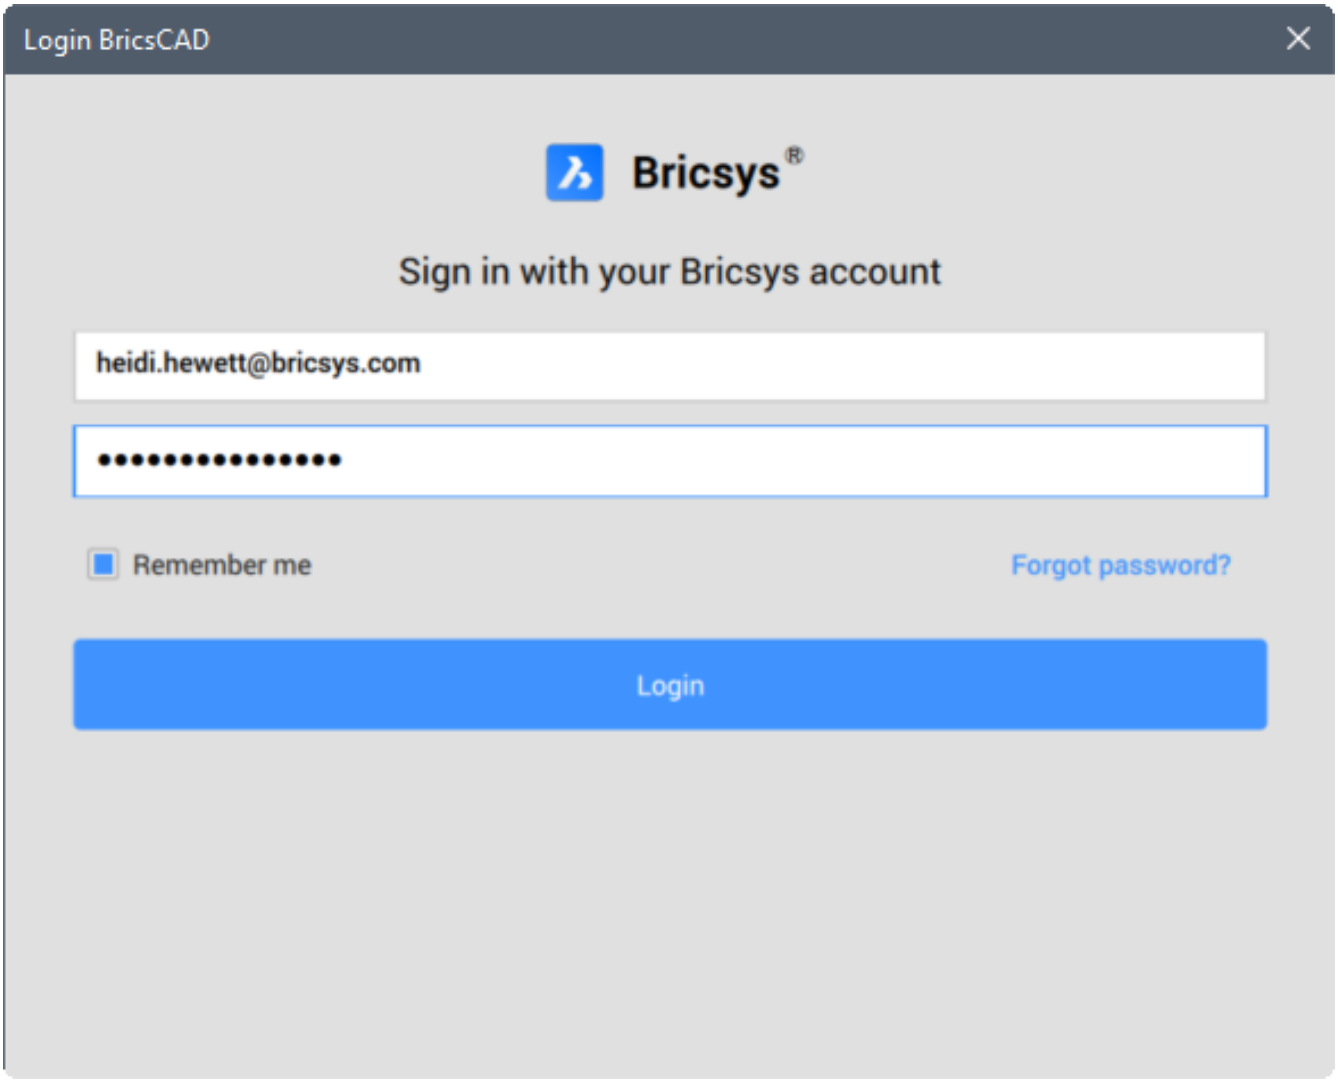

Figure 6.2764

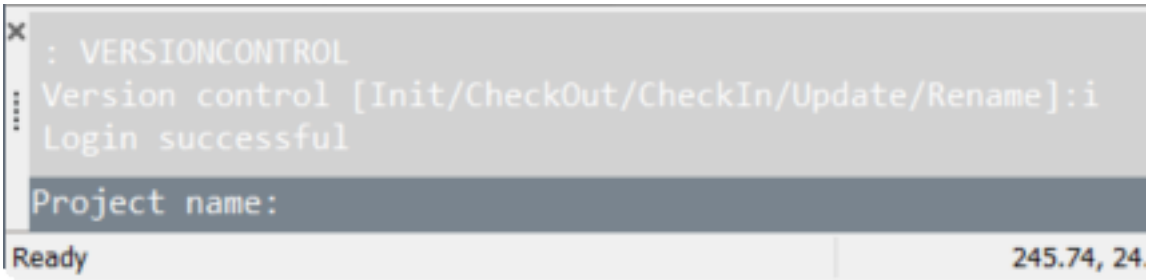

Figure 6.2765

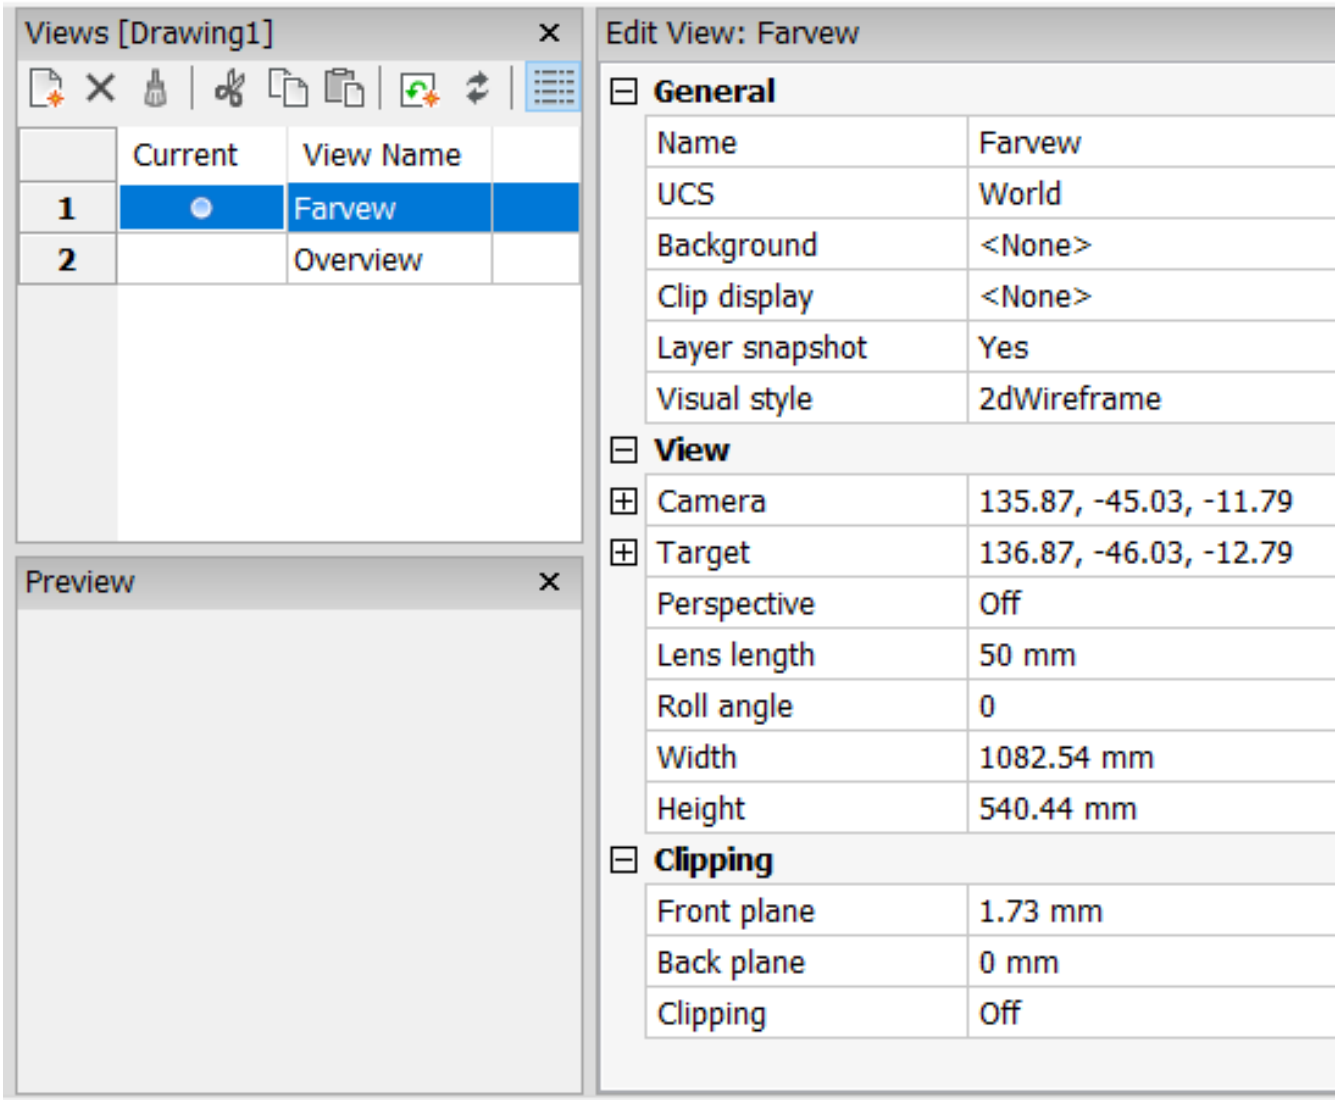
6.31.2 View

(6.2981 on page 6079) Creates and sets named 2D and 3D views through the Drawing Explorer.

Accessing the Command

command bar: **view** aliases: **ddview v expviews** menu bar: **Tools | Drawing Explorer | Views** toolbar: View | ribbon: **Home | Settings | Drawing Explorer | Views : View** Displays the Views section of the Drawing Explorer dialog box: (6.2766 on the next page) Create or select named views, and then click **X**. Press **F1** to access help.

Figure 6.2766



Toolbar Options

Toolbar Option	Description
Current	Designates the current view.
New	Creates new named views; prompts you: **View: ? to list saved views/Save/Window - (enter an option:)** • **? to list saved views** - lists the names of views saved in this drawing; prompts you: **View(s) to list <List all views> - (enter a name or press Enter for all)**; the program respond with a list: `Name of view: NewView1 Space: Model Height of view: 10.` Press F2 (6.29.16) to see the Prompt History window. • **Save** - saves the current viewpoint as the named view, and then returns to the Drawing Explorer • **Window** - saves a windowed area as the view; prompts you: 1. **First corner of view window - (pick a point, or enter x,y coordinates.)** 2. **Opposite corner - (pick another point, or enter x,y coordinates, and then the program returns to the Drawing Explorer.)**
Delete	Erases the named view from the drawing without warning.
Regen	Regenerates the current viewport.
Regen at each change	Toggles the regeneration of the current viewport after each change ON/OFF.

Edit View Options: General

View Name	Specifies the name of the view. Click to rename it.
UCS	Assigns a UCS: 1. Click the **UCS** droplist 2. Choose WCS or the name of a saved UCS When the drawing contains no saved UCSes, the droplist shows <None>. See the Ucs (6.30.1) and ExpUcs (6.13.24) commands.
Background	Sets the background for the view: 1. Click **Browse**; displays the Background dialog box 2. Choose a background style 3. Click **OK**. The program returns to the Drawing Explorer. See the Background (6.6.3) command.

Clip Display	Assigns a clip display: 1. Click the **Clip Display** droplist 2. Select a section plane
Layer Snapshot	Toggles whether to assigned the current on and off settings of layers to the view: • **Yes** - assigns the current visual state of layers, so that the next time you make this view current, the layers turn themselves on or off • **No** - doesn't do that
Visual Style	Sets the visual style: 1. Click the **Visual Style** droplist 2. Choose a visual style name See the VisualStyles (6.31.15) command.

Edit View Options: View

Camera	Specifies the camera point of the view in x,y,z coordinates in visual perspective mode. To edit the coordinates: 1. Click the **Camera** field 2. Enter new x, y, and/or z coordinates
Target	Specifies the target point of the view in x,y,z coordinates in visual perspective mode. To edit the coordinates: 1. Click the **Target** field 2. Enter new x, y, and/or z coordinates
Perspective	Toggles p**erspective** view: • **On** - view is displayed in visual perspective mode • **Off** - view displays in parallel perspective mode A camera glyph is displayed in the drawing for perspective views (see the Camera (6.9.1) command).
Lens Length	Sets the lens length of the camera. To edit the length: 1. Click the **Lens Length** field 2. Enter a new distance: • 50mm is normal view • 55mm or higher is a telephoto view • 45 or lower is a wide angle view

Roll Angle	Rotates the camera around the view axis. To edit the length: 1. Click the **Roll Angle** field 2. Enter a new angle
Width	Specifies the width of the view in current units. To edit the length: 1. Click the **Width** field 2. Enter a new width of view, in drawing units
Height	Specifies the height of the view in current units. To edit the height: 1. Click the **Height** field 2. Enter a new height of view, in drawing units

Edit View Options: Clipping

Front Plane	Sets the distance between the target point and the front clipping plane. To move the front plane: 1. Click the **Front Plane** field 2. Enter a new distance, in drawing units
Back Plane	Sets the distance between the target point and the back clipping plane. To move the back plane: 1. Click the **Back Plane** field 2. Enter a new distance, in drawing units
Clipping	Toggles the clipping planes, which remove from any entities that are outside the planes: 1. Click the **Clipping** droplist 2. Choose an option: • **Off** - both clipping plans are turned off • **Front on** - the front clipping plane is turned on • **Back on** - the back clipping plane is turned on • **Front and back on** - both the front and back clipping planes are turned on

Procedures

- Exploring views (1.23.10)
- Saving a view (1.23.10)
- Restoring a view (1.23.10)
- Defining the view background (1.23.10)

- To edit the view background (1.23.10)

Related Commands

-View (6.31.3) - controls named views through the command bar. Background (6.6.3) - sets the model space background for the current viewport and saved views. Camera (6.9.1) - creates perspective views. MatchPerspective (6.21.7) - matches the current model space perspective view with a background image by selecting 3 or more matching point pairs. Print (6.24.51) - plots named views. -Rename (6.26.19) - renames views through the Drawing Explorer. Zoom (6.35.7) - utilizes the Previous option to show the previous view. Explorer (6.13.15) - Opens the Drawing Explorer dialog box.

Figure 6.2767

6.31.3 -View

(7.3 on page 6132) Creates and sets named views through the command bar.

Accessing the Command

command bar: **-view** alias: -**v** menu bar: **View | Save/Restore View** ribbon: **View | View | Viewpoint | Save/Restore Views : -View Prompts you in the command bar:** View [? to list/Delete/Orthographic/Restore/Save/Window]: **(Enter an option, or else enter the name of a hidden option)**

- Hidden orthographic view options: Top/Bottom/Front/Back/Left/Right
- Hidden isometric view options: SWiso/SEiso/NEiso/NWiso

Command Options

Option	Description
? to list	Lists the names of views saved in this drawing; prompts you: **View(s) to list <List all views> - (enter a name or press Enter to list the names of all saved views)**; the program reports something like this: `Name of view: NewView1 Space: Model Height of view: 10.` Press **F2** to see the Prompt History window.
Delete	Erases named views from the drawing; prompts you: **View names to be deleted - (enter one or more names; separate multiple names with commas.)**
Orthographic*	Switches to an orthographic view; prompts you: **Enter an option: [Top/Bottom/Front/BAck/Left/Right]<Top>: (enter an option.)** If the UCSORTHO (1.17.10) system variable is ON the related orthographic UCS is restored automatically.
Restore	Restores a named view; prompts you: **View to restore - (enter the name of a view.)**
Save	Saves the current viewpoint as the named view; prompts you: **Save view as - (enter a name.)**
Window	Saves a windowed area as the view; prompts you: 1. **First corner of view windo**w - **(pick a point or enter x,y coordinates.)** 2. **Opposite corner** - **(pick another point or enter x,y coordinates.)**
Twist	This option is hidden. Allows to rotate the view about the screen Z-axis, much like the Twist mode (1.23.7) of the Look From (1.23.7) widget. Type **twist** at the command prompt. Prompts you: **Specify twist angle** - type a value, then press Enter. Angles are measured according to the value of the ANGDIR system variable. The default setting is Counter Clockwise (CCW).

*The orientation of the orthographic and isometric views is based on the coordinate system specified by the UCSBASE (1.17.10) system variable, which is set to the WCS (world coordinate system) by default. When one of the orthographic or isometric views is restored, BricsCAD zooms to the extents in the current viewport.

Related Commands

View (6.31.2) - controls named views through the Drawing Explorer. MatchPerspective (6.21.7) - matches the current model space perspective view with a background image by selecting 3 or more matching point pairs. Print (6.24.51) - plots named views. Rename (6.26.20) - renames views through the Drawing Explorer. Zoom (6.35.7) - utilizes the Previous option to show the previous view.

Figure 6.2768

6.31.4 ViewBase

(6.2880 on page 5977) Generates associative orthographic and isometric views of 3D models in paper space layouts.

NOTES

- This command is valid in model space only .
- Use the Tab key to select obscured entities.
- The GENERATEASSOCVIEWS (Generate associative drawings) system variable enables associative dimensions for generated views, as a result they are updated automatically when the 3D model changes.
- The GENERATEASSOCATTRS (Generate associative attributes) system variables controls the generation of associative data on 3D solids during modeling. When ON, 3D solids contain associative data upon creation. This allows VIEWBASE to generate drawings in which dimensions and tags are updated automatically when the 3D model has been modified.

Accessing the Command

command bar: **viewbase** transparent: **'viewbase** menu bar: **Model | Drawing Views | Generate Drawing Views** toolbar: **Drawing Views | Generate Drawing Views** ribbon (Mechanical workspace):

- **Home | Drawing Views | Generate Drawing Views**
- **Annotate | Drawing Views | Generate Drawing Views**

: ViewBase Prompts you in the command bar: Preset: "None", View scale: "Adapt to paper size" Select objects or [Entire model/preseTs/Special views/selection options (?)] <Entire model>: **(Select one or more 3D solids, blocks, components in the model, or press Enter to select the entire model; or choose an option. Hit the Tab key select nested entities..)** Enter new or existing layout name to make current <LayoutName>: **(Enter the name of a new or existing layout, or press Enter to accept the current layout)** The command switches to the layout tab: Select position for base view [Scale/Hidden lines/Tangent lines/Orientation/Projection type/Isometric geometry/sElect] <eXit>: **(Pick a point at which position the base view, or enter an option)** Select position for projected view [eXit] <eXit>: **(Move the cursor* left, right, above or below the base view to create other views, and click; continue until all views are inserted or press Enter to conclude before.)** * Orientation and layout of the views depend on the selected projection type (see below).

Command Options

Option	Description
Select objects	Selects the entities in model space from which to generate the drawing views in a layout tab.
Entire model	Select all the 3D entities in model space.
preseTs	Specifies the types of generated drawings and their placement in the layout; displays the Drawing View Presets dialog box; see below. The selected preset is saved through the DRAWINGVIEWPRESET (1.17.10) system variable.

Special views

Select a style of exploded representations, if any exist in the drawing; prompts you: **Select view [Exploded view/Unfolded view/Back] <Back>: - (enter an option:)**

- **Exploded view** -displays a dialog box: (6.2770 on page 5875) From the drop-down list, choose a style for the exploded representation. Prompts you: **Enter new or existing layout name to make current <LayoutName>**: **(Enter the name of a new or existing layout, or press Enter to accept the current layout)** The command switches to the layout tab, prompts you: **Select position for base view [Scale/Hidden lines/Tangent lines/trailiNg lines/Orientation/Projection type/Isometric geometry/sElect/eXit] <eXit>:**
  - **trailiNg lines -** controls the visibility of trailing lines; prompts you: **Show trailing lines [Yes/No]: - (enter an option);**
- **Unfolded view -** prompts you: **Select a solid with associated unfolded view [Back/selection options (?)]:** - **(Select one or more 3D solids in model tab, or press Enter to select all of them)**
- **Back** - returns to the previous prompt.

To create exploded views, use the BMEXPLODE (6.8.10) command; the model must have inserts of mechanical components to use this command.

selection options (?)

Selects one or more entities through a variety of selection methods, see Select (6.27.16).

Scale

Sets the Scale property of the paper space viewports for the various views; prompts you: **Adjust view scale [fit 4 views/fit 9 views/fit 5 views/fit 10 views/Standard scales/Custom scales] <fit 4 views>: - (enter an option:)**

- **fit 4 views** - adjusts the scale is adjusted to fit the four standard orthographic views: Front, Top, Left, Right. The Front view (base view) is defined by the Orientation (6.31.4) option.
- **fit 9 views** - adjusts the scale to fit five orthographic views and four isometric views.
- **fit 5 views** - adjusts the scale to fit five orthographic views: Front, Top, Left, Right, Back.
- **fit 10 views** - adjusts the scale to fit six orthographic views and four isometric views. <
- **Standard scales** - displays the scale list as maintained by the ScaleListEdit (6.27.7) command; select a scale from the list.
- **Custom scales** - prompts you to type a scale in the command bar.

Hidden Lines	Controls the visibility of hidden lines; prompts you: **Show hidden lines [Yes/No]** - **(enter an option:)** • **Yes** - displays hidden lines in the section view • **No** - turns off hidden lines When the BM_Ortho_Hidden and BM_Isometric_Hidden layers are off or frozen, hidden lines will not display.
Tangent Lines	Toggles whether tangent edges between tangent faces are created. Visible tangent edges are created on the BM_Tangent_Visible layer. Hidden tangent edges are created on the BM_Tangent_Hidden layer. Prompts you: **Enable tangent edges on basic views? [Yes/No] <No>** - **(enter an option:) No** - does not display tangent lines: (6.2771 on page 5876) **Yes** - displays tangent lines: (6.2772 on page 5876) Tangent edges are always created for isometric views. Freeze or switch off the display of the BM_Tangent_Visible layer to hide tangent edges in isometric views. (6.2773 on page 5876)
Orientation	Defines the base view. Rotates the 3D model so that the main view is projected on the vertical projection plane (V.P.). (6.2774 on page 5877) Prompts you: **Select orientation [Front/bAck/Left/Right/Top/Bottom/Current] <Front>:** - **(enter an orientation to change the base view.)**
Projection type	Defines the layout of the views; prompts you: **Select the projection type [First angle/Third angle] <First angle>** - **(enter a projection type:)** • **First angle** - also known as European projection: (6.2775 on page 5878)(6.2776 on page 5878) • **Third angle** - also known as American projection: (6.2777 on page 5879)(6.2778 on page 5879) The default projection type depends on the value of the MEASUREMENT (1.17.10) variable: • **0** - (Imperial) generates the third angle projection • **1** - (Metric) generates the first angle projection
Isometric Geometry	Defines the style for the isometric views: rendered 3D view or 2D drawing. Prompts you: **Create isometric views as [2D views/3D views] <2D views>** - **(enter an option:)** • **2D views** - draws isometric views as 2D drawings: (6.2779 on page 5880) • **3D views** - draws isometric views as 3D solids with the Conceptual visual style applied. (6.2780 on page 5880)

Select	Selects additional entities to include or exclude; prompts you: **[Remove/Entire model/Layout/selection options (?)] <Layout>: - (enter an option:)** • **Remove** - removes entities from drawing views • **Entire model** - includes all entities from model space in the drawing views • **Layout** - opens the previous layout with updated drawing views
Select position for projected view	Depending on the position of the cursor with respect to the base view one of five orthogonal views (top, left, right, back and bottom) and four isometric views can be inserted. The views are aligned automatically depending on the selected projection type (see above). Tap the **Ctrl** key to toggle alignment on and off; when off, you can place the current view in any location.
eXit	Concludes the command.

NOTES	When the GENERATEASSOCVIEWS (1.17.10) variable is On, associative dimensions are updated automatically when the 3D model is modified. DRAWINGVIEWQUALITY (1.17.10) variable defines the quality of drawing views.

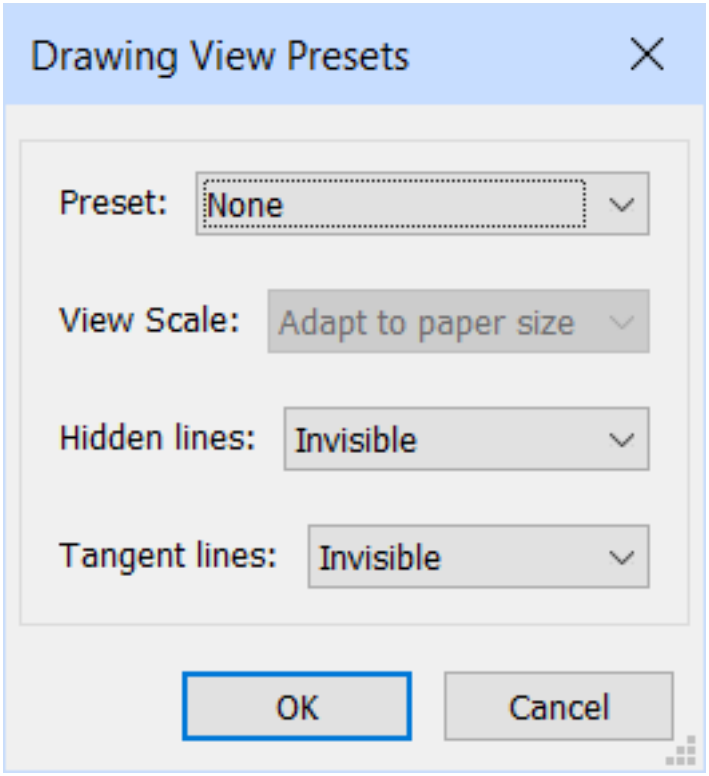
Drawing View Presets Dialog Box

To access this dialog box, enter the **preseTs** option: (6.2769 on page 5875)

Dialog Box Option	**Description**
Preset	Select a preset view arrangement: 1. Click the **Preset** droplist 2. Choose an option • **None** - no preset affects the views generated • **Architectural Views** - generates – Five standard views: Front, Right, Back, Left (used for elevations) and Top views – Three section views: two horizontal sections (for plans) and 1 vertical section • **Mechanical Views** - generates – Three standard views: Front, Top and Left (first angle projection) or Right (third angle projection) The layout of the mechanical views is controlled by the projection type: first or third angle. The current projection type is saved in the PROJECTIONTYPE (1.17.10) variable.
View Scale	Sets the default scale factor for the drawing views: 1. Click the **View Scale** droplist 2. Select a scale factor. The scale list can be edited by the ScaleListEdit command.

Hidden Lines	Sets the default setting for hidden lines in drawing views: 1. Click the **Hidden Lines** droplist 2. Choose **Visible** or **Invisible**.
Tangent Lines	Sets the default for Tangent Lines in drawing views: 1. Click the **Tangent Lines** droplist 2. Choose **Visible** or **Invisible**.

Figure 6.2769



Related Commands

Flatshot (6.14.10) - creates a hidden line representation of 3D solids in model space. MvSetup (6.21.34) - creates multiple paper space viewports; aligns, rotates and scales paper space viewports. In model space the command creates a rectangle, representing a paper sheet with respect to a specified scale. Solprof (6.27.43) - creates a hidden line representation of 3D solids in a layout viewport. ViewDetail (6.31.6) - creates a detail view of a portion of a standard generated drawing at a larger scale. ViewDetailStyle (6.31.7) - allows to specify the visual format of detail views and detail symbols. ViewEdit (6.31.8) - allows changing the scale and the hidden line visibility of drawing views. ViewExport (6.31.11) - Exports the content of drawing views obtained by ViewBase and ViewSection (6.31.12) to the Model Space of the drawing or to a new drawing. ViewProj (6.31.9) - generates additional projected views from an existing drawing view. ViewSection (6.31.12) - creates a cross section view based on a standard drawing view generated by the VIEWBASE command in a paper space layout. ViewSectionStyle (6.31.22) - allows to specify the visual format of section views and section lines. ViewUpdate (6.31.13) - updates a selection of drawing views or sections when VIEWUPDATEAUTO = 0.

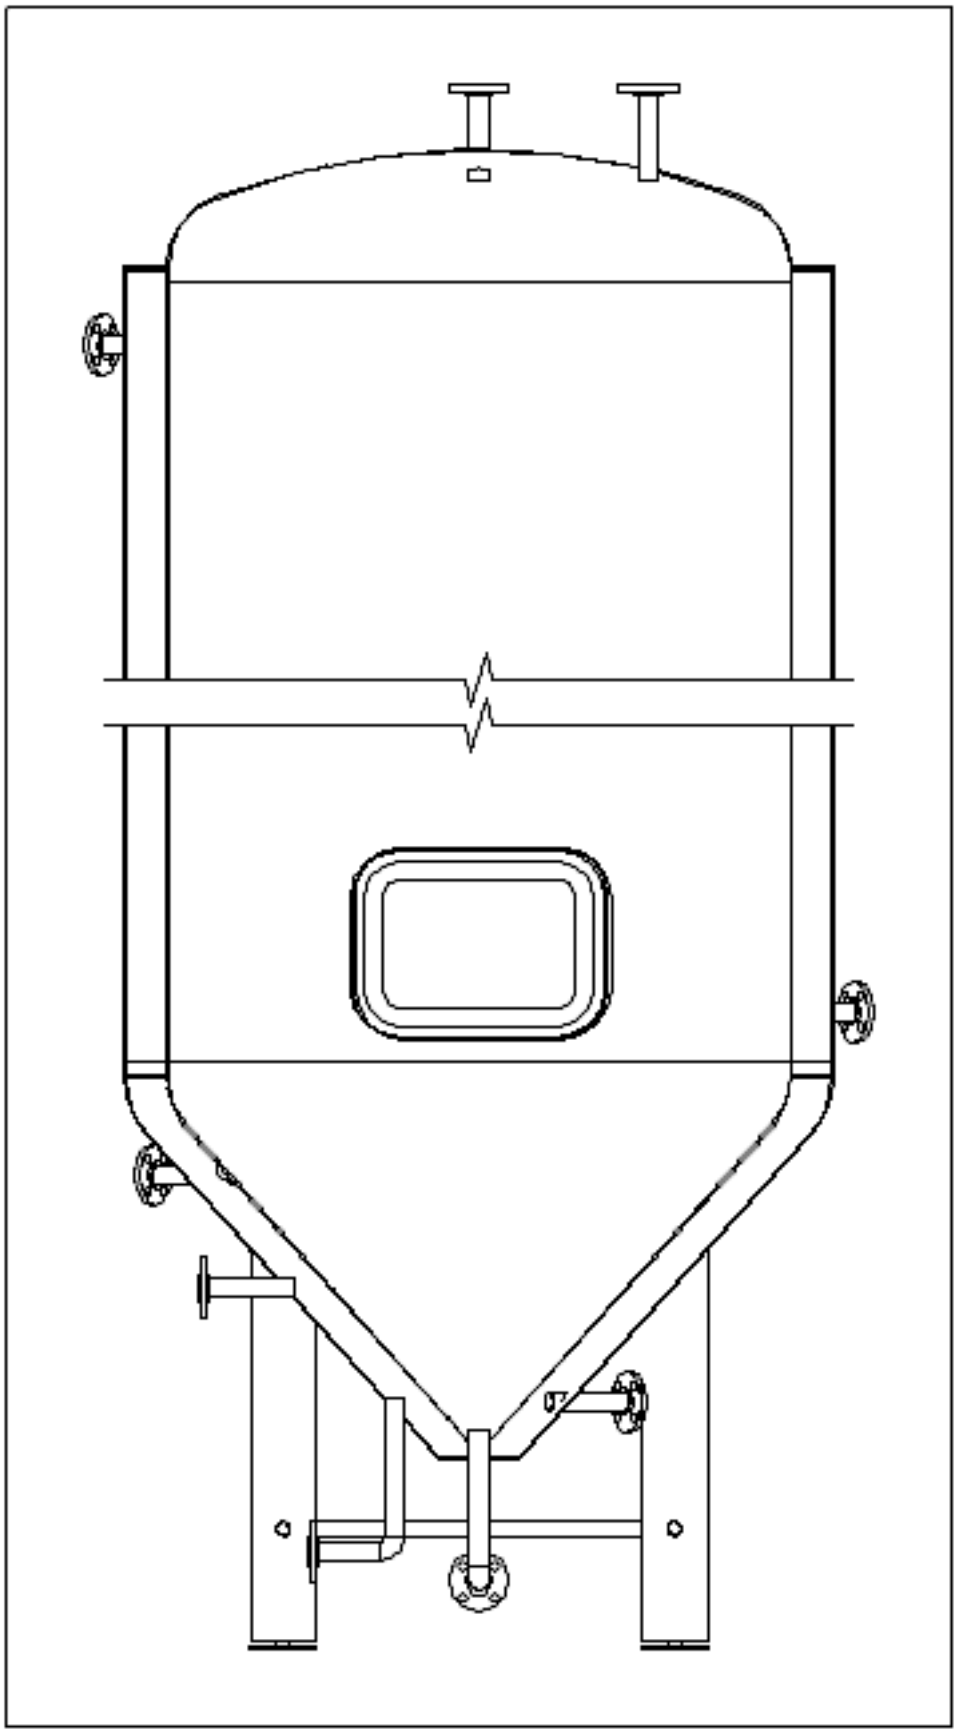
6.31.5 ViewBreak

(6.2880 on page 5977) Creates a broken view on drawing views generated by the ViewBase (6.31.4) command in a paper space layout.

NOTE	The command applies to paper space only.

(6.2782 on the next page)

Figure 6.2782



Accessing the Command

command bar: **viewbreak** transparent: **'viewbreak** menu bar: **Model | Drawing Views | Break View** toolbar: **Drawing Views | Break View** ribbon (Mechanical workspace):

- **Home | Drawing Views | Break View**
- **Annotate | Drawing Views | Break View**

: ViewBreak Prompts you in the command bar: Select drawing view: **(Click inside a drawing view)** Select first point [Type/Vertical]: **(Pick a point or enter an option)** Select second point: **(Pick another point)**

Command Options

Option	Description
Select drawing view	Selects the drawing view to generate the broken view from - click inside a drawing view.
Select first point	Specifies the first plane of the cut - pick a point in the view.
Type	Allows to set the broken symbol type; prompts you: **Select the type of broken symbol [Spline/Zigzag/Line/SmallZigzag] <SmallZigzag>** - Choose an option. • **Spline** – spline geometry. Supports the Gap distance, Width and Height properties. (6.2784 on page 5885) • **Zigzag** - pline geometry. Supports the Gap distance, Width and Height properties. (6.2785 on page 5886) • **Line** - line geometry. Supports the Gap distance property. (6.2786 on page 5886) • **Small Zigzag**. Supports the Gap distance, Width, Height and Step properties. (6.2787 on page 5886) Edit the properties of the Broken Symbol in the Properties panel: (6.2788 on page 5886) • **Type** - click the field, then select the type in the drop-down list. • **Gap distance** - defines the distance* between the two parts of the broken symbol. • **Width** - defines the width* of the shape symbol in the symbol direction. • **Height** - defines the height* of the shape symbol in the direction orthogonal to the symbol direction. • **Step** – defines the distance* between the small Zig-zag symbols. * Expressed in layout units.
Vertical	Aligns the symbol along the Y axis. (6.2789 on page 5887)
Horizontal	Aligns the symbol along the X axis. (6.2790 on page 5887)
Select second point	Specifies the second plane of the cut - pick a point in the view.

NOTE

The default direction of the symbol is based on the size of the viewport:

- **Vertical** if the viewport is wider then high.
- **Horizontal** if the viewport is higher than wide.

Edit Grips

You can edit break symbol grips. Select the break symbol. 2 Grips display: (6.2783 on the next page)

1. Controls the position of the first break plane in the model space
2. Controls the position of the second break plane in the model space

6.31.6 ViewDetail

(6.2880 on page 5977) Draws view details of drawing views made with the ViewBase (6.31.4) command.

NOTE	This command operates only paper space.

(6.2792)

Accessing the Command

 **Circular Detail View** ===ERROR WITH DOWNLOADED IMAGE=== **Rectangular Detail View** command bar: **viewdetail** menu bar: **Model| Drawing Views | Detail View Types | Circular Detail View** and **Rectangular Detail View** toolbars:

- **Drawing Views | Circular Detail View** and **Rectangular Detail View**
- **Detail Section Types | Circular Detail View** and **Rectangular Detail View**

ribbon (Mechanical workspace):

- **Home | Drawing Views | Circular Detail View** and **Rectangular Detail View**
- **Annotate | Drawing Views | Circular Detail View** and **Rectangular Detail View**

: ViewDetail Prompts you in the command bar. Select drawing view: **(Click inside a drawing view; the program highlights the selected view)** Specify detail center or select boundary type [Circular/Rectangular] <Circular>: **(Pick a point at the center of the detail view, or else choose an option)** Select radius of detail view: **(Pick a point or enter a number to set the radius of the detail view)** Select position for detail view [Scale] <eXit>: **(Pick a point to position the detail view, or enter an option)** Select option [Scale/Hidden lines/Tangent lines/anChor/Annotation/Boundary/modeL edge] <eXit>: **(Select an option, or else press Enter to end the command)**

Command Options

Option	Description
Select drawing view	Select the drawing view from which to made the detail: click inside a drawing view; the program highlights the selected view

Select boundary type	Specifies the style of the view boundary: • **Circular** - draws a circular boundary; prompts you: **Select radius of detail view** - **(indicate the point with the cursor, or type a value)** • **Rectangular** - draws a rectangular boundary; prompts you: **Select radius of detail view** - **(indicate the point with the cursor, or type a value)** You can always use the Boundary option switch between circular and rectangular boundaries.
Select position for detail view	Specifies the location for the detail view: pick a point in the layout away from the parent view
Scale	Specifies the scale of the detail view, which by default is twice the parent viewport scale; prompts you: **Adjust view scale [Standard scales/Custom scale/Relative custom scale] <Standard scales>:** - **(enter an option:)** • **Standard scales** - choose a standard scale in the list; the list can be edited by the SCALELISTEDIT (6.27.7) command. • **Custom scale** - specify a custom scale factor; prompts you: **Enter scale <1.00>** - **(enter a scale factor.)** • **Relative custom** - calculates the scale factor relative to parent view; prompts you: **Enter scale <2.00>** - **(enter a number)**; the scale factor of the source view is multiplied by this number.
Hidden lines	Control the visibility of hidden lines; prompts you: **Show hidden lines [Yes/No/from Parent]** - **(enter an option:)** • **Yes** - displays hidden lines in the section view • **No** - turns off hidden lines • **from Parent** - uses the same hidden lines setting as the parent view When the BM_Ortho_Hidden and BM_Isometric_Hidden layers are off or frozen, hidden lines will not display.
Tangent lines	Controls the display of tangent edges, which appear in the transition from a flat face and a curved face, such as with fillets; prompts you: **Show tangent lines [Yes/No]** - **(enter an option:)** • **Yes** - displays tangent lines: (6.2794 on page 5891) • **No** - does not display tangent lines (6.2795 on page 5892)

anChor	Determines how the viewport changes relative to the section; prompts you: **Anchor view on paper space? [Yes/No]** - **(enter an option:)** • **Yes** - the center of the viewport is anchored so that the viewport grows and shrinks around its center point • **No -** the position of the geometry is fixed The AUTOVPFITTING (1.17.10) variable controls whether the size of the viewport is adjusted automatically to fit the current extents of the 3D geometry. By default AUTOVPFITTING = ON.
Annotation	Determines the annotations to use; prompts you: **Select annotation [Identifier/Label]** - **(enter an option:)** • **Identifier** - specifies the view detail identifier. prompts you: **Specify the identifier <A>** - **(enter a name for the view detail.)** • **Label** - toggles the display of the view detail label; prompts you: **Show view label [Yes/No]** - **(press Y or N)**
Boundary	Toggles the style the boundary between circular and rectangular; prompts you: **Detail boundary [Rectangular/Circular]** - **(choose an option:)** • **Circular** - changes the boundary to a circle • **Rectangular** - changes the boundary to a rectangle
modeL edge	Controls whether a connection line is drawn between the detail view and the detail boundary in the parent view; prompts you: **Model edge type [smooth with Border/smooth with Connection line]** - **(enter an option:)** • **smooth with Border** - does not draw a linem • **smooth with Connection line** - draws a connecting line from the detail view to the parent view

The GENERATEASSOCVIEWS (1.17.10) variable controls whether VIEWDETAIL produces 2D views which are persistently associated with the source 3D model. If GENERATEASSOCIVIEWS is ON, associative dimensions are updated automatically when the 3D model is modified.

Grips Editing

Detail views can be edited through grips: select the view and six grips display: (6.2793 on the facing page)

1. Controls the position of the identifier
2. Controls the position of the section detail.
3. 4 grips control the size of the detail boundary.

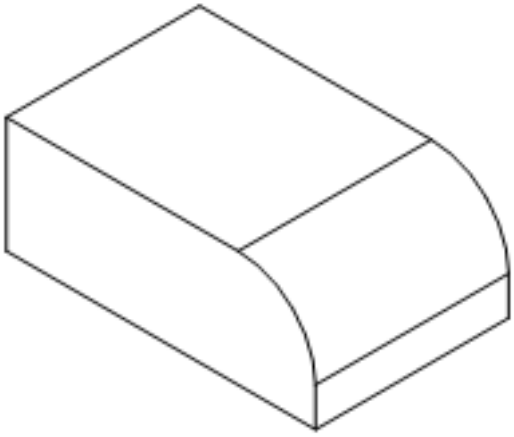

Figure 6.2795

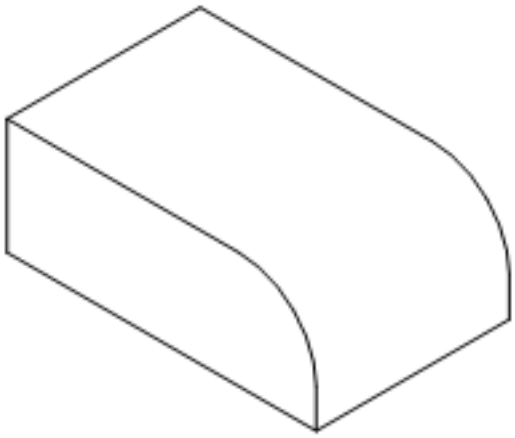

Figure 6.2796

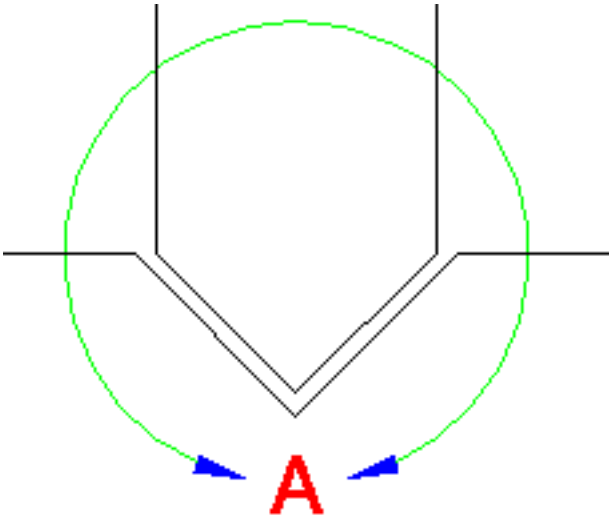
Figure 6.2797



6.31.7 ViewDetailStyle

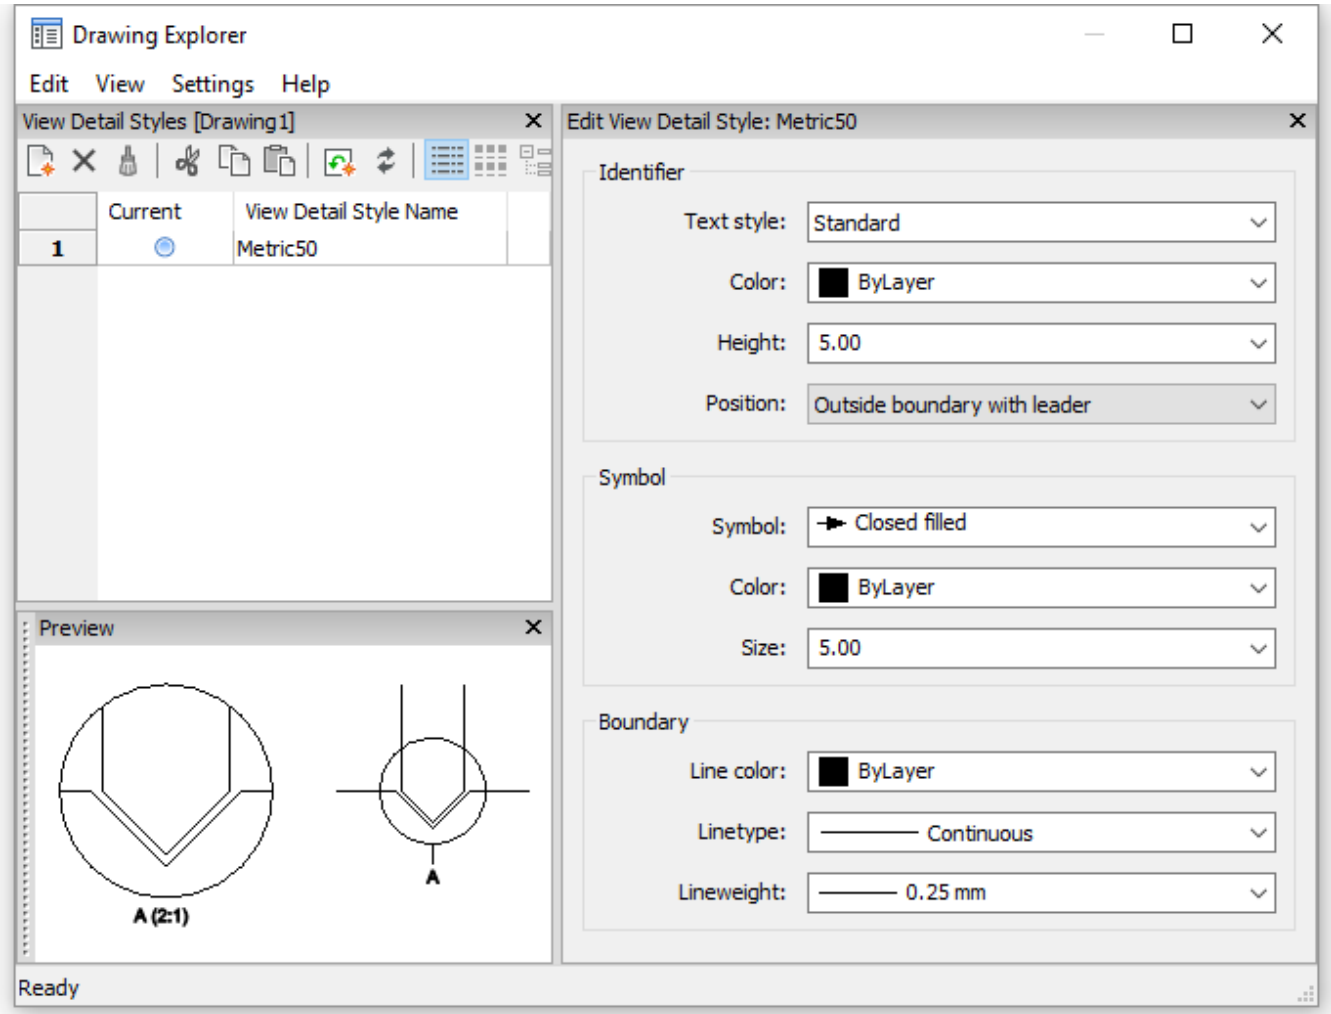
(6.2981 on page 6079) Specifies the identifiers, symbols, and boundaries used by detail views made from drawing views, created by the ViewBase (6.31.4) command, in the Drawing Explorer. (6.2797)

- **Identifier** - red
- **Symbol** - blue
- **Boundary** - green

Accessing the Command

command bar: **viewdetailstyle** menu bar: **View | Drawing Views | Detail Style** ribbon (Mechanical workspace): **Annotate | Drawing Views| Detail Style** toolbar: **Drawing Views | Detail Style : ViewDetailStyle** Displays the View Detail Styles section of the Drawing Explorer dialog box: (6.2798 on the next page)

Figure 6.2798



Toolbar Option

Toolbar Option	Description
===ERROR WITH DOWNLOADED IMAGE=== New	Creates a new view detail style as a copy of the currently selected style.
===ERROR WITH DOWNLOADED IMAGE=== Delete	Removes the selected style from the drawing.

Edit View Detail Style Options

Option	Description
Identifier	Defines the properties of the view detail identifier: **Text Style** - specifies the text style used by the identifier text: 1. Click the droplist 2. Choose the name of a text style To employ a different text style, use the Style command to create it. **Color** - specifies the color of the identifier: 1. Click the droplist 2. Choose a color swatch from the list, or else choose **Select Color** to get access to a lot more colors **Height** - specifies the height of the identifier: 1. Click the droplist 2. Choose one of the preset heights, or else type in a different value **Position** - determines where the identifier is located: • **Outside boundary** - places the identifier outside the detail's boundary; no symbol is used • **Outside boundary with leader** - outside the detail's boundary and draws a leader from the parent view to the detail; ; no symbol is used • **On boundary** - on the detail's boundary • **On boundary with leader** - places the identifier on the detail's boundary and draws a leader from the parent view to the detail
Symbol	Defines the properties of the symbol, which typically is an arrow: • **Symbol** - specifies the look of the symbol; choose None for no symbol • **Color** - specifies the color of the symbol • **Size** - specifies the size of the symbol

Boundary	Defines the properties of the detail viewport boundary: • **Line color** - specifies the color of the boundary line • **Linetype** - specifies the line type of the boundary line • **Lineweight** - specifies the weight of the boundary line

Related Commands

ViewBase (6.31.4) - generates associative orthographic and standard isometric views of a 3D solid model in a paper space layout. ViewDetail (6.31.6) - creates a detail view of a portion of a standard generated drawing at a larger scale. ViewSection (6.31.12) - creates a cross section view based on a standard drawing view generated by the ViewBase (6.31.4) command in a paper space layout. ViewSectionStyle (6.31.22) - allows to specify the visual format of section views and section lines.

Figure 6.2799

6.31.8 ViewEdit

(6.2880 on page 5977) ViewEdit changes the scale and hidden line visibility of a drawing view(s) if the view(s) was created with the ViewBase (6.31.4) command.

NOTE	This command only works in paper space.

Access the Command

command bar: **viewedit** transparent: **'viewedit** menu bar: **Model | Drawing Views | Edit View** toolbar: **Drawing Views | Edit View** ribbon (Mechanical workspace): **Annotate | Drawing Views| Edit View** Quad cursor menu: **Model | Edit View : ViewEdit Prompts you in the command bar:** Select drawing views [All views] <All views>: **(Click inside one or more drafting viewports, then hit Enter)** The next prompt will vary dependant on the selected view type. When different view types are selected, only the shared options are available:

- Standard views:

Select option [Scale/Hidden lines/Tangent lines/anChor/sElect/Geometry/Rotate view] <eXit>: **(Select an option)**

- Section views:

Select option [Scale/Hidden lines/Tangent lines/anChor/Geometry/Annotation/Depth/Projection/Rotate view] <eXit>: **(Select an option)**

- Detail views:

Select option [Scale/Hidden lines/Tangent lines/anChor/Annotation/Boundary/modEl edge] <eXit>: **(Select an option)**

- Exploded views:

Select position for base view [Scale/Hidden lines/Tangent lines/trailiNg lines/Orientation/Projection type/Isometric geometry/sElect/eXit] <eXit>: **(Select an option)**

Command Options

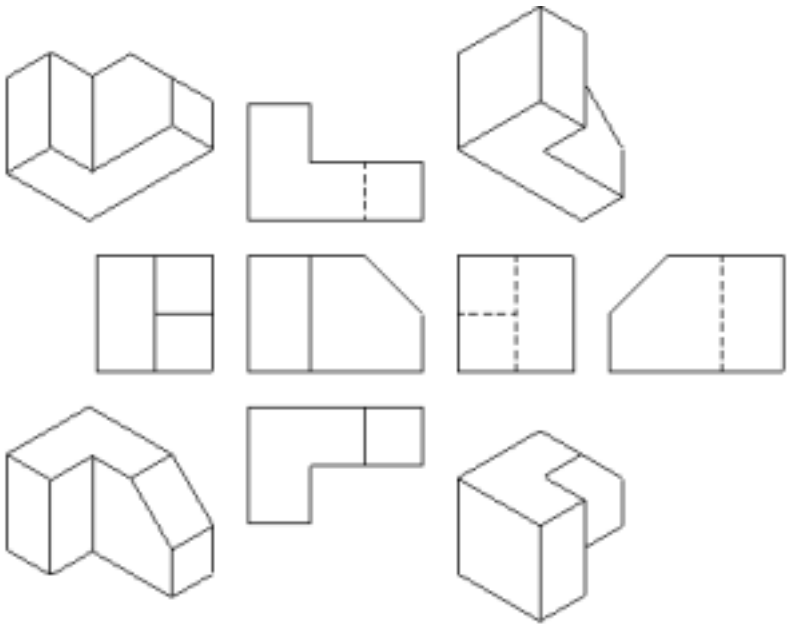
Option	Description
Select drawing views	Select the drawings view(s) to modify: click inside one or more drafting viewports or hit **Enter** to select all drawing views in the current layout: • **Standard views:** see the ViewBase (6.31.4) command • **Section views:** see the ViewSection (6.31.12) command • **Detail views:** see the ViewDetail (6.31.6) command
Rotate view	Rotates the drawing view viewport but does not rotate the frame. Prompts you: **Select first point of segment: (Pick a point or enter x,y coordinates) Select second point of segment: (Pick a point or enter x,y coordinates) Select orientation [Horizontal/Vertical/Custom angle]:** • **Horizontal**: rotates a segment horizontally. • **Vertical**: rotates a segment vertically. • **Custom angle**: allows you to set the angle of alignment. Prompts you:

Related Commands

ViewBase (6.31.4) - generates associative orthographic and standard isometric views of a 3D solid model in a paper space layout. ViewExport (6.31.11) - exports the content of drawing views and sections to the model space of the drawing, if the views were created with the ViewBase (6.31.4) and VIEWSECTION (6.31.12) commands. ViewDetail (6.31.6) - creates a detail view of a portion of a drawing at a larger scale. ViewDetailStyle (6.31.7) - allows you to set the visual format of detail views and detail symbols. ViewExport (6.31.11) - exports the content of drawing views, to the Model Space of the drawing or to a new drawing, if the views were created with the ViewBase (6.31.4) and ViewSection (6.31.12) commands. ViewProj (6.31.9) - generates additional projected views from an existing drawing view. ViewSection (6.31.12) - creates a cross-section view based on a standard drawing view, in a paper space layout, if the view was generated with the ViewBase (6.31.4) command. ViewSectionStyle (6.31.22) - allows you to set the visual format of section views and section lines. ViewUpdate (6.31.13) - updates a selection of drawing views or sections when VIEWUPDATEAUTO = 0.

Figure 6.2800

Figure 6.2801



6.31.9 ViewProj

(6.2880 on page 5977) Generates additional projected views from an existing drawing view previously created by the ViewBase (6.31.4) command (short for "view projection"). Up to five orthogonal and four isometric views can be generated from an existing drawing view: (6.2801)

Accessing the Command

command bar: **viewproj** transparent: **'viewproj** menu bar: **View| Drawing Views | Projected Views** toolbar: **Drawing Views | Projected Views** ribbon (Mechanical workspace):

- **Home | Drawing Views | Projected View**
- **Annotate | Drawing Views| Projected Views**

: ViewProj Prompts you in the command bar: Select drawing view: **(Click inside an existing drawing view)** Select position for projected view [Isometric geometry] <eXit>: **(Position the projected views with respect to the existing drawing view, or press Enter to end the command)**

Command Options

Option	Description
Select drawing view	Selects the view from which to project the new view: click inside an existing drawing view
Select position of projected view	Positions the new view: move the cursor, and then click. Depending on where you move the cursor, you can placed one of five orthogonal views or four isometric views. The views are aligned automatically. Tap the **Ctrl**-key to toggle alignment on off; when off, you can place the view anywhere on the sheet.

Isometric geometry	Sets the style for isometric views; prompts you: **Create isometric views as [3D views / 2D views] <2D> - (enter an option:)** • **2D views** - draws isometric views as 2D projections of the 3D geometry, and turns on the BM_Isometric_Hidden layer so that hidden lines are shown as dashed lines • **3D views** - draws isometric views as 3D geometry, and sets the visual style of the viewport (6.2802 on the next page)

Related Commands

ViewBase (6.31.4) - generates associative orthographic and standard isometric views of a 3D solid model in a paper space layout. ViewExport (6.31.11) - exports the content of drawing views and sections obtained by ViewBase (6.31.4) and ViewSection (6.31.12) to the Model Space of the drawing. ViewDetail (6.31.6) - creates a detail view of a portion of a standard generated drawing at a larger scale. ViewDetailStyle (6.31.7) - allows to specify the visual format of detail views and detail symbols. ViewEdit (6.31.8) - allows changing the scale and the hidden line visibility of drawing views. ViewExport (6.31.11) - Exports the content of drawing views obtained by ViewBase (6.31.4) and ViewSection (6.31.12) to the Model Space of the drawing or to a new drawing. ViewSection (6.31.12) - creates a cross section view based on a standard drawing view generated by the ViewBase (6.31.4) command in a paper space layout. ViewSectionStyle (6.31.22) - allows to specify the visual format of section views and section lines. ViewUpdate (6.31.13) - updates a selection of drawing views or sections when VIEWUPDATEAUTO (1.17.10) = 0.

Figure 6.2802

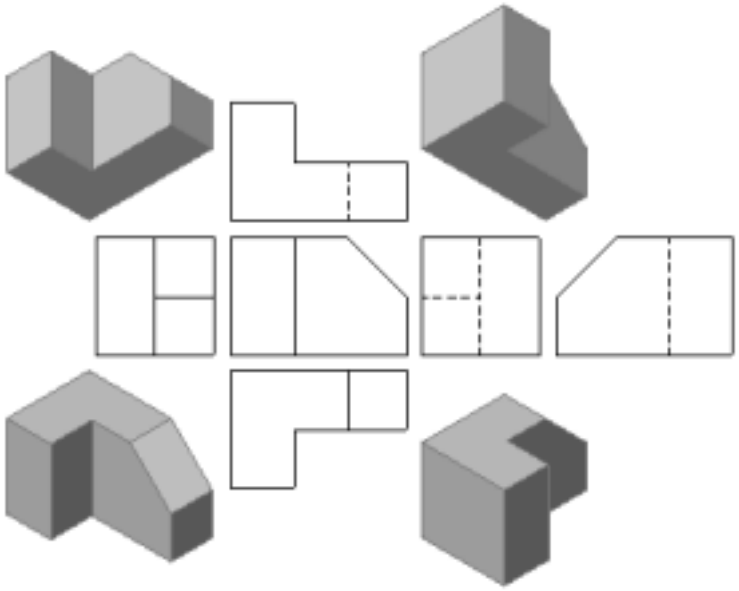


Figure 6.2803

6.31.10 ViewRes

(7.3 on page 6132) Sets the view resolution, and toggles fastzoom mode (short for "view resolution").

Accessing the Command

command bar: **viewres : ViewRes Prompts you in the command bar:** Do you want fast zooms? [Yes. fast zooms/No. regular zooms] <Yes>: **(Type Y or N.)** Enter curve display quality (range 1-20000) <100>: **(Enter a number, or press Enter to accept the default.)** When ViewRes is set to a low value, zoomed-in circles can look like polygons: (6.2804 on the next page) Enter the Regen (6.26.23) command to make circles look round again: (6.2805 on the facing page)

Figure 6.2804

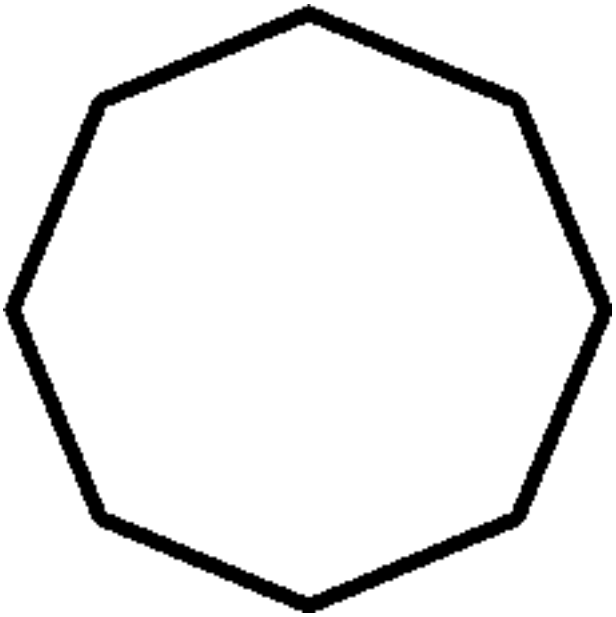

Figure 6.2805

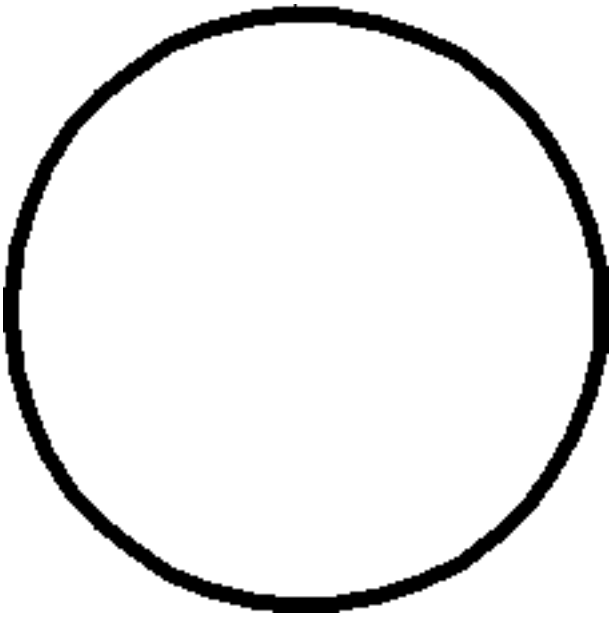


Command Options

Option	Description
Do you want fast zooms?	Specifies how redraws are handled: • **Yes** - redraws and other commands that activate redraws refresh the drawing screen • **No** - redraws acts like regens: they re-read the drawing database and then refresh the screen
Enter curve display quality	Specifies the roundness of circles and other curved entities; enter a number between 1 and 20000: • **1** - very fast display, but circles can look like polygons • **100** - default value • **20000** - slower display, but circles almost always look round With today's fast computers and graphics boards, you can safely enter 20000.

Related Command

Regen (6.26.23) - regenerates the drawing.

Figure 6.2806

6.31.11 ViewExport

(6.2880 on page 5977) Exports drawing views generated by the ViewBase (6.31.4) and ViewSection (6.31.12) commands to the model tab of the current drawing, via the Clipboard to a new drawing, or as a DWG/DXF file on disc.

NOTE	This command operates only paper space.

Accessing the Command

command bar: **viewexport** transparent: **'viewexport** menu bar: **Model | Drawing Views | Export Drawing Views** toolbar: **Drawing Views | Export Drawing Views** ribbon (Mechanical workspace):

- **Home | Drawing Views | Export Drawing Views**
- **Annotate | Drawing Views | Export Drawing Views**

: ViewExport Prompts you in the command bar: Select drawing views [All views] <All views>: **(Select one or more views, or press Enter to export all of them)** Choose destination [Clipboard/File/Model space] <Model space>: **(Select an option)**

Command Options

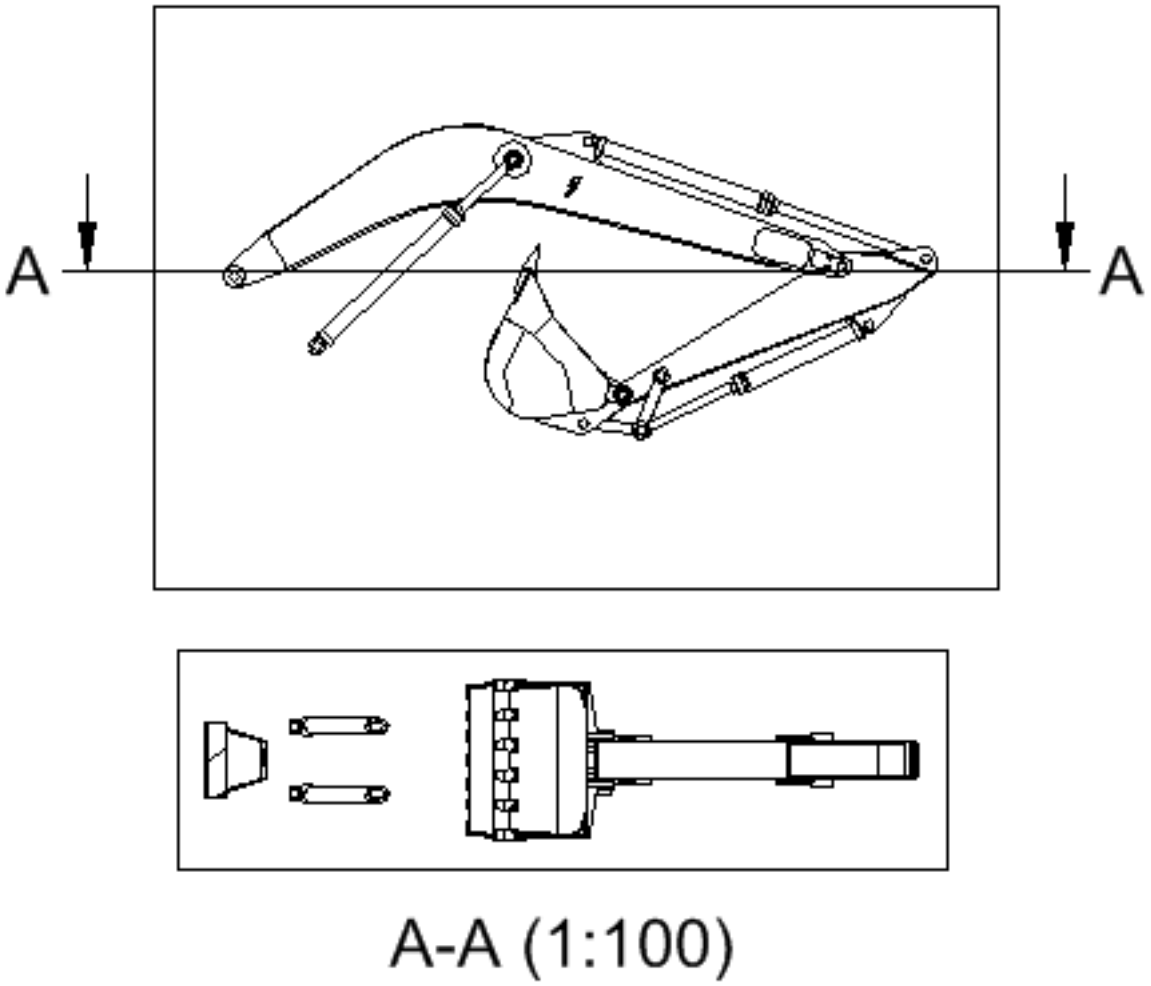
Option	Description
Select drawing views	Click inside the inside of one or more viewports; the program shows selected viewports by dashed lines.
All views	All views in the current layout will be exported.
Choose destination	Specifies the destination of the views: • **Clipboard** - exports the selected view(s) to the clipboard, which can then be pasted into another drawing • **File** - exports the selected views to a DWG or DXF file; displays the Save Exported Views dialog box • Model space - exports the view to the current drawing's model space; prompts you: 1. **Remove exported views? <No>/Yes** - **(enter an option:)** • **Yes** - the viewports of exported views are removed from the layout • **No** - viewports of exported views are kept in the layout 2. The program switches to model tab, and then prompts you: **Select position for exported views** - **(pick a point;)** the program places the views as blocks made of lines and other 2D entities

Related Commands

Flatshot (6.14.10) - creates a hidden line representation of 3D solids in model space. Solprof (6.27.43) - creates a hidden line representation of 3D solids in a layout viewport. ViewBase (6.31.4) - generates associative orthographic and standard isometric views of a 3D solid model in a paper space layout. ViewExport (6.31.11) - exports the content of drawing views and sections obtained by ViewBase. (6.31.4) ViewSection (6.31.12) to the Model Space of the drawing. ViewEdit (6.31.8) - allows changing the scale and the hidden line visibility of drawing views. ViewDetail (6.31.6) - creates a detail view of a portion of a standard generated drawing at a larger scale. ViewDetailStyle (6.31.7) - allows to specify the visual format of detail views and detail symbols. ViewProj (6.31.9) - generates additional projected views from an existing drawing view. ViewSection (6.31.12) - creates a cross section view based on a standard drawing view. ViewSectionStyle (6.31.22) - allows to specify the visual format of section views and section lines. ViewUpdate (6.31.13) - updates a selection of drawing views or sections when VIEWUPDATEAUTO = 0.

Figure 6.2807

Figure 6.2808



6.31.12 ViewSection

(6.2880 on page 5977) ViewSection creates cross-section views of drawing views generated with the ViewBase (6.31.4) command in a paper space layout.

NOTE	This command operates only in paper space.

(6.2808)

Access the Command

===ERROR WITH DOWNLOADED IMAGE=== **Generate Full Section View** ===ERROR WITH DOWNLOADED IMAGE=== **Generate Half Section View** ===ERROR WITH DOWNLOADED IMAGE=== **Generate Offset Section View** ===ERROR WITH DOWNLOADED IMAGE=== **Generate Aligned Section View** command bar: **viewsection** transparent: **'viewsection** menu bar: **Model | Direct Modeling | Drawing Views | Section Types** toolbar:

- **Drawing Views |** Section types
- **Section types**

ribbon (Mechanical workspace):

- **Home | Drawing Views**
- **Annotate | Drawing Views**

: **ViewSection Prompts you in the command bar:** Select drawing view: **(Click inside a drawing view)** Specify start point of section line or select type [Full/Half/Offset/Aligned] <Full>: **(Pick a point or enter an option)** Specify next point of section line [Done] <Done>: **(Pick another point)** As you move the cursor, the program draws the section view dynamically, parallel to the section line. Select position for section view: **(Pick a point to place the section**

Command Options

Option	Description
Select drawing view	Selects the drawing view to generate the section from - click inside a drawing view.
Specify start point of section line	Specifies one end of a section line - pick a point in the layout.
Specify next point of section line	Specifies the second point of the section line. Prompts you: **Specify next point of section line [Done] <Done>** - **(Enter an option.)** • Pick another point to create a jogged section line • Enter **Done** to end the draw section process The command repeats so that you can draw sections lines with jogs.
Select type	Control the shape of the section plane. Prompts you: **Select type [Full/Half/Offset/Aligned] <Full>** - **(Enter an option:)** 1. **Full**  - section line defines an infinite plane that cuts through the entire model. 2. **Half**  - section line defines a half-plane that cuts part of the model. Prompts you: 3. **Specify start point of section line or [Type] <Type>** - **(pick a point - #1 in the figure below.)** 4. **Specify next point of section line [Done] <Done>** - **(pick another point to define the limit of the half plane - #2 in the figure below.)** 5. **Specify next point of section line [Done] <Done>** - **(pick the point that defines the view direction - #3 in the figure below.)** The position of the third point determines whether the part of the model that is not cut displays (left) or not (right). (6.2810 on page 5913) • **Offset**  - the section line defines a series of cutting regions located on different offsets from each other. Enter **Done** to complete the section line. • **Aligned**  - the section line defines a polyline, where every segment defines a cutting region. The resulted section will have the length equal to the sum of the lengths of cutting regions. Enter **Done** to complete the section line.
Select position for section view	Specifies the location of the section view: • As you move the cursor, the section view stays perpendicular to the section line. • To place the section view anywhere on the sheet, hit the **Ctrl** key to turn off alignment.

Scale	Sets the scale of the section view. Prompts you: **Adjust view scale [Standard scales/Custom/from Parent]** - **(Enter an option:)** • **Standard scales** - displays the list of scale factors defined by the ScaleListEdit (6.27.7) command. Prompts you: **Enter the scale number <1>** - **(Enter a number from the list displayed by the program.)** • **Custom** - prompts you to enter a scale in the command bar: **Enter scale <1.000>** - **(Enter a scale factor.)** • **from Parent** - sets the scale of the section view equal to the scale of the parent viewport.
Hidden lines	Allows you to control the visibility of hidden lines. Prompts you: **Show hidden lines [Yes/No/from Parent]** - **(Enter an option:)** • **Yes** - displays hidden lines in the section view • **No** - turns off hidden lines • **from Parent** - uses the same hidden line setting as the parent view When the BM_Ortho_Hidden and BM_Isometric_Hidden layers are off or frozen, hidden lines do not display.
Tangent lines	Controls the display of tangent edges, which appear in the transition from a flat face and a curved face. Prompts you: **Show tangent lines [Yes/No]** - **(Enter an option:)** • **Yes** - displays tangent lines: (6.2811 on page 5913) • **No** - does not display tangent lines: (6.2812 on page 5914)
anChor	Determines how the viewport changes relative to the section. Prompts you: **Anchor view on paper space? [Yes/No]** - **(Enter an option:)** • **Yes** - the center of the viewport is anchored so that the viewport grows and shrinks around its center point • **No -** the position of the geometry is fixed The AUTOVPFITTING (1.17.10) variable controls whether the size of the viewport is adjusted automatically to fit the current extents of the 3D geometry. By default AUTOVPFITTING = ON.

Geometry	Selects the visual style for the section view. Prompts you: **Choose geometry type [2D/3D]** - **(Enter an option:)** • **2D** - section view uses the 2dWireframe visual style • **3D -** section view uses a rendered visual style. This is Conceptual by default. Use the Properties (1.15.4) panel to choose a different visual style: (6.2813 on page 5914)
Annotation	Determines the annotations to use. Prompts you: **Select annotation [Identifier/Label]** - **(Enter an option:)** • **Identifier** - specifies the view detail identifier. Prompts you: **Specify the identifier <A>** - **(Enter a name for the view detail)** • **Label** - toggles the display of the view detail label. Prompts you: **Show view label [Yes/No]** - **(Press Y or N.)**
Depth	Specifies the view depth of a section view. Prompts you: **Choose depth mode [Full/Custom] - (Enter an option:)** • **Full -** sets the depth to the extents of the model (maximum view depth) • **Custom -** limits the view depth. Prompts you: **Enter depth distance** - **(Type a positive value or move the cursor to define the view depth dynamically.)**
Projection	Determines how the section is projected. Prompts you: **Select projection method [Normal/Orthogonal]** - **(Enter an option:)** • **Normal** - draws the section as a union of projections from every cutting region (each segment of the section polyline) in its normal direction. • **Orthogonal** - draws the section in the normal direction of the first section region (the first segment of the section polyline).

Rotate view	Allows you to rotate the drawing view viewport but does not rotate the frame. Prompts you: Select first point of segment: **(Pick a point or enter x,y coordinates)** Select second point of segment: **(Pick a point or enter x,y coordinates)** Select orientation [Horizontal/Vertical/Custom angle]: • Horizontal: rotates a segment horizontally. • Vertical: rotates a segment vertically. • Custom angle: allows you to specify the angle of alignment. Prompts you: Specify the angle: enter the rotation angle or pick the rotation point. Second point: enter an angle or pick a point.

NOTES

- The GENERATEASSOCVIEWS (1.17.10) system variable controls whether VIEWSECTION produces 2D views. These are associated with the source 3D model.
- If GENERATEASSOCIVIEWS (1.23.14) is ON, associative dimensions are updated automatically when the 3D model is modified.
- If the Sectionable property (6.8.32) of a mechanical component is OFF, the component appears non-sectioned in the section views of the **Full** section type.

Edit Grips

You can edit section lines with grips. Select either the section line, one of the identifiers or an arrow. 5 Grips display: (6.2809) 1. Controls the position of the first identifier. 2. Defines the start point of the section line. 3. Allows you to move the section line. 4. Defines the endpoint of the section line. 5. Controls the position of the second identifier.

6.31.13 ViewUpdate

(6.2880 on page 5977) Manually updates drawing views created the ViewBase (6.31.4) and ViewSection (6.31.12) commands, when automatic updates (VIEWUPDATEAUTO (1.17.10)) are turned off.

NOTE	This command works only in paper space.

Accessing the Command

command bar: **viewupdate** menu bar: **Model | Drawing Views | Update Drawing Views** toolbar: **Drawing Views | Update Drawing Views** ribbon (Mechanical workspace):

- **Home | Drawing Views |Update Drawing Views**
- **Annotate | Drawing Views |Update Drawing Views**

Quad cursor menu: **Model | Update Drawing Views : ViewUpdate Prompts you in the command bar:** Select drawing views [All views] <All views>: **(Click inside a view, or press Enter to update all views)**

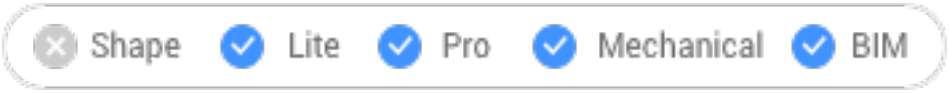
Command Options

Option	Description
Select drawing views	Click inside a view
All views	Updates all drawing views in the current layout

Related Commands

ViewBase (6.31.4) - generates associative orthographic and standard isometric views of a 3D solid model in a paper space layout. ViewExport (6.31.11) - exports the content of drawing views and sections obtained by VIEWBASE (6.31.4) and VIEWSECTION (6.31.12) to the Model Space of the drawing. ViewDetail (6.31.6) - creates a detail view of a portion of a standard generated drawing at a larger scale. ViewDetailStyle (6.31.7) - allows to specify the visual format of detail views and detail symbols. ViewEdit (6.31.8) - allows changing the scale and the hidden line visibility of drawing views. ViewExport (6.31.11) - Exports the content of drawing views obtained by VIEWBASE (6.31.4) and VIEWSECTION (6.31.12) to the Model Space of the drawing or to a new drawing. ViewProj (6.31.9) - generates additional projected views from an existing drawing view. ViewSection (6.31.12) - creates a cross section view based on a standard drawing view generated by the VIEWBASE (6.31.4) command in a paper space layout. ViewSectionStyle (6.31.22) - allows to specify the visual format of section views and section lines.

Figure 6.2815



6.31.14 VisibilityStates

(6.2947 on page 6049) Creates visibility parameters and states for drawing entities. Note: BricsCAD visibility states are not compatible with AutoCAD® visibility states. When you open a drawing with BricsCAD parametric blocks in AutoCAD® they display as saved in BricsCAD. However, when such parametric blocks are edited, or copied to another drawing in AutoCAD® , all entities in the block become visible.

Accessing the Command

Keyboard: **visibilitystates** Drafting workspace: Ribbon: **Parametric | 2D Parametric Block : visibilitystates** Displays the **Manage Visibility** dialog box with a list of visibility states, if any, in the current drawing or when editing a block definition (see BEDIT (6.6.7) command).

(6.2816 on page 5918)
No visibility states yet.

(6.2817 on page 5918)
Current visibility parameters and their states.

- Double click a parameter to collapse/expand its states.
- Click a state to apply it. The visibility state icon changes accordingly.

Command Options

Option	Description
New Parameter	Creates a new visibility parameter. Displays a dialog box: (6.2822 on page 5919) Type a name for the new parameter, then click the **OK** button.
Parameter Menu	Right click the parameter: (6.2819 on page 5919) or (6.2820 on page 5919) • **Show invisible**: Shows all invisible entities greyed out; visible entities according to the currently selected state(s) highlight. (6.2821 on page 5919) • **Rename...**: Displays the **Rename** dialog box. Type a name to replace the existing name, then click the **OK** button. Parameter names cannot start with a number or contain +, -, /, ... (6.2822 on page 5919) • **Delete**: Deletes the parameter and its visibility states. • **Add State**: Displays the **Rename** dialog box. Type a name for the new state to replace the default name, then click the **OK** button. (6.2826 on page 5920) • **Select visible entities for all states***: First choose **Show invisible**, then select the entities to remove all visibility states from for the selected parameter. Prompts you: **Select entities to make visible for all states of Opening [selection options (?)]:** Select the entities, then press Enter or right click. * When a selection set exists the option reads: **Make selection visible in all states**.

State Menu	Right click a visibility state: (6.2824 on page 5920) or (6.2825 on page 5920) • **Show invisible**: Shows all invisible entities greyed out; visible entities according to the currently selected states highlight. • **Rename...** : Displays the **Rename** dialog box. Type a name to replace the existing name, then click the **OK** button. (6.2826 on page 5920) • **Delete**: Deletes the selected state. • **Select visible entities***: Prompts you: **Select entities to make visible for Opening=45 [selection options (?)]:** Select the entities, then press Enter or right click. • **Select invisible entities***: Prompts you: **Select entities to make invisible for Opening=45 [selection options (?)]:** Select the entities, then press Enter or right click. * When a selection set exists the options read: **Make selection visible** and **Make selection invisible**.

Notes	• Entities can have a state assigned in multiple parameters. • It is not yet possible to edit the order of states. • Visibility states are not copied along with the entity. • The BLOCK and WBLOCK commands do not save visibility states. Use the CREATELIBRARYBLOCK (6.9.55) command instead or save the block as a drawing.

Related Commands

LayFrz (6.20.12) - freezes layers associated with selected entities. LayThw (6.20.16) - thaws all frozen layers. LayIso (6.20.7) - isolates layers associated with selected entities. LayUnIso (6.20.20) - unisolates locked or turned off layers. LayOn (6.20.13) - turns on all layers that were turned off in the drawing, except for frozen layer . LayOff (6.20.11) - turns off layers associated with selected entities HideObjects (6.16.10) - hides the selected entities. IsolateObjects (6.17.22) - hides all but the selected entities. UnisolateObjects (6.30.7) - unhides entities that were hidden.

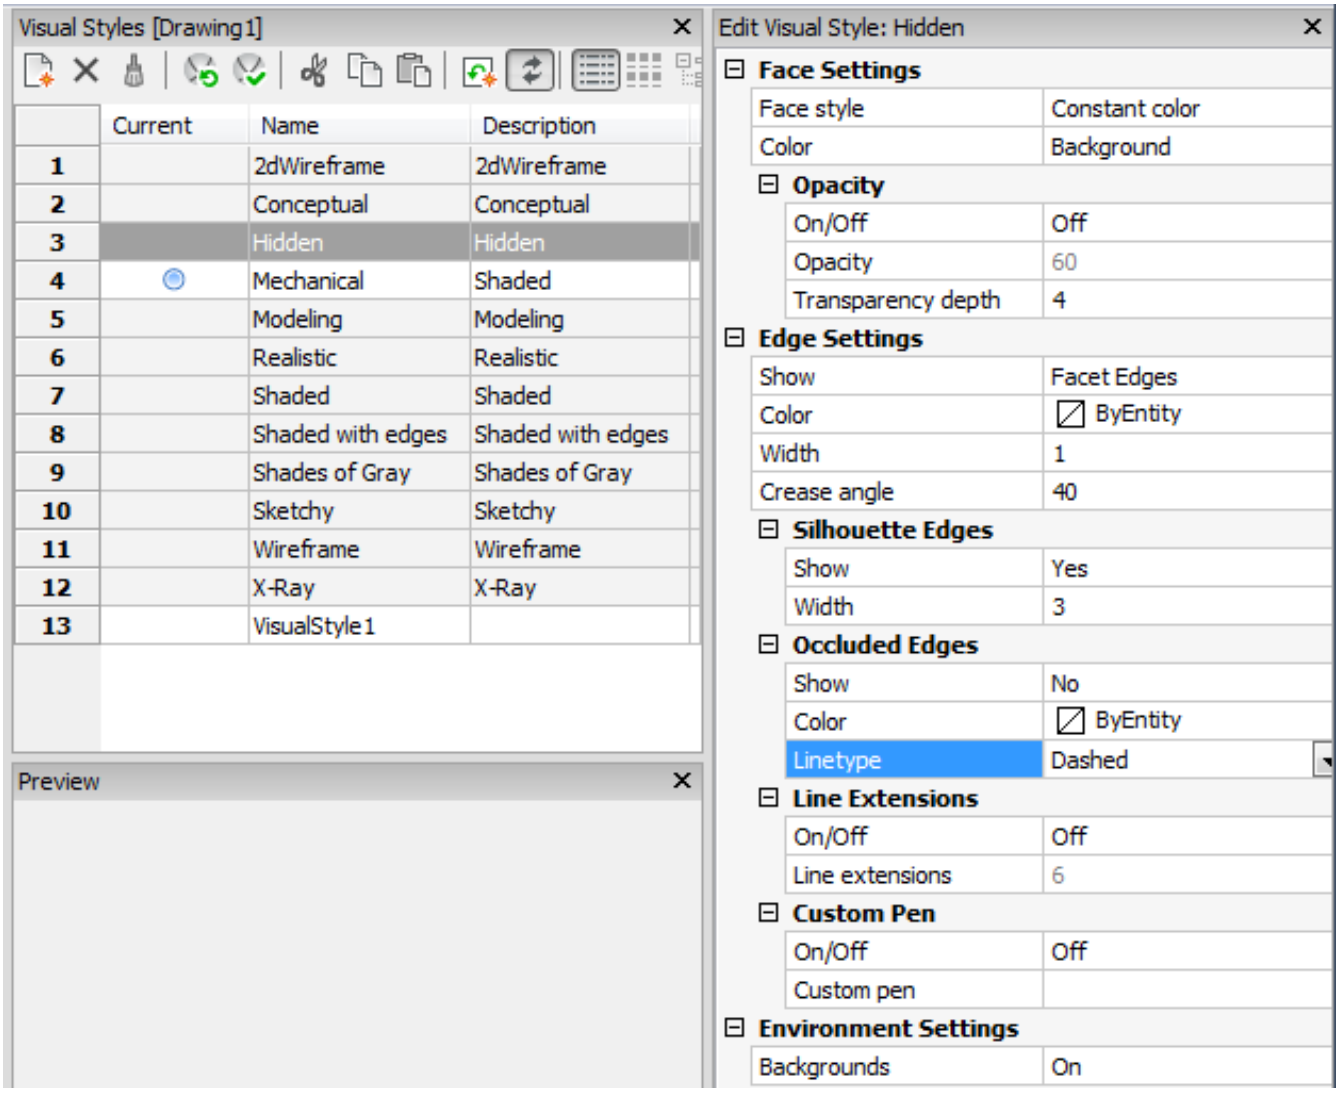
6.31.15 VisualStyles

(6.2981 on page 6079) Creates and modifies visual style definitions in the Drawing Explorer.

Accessing the Command

command bar: **visualstyles** menu bar: **Tools | Drawing Explorer | Visual Styles** ribbon: **Home | Settings | Drawing Explorer | Visual Styles** : **VisualStyles** Displays the Visual Styles section of the Drawing Explorer dialog box: (6.2828 on the next page)

Figure 6.2828



Toolbar Options

Some options do not appear when certain settings are turned off.

Option	Description
===NO VALID URL FOR IMAGE=== New	Creates a new visual style.
Delete	Deletes the selected visual style, except for predefined visual styles such as 2dWireframe, 3D Hidden, 3dWireframe, Conceptual, Realistic, and so on.
Apply visual style	Applies the selected visual style to the current viewport.
Edit visual style	Displays the settings of the selected visual styles. To edit a setting: click the settings field, then type a new value or select an option in the drop down list.

Edit Visual Styles Options

Option	Description

Face Settings

Specifies the look of faces of 3D models: **Face Style** - selects an overall color scheme for the visual style:

- **Real** - makes the faces look real, like a rendered mode; displays materials if applied
- **Gooch** - substitutes warm and cool colors for light and dark
- **Constant Color** - applies a single color to each face
- **None** - no style applied to faces, like wireframe mode

Lighting Quality - specifies the quality of curved faces:

- **Faceted** - lowest quality but fastest rendering
- **Smooth** - good quality
- **Smoothest** - best quality at cost of slower rendering

Color -

- **Normal** - face colors are displayed normally
- **Monochrome** - face colors are displayed in a monochrome color, as specified by the Monochrome Color option
- **Tint** - face colors have their hue and saturation changed
- **Desaturate** - face colors have their saturation reduced by 30%.
- **Background** - faces take on the background color

Material Display - determines whether materials are displayed; materials are applied with the MaterialAssign (6.21.8) command:

- **Materials and texture** - both materials (the look of the surface, such as brick) and the texture maps (bumpiness) are rendered, at the cost of rendering speed
- **Materials** - materials are displayed on the faces of 3D models
- **Off** - materials are not displayed, which leads to quicker renderings

When Material Display is not off, then highlights and opacity are ignored, as materials provides their own values for them.

Opacity

Specifies the level of transparency of faces: **On/off** - toggles opacity on and off **Opacity** - specifies the level of transparency (Not available when materials are on):

- **0** - Opaque
- **1** - Transparent
- **2** thru **99** - Translucent

Transparency depth - specifies how far transparency reaches in terms of the number of overlapping entities

Lighting	Determines whether shadows are displayed. **Shadow display** - choose one: • **Off** — objects cast no shadows, the preferred option as shadow-casting slows down the program's display speed, so leave it turned off unless you are saving images to file or plotting them • **Ground shadows** — objects cast shadows on the shadow plane (described later), but not on each other • **Full shadows** — objects cast shadows on the ground and on each other
Edge Settings	Specifies the style of edge to display: **Show** - **(choose one:)** • **None** - neither facets nor isolines nor edges are displayed; this setting turns off many other settings • **Isolines** - isolines and edges are displayed; isoline are the curved lines that simulate the surfaces of curved faces • **Facet Edges** - facets and edges are displayed on entities **Color** - specifies the color for all edges **Width** - specifies the width of edge lines **Number of lines** - specifies the number of isolines drawn on curved surfaces, from 0 to 2047 **Always on top** - determines if all isolines are displayed, or only those that are "on top" (hidden isolines being hidden)
Silhouette Edges	Determines how fat outlines are around models: **Show** - toggles the display of silhouette edges **Width** - width of the silhouette edges in the range of 1 to 25 pixels; applies to all entities in the viewport equally

Occluded Edges	Specifies how to handle occluded (hidden) edges and facets; this setting allows you to display hidden lines in a different color and linetype from visible lines: **Show** - toggles the visibility of occluded edges and facets: • **On** - hidden lines are shown “through” the model • **Off** - hidden lines are not shown **Color** - specifies the color for visible obscured edges and facets; **Linetype** - specifies the line type for visible obscured edges and facets; the program does not use the usual linetype patterns, but a separate set: • Solid • Dashed • Dotted • Sparse dot • Short dash • Medium dash • Medium long dash • Long dash • Double short dash • Double medium dash • Double long dash All of these settings do not apply to isolines.
Line Extensions	Extends edges beyond their boundaries; also known as "overhang": **On/Off** - turn line extensions on or off **Line extensions** - specify the distance the lines extend beyond boundaries, such as face edges
Custom Pen	Determines the use of a custom line drawing style: **On/Off** - turns it on and off **Custom pen** - specifies the style of line drawing
Background Settings	Toggles the display of a background in the viewport: **Backgrounds** - turn on or off Backgrounds consist of either a solid color, a gradient of two or three colors, or a raster image, and are set by the Background (6.6.3) command.

The ANTIALIASSCREEN (1.17.10) system variable controls the amount of anti-aliasing (edge smoothing) applied during on-screen rendered mode display. The default value is 1, maximum value is 5. High anti-alias values incur a high calculation cost. **Mechanical Drafting** and **Mechanical Drafting Section** visual styles are used by the BmGenDraft (6.31.4) and BmGenSection (6.31.12) commands

Related Commands

AniPath (6.4.13) - records the animation of a camera moving along a path or panning in a 3D model and saves it to a movie file. Figure 6.2832

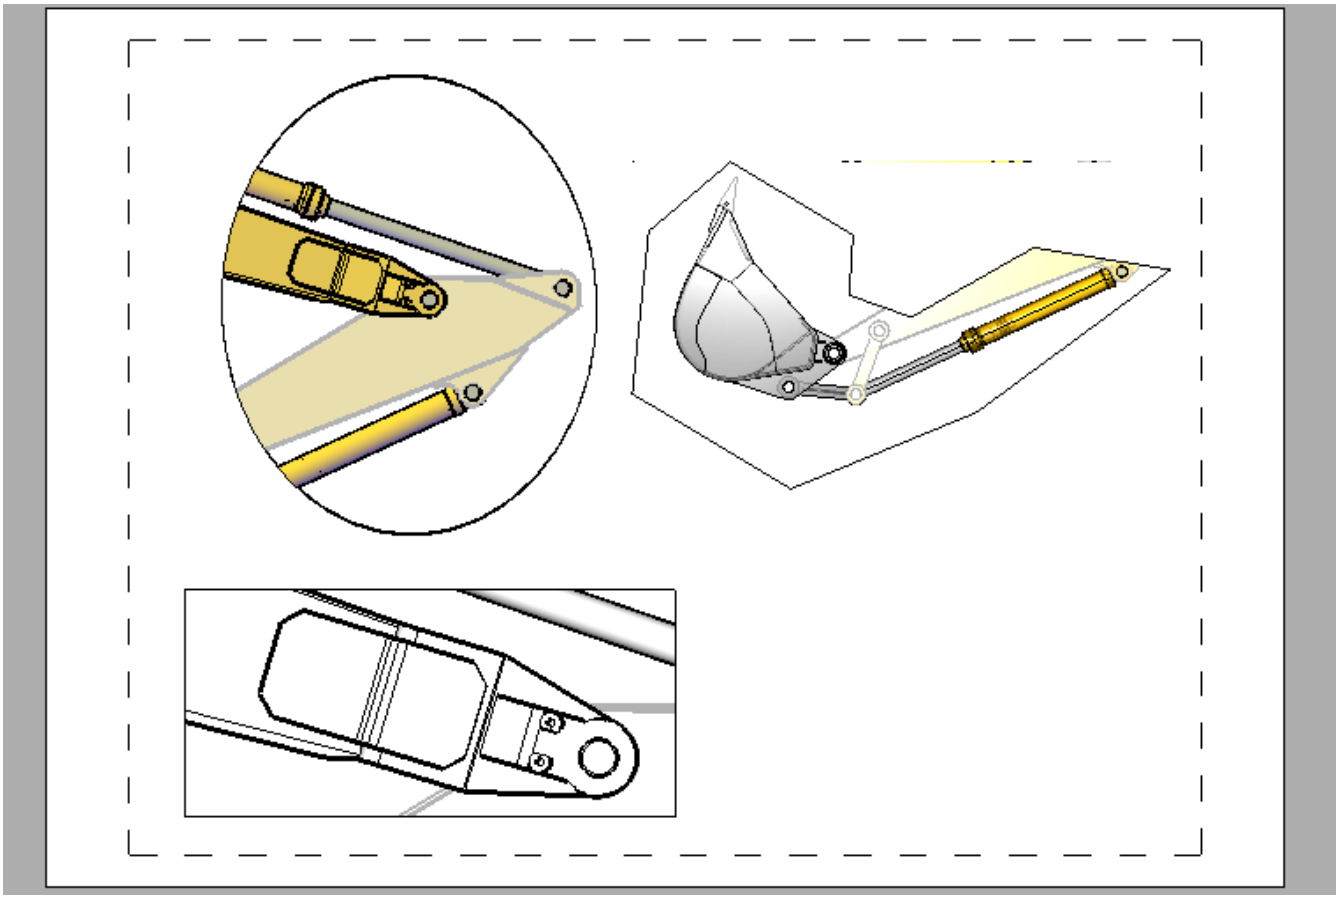
Figure 6.2833



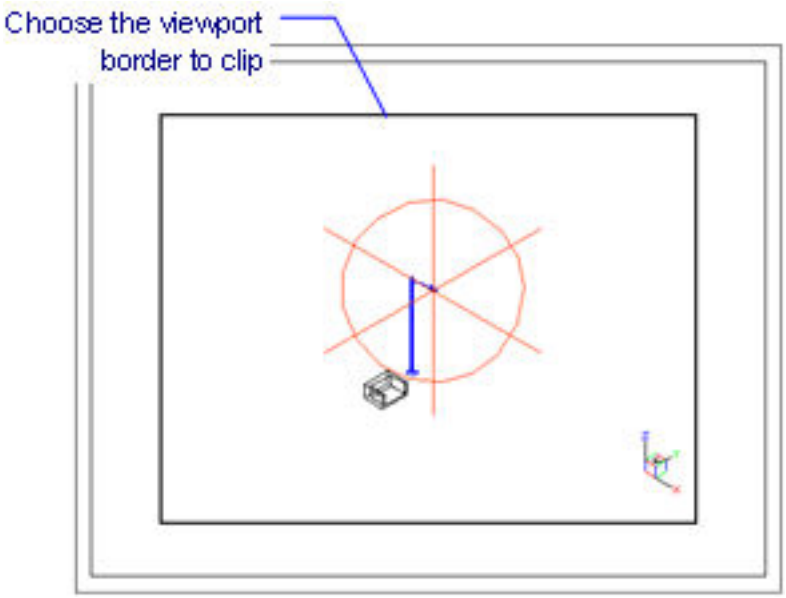
6.31.18 VpClip

(6.2981 on page 6079) Makes viewports from entities or as polygons (short for "viewport clipping"); this command is useful for showing less of a drawing by unwanted clipping portions. **Note:** This command operates only in the paper space of a layout tab, and works only with existing viewports; use the MView (6.21.37) command to make additional viewports (6.2833)

Accessing the Command

command bar: **vpclip : VpClip Prompts you in the command bar:** Select viewport to clip: **(Choose a viewport border)** (6.2834 on the next page) Select clipping entity or [Polygonal]: **(Choose a closed entity, or press P)**

Figure 6.2834



Command Options

Option	Description
Select viewport to clip	Chooses the viewport to clip: in a layout tab: • Click on the border of a single viewport. • Clipped viewports can be reclipped. • Use the Delete option to remove clipping.
Select clipping entity	Converts a closed entity, such as a circle or closed polyline. into a viewport boundary. The entity must have be drawn in paper space. (6.2835 on page 5933)
Polygonal	Draws a polygonal viewport border made of straight and arc segments; prompts you: (6.2836 on page 5933) 1. **Specify start point - (pick the first point of the polyline.)** 2. **Set next point or [draw Arcs/Distance] - (pick another point, or choose an option.)** 3. **Set next point or [draw Arcs/Distance/Follow/Undo] - (pick another, point or choose an option.)** 4. **Set next point or [draw Arcs/Close/Distance/Follow/Undo] - (enter an option:)** • Pick another point • Choose an option • Press **Enter** to close the polygon automatically Polygonal viewports must have at least three vertices.

Polygonal | draw Arcs	Draws an arc segment in the polygonal viewport; prompts you: **Set end of arc or [draw Lines/ Angle/ CEnter/ CLose/ Direction/ Radius/ Second point/Undo]** - **(Pick a point or enter an option;)** see the Arc (6.4.21) command for the meaning of the options
Polygonal | Distance	Specifies the distance and angle for the next polygonal segment; prompts you: 1. **Distance for segment** - **(enter a distance, or show the distance by picking a point.)** 2. **Angle of segment** - **(enter an angle, or show the angle by picking a point.)**
Polygonal | Follow	Draws the next segment at the same angle as the previous polygonal segment; prompts you: **Length of line** - **(specifies the length of the segment.)**
Polygonal | Undo	Undoes the last polygonal segment.
Polygonal | Close	Closes the polygon, and then displays the model space drawing.
Polygonal | Delete	Deletes the clipping boundary, and returns the original rectangular viewport. (This option appears only when you select a clipped viewport.)

Related Commands

XClip (6.34.2) - clips externally-referenced drawings. ImageClip (6.17.7) - clips images. MView (6.21.37) - creates viewports in paper space. VPorts (6.31.26) - creates viewports in model space. MSpace (6.21.32) - switches to model space. PSpace (6.24.59) - switches to paper space.

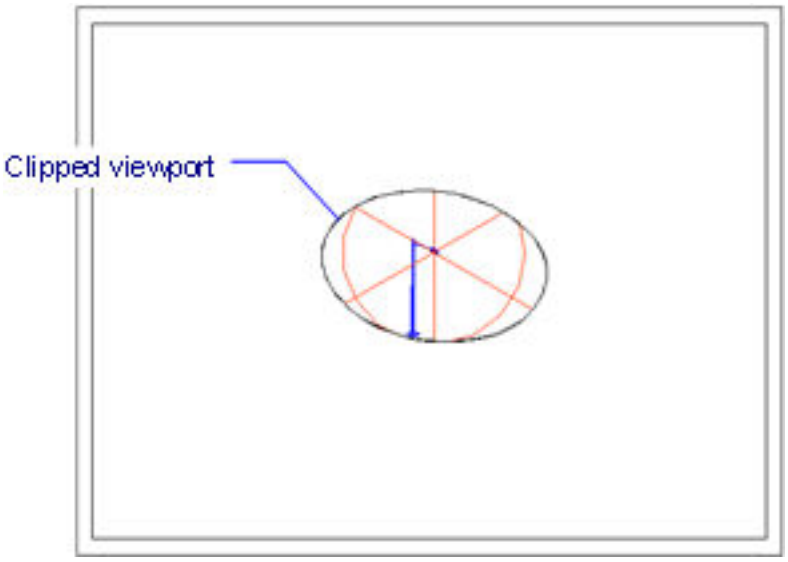

Figure 6.2836

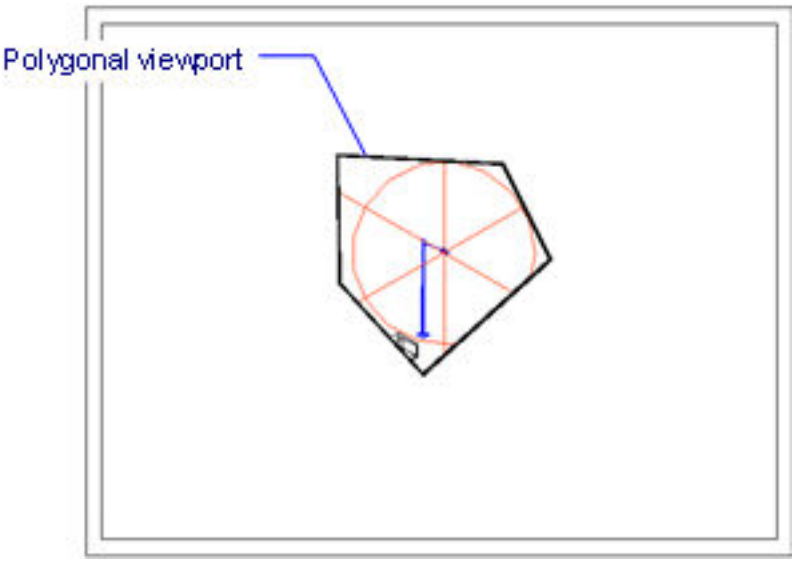

Figure 6.2837

6.31.19 VmlOut

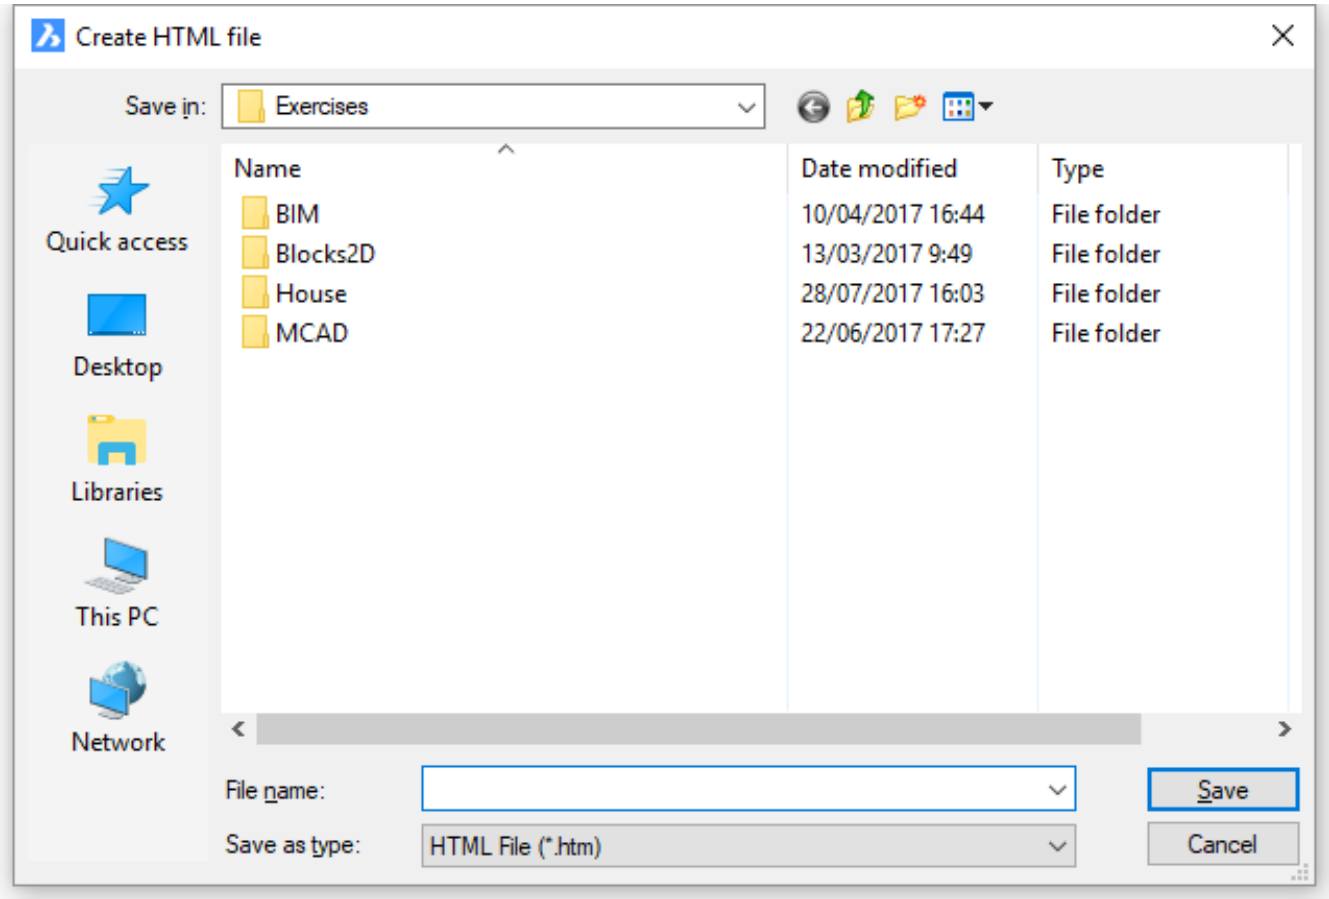
(6.2981 on page 6079) Exports drawings in VML format, embedded in an HTML file (short for "vector markup language").

Accessing the Command

command bar: **vmlout** : **VmlOut** Displays a dialog box: (6.2838 on the next page)

1. Enter a file name.
2. Click **Save**. The VML data is saved in an HTML file.
3. To view the image, open the file in a Web browser; you may need to install a VML plug-in.

Figure 6.2838



Command Options

Option	Description
File name	Specifies the name of the file.
Save as type	Saves the VML data in an HTML file, short for "hyper text markup language".
Save	Saves the file. The output is in HTML format and looks something like this:

```
<html xmlns:v="urn:schemas-microsoft-com:vml"> <head>
```

Related Commands

BmpOut (6.6.20) - exports drawings in BMP format. Export (6.13.18) - exports drawings in BMP, DWF, DXF, DWT, PDF, WMF, EMF, SLD, and older DWG formats. Import (6.17.10) - imports DXF files. MSlide (6.21.31) - exports drawings in WMF, EMF, and SLD formats. VSlide (6.31.24) - displays files in WMF, EMF, and SLD formats. WmfOut (6.33.12) - exports drawings in WMF, EMF, and SLD formats.

Figure 6.2839

6.31.20 VpLayer

(6.2981 on page 6079) Changes the properties of layers in the current paper space viewport, at the command prompt (short for "view port layer"). This allows every viewport to show a different set of layers. **Note:** This command does not operate in model space.

Accessing the Command

command bar: **vplayer** alias: **vl : VpLayer Prompts you in the command bar:** [List frozen layers/Color/LineType/LineWeight/TP layers/Thaw layers/Reset layers/New frozen layers/Default visibility setting]: **(Enter an option, or press Enter to leave the layer properties unchanged)** This command operates only in layout mode. * Current viewport: double click inside the viewport, before starting the command.

Command Options

Option	Description
List frozen layers	Reports whether layers are frozen in the selected viewport; prompts you: **Select a viewport** - click a viewport border; responds with the following report: **The following layers are frozen in viewport n: LayerName(s)** When no layers are frozen, reports: **No layers are frozen in viewport n.**
Color	Overrides the color of specific layers in selected viewports; prompts you: 1. **New truecolor: Red,Green,Blue** - type the RGB code for the new layer color, e.g. 123,213,12. 2. **Select layer name(s) to override color** Do one of the following: • – Type the layer name(s), separated by commas.) – Press Enter, to select entities in the current viewport*. Prompts you: **Select entities [selection options (?)]** - click an entity in the current viewport. Entities in set: 1 **Select entities [selection options (?)]** - select more entities or press Enter. 3. **Specify viewport(s) [All/Select/Current/eXcept current] <Current>** Choose an option: • **All** - apply color to all viewports in the current layout. • **Select** - prompts you to select the viewports: Select a viewport - click a viewport. Entities in set: 1 Select a viewport - click another viewport, or press Enter to end. • **Current** - applies to the color to current viewport • **Except current** - apply the color to all viewports, except the current one

Line Type	Overrides the linetype of specific layers in selected viewports; prompts you: 1. **Loaded linetype name or [? to list] <Continuous>** - press Enter or choose an option. • **? to list** - displays a list of available linetypes in the command bar. 2. See step 2 and 3 in the **Color** option above.
Line Weight	Overrides the line weight of specific layers in selected viewports; prompts you 1. **Enter lineweight (0.00 mm - 2.11 mm)** - type a lineweight. 2. See step 2 and 3 in the **Color** option above.
Transparency	Overrides the transparency of specific layers in selected viewports; prompts you 1. **Enter transparency (0 - 90**) - type a value. 2. See step 2 and 3 in the **Color** option above.
Freeze layers	Freezes specific layers in the current viewport; prompts you: **Select the layer(s) to freeze** - See step 2 and 3 in the **Color** option above.
Thaw layers	Thaws specific layers in the current viewport; prompts you: **Select the layer(s) to thaw** - See step 2 and 3 in the **Color** option above.
Reset layers	Resets frozen and thawed layers to their original settings; prompts you: **Select the layer(s) to reset** - See step 2 and 3 in the **Color** option above.
New frozen layers	Creates new layers that are initially frozen (invisible) when a new viewport is created; prompts you: **New frozen layer name(s)** - See step 2 and 3 in the **Color** option above.
Default visibility settings	Changes the default freeze/thaw setting for layers; prompts you: 1. **Layer name(s)** - See step 2 in the **Color** option above. 2. **Setting Frozen/<Thawed>** - enter an option: • **Frozen** - changes the layer's default property to frozen • **Thawed** - changes the layer's default property to thawed

Related Commands

-Layer (6.20.3) - creates layers and changes their properties in the command bar. Layer (6.13.17) - creates layers, changes their properties, and removes layers through the Drawing Explorer. LayersPanelOpen (6.20.5) - opens the Layers panel, which allows to edit the layers in the current drawing, apply layer states and layer filters.

Figure 6.2840

6.31.21 VPoint

(6.2981 on page 6079) Changes the 3D viewpoint. **Note:** It is faster, and easier, to use the LookFrom (6.20.41) widget to change the 3D viewpoint.

Accessing the Command

command bar: **vpoint** aliases: **viewpoint -vp -viewpoint -vpoint : VPoint Prompts you in the command bar:** Set view point or [Rotate/PLan view/PErspective] <0, 0, 1>: **(Enter x,y,z coordinates, an option, or else press Enter for a dialog box)**

Command Options

Option	Description
Set view point	Specifies the viewpoint: enter x,y or x,y,z coordinates such as -1,-1,1 for the front-left isometric viewpoint
Rotate	Changes the viewpoint by specifying angles; prompts you: 1. **Angle in XY plane from X axis <45> - (specify an angle counter-clockwise from the x ais, or pick two points.)** 2. **Angle from the XY plane <60> - (specify an angle up or down from the x,y plane, or pick two points.)**
Plan view	Displays the plan view of the current UCS. See the Plan (6.24.26) command.
Perspective	Set the Perspective property for the viewport; prompts you: **Perspective [perspective ON/perspective OFf] <Perspective off> - (choose an option:)** • ON -turns on perspective viewing mode, so that objects further away look smaller • **OFf** - turns off perspective mode, returning to orthogonal viewing mode

Dialog Box Options

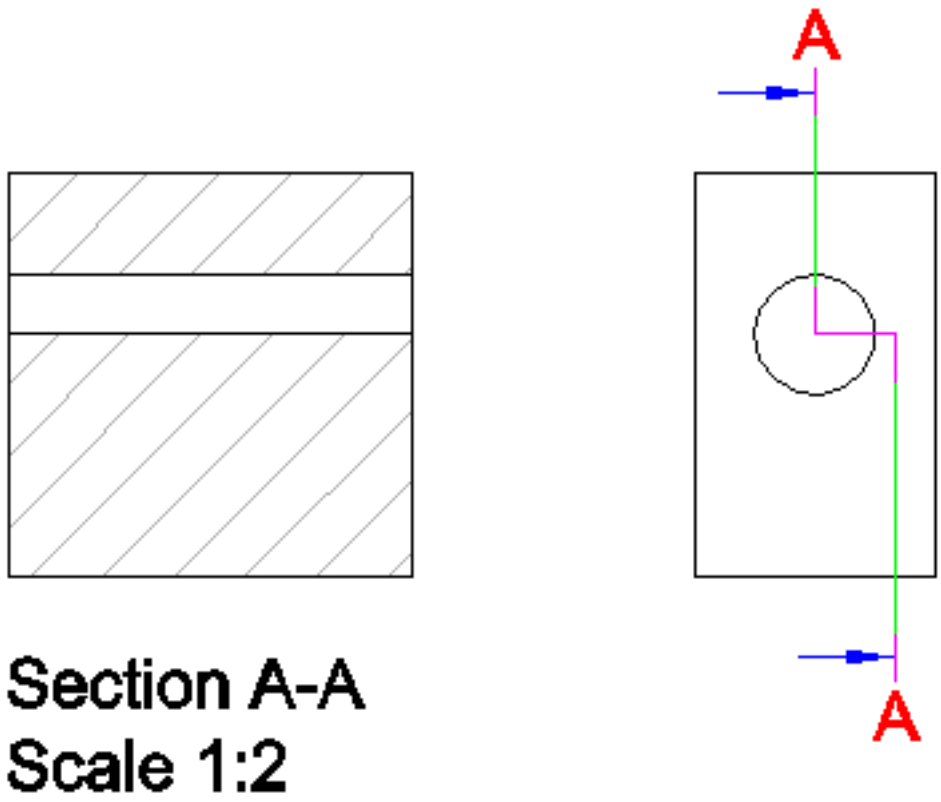
See the DdVpoint (6.10.23) command.

Related Commands

DdVPoint (6.10.23) - changes the 3D viewpoint of the drawing through a dialog box. DView (6.10.53) - changes the 3D viewpoint interactively, and turns on perspective mode. RtRot (6.26.37) - rotates 3D drawings in real-time

Figure 6.2841

Figure 6.2842



6.31.22 ViewSectionStyle

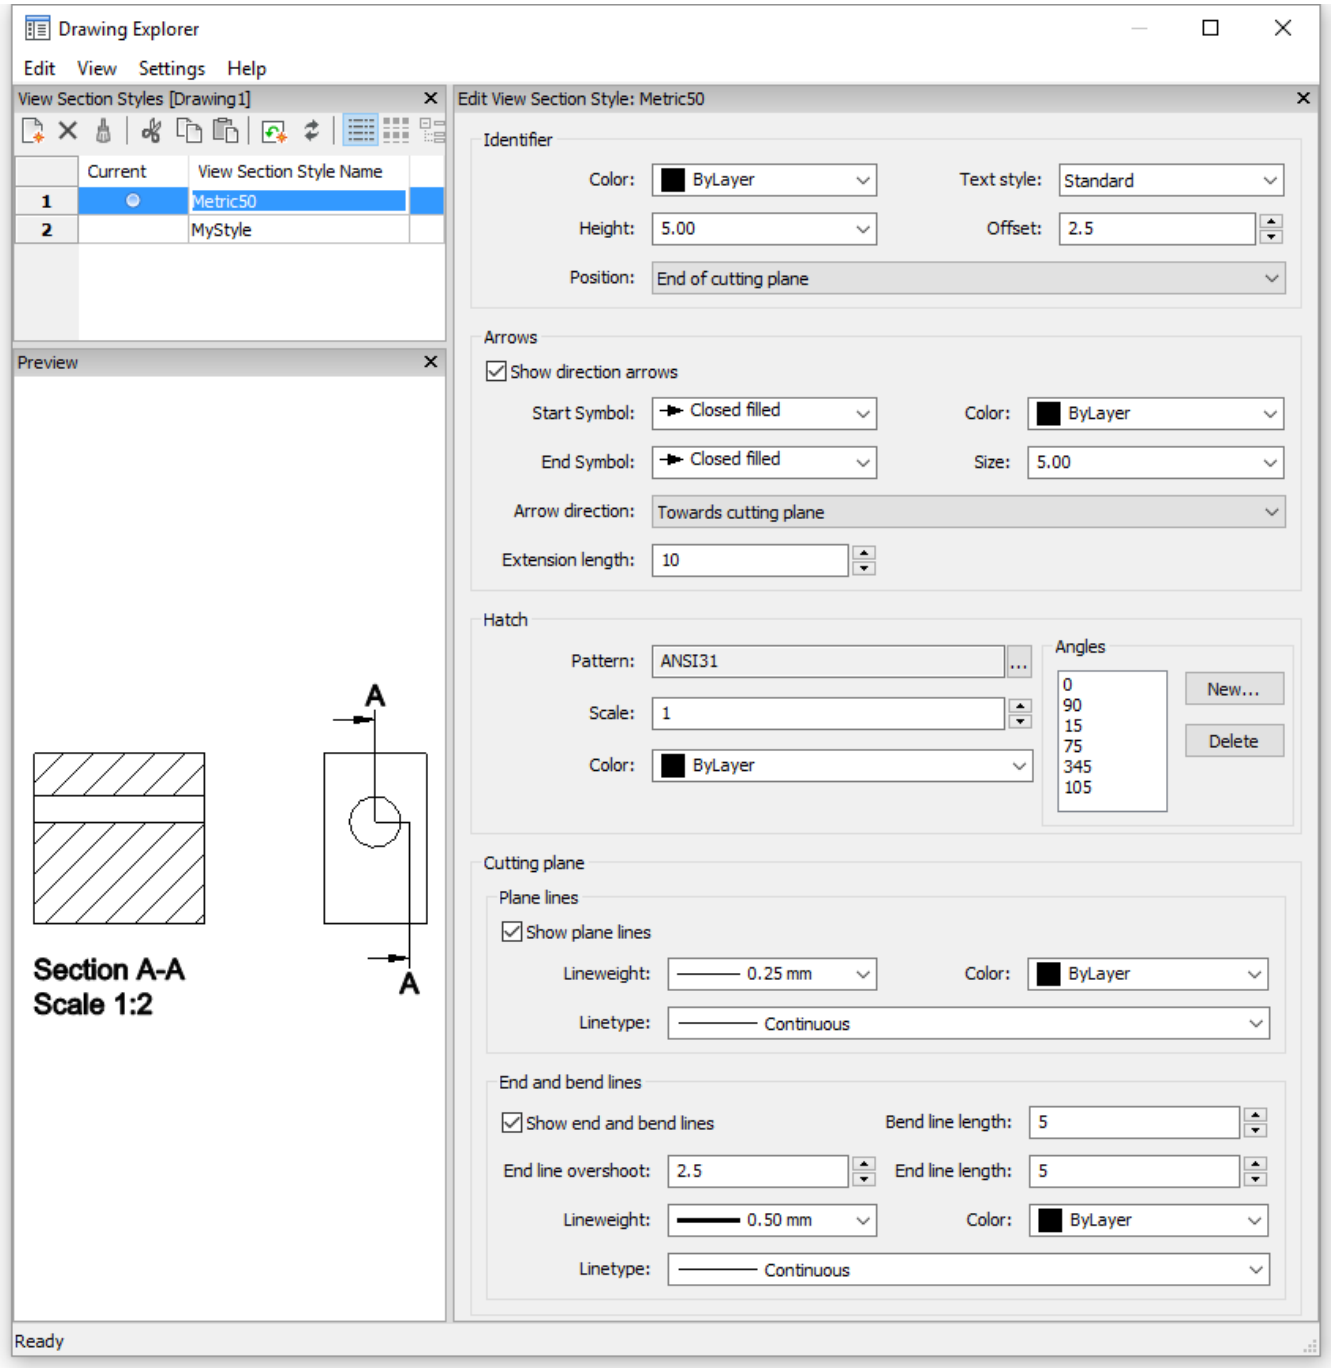
(6.2981 on page 6079) Specifies the visual format of section views made from drawing views, created by the ViewBase (6.31.4) command, in the Drawing Explorer. (6.2842)

- **Identifier** - red
- **Arrows** - blue
- **Hatch** - gray
- **Cutting plane**- green
- **End and bend lines -** pink

Accessing the Command

command bar: **viewsectionstyle** transparent: **'viewsectionstyle** menu bar: **Drawing Views | Section Style** toolbar: **View| Drawing Views | Section Style** ribbon (Mechanical workspace): **Annotate | Drawing Views| Section Style : ViewSectionStyle** Displays the View Section Styles section of the Drawing Explorer dialog box: (6.2843 on the following page)

Figure 6.2843



Toolbar Options

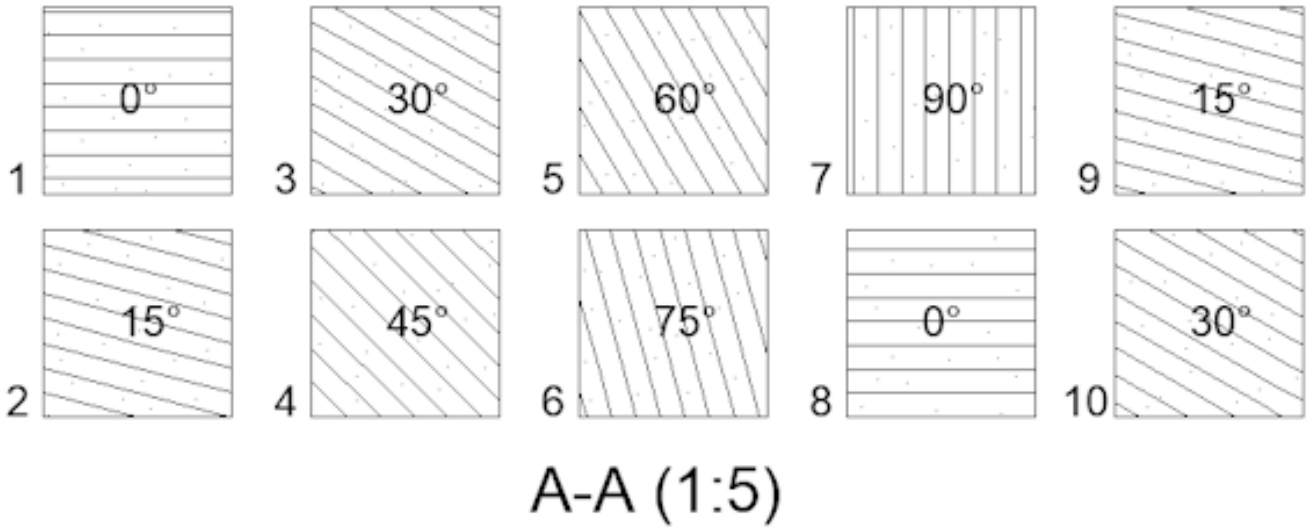
Toolbar Option	Description
===ERROR WITH DOWNLOADED IMAGE=== New	Creates a new view detail style as a copy of the currently selected style.
===ERROR WITH DOWNLOADED IMAGE=== Delete	Removes the selected style from the drawing.

Edit View Section Style Options

Option	Description
Identifier	Sets the properties of the section identifier: **Color** - specifies the color of the identifier: 1. Click the droplist 2. Choose a color swatch from the list, or else choose **Select Color** to get access to a lot more colors **Text Style** - specifies the text style used by the identifier text: 1. Click the droplist 2. Choose the name of a text style To employ a different text style, use the Style (6.27.55) command to create it. **Height** - specifies the height of the identifier: 1. Click the droplist 2. Choose one of the preset heights, or else type in a different value **Offset** - specifies the distance from the end of the cut lines to the arrow; enter a distance. **Position** - determines where the identifiers are located: • **End of cutting plane** - places the identifiers at the ends of the cutting lines • **Above direction line** - outside the detail's boundary and draws a leader from the parent view to the detail; ; no symbol is used • **On boundary** - on the detail's boundary • **On boundary with leader** - places the identifier on the detail's boundary and draws a leader from the parent view to the detail

Arrows	Sets the properties of the section arrows: • **Show direction arrows** - toggles the display of the arrows • **Start Symbol** - specifies the look of the start symbol • **Color** - specifies the color of the arrow • **End Symbol** - specifies the look of the end symbol • **Size** - specifies the size of the arrow • **Arrow direction** - points the arrow towards or away from the cutting line • **Extension length** - determines the length of the "dimension" line on the arrows
Hatch	Sets the properties of the section hatching: • **Pattern** - choose a pattern name from the droplist • **Browse** - displays the Hatch Pattern Palette dialog box, from which you choose a pattern visually • **Angles** - sets the angle for the pattern, one angle for subsequent cuts; the first angle in the list is applied to the first solid, the second angle to the second, and so on. When there are more solids to cut than angles listed, then the program starts again from the first angle. See figure below. • **New** - adds angles to the list; displays the New Hatch Angle dialog box, in which you enter an angle • **Delete** - deletes the selected angle from the list • **Scale** - specifies the scale of the pattern • **Color** - specifies the color of the pattern (6.2844 on the next page)
Cutting Plane | Plane Lines	Sets the properties of the cutting plane lines: • **Show plane lines** - toggles the display of the lines • **Lineweight** - specifies the weight of the lines • **Color** - specifies the color of the lines • **Linetype** - specifies the pattern of the lines
Cutting Plane | End and Bend Lines	Sets the properties of the end and bend lines: • **Show end and bend lines** - toggles the display of the lines • **Bend line length** - specifies the distance the bend line offsets from one cut line to another • **End line overshoot** - specifies the distance from the section to the end of the plane line • **End line length** - specifies the length of the end lines • **Lineweight** - specifies the weight of the lines • **Color** - specifies the color of the lines • **Linetype** - specifies the pattern of the lines

Figure 6.2844

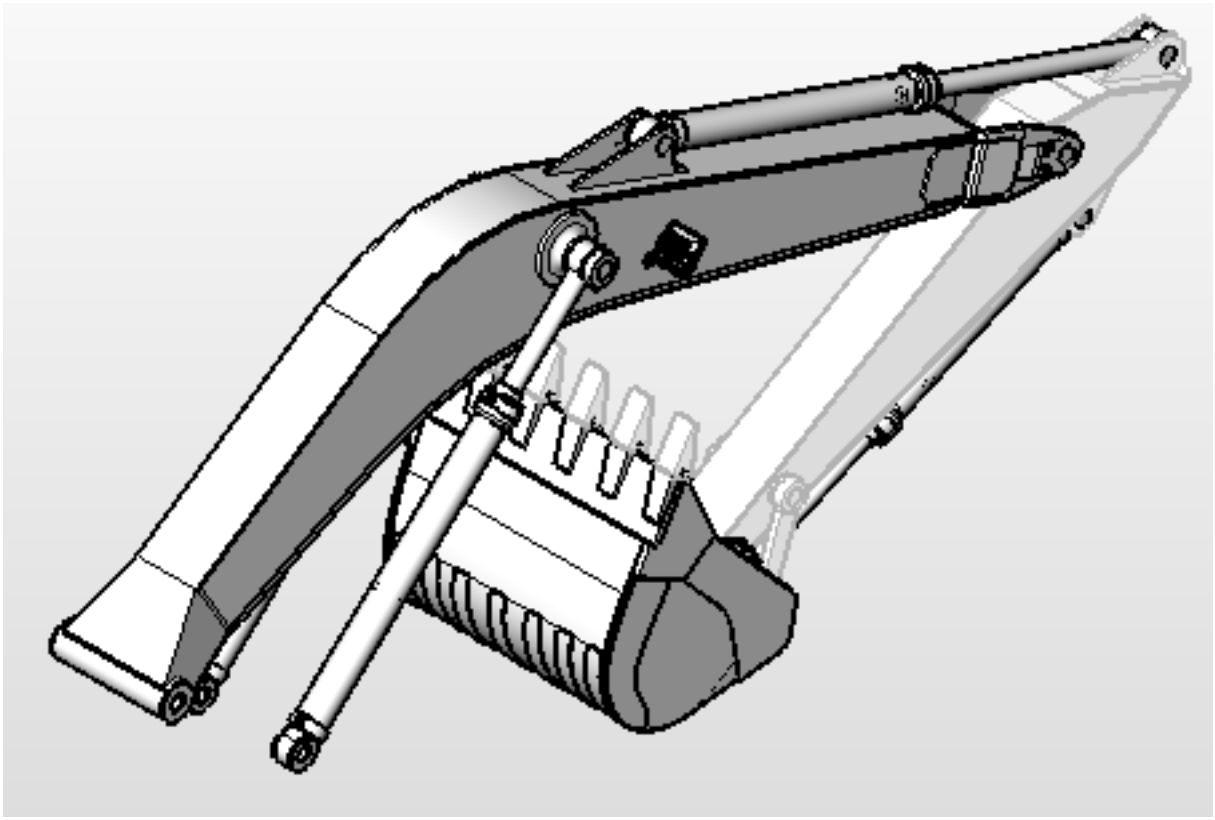


Related Commands

ViewBase (6.31.4) - generates associative orthographic and standard isometric views of a 3D solid model in a paper space layout. ViewDetail (6.31.6) - creates a detail view of a portion of a standard generated drawing at a larger scale. ViewDetailStyle (6.31.7) - allows to specify the visual format of detail views and detail symbols. ViewSection (6.31.12) - creates a cross section view based on a standard drawing view generated by the ViewBase (6.31.4) command in a paper space layout.

Figure 6.2845

Figure 6.2846



6.31.23 VsCurrent

(6.2981 on page 6079) Sets the visual style for the current viewport, in the command line. (6.2846)

Accessing the Command

command bar: **vscurrent** : **vscurrent Prompts you in the command bar:** Enter visual style [2dwireframe/Wireframe/Hidden/Rea with Edges/shades of Grey/SKetchy/X-ray/Other/cUrrent] <Modeling>: **(Enter an option)**

Command Options

Option	Description
2dwireframe	Specifies the visual style for 2D drawings.
cUrrent	Specifies the current visual style; press **Enter** to keep it.
Wireframe, Hidden, Realistic, Conceptual, Shaded, shaded with Edges, shades of Grey, SKetchy, **and** X-ray	Specifies the visual style to apply to the current viewport for 3D models: • Enter the name of a style • Press **Enter** to keep the default style The styles named in this list are the ones included with the program.

Other	Choose a user-defined visual style that was created with the VisualStyles command; prompts you: **Enter a visual style name or [?]** - **(enter an option:)** • Type the name of a visual style • Press **?** to see a list all available visual styles; perss **F2** to open the Prompt History window: `2dWireframe Conceptual Hidden Modeling Realistic`

Related Commands

-VisualStyles (6.31.17) - manages visual style definitions at the command line. VisualStyles (6.31.15) - creates and controls visual style definitions in the Drawing Explorer.

Figure 6.2847

6.31.24 VSlide

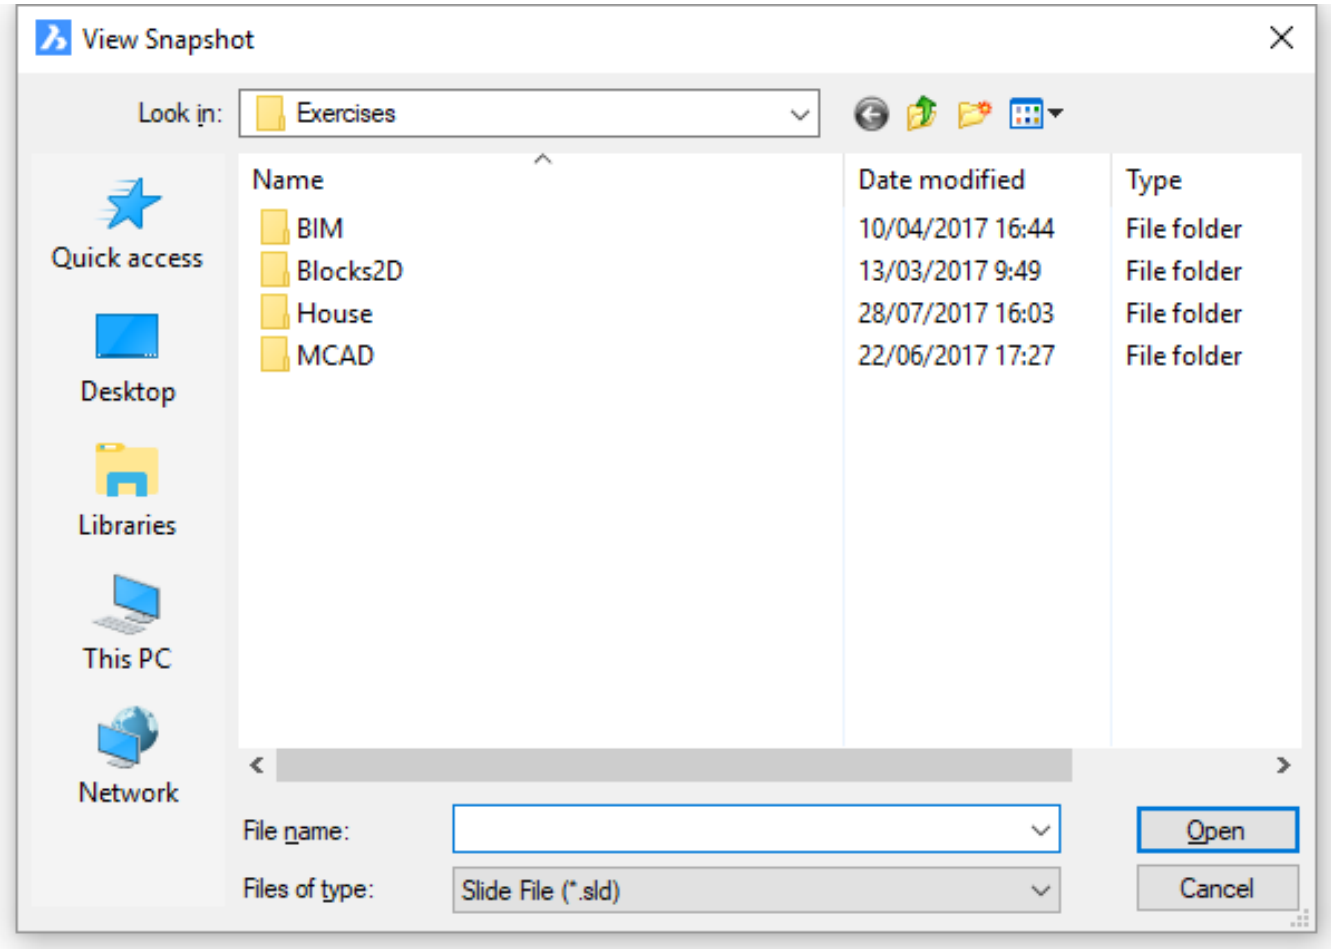
(6.2981 on page 6079) Displays images saved as SLD and WMF files (short for "view slide"). **Note:** WMF files are not supported by the Linux platform.

Accessing the Command

 command bar: **vslide** aliases: **vs vsnapshot** menu bar: **Tools | View Snapshot** ribbon: **Tools | Action Recorder | View Snapshot** toolbar: **Tools |**  **: VSlide** Displays a dialog box: (6.2848 on the next page)

1. Choose a file.
2. Click **Open**.
3. To remove the slide from the viewport, enter the Redraw (6.26.9) command.

Figure 6.2848



Command Options

Option	Description
File name	Specifies the name of the slide file.
Files of type	Selects the file type of the slide file: • Slide File (*.sld) - proprietary graphics format created by Autodesk for saving screen grabs of viewports • Slide Library (*.slb) - collection of slide files used to display slideshows of CAD designs • Enhanced Metafile (*.emf) - enhanced WMF format • Windows Metafile (*.wmf) - hybrid raster-vector format developed by Microsoft
Open	Displays the slide in the current viewport. Enter the Redraw (6.26.9) command to remove the slide.

Related Commands

MSlide (6.21.31) - saves drawings in SLD, EMF, and WMF formats. Redraw (6.26.9) - removes the slide from the viewport.

Figure 6.2849

6.31.25 VtOptions

(6.2981 on page 6079) Sets the options for view transitions through the Settings dialog box (short for "view transition options"). **Note:** When view transitions are turned on, view changes like zooming and panning occur smoothly and slowly, allowing you to see the area being zoomed in or panned to. This command has no effect on the view change commands that begin with RT (real-time).

Accessing the Command

command bar: **vtoptions** transparent: **vtoptions** : **VtOptions** Displays the View Transition Options section of the Settings dialog box: (6.2850)

1. Make changes to the settings
2. Click the **X** to close the dialog box.

Figure 6.2850

View transition options	
Enable view transitions	0x0003 (3)
1	☑ For zoom/pan
2	☑ For rotation
4	☐ For unattended mode
View transition duration	750
View transition minimum FPS	7

Dialog Box Options

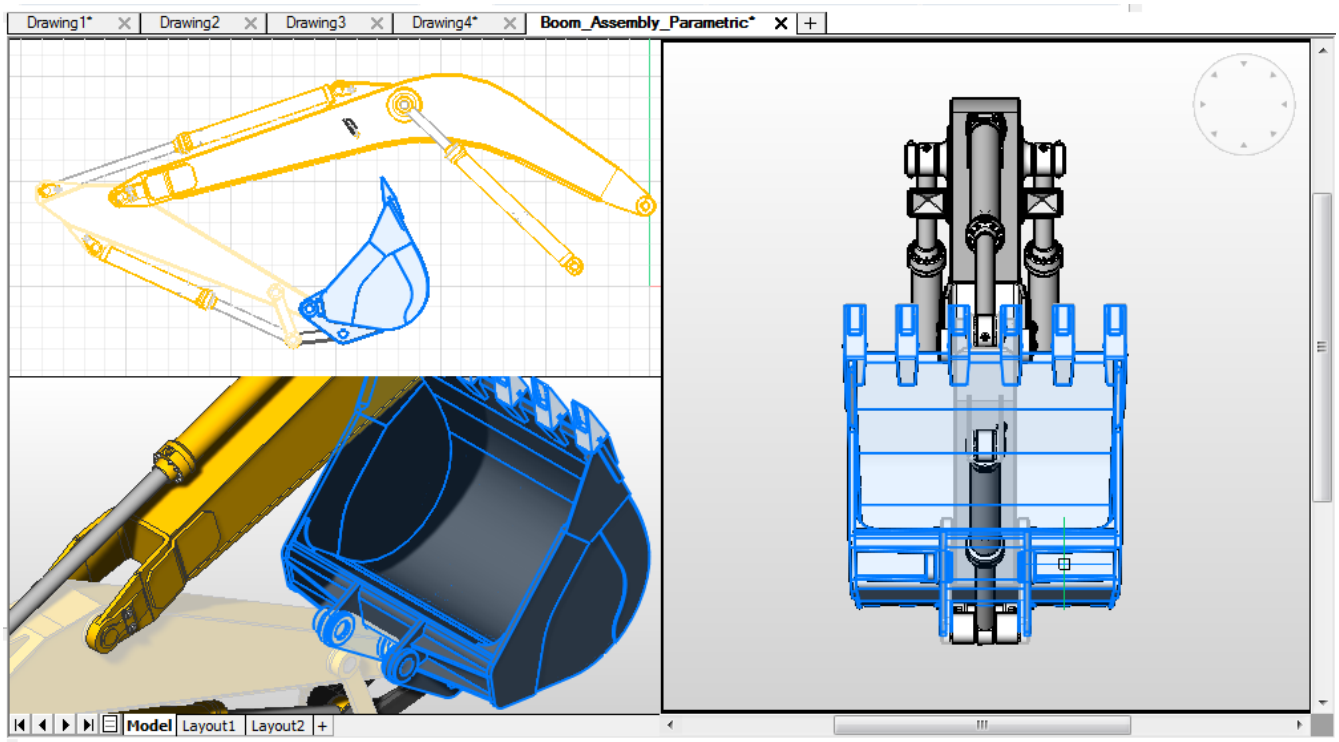
Option	Description
Enable View Transitions	Determines which view change command is affected by view transitions: **For zoom/pan** - when on, zooms and pans occur smoothly **For rotation** - when on, 3D view rotations (orbits) occur smoothly **For unattended mode** - when on, view changes occur smoothly during scripts, LISP routines, and so on
View transition duration	Specifies the length of time it takes for a view transition to finish: • **0** - turns off the view transition • **750** - default number of milliseconds • **5000** - longest duration (5 seconds)
View transition minimum FPS	Specifies the speed of the transition in terms of frames per second (FPS): • **0** - turns off the view transition • **7** - default FPS • **30** - fastest transition

Related Commands

Pan (6.24.3) and -Pan (6.24.4) - move the drawing within the current viewport. Zoom (6.35.7) - increases and decreases the size of the drawing within the current viewport.

Figure 6.2851

Figure 6.2852



6.31.26 VPorts

(6.2981 on page 6079) Creates one or more viewports in model space (short for "viewports"). Viewports allow you to see more than view of the same drawing. **Note:** To create viewports in paper space, use the MView (6.21.37) command. (6.2852)

Accessing the Command

command bar: **vports** transparent: **'-vports** aliases: **viewports vport vw -vports** menu bar: **View | Viewports** ribbon: **Home | Settings Layouts | Viewports View | View | Viewports** toolbar: **View | Layout | :** **VPorts Prompts you in the command bar.** Viewports [? to list/Save/Restore/Delete/Join/SIngle/create 2 viewports/create 3 viewports/create 4 viewports] <Create 3 viewports>: **(Enter an option or press Enter to create 3 viewports.)** The current (active) viewport is shown by a heavy rectangle. Double-click a viewport to make it the active one. You can repeat the command to create additional viewports inside viewports to a maximum of 64. Properties like grid, snap, UCS icon, and visual style are set independently in each viewport.

Command Options

Option	Description

? to list	Lists the names and x,y coordinates of saved viewports; a typical display looks like this: `Viewport Name LL Corner UR Corner ----------` • **LL Corner** - lower-left corner • **UR Corner** - upper-right corner. Press **F2** to view the list in the prompt history window.
Save	Saves the current viewport arrangement by name; prompts you: **Viewport configuration to save** - **(specifies a name by which to save the viewport configuration)**; when the name already exists, prompts you: **A viewport configuration with that name exists, Overwrite?(Yes/No)?** - **(enter an option)**: • **Yes** - replaces the viewport configuration name with the new one • **No** - repeats the prompt, 'Viewport configuration to save'; enter a different name
Restore	Restores a named viewport configuration; prompts you: **Viewport configuration to restore** - **(enter the name of a save viewport configuration to restore.)**
Delete	Erases a named viewport configuration from the drawing; prompts you: **Viewport configuration to delete** - **(specify the name of a viewport configuration.)** You cannot delete more than one viewport configuration at a time.
SIngle	Creates a single viewport of the current viewport, removing all other viewports. (6.2853 on page 5954) Use this option to return the drawing to its original, single-viewport state.
Join	Joins two or more viewports into a single viewport; prompts you: 1. **Select dominant viewport <Current>** - **(choose the viewport that will be retained, or press Enter to select the current viewport)** 2. **Select viewport to join** - **(choose the viewport that will unified with the first viewport.)** If the two viewports were to join to form a non-rectangular shape, such as an L or a T shape, BricsCAD complains, "The selected viewports do not form a rectangle." The 'Select viewport to join' prompt repeats for you to try again.
2	Spits the current viewport into two rectangular viewports; prompts you: **Two viewports [Horizontal/Vertical] <Vertical>** - **(type H or V.)** • **Horizontal** - creates two horizontal viewports, one above the other: (6.2854 on page 5954) • **Vertical** - creates two vertical viewports, one beside the other: (6.2855 on page 5954)

3	Spits the current viewport into three rectangular viewports; prompts you: **Three viewports [Horizontal/Vertical/Above/Below/Left/Right] <Right> - (enter an option.)** • **Horizontal** - creates three horizontal viewports: (6.2856 on the next page) • **Vertical** - creates three vertical viewports: (6.2857 on page 5955) • **Above** - creates a single wide viewport above two side-by-side viewports: (6.2858 on page 5955) • **Below** - creates two side-by-side viewports above one wide viewport: (6.2859 on page 5955) • **Left** - creates one tall viewport to the left of two stacked viewports: (6.2860 on page 5955) • **Right** - creates one tall viewport to the right of two stacked viewports: (6.2861 on page 5956)
4	Spits the current viewport into four rectangular viewports: (6.2862 on page 5956) This style is sometimes called "engineering" viewports, as it allows you to see the top, front, side, and isometric views at the same time -- once you adjust the viewpoint in each viewport, which can be done with the MvSetup (6.21.34) command.

Procedures

- Creating viewports in model space (1.23.11)
- Drawing in multiple viewports (1.23.11)
- Joining adjacent viewports (1.23.11)

Related Commands

VpClip (6.31.18) - clips viewports. MView (6.21.37) - creates viewports in paper space. MvSetup (6.21.34) - creates four engineering viewports MSpace (6.21.32) - switches to model space. PSpace (6.24.59) - switches to paper space. RedrawAll (6.26.10) - redraws all viewports. RegenAll (6.26.24) - regenerates the drawing in all viewports. Zoom (6.35.7) - utilizes the XP option to specify the zoom factor in paper space relative to model space.

Related Commands

AddInMan (6.4.3) - loads and unloads VBA functions through a dialog box. AppLoad (6.4.17) - selects external routines to load when BricsCAD starts. Netload (6.22.3) - loads a .NET application. VbaMan (6.32.4) - manages VBA projects. VbaNew (6.32.5) - starts a new VBA project. VbaRun (6.32.6) and -VbaRun (6.32.7) - runs VBA macros. VbaSecurity (6.32.8) - depending on the selected security level (Low, Medium or High) VBA macros are allowed to run automatically or not. VbaUnload (6.32.9) - unloads VBA projects.

Figure 6.2865

6.32.2 VbaLoad

(6.2880 on page 5977) * Command only available on the Windows platform Loads VBA projects through a dialog box (short for "visual basic for applications load").

Accessing the Command

command bar: **vbaload** menu bar: **Tools | VBA | Load Project : VbaLoad** Displays a dialog box: (6.2866 on the next page)

1. Choose a DVB or VBI file.
2. Click **Open**. BricsCAD warns about the potential hazard of macros: (6.2867 on the facing page)
3. Click **Enable Macros**; see the Security (6.32.8) command for details.
4. To run the macros in the project, use the VbaRun (6.32.6) command.

Figure 6.2866

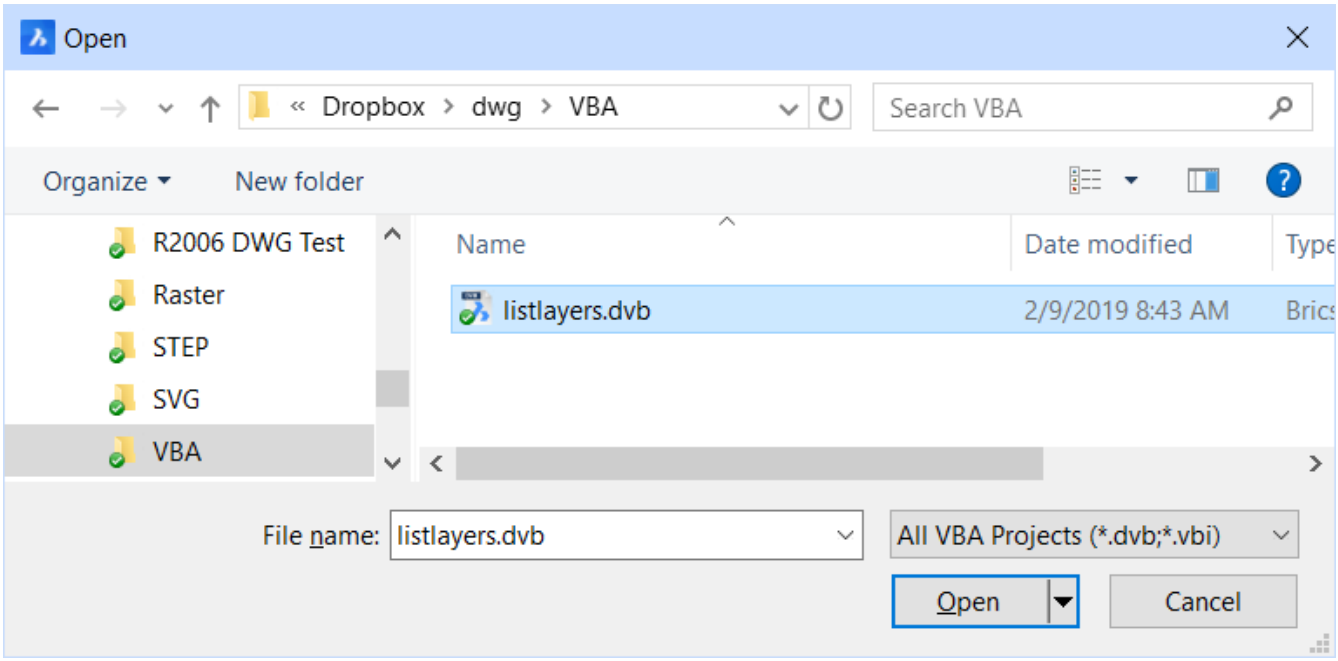

Figure 6.2867

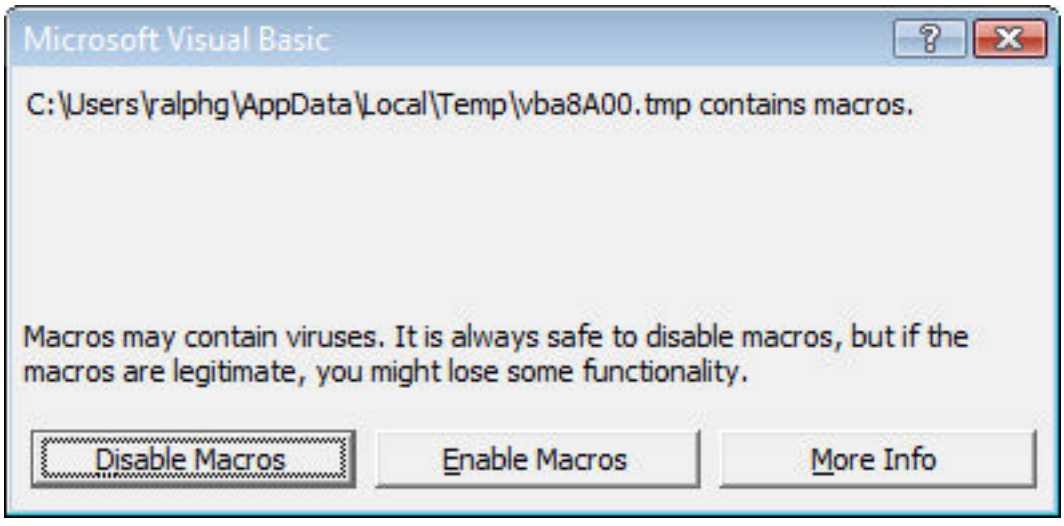


Command Options

Option	Description
File name	Specifies the name of the DVB file. DVB files hold VBA projects.
Open	Opens the DVB file.

Related Commands

AddInMan (6.4.3) - loads and unloads VBA functions through a dialog box. AppLoad (6.4.17) - selects external routines to load when BricsCAD starts. Netload (6.22.3) - loads a .NET application. -VbaLoad (6.32.3) - loads VBA projects. VbaMan (6.32.4) - manages VBA projects. VbaNew (6.32.5) - starts a new VBA project. VbaRun (6.32.6) and -VbaRun (6.32.7) - runs VBA macros. VbaIde (6.32.1) - opens the VBA integrated development environment. VbaSecurity (6.32.8) - depending on the selected security level (Low, Medium or High) VBA macros are allowed to run automatically or not. VbaUnload (6.32.9) - unloads VBA projects.

Figure 6.2868

6.32.3 -VbaLoad

(6.2880 on page 5977) * Command only available on the Windows platform Loads VBA projects in the command bar (short for "visual basic for applications load").

Accessing the Command

command bar: **-vbaload : -VbaLoad Prompts you in the command bar:** VBA Project Name: **(Enter the path and name of a DVB or VBI file)** When you specify the name of an already-loaded DVB or VBI file, BricsCAD reports, "Project is already loaded." This command will not load VBA projects that are embedded in drawings, because opening a drawing loads its associated project automatically.

Command Options

Option	Description
VBA Project Name	Names the DVB or VBI file. DVB and VBI are VBA project files, which contain one or more VBA macros.

Related Commands

AddInMan (6.4.3) - loads and unloads VBA functions through a dialog box. AppLoad (6.4.17) - selects external routines to load when BricsCAD starts. Netload (6.22.3) - loads a .NET application. VbaLoad (6.32.2) loads VBA projects. VbaMan (6.32.4) - manages VBA projects. VbaNew (6.32.5) - starts a new VBA project. VbaRun (6.32.6) and -VbaRun (6.32.7) - runs VBA macros. VbaSecurity (6.32.8) - depending on the selected security level (Low, Medium or High) VBA macros are allowed to run automatically or not. VbaUnload (6.32.9) - unloads VBA projects.

Figure 6.2869

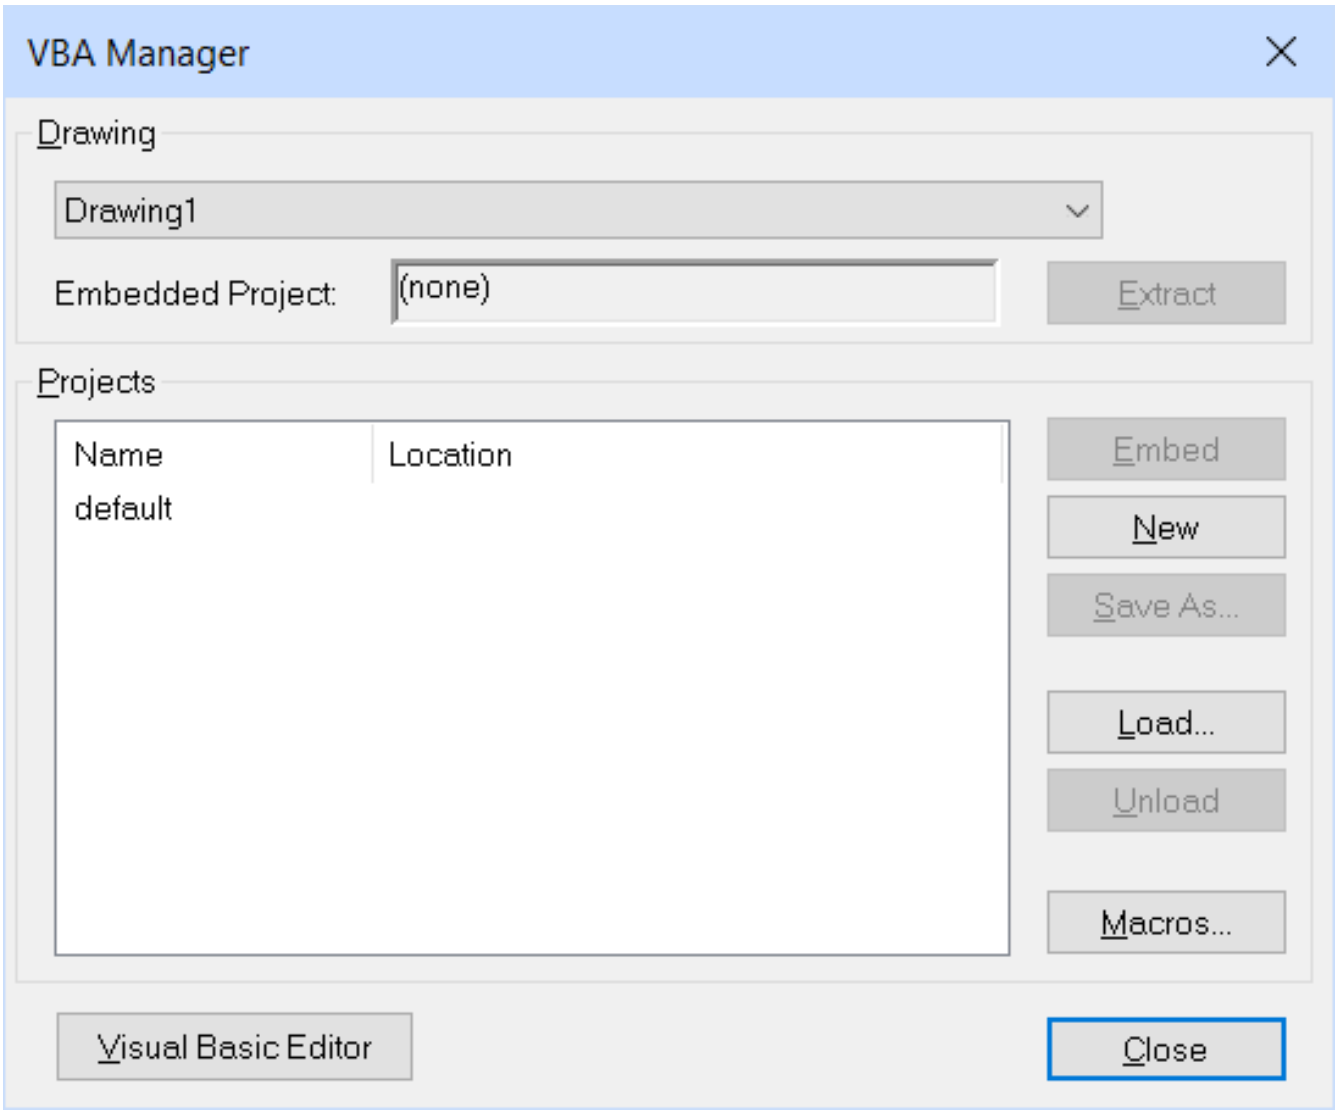
6.32.4 VbaMan

(6.2880 on page 5977) * Command only available on the Windows platform Manages VBA projects (short for "visual basic for applications manager").

Accessing the Command

command bar: **vbaman** shortcut: **Shift+F6** menu bar: **Tools | VBA | Project Manager : VbaMan** Displays a dialog box: (6.2870 on the next page) Choose options, and then click Close.

Figure 6.2870



Command Options

Option	Description
Drawing	Lists the names of drawings currently open in BricsCAD: (6.2871 on the facing page) Choose a drawing name from the droplist; the embedded project is listed in the Embedded Project text box, if any.
Embedded Project Name	Lists the name of the embedded project, if any. Lists the names of projects loaded into BricsCAD at this time.
Location	Lists the drive and folder names of DVB and VBI files.
Extract	Removes the project from the current drawing; displays dialog box: (6.2872 on the next page) • **Yes** - displays the Save As dialog box: 1. Name the project. 2. Click **Save**. • **No** - removes the project from the drawing without saving it as a DVB file. • **Cancel** - cancels the command; the project remains in the drawing.
Embed	Embeds a project in the current drawing. If the project is a new one, and has not yet been saved, this option displays the Save As dialog box. Each drawing can contain just one embedded project; after one project is embedded, the Embed button becomes unavailable. To change embedded projects, use the Extract option to remove the current project.
New	Creates a new VBA project; gives the generic name VbaProject . Use the Save As option to rename and save the DVB or VBI project file.
Save As	Saves the selected project by another name. Displays the Save As dialog box: 1. Enter a file name. 2. Click **Save**.
Load	Loads DVB and VBI project files; displays the Open dialog box: 1. Choose a DVB or VBI file. 2. Click **Open**. See the VbaLoad (6.32.2) command.
Unload	Unloads the selected project without a warning.
Macros	Displays the Run BricsCAD VBA Macro dialog box: 1. Choose the macro to run. 2. Click **Run**. See the VbaRun (6.32.6) command.
Visual Basic Editor	Opens the VBA integrated development environment. See the VbaIde (6.32.1) command.
Close	Closes the dialog box.

AddInMan (6.4.3) - loads and unloads VBA functions through a dialog box. AppLoad (6.4.17) - selects external routines to load when BricsCAD starts. Netload (6.22.3) - loads a .NET application. VbaNew (6.32.5) - starts a new VBA project. VbaRun (6.32.6) and -VbaRun (6.32.7) - runs VBA macros. VbaIde (6.32.1) - opens the VBA integrated development environment. VbaSecurity (6.32.8) - depending on the selected security level (Low, Medium or High) VBA macros are allowed to run automatically or not. VbaUnload (6.32.9) - unloads VBA projects.

Figure 6.2873

6.32.5 VbaNew

(6.2880 on page 5977) * Command only available on the Windows platform Starts a new VBA project (short for "visual basic for applications new").

Accessing the Command

command bar: **vbanew** menu bar: **Tools | VBA | New Project : VbaNew**

Command Options

No options.

Related Commands

AddInMan (6.4.3) - loads and unloads VBA functions through a dialog box. AppLoad (6.4.17) - selects external routines to load when BricsCAD starts. Netload (6.22.3) - loads a .NET application. vbaide (6.32.1) - opens the VBA editing window. VbaRun (6.32.6) and -VbaRun (6.32.7) - runs VBA macros. VbaMan (6.32.4) - manages VBA projects. VbaSecurity (6.32.8) - depending on the selected security level (Low, Medium or High) VBA macros are allowed to run automatically or not. VbaUnload (6.32.9) - unloads VBA projects.

Figure 6.2874

6.32.6 VbaRun

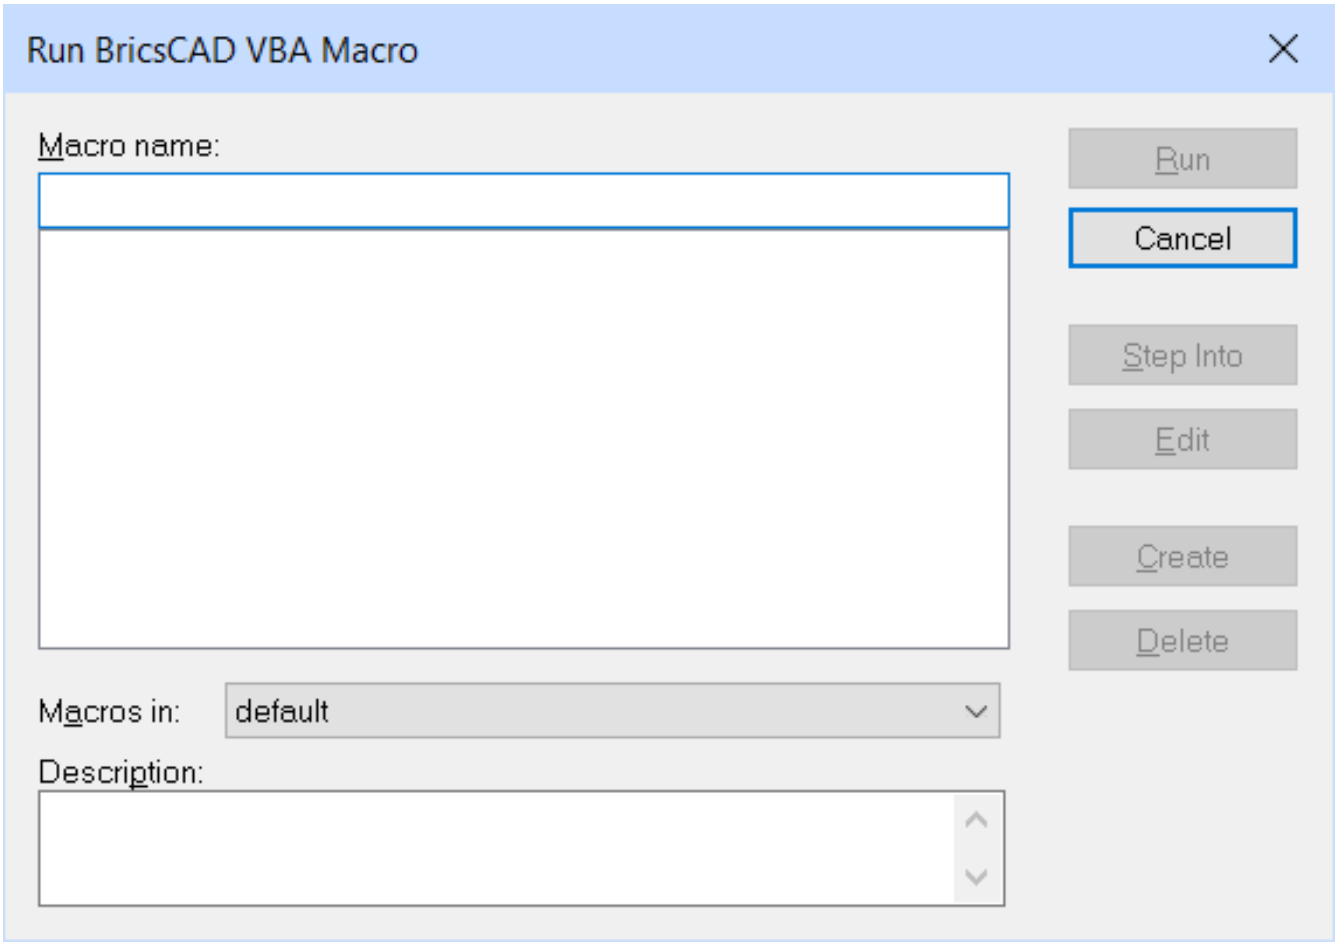
(6.2880 on page 5977) * Command only available on the Windows platform Runs, creates, edits, and deletes VBA macros through a dialog box (short for "visual basic for applications run").

Accessing the Command

command bar: **vbarun** shortcut: **Alt+F8** menu bar: **Tools | VBA | Macros : VbaRun** Displays a dialog box: (6.2875 on the following page)

1. Choose the name of a macro.
2. Click **Run**.

Figure 6.2875



Command Options

Option	Description
Macro name	Lists the names of macros found in the project file. Choose one to run.
Macros in	Lists the names of projects loaded into the current drawing. Choose one from the droplist.
Description	Describes the macro. You can edit this text.
Run	Runs the selected macro.
Cancel	Closes the dialog box.
Step Into	Opens the integrated development environment window. The macro is in debug mode, which runs one line of code at a time. See the VbaIde (6.32.1) command.
Edit	Opens the macro in the integrated development environment window. The macro is in editing mode, which allows you to change the code. See the VbaIde (6.32.1) command.
Create	Creates new macros; follow these steps: 1. In the **Macro Name** field, enter a name for the new macro 2. Click **Create**. 3. Notice the integrated development environment window. Enter VBA code. See the VbaIde (6.32.1) command.

Delete	Deletes the macro; prompts you: **Are you sure you want to delete the macro - (enter Y or N.)** • **Yes** - erases the macro • **No** - does not erase the macro

Related Commands

VbaIde (6.32.1) - opens the VBA integrated development environment. VbaSecurity (6.32.8) - depending on the selected security level (Low, Medium or High) VBA macros are allowed to run automatically or not. VbaUnload (6.32.9) - unloads VBA projects.

Figure 6.2876

6.32.7 -VbaRun

(6.2880 on page 5977) * Command only available on the Windows platform Runs VBA macros from the command bar (short for "visual basic for applications run"). **Note:** This command is meant for use by macros and programs.

Accessing the Command

command bar: **-vbarun : -VbaRun Prompts you in the command bar:** Macro name: **(Enter the name of a VBA macro)**

- If the macro is part of a project and a module, enter its name in this format: **project.module.macro**
- If the DVB file is not loaded into BricsCAD, enter the name of the macro in this format: **project.dvb!project.module.macro**

Command Options

Option	Description
Macro name	Names the VBA macro to be run.

Related Commands

AddInMan (6.4.3) - loads and unloads VBA functions through a dialog box. AppLoad (6.4.17) - selects external routines to load when BricsCAD starts. Netload (6.22.3) - loads a .NET application. VbaLoad (6.32.2) and -VbaLoad (6.32.3) - loads VBA projects. VbaMan (6.32.4) - manages VBA projects. VbaNew (6.32.5) - starts a new VBA project. VbaRun (6.32.6) - runs VBA macros. VbaIde (6.32.1) - opens the VBA integrated development environment. VbaSecurity (6.32.8) - depending on the selected security level (Low, Medium or High) VBA macros are allowed to run automatically or not. VbaUnload (6.32.9) - unloads VBA projects.

Figure 6.2877

6.32.8 VbaSecurity

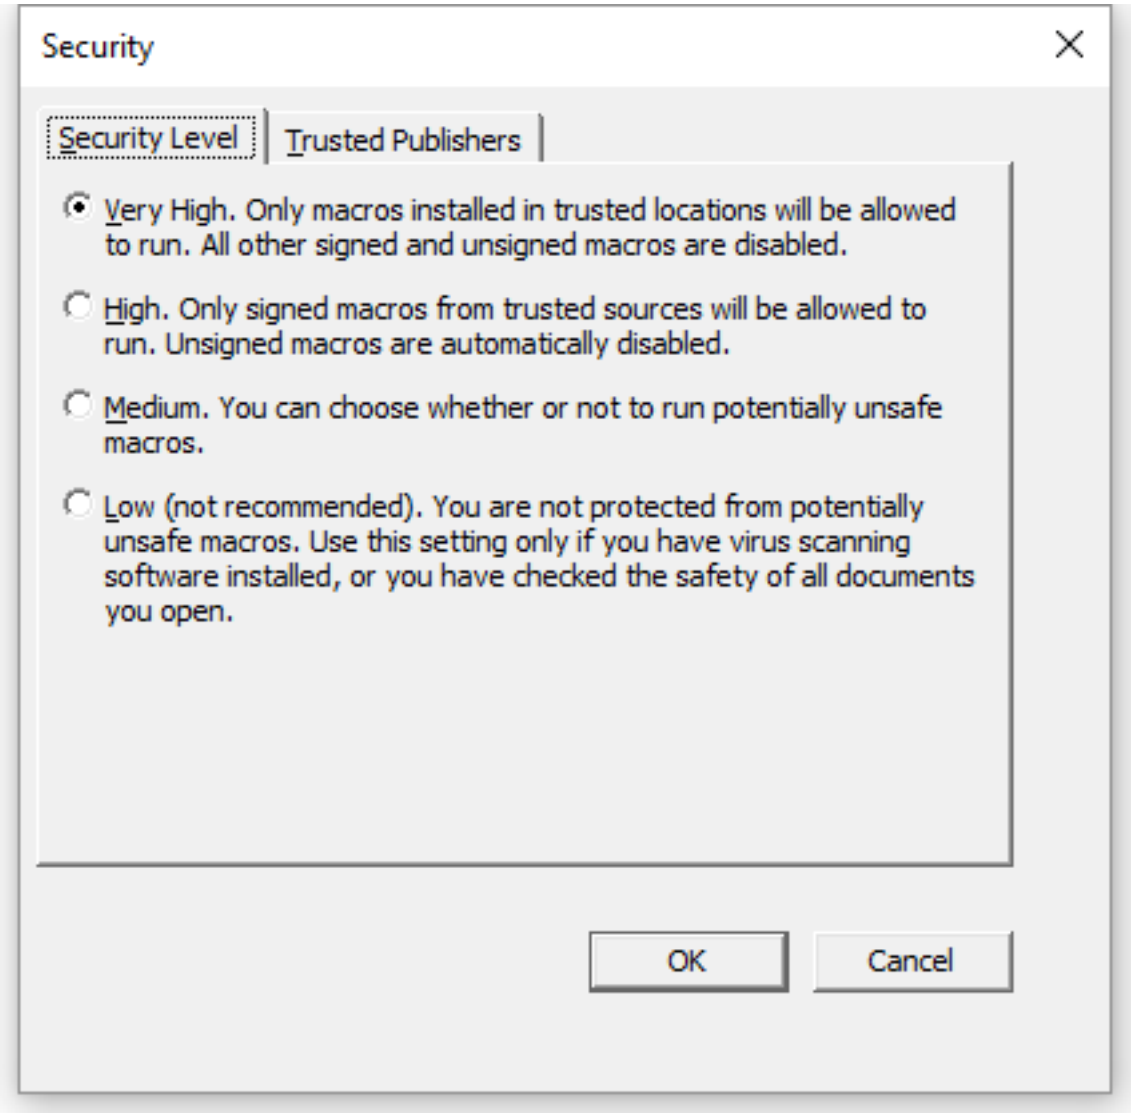
(6.2880 on page 5977) * Command only available on the Windows platform Sets the security level to Low, Medium, High or Very High to determine whether VBA macros are allowed to run automatically. **Note:** This command helps protect your computer, because Microsoft's design of VBA applications allows them to run destructive code, which can damage files on your computer.

Accessing the Command

command bar: **vbasecurity** menu bar: **Tools | VBA | Security : VbaSecurity** Displays a dialog box: (6.2878 on the next page)

1. Choose a level of security
2. Click **OK**.

Figure 6.2878



Command Options

Option	Description
Very High	Only VBA macros installed in trusted locations will be allowed to run. All other signed or unsigned macros are disabled.
High	Only signed macros from trusted sources will be allowed to run. Unsigned macros are automatically disabled.
Medium	BricsCAD displays a dialog box when a VBA macro runs. The dialog box allows you to choose whether or not to run the macro.
Low	All VBA macros are run.

Trusted Sources Option	Description
Trusted Publishers	Lists the names of VBA macros that can be trusted. These are the only macros that will run when security is set to High. (6.2879 on the following page)
Remove	Removes the selected VBA macro from the list.
Trust access to Visual Basic Project	Allows access to the VBA Project.

Related Commands

AddInMan (6.4.3) - loads and unloads VBA functions through a dialog box. AppLoad (6.4.17) - selects external routines to load when BricsCAD starts. Netload (6.22.3) - loads a .NET application. VbaRun (6.32.6) and -VbaRun (6.32.7) - runs VBA macros. VbaUnload (6.32.9) - unloads VBA projects.

Figure 6.2879

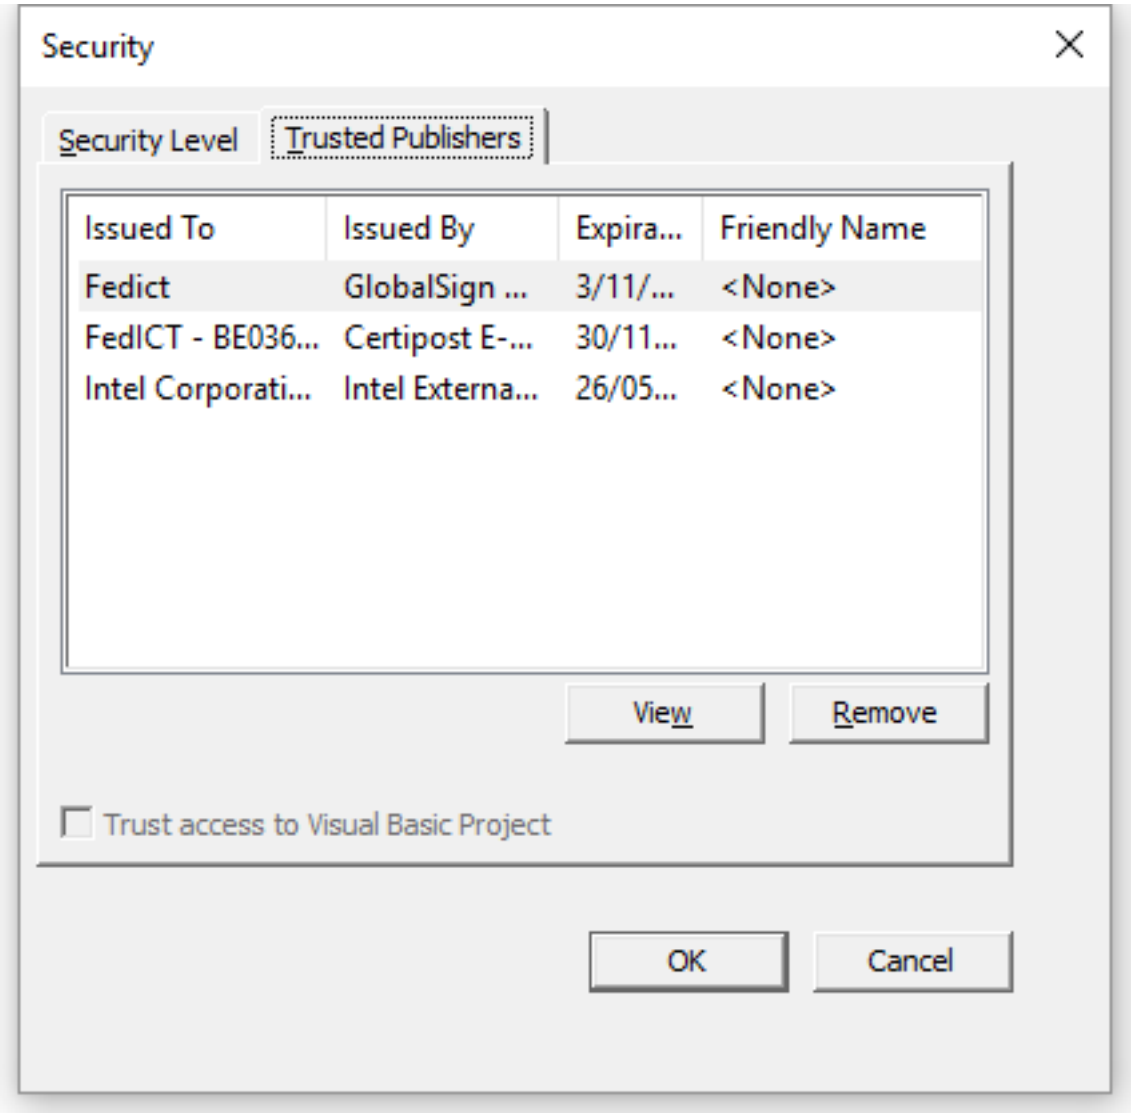


Figure 6.2880

6.32.9 VbaUnload

(6.2880) * Command only available on the Windows platform Unloads VBA projects (short for "visual basic for applications unload"). **Note:** This command is not available in the 64-bit version of the program.

Accessing the Command

command bar: **vbaunload : VbaUnload Prompts you in the command bar:** VBA Project Name: **(Enter the name of a DVB or VBI project, or press Enter)**

Command Options

Option	Description
VBA Project Name	Names the DVB or VBI file to unload. To unload the current project, press Enter at the 'VBA Project Name" prompt. DVA and VBI files are VBA project files, that contain one or more VBA macros.

Related Commands

AddInMan (6.4.3) - loads and unloads VBA functions through a dialog box. AppLoad (6.4.17) - selects external routines to load when BricsCAD starts. Netload (6.22.3) - loads a .NET application. VbaIde (6.32.1) - opens the VBA integrated development environment. VbaMan (6.32.4) - manages VBA projects. VbaNew (6.32.5) - starts a new VBA project. VbaRun (6.32.6) and -VbaRun (6.32.7) - runs VBA macros. VbaSecurity (6.32.8) - depending on the selected security level (Low, Medium or High) VBA macros are allowed to run automatically or not.

6.33 W

6.33.1 WBlock

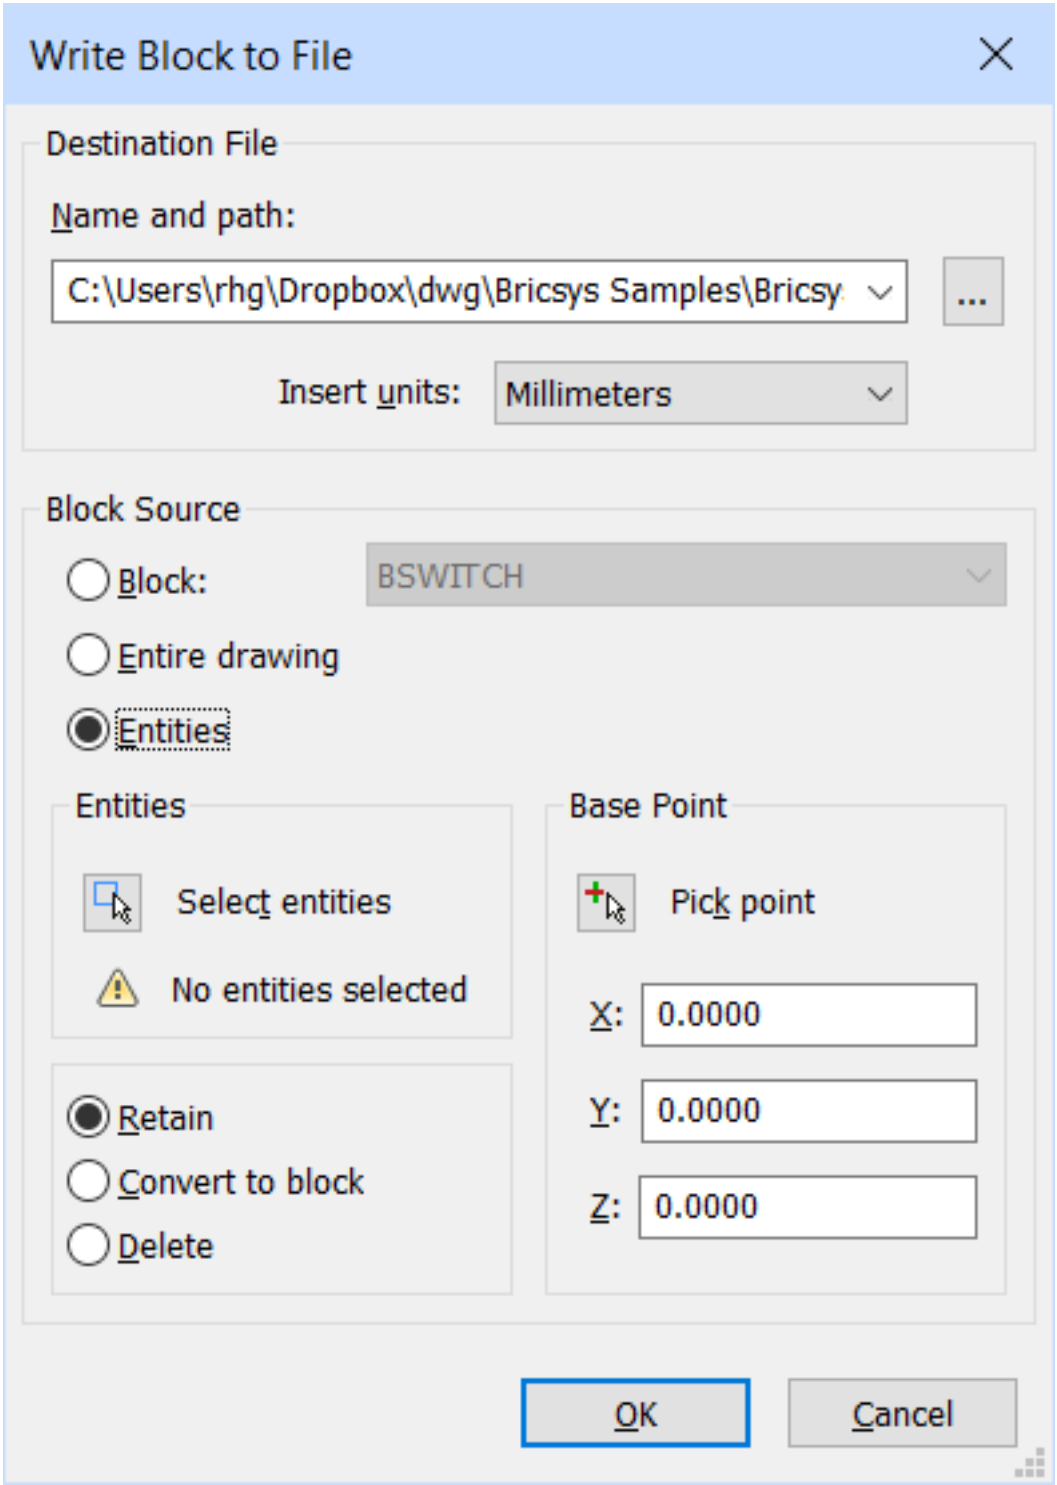
(7.3 on page 6132) Saves blocks and other drawing entities to DWG/DXF files, through a dialog box (short for "write block").

Figure 6.2881

Accessing the Command

command bar: **wblock** alias: **w** menu bar: **Tools | Write Block** ribbon: **Insert | Blocks | Create Block | Save Block** toolbar: **Tools |** : **WBlock** Displays a dialog box: (6.2882 on the next page)

Figure 6.2882



Dialog Box Options

Option	Description
Destination File	Specifies what the file should be named, and where it should be saved **Name and path** - specifies the default path and file name (new-block.dwg) **Browse** - changes the path and file name; displays the Save Block dialog box: • **Save in** - select a folder and/or drive in which to save the file • **File name** - type the name of the file, or accept the default • **Save as type** - choose from DWG or DXF format **Insert Units** - specifies the units to be used by the exported entities when they are later inserted into other drawings: 1. Click the **Insert Units** droplist 2. Choose a measurement unit Units are saved in the INSUNITS variable.
Block Source	Selects the part of the drawing to save to a new file: **Block** - saves a block from the drawing; this option is unavailable when no blocks exist in the drawing (all other options become unavailable): 1. Choose the **Block** radio button 2. Click the droplist 3. Choose the name of a block from the the list **Entire drawing** - saves the entire drawing to the file; this is like using the SaveAs (6.27.3) command. although some longtime CAD users report that using WBlock can strip out errors in the drawing (all other options become unavailable). **Entities** - saves entities that you select to the file

Entities	When the Block Source is set to Entities, then the following options become available: **Select**  - selects entities in the drawing; the dialog box disappears and you are prompted at the command line: 1. **Select entities for block - (choose one or more entities using any selection method.) Entities in set: 1** 2. **Select entities for block - (choose more entities, or else press Enter to return to the dialog box.)** Specifies what to do with the selected entities after you click OK to close the dialog box: • **Retain** - keeps the selected entities as they are; this is like copying the selection to a new drawing • **Convert to block** - converts the selected entities to a block in the current drawing • **Delete** - deletes the entities you had selected in the drawing; this is like moving the selection to a new drawing
Base Point	Specifies the origin point of the saved entities,in the new file: **Select**  - selects entities in the drawing; the dialog box disappears and you are prompted • **Insertion point for new block or [Annotative] - (select the base point in the drawing or enter x,y,z coordinates; ignore the Annotative option, as it does not work.)** **X**, **Y**, and **Z** - enter coordinates of the base point
OK	Saves the entities -- the block, the entire drawing, or selected entities -- to the file on disk. You can use the Open (6.23.8) command to open the file in a new window, or use the Insert (6.17.13) command to insert the file as a block into any drawing.

Procedures

- To save a block to a separate file (1.30.6)

Related Commands

-WBlock (6.33.3) - writes blocks and other drawing parts to files on disk through the command bar. -Block (6.6.12) - creates blocks at the command line. Block (6.6.11) - creates blocks through a dialog box. Blockify (6.6.13) - Automatically detects equally shaped solids in a model and replaces them by block references. Searches the drawing for an identical set of a 2D entities and replaces them by block references. BSaveAs (6.6.14) - saves a copy of the block definition being edited in the drawing or as a separate drawing. Export (6.13.18) - exports the drawing in a variety of raster and vector formats. ExportLayout (6.13.19) - exports all visible objects from the current layout to the model space of a new drawing. Insert (6.17.13) - inserts blocks and drawings through a dialog box. -Insert (6.17.14) - inserts blocks and drawings through the command bar. MInsert (6.21.15) - inserts blocks as a rectangular array. SaveAs (6.27.3) - saves drawings in DWG, DWF, and DXF formats for a variety of versions.

Figure 6.2883

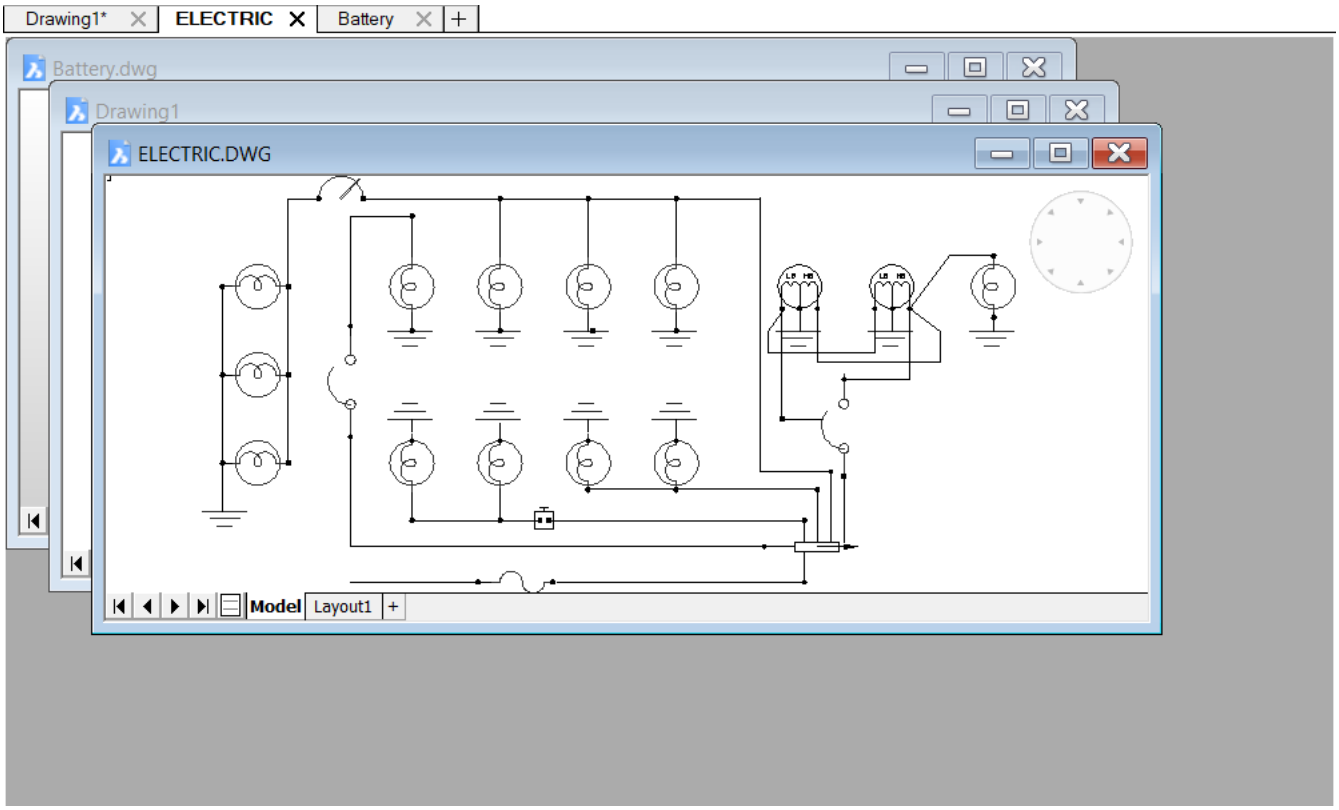
6.33.2 WCascade

(6.2981 on page 6079) * Command only available on the Windows platform Cascades drawing windows in an overlapping pattern (short for "window cascade").

Accessing the Command

command bar: **wcascade** menu bar: **Window | Cascade** ribbon: **View | Windows | Cascade** : **WCascade** Displays no prompt in the command bar. Windows are cascaded (overlapping), the the current drawing the topmost one. (6.2884 on the next page)

Figure 6.2884



Command Options

No options.

Related Commands

SysWindows (6.27.65) - arranges windows. WClose (6.33.7) - closes the current window. WCloseAll (6.33.5) - closes all windows. WhTile (6.33.13) - tiles windows horizontally. WiArrange (6.33.9) - arranges iconized windows. WvTile (6.33.16) - tiles windows vertically.

Figure 6.2885

6.33.3 -WBlock

(7.3 on page 6132) Saves blocks and other drawing entities to DWG/DXF files, (short for "write block").

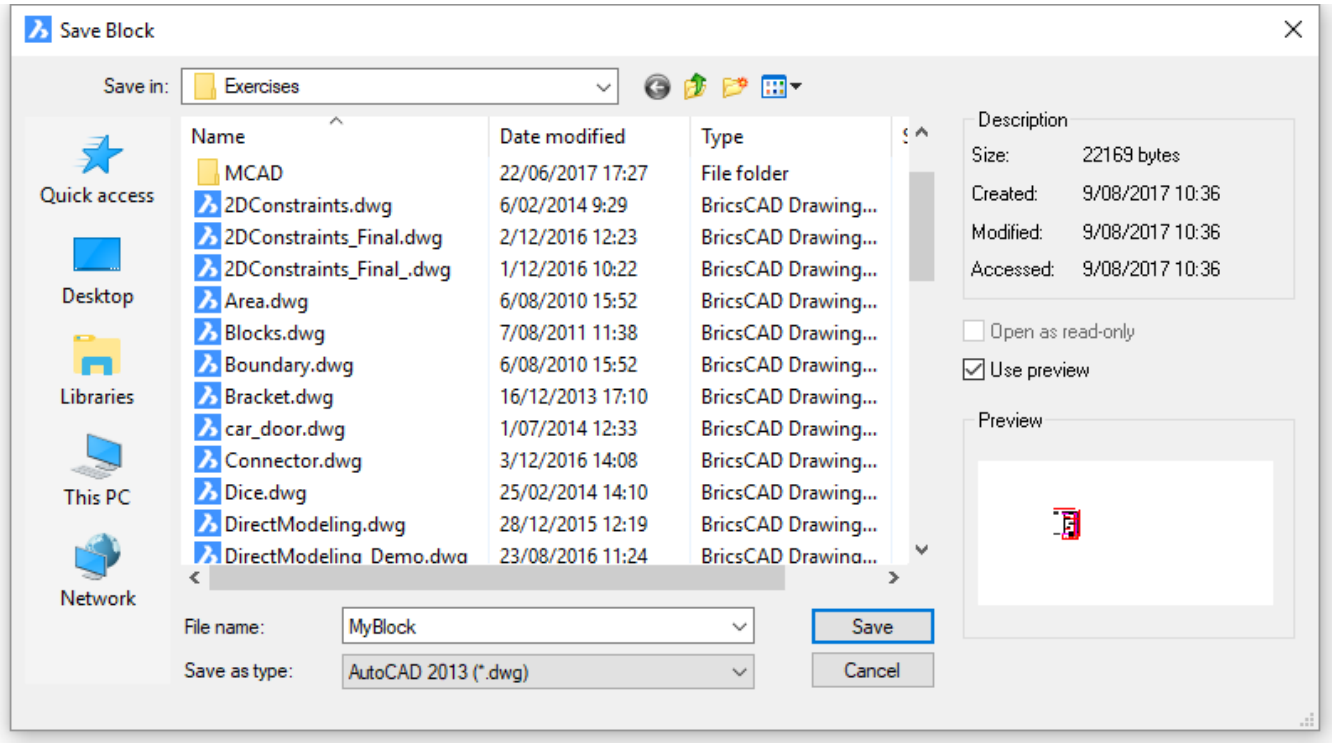
Accessing the Command

command bar: **-wblock** alias: **-w** : **-WBlock** A File dialog displays: (6.2886 on the next page)

1. (Optional) Select a folder from the Save In droplist
2. Enter a name in the File name field or accept the default
3. Click Save. The program prompts you in the command bar:

Block to save as WBlock or [& to include multiple blocks/* for whole drawing] <Select entities>: **(Type the name of the block you want to write to a file, or enter an option)**

Figure 6.2886



Command Options

Option	Description
Block to save as WBlock	Type the name of the block you want to write to a file.
Select entities	Selects individual entities to write to the file on disk: 1. **Insertion point for new block or [Annotative]** - **(pick the origin point of the drawing, or enter x,y,z coordinates; ignore the Annotative option, as it does not work.)** 2. **Select entities for block** - **(select one or more entities.) Entities in set: 1** 3. **Select entities for block** - **(select more entities, or else press Enter to create the drawing file)** The selected entities are deleted from the current drawing. Use the Oops (6.23.7) command to restore the entities.
& to include multiple blocks	Saves multiple blocks from this drawing to the file on disc. Type & or M: **Blocks to save** - type the names of the blocks, each separated by commas. The block definitions are saved to the new drawing.
for whole drawing	Saves the whole drawing, equivalent to SaveAs (6.27.3). Type * or **A**. All entities in the current drawing are saved to the new drawing.

Related Commands

WBlock (6.33.1) - writes blocks and other drawing parts to files on disk through a dialog box. Blockify (6.6.13) - Automatically detects equally shaped solids in a model and replaces them by block references. Searches the drawing for an identical set of a 2D entities and replaces them by block references. Export (6.13.18) - exports the drawing in a variety of raster and vector formats. ExportLayout (6.13.19) - exports all visible objects from the current layout to the model space of a new drawing. Insert (6.17.13) - inserts blocks and drawings through a dialog box. -Insert (6.17.14) - inserts blocks and drawings through the command bar. MInsert (6.21.15) - inserts blocks as a rectangular array. SaveAs (6.27.3) - saves drawings in DWG, DWF, and DXF formats for a variety of versions.

Figure 6.2887

6.33.4 Weblight

(6.2981 on page 6079) Creates web lights, which illuminates scenes with a 3D representation of the light's intensity distribution. **Note:** Web lights are defined by IES files, which are provided by lighting manufacturers.

Accessing the Command

 command bar: **weblight** menu bar: **View | Rendering | Lights | New web light** toolbar: **Lights |** : **Weblight**
Prompts you in the command bar:

- If the LIGHTINGUNITS variable is 0 (No lighting units), the following prompt displays:

Command not allowed when LIGHTINGUNITS = 0

- If the LIGHTINGUNITS variable is 1 (American lighting units) or 2 (International lighting units), the following prompts display:

Specify source position <0,0,0>: **(Specify the position of the light)** Specify target position <0,0,-10>: **(Specify the target point of the light)** Enter an option to change [Name/Intensity factor/ Status/ Photometry/ weB/ shadoW/ filterColor/eXit] <eXit>: **(Enter an option)**

Command Options

Option	Description
Specify source position	Specifies the location of the light in 3D space: • Pick a point in the drawing to position of the light • Enter x,y,z coordinates • Press **Enter** to accept the default location
Specify target position	Specifies the location of the target, the point at which the light is focused: • Pick a point in the drawing to position of the target • Enter x,y,z coordinates • Press **Enter** to accept the default location
Name	Specifies a name for the light; prompts you: **Enter light name <Weblight1> - (enter a name or press Enter to accept the default name.)**

Intensity Factor	Specifies the intensity of the light; prompts you: **Enter intensity (0.00 - max float) <1.0>** - **(enter an option:)** • Enter an intensity values between 0.00 and the maximum value supported by your system (max float = maximum value of a floating point number) • Press **Enter** to accept the default value
Status	Toggles the use of this light; prompts you: **Enter status [ON/OFf] <ON>** - **(enter an option:)** • **ON** - light is included when calculating renderings • **OFf** - light is excluded
Photometry	Specifies the photometric properties of the light; prompts you: **Enter a photometric option to change [Intensity/Color/eXit] <Intensity>** - **(enter an option:)** • **Enter intensity (Cd) or enter an option [Flux/Illuminance] <1500.0>**: - **(enter the intensity expressed in candela or an option:) Enter Flux (Lm)** - **(enter the luminous flux expressed in lumens.) Enter Illuminance (Lx or Fc) or enter an option [Distance] <9424.8>** - **(enter the illuminance expressed in lux or foot-candles.) Enter Distance** - **(Enter a distance expressed in drawing units.)** • **Enter color name or enter an option [?/Kelvin] <D65>** - **(enter a color name.) ?** - lists the names of available colors, such as: `D65 Fluorescent Coolwhite White` **Enter Kelvin temperature <3600.0>** - **(enter a color temperature expressed in degrees Kelvin.)**
Web	Specifies the light distribution map, called a "web" as an uneven light distribution can look vaguely like a spider's web: (6.2888 on page 5990) Prompts you: **Enter a Web options to change: File/X/Y/Z/<Exit>** - **(enter an option:)** • **Enter Web file** - **(enter the name of an IES file, which is a text file that describes the intensity of a light source at many points on a spherical grid (image credit Vertheim).)** • **Enter Web X rotation in degrees <0.0000>** - **(define the X rotation for the web.)** • **Enter Web Y rotation in degrees <0.0000>** - **(define the Y rotation for the web.)** • **Enter Web Z rotation in degrees <0.0000>** - **(define the Z rotation for the web.)**

Shadow	Specifies the look of shadows cast by this light; prompts you: **Enter shadow settings [Off/Sharp/soFt mapped/soft sAmpled] <Sharp>** - **(enter an option:)** • **Off** - disables the calculation of shadows for the light. • **Sharp** - displays shadows with sharp edges. Use this option to increase performance. • **Soft mapped** - displays realistic shadows with soft edges. Prompts you: **Enter map size [64/128/256/512/1024/2048/4096] <256>:** • **Soft sampled** : Displays realistic shadows with softer shadows based on extended light sources; prompts you: **Enter an option to change Shape/sAmples/Visible/<eXit>** - **(enter an option:) Enter shape [Disk/Rect] <Disk>** - **(type D or R.) Enter radius <0.0>** - **(enter the radius of the disk.) Enter Width <0.0>** - **(enter width of the rectangle.) Enter Length <0.0>** - **(enter length of the rectangle.)** • **Enter Shadow Sample <16>** - **(specify the sampling size of the shadow; larger numbers are more accurate but take longer to render.)** • **Enter Shape Visibility [Yes/No] <No>** - **(type Y or N to cast a shadow that represents shapes (more accurate) or is rectangular (faster to render).)**
Filter Color	Specifies the color of the light; prompts you: **Enter true color (R,G,B) or enter an option [Index color/Hsl]:<255,255,255>** - **(enter an option:)** • **Enter true color** - the RGB color model is an additive color model in which red, green, and blue light are added together in various ways to reproduce a broad array of colors. The name of the model comes from the initials of the three additive primary colors, red, green, and blue. The component values are stored as integer numbers in the range 0 to 255, the range that a single 8-bit byte can offer (by encoding 256 distinct values). • **Index color** - specifies an AutoCAD Color Index color. • **Hsl** - specifies the color using three parameters Hue, Saturation and Lightness
Exit	Concludes the command and creates the light.

Related Commands

Distantlight (6.10.34) - creates a distant light. Light (6.20.30) - creates a new light in the drawing. Lightlist (6.20.36) - displays the Drawing Explorer - Lights dialog window. Pointlight (6.24.47) - creates a point light. Render (6.26.21) - calculates a photorealistic image of the 3D model. Spotlight (6.27.47) - creates a spot light. Sunproperties (6.27.70) - displays the Sun Properties of the Active Viewport editor in the Drawing Explorer - Lights dialog.

Figure 6.2888

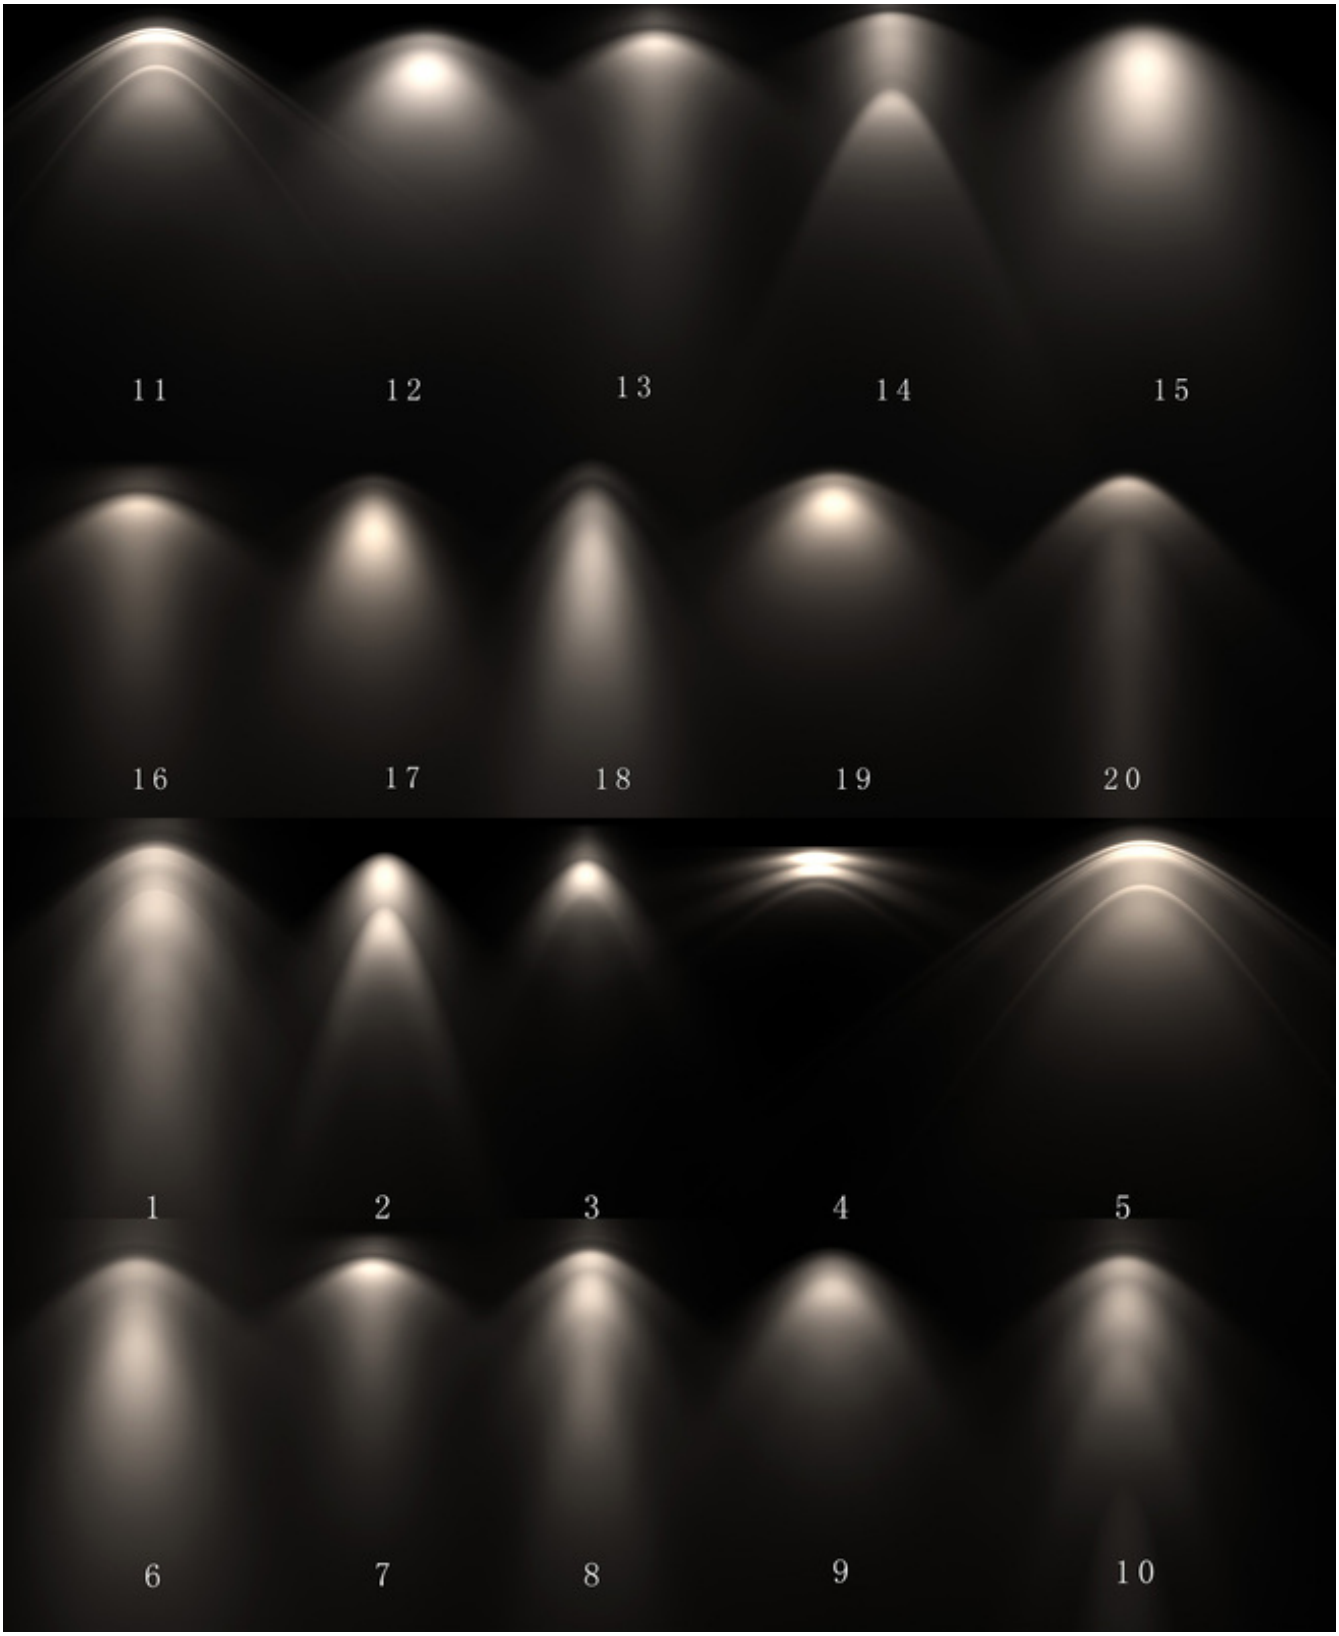


Figure 6.2889

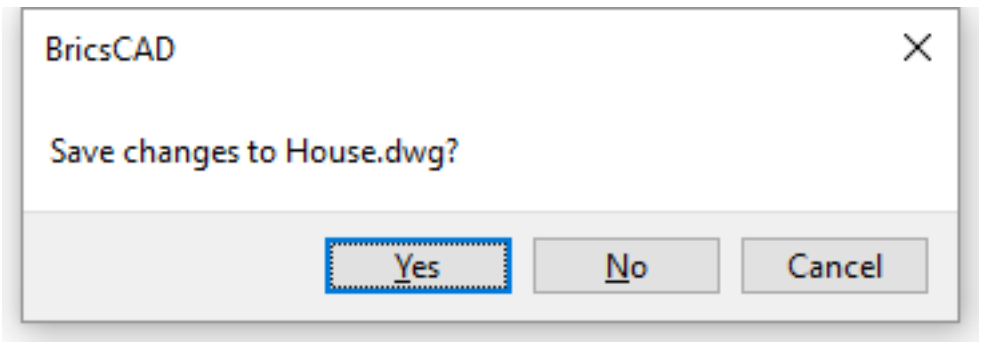
6.33.5 WCloseAll

(6.2981 on page 6079) Closes all drawing windows at once (short for "windows close all").

Accessing the Command

command bar: **wcloseall** alias: **closeall** menu bar: **Window | Close All** : **wcloseall** If any drawing has not been saved, displays a dialog box for each one: (6.2890) Click a button. This dialog box repeats for every unsaved drawing.

Figure 6.2890



Command Options

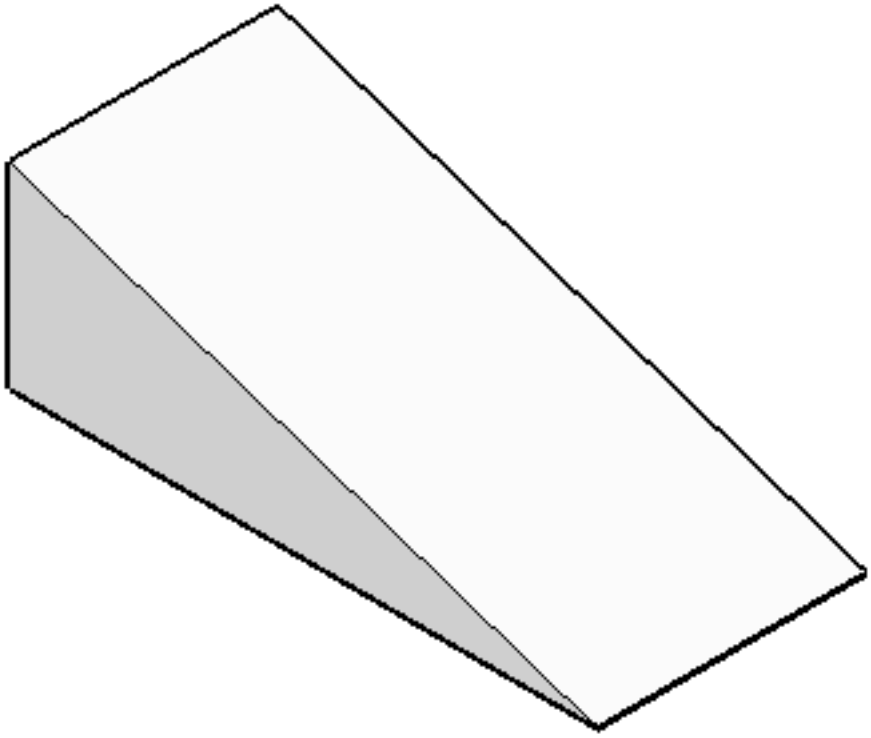
Option	Description
Yes	Saves the drawing. Displays the Save Drawing As dialog box; enter a file name, and then click **Save**. See SaveAs (6.27.3) command.
No	Does not save the drawing. Closes the drawing without saving.
Cancel	Cancels the command. Returns to the drawing; does not save or close it.

Related Commands

WCascade (6.33.2) - cascades the windows. WClose (6.33.7) - closes the current windows. WhTile (6.33.13) - tiles windows horizontally. WiArrange (6.33.9) - arranges iconized windows. WvTile (6.33.16) - tiles windows vertically. SysWindows (6.27.65) - arranges windows.

Figure 6.2891

Figure 6.2892



6.33.6 Wedge

(7.3 on page 6132) Draws wedges:

- Classic: wedge is drawn from a 3D polyface mesh; see the Ai_Wedge (6.5.21) command
- Other license levels: wedge is drawn as a 3D solid

(6.2892)

Accessing the Command

 command bar: **wedge** alias: **we** menu bar: **Model| 3D Solids | Wedge** ribbon: **Solid | Create | Primitive | Wedge** toolbar: **3D Solids |**  : **Wedge Prompts you in the command bar:** Set corner of wedge or [Center] <4.25,0.00,1.84>: **(Pick a point, or enter coordinates)** Set opposite corner or [Cube/Length of side]: **(Pick another point, or else enter an option)** Height of wedge [2Point]: **(Specify the height, or else enter an option.)** (6.2893 on the following page) If Dynamic Dimensions (1.21.9) are active, you can enter the dimensions in the dynamic dimensions entry fields. (6.2894 on the next page)

Figure 6.2893

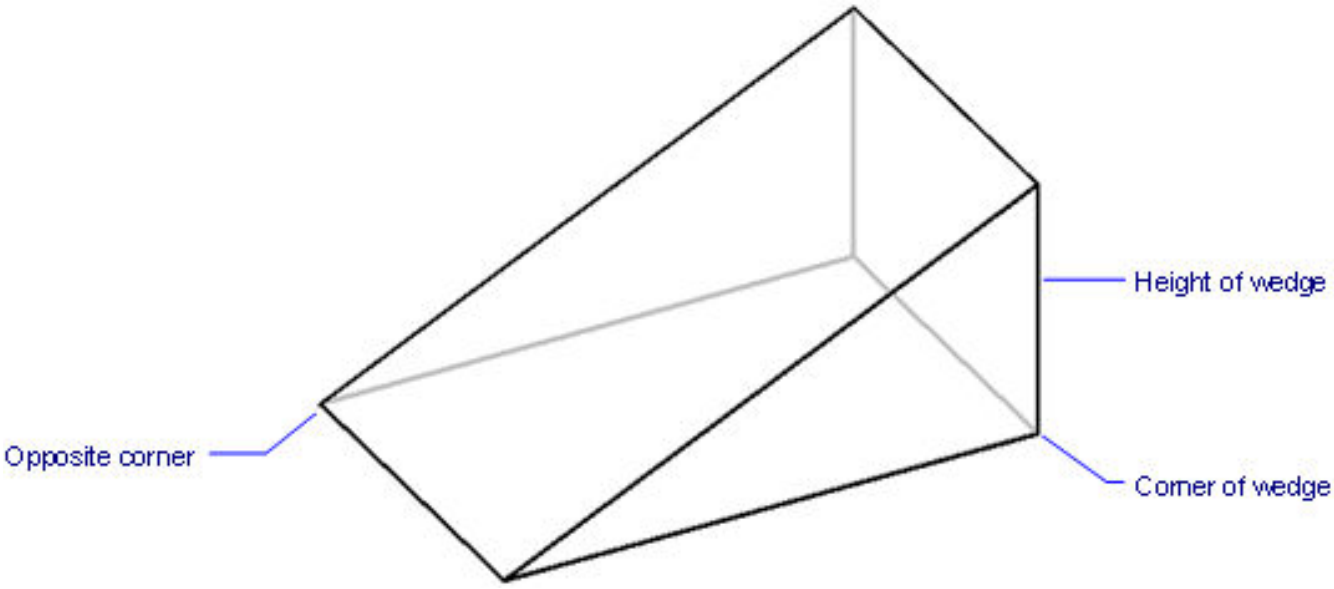


Figure 6.2894

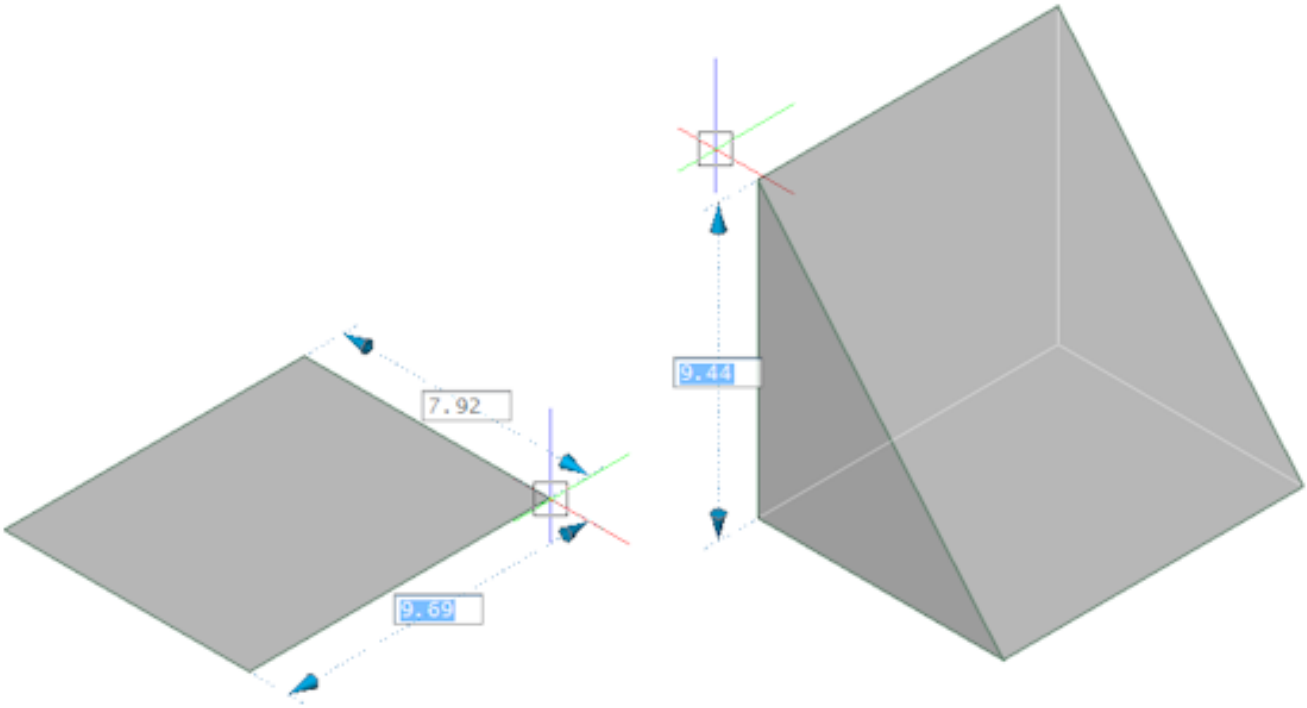


Command Options

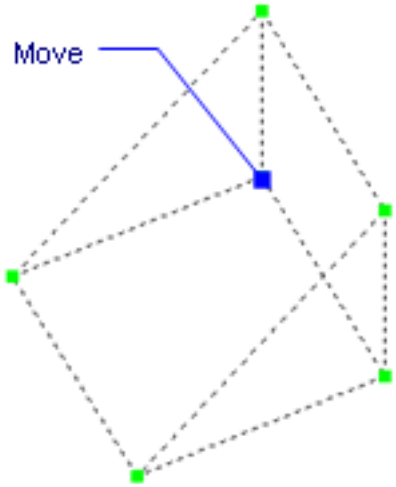
Option	Description
Set corner of wedge	Specifies one corner of the wedge's base: • Pick a point • Enter x,y or x,y,z coordinates • Press **Enter** to accept the default coordinates • Or select the Center option Prompts you: **Set opposite corner - (pick another point, or enter other coordinates.)**
Center	Draws the wedge based on the center point of the entire wedge and a corner of the base; prompts you: 1. **Center of wedge - (specify the center of the entire wedge (not the base).)** 2. **Corner of wedge - (specify the location of one of the base's corners..)**
Height of wedge	Specifies the height of the wedge; the tall end of the wedge is drawn from the first corner point that you specified: • Pick a point • Enter a height; enter a negative height to draw the wedge upside down • Press **Enter** to accept the default height • Or select the **2Point** option
Cube	Draws a wedge with equal sizes for its length, width, and height; prompts you: (6.2896 on page 5997) **Length of sides of cubic wedge - (enter an option:)** • Enter a number for the distance that applies equally for the length, width, and height • Press **Enter** to accept the default
Length	Draws the wedge by specifying distances for each of its length, width, and height; don't enter coordinates! Prompts you: (6.2897 on page 5997) 1. **Length of side - (specify the length, which will be drawn in the x direction; enter a negative number to draw the wedge in the negative x direction.)** 2. **Width across wedge - (specify the width of the base, which will be drawn in the y direction.)** 3. **Height of wedge - (specify the height, which will be drawn in the z direction.)** In all cases, you can enter a negative number to drawn the wedge in the opposite direction, such as a negative height to draw it upside down.

Grips Editing

Wedges can be edited directly through grips:

1. Select the wedge. Notice that it has several grips.

Figure 6.2895



2. Drag a grip to move the wedge. (All grips perform the same function: move.)

(6.2895)

Related Commands

Box (6.6.18) - creates 3D boxes as solid models. Cone (6.9.46) - creates 3D cones as solid models. Cylinder (6.9.49) - creates 3D cylinders as solid models. Dish (6.10.42) - creates the lower half of 3D balls as solid models. Dome (6.10.35) - creates the upper half of 3D balls as solid models. Extrude (6.13.25) - extrudes 2D entities into 3D solid models. Interfere (6.17.17) - creates 3D volumes of intersecting 3D solid models. Intersect (6.17.20) - removes volumes not in common between two solid models. MassProp (6.21.2) - reports the mass properties of 3D solid models and 2D regions. Pyramid (6.24.64) - creates a pyramid as a 3D solid (Pro and Platinum). Creates a pyramid as a polygon mesh (Classic) Revolve (6.26.45) - revolves 2D entities into 3D solid models. Slice (6.27.40) - cuts 3D solids into two parts. SolidEdit (6.27.42) - edits the bodies, faces, and edges of 3D models. Sphere (6.27.50) - creates 3D balls as solid models. Subtract (6.27.58) - removes one solid model from a second. Torus (6.29.29) - creates 3D donuts as solid models. Union (6.30.6) - joins two or more solid models into a single entity.

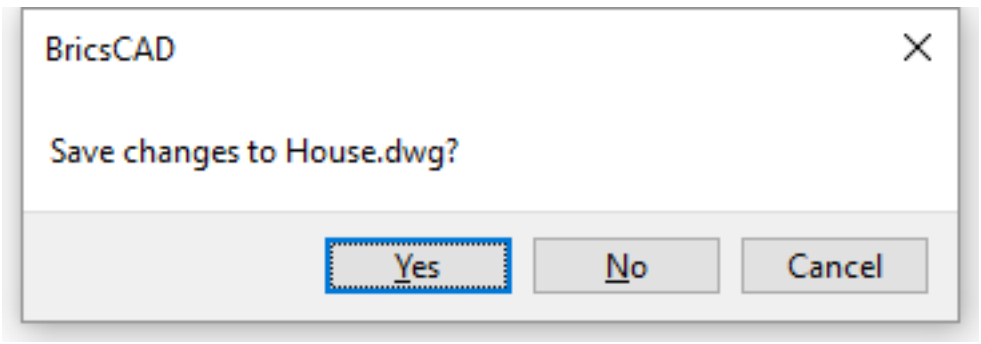
6.33.7 WClose

(7.3 on page 6132) Closes the current drawing window.

Accessing the Command

command bar: **wclose** shortcut: **Ctrl+F4** alias: **close** menu bar: **File | Close Window | Close** : **WClose** When the drawing is not saved, then the program displays a dialog box: (6.2899) Click a button.

Figure 6.2899



Command Options

Option	Description
Yes	Saves the drawing. Displays the Save Drawing As dialog box; enter a file name, and then click **Save** . See theSaveAs (6.27.3) command.
No	Does not save the drawing. Closes the drawing without saving.
Cancel	Cancels the command. Returns to the drawing; does not save or close it.

Related Commands

WCascade (6.33.2) - cascades the windows. Close (6.9.18) - closes the current drawing. WCloseAll (6.33.5) - closes all windows. WhTile (6.33.13) - tiles windows horizontally. WiArrange (6.33.9) - arranges iconized windows. WvTile (6.33.16) - tiles windows vertically. SysWindows (6.27.65) - arranges windows.

Figure 6.2900

6.33.8 WhoHas

(6.2981 on page 6079) Reports the ownership of a drawing file that is in use by someone else.

Accessing the Command

command bar: **whohas** : **WhoHas** Displays a file dialog box: (6.2901 on the facing page)

1. Choose a drawing to check on its ownership.
2. Click **Open**. The program displays the following dialog box.
3. Review its message, then clik **OK**.

(6.2902 on the next page) **Note:**The information in the dialog box is stored in a temporary DWL (drawing lock) file, which is deleted when the drawing is closed.

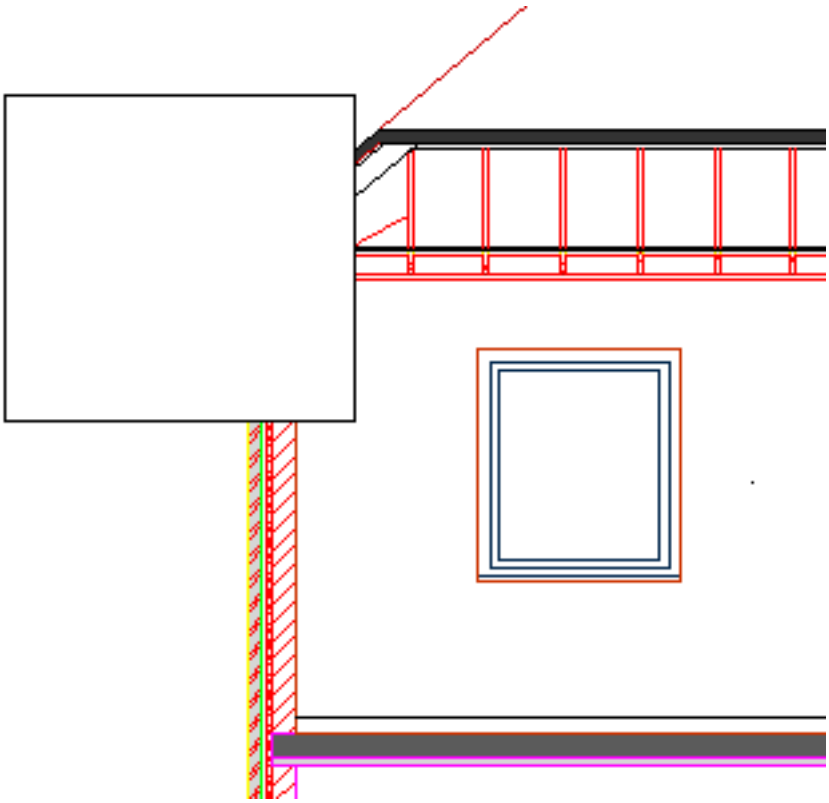
No options.

Related Commands

WCascade (6.33.2) - cascades the windows. WClose (6.33.7) - closes the current window. WCloseAll (6.33.5) - closes all windows. WhTile (6.33.13) - tiles windows horizontally. WvTile (6.33.16) - tiles windows vertically. SysWindows (6.27.65) - arranges windows.

Figure 6.2905

Figure 6.2906



6.33.10 WipeOut

(6.2981 on page 6079) Draws wipeouts in a variety of shapes to mask parts of drawings; controls the display of wipeout frames. (6.2906)

Accessing the Command

 command bar: **wipeout** menu bar: **Draw | WipeOut** ribbon: **Draw | Markup | Wipeout** toolbar: **Draw |**  : **WipeOut Prompts you in the command bar:** Specify start point or [Polyline/Frames]: **(Pick a point, or enter an option)** Specify next point: **(Pick another point)** Specify next point or [Undo]: **(Pick another point, or type U)** Specify next point or [Undo/Close]: **(Enter another point, or type C to end the command)**
Use the DrawOrder (6.10.40) command to move the wipeout in front or behind other entities.

Command Options

Option	Description
Specify start point	Specifies the first corner of the wipeout entity: • Pick a point • Enter x,y coordinates

Specify next point	Specifies the second corner of the wipeout entity: • Pick a point • Enter x,y coordinates
Polyline	Uses a closed polyline to construct the wipeout frame. First, draw a closed polyline made of line segments (no arcs or splines) with the PLine (6.24.27) command, then return to this command. Prompts you: 1. **Select a closed polyline - (pick a closed polyline composed of line segments.)** 2. **Delete selected polyline? [Yes/No] <No> - (enter an option:)** • **Yes** - erases the polyline. • **No** - does not erase the polyline, leaving it in place
Frames	Toggles the display of wipeout frame; this option applies to the frames of all wipeout entities in the drawing; prompts you: **Enter frame setting [ON/OFf/Display but not plot] <ON> - (choose an option.)** • **OFf** - turns off all frames; when the frame is off, the wipeout cannot be selected • **ON** - turns on frames; wipeouts can be selected and be printed • **Display but not plot** - turns on the display of frames in the drawing,but they are not printed
Undo	Removes the last segment.
Close	Creates the wipeout.

Grips Editing

Wipeouts can be edited directly through grips:

1. Select the wipeout. Notice that it has one grip at each vertex.
2. Drag a grip to stretch the vertex.

Procedures

- To create a wipeout using points (1.25.25)
- To create a wipeout from a polyline (1.25.25)
- To control the display of the edges of wipeouts (1.25.25)

Related Commands

DrawOrder (6.10.40) - changes the display order of overlapping entities. PLine (6.24.27) - draws polylines. RevCloud (6.26.33) - draws revision clouds.

Figure 6.2907

6.33.11 WNext

(6.2981 on page 6079) Displays the next drawing window, useful when multiple drawings are open (sort for "window next").

Accessing the Command

command bar: **wnext** keyboard: **Ctrl + Tab** menu bar: **Windows | Next** : **WNext** Bring the next drawing window to the foreground.

Command Options

No command options.

Related Commands

Wprev (6.33.17) - Displays the previous drawing window if multiple drawings are open simultaneously.

Figure 6.2908

6.33.12 WmfOut

(6.2981 on page 6079) * Command only available on the Windows platform Exports the current view to a file in WMF, EMF, or SLD formats (short for "windows metafile output").

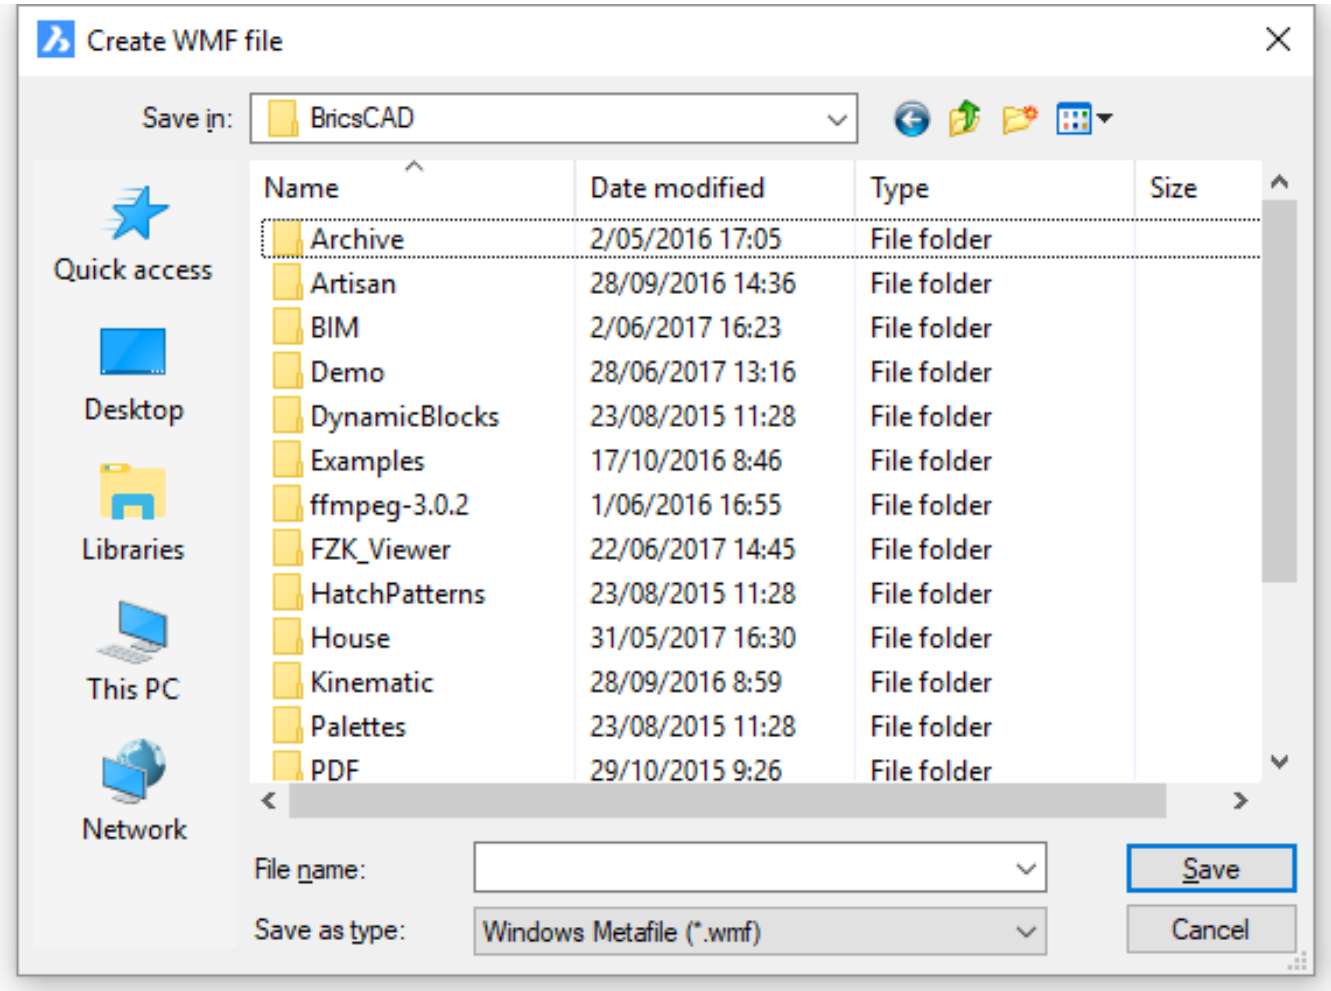
Accessing the Command

command bar: **wmfout** alias: **wo** Before using this command, set the viewport the way you wish it to be saved. : **WmfOut** Displays a dialog box: (6.2909 on the facing page)

1. Enter a file name
2. Choose a file type
3. Click **Save**

WMF, EMF, and SLD files can be viewed in the current viewport with the VSlide (6.31.24) command.

Figure 6.2909



Dialog Box Options

Option	Description
File name	Specifies the name of the slide (snapshot).
Save as type	Specifies the file format: • **SLD** - compatible with AutoCAD • **EMF** - enhanced WMF format • **WMF** - Windows meta format, a hybrid of vector and raster formats The PictureExportScale preference sets the scale factor when exporting to WMF or EMF.
Save	Saves the file.

Related Commands

BmpOut (6.6.20) - exports drawings in BMP format. Export (6.13.18) - exports drawings in BMP, DWF, DXF, DWT, PDF, WMF, EMF, SLD, and older DWG formats. MSlide (6.21.31) - exports drawings in WMF, EMF, and SLD formats.

Figure 6.2910

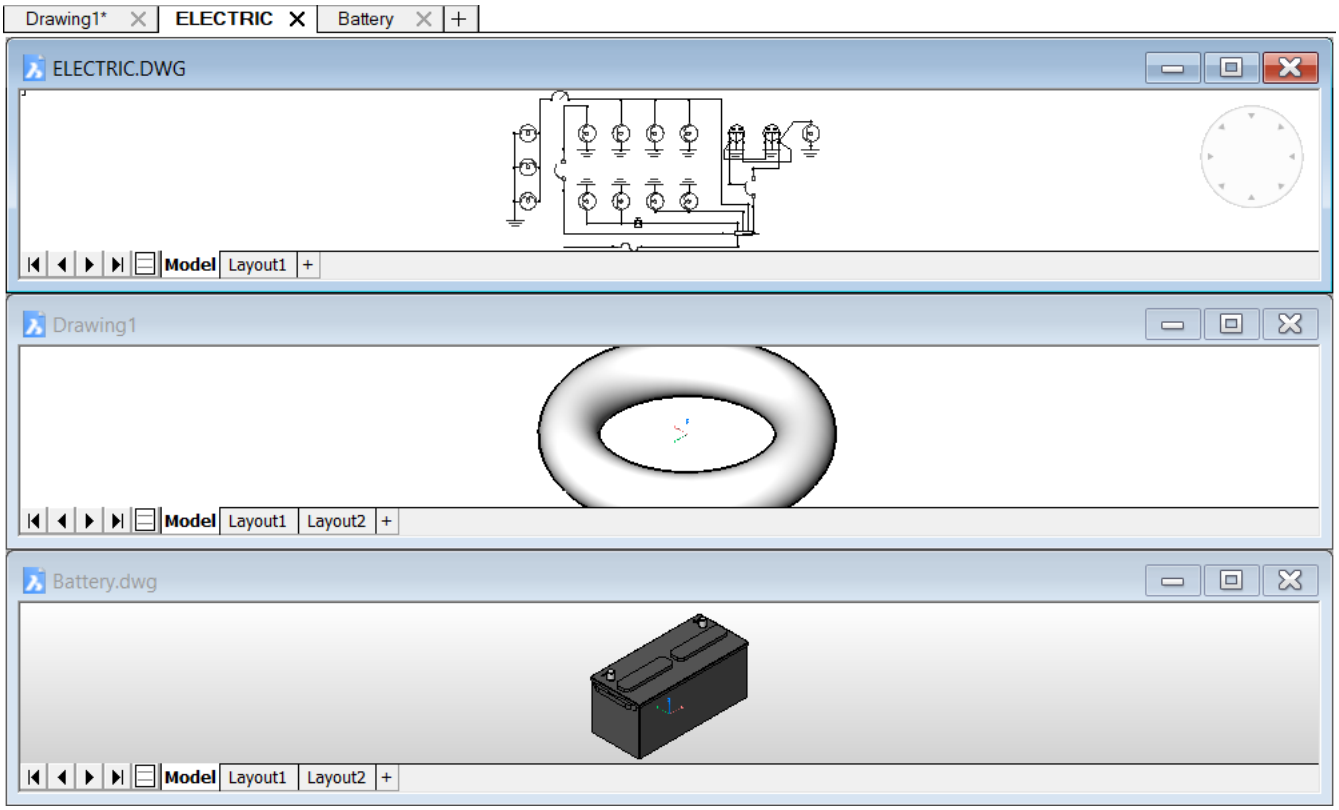
6.33.13 WhTile

(6.2981 on page 6079) Tiles drawing windows horizontally (short for "window horizontal tile").

Accessing the Command

command bar: **whtile** menu bar: **Window | Tile Horizontally** ribbon: **View | Windows | Tile Horizontally** : **WhTile** Displays no prompt in the command bar. Windows are tiled horizontally, with the most recent drawing at the top. (6.2911 on the following page)

Figure 6.2911



Command Options

No options.

Related Commands

WCascade (6.33.2) - cascades the windows. WClose (6.33.7) - closes the current window. WCloseAll (6.33.5) - closes all windows. WiArrange (6.33.9) - arranges iconized windows. WvTile (6.33.16) - tiles windows vertically. SysWindows (6.27.65) - arranges windows.

Figure 6.2912

6.33.14 Workspace

(6.2981 on page 6079) Sets the current workspace and lets you create, modify, and save workspaces.

Accessing the Command

command bar: **workspace** : **Workspace Prompts you in the command bar:** Workspace [set Current/Save As/Rename/Delete/S
<Set Current>: **(Select an option)**

Command Options

Option	Description
Set Current	Sets the current workspace. Prompts you: **Enter workspace name to make current [?] <CURRENT_WORKSPACE>** - **(enter an option:)** • Press **?** to list the existing workspaces in the window; displays a list that looks something like this: `Workspace Name -------------- BIM Drafting Drafting (to` • Type the name of the workspace • Press **Enter** to keep the current workspace
Save As	Saves the current settings to a new workspace; prompts you: **Save current workspace as <CURRENT_WORKSPACE>** - **(enter an option:)** • Press **?** to list the existing workspaces in the window • Press **Enter** to save the current workspace, thereby changing it • Type the name of a new workspace
Rename	Renames a workspace. Prompts you: **Enter workspace to rename [?] <CURRENT_WORKSPACE>** - enter an option: • Press **?** to list the existing workspaces in the window • Press **Enter** to rename the current workspace • Type the name of another workspace to rename; prompts you: **Enter new workspace name <CURRENT_WORKSPACE>** - type a new name

Delete	Deletes a workspace. Prompts you: **Enter workspace to delete [?]** - **(enter an option:)** • Press **?** to list the existing workspaces in the window • Type the name of an existing workspace,; prompts you: **Do you really want to delete the workspace "WORKSPACE"? [Yes/No] <N>** - **(type Y to delete the workspace.)**
Settings	Opens the Workspaces tab of the Customize dialog box. Make adjustments to the workspace of your choice. See the Customize (6.9.47) command.

Procedures

- Managing workspaces (1.17.11)
- Setting the current workspace (1.17.11)
- Creating a workspace (1.17.11)
- Editing a workspace (1.17.11)
- Deleting a workspace (1.17.11)

Related Commands

Customize (6.9.47) - customizes the user interface of BricsCAD: menus, toolbars, keyboard shortcuts, mouse actions, tablet, Quad settings, workspaces, aliases, and shell commands. WsSave (6.33.19) - saves the current workspace under a different name, thus creating a new workspace.

Figure 6.2913

6.33.15 WorkSets

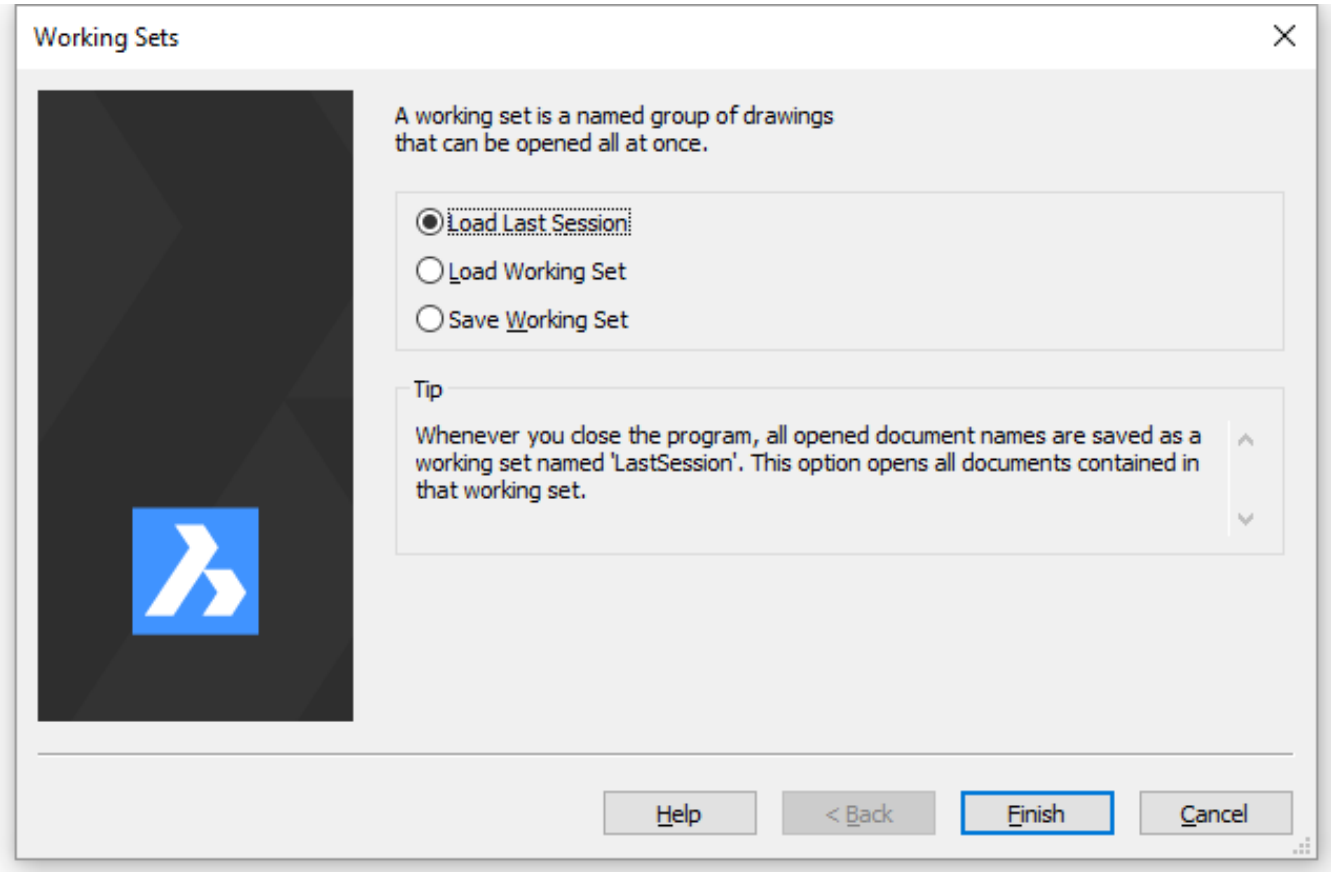
(6.2981 on page 6079) Creates and loads sets of drawing files, making it convenient to load an entire group of drawings at once.

Accessing the Command

command bar: **worksets** menu bar: **File | Working Sets** ribbon: **Home | File | Working Sets** : **WorkSets**
Displays a dialog box: (6.2914 on the next page)

1. Select an option.
2. Click Next or Finish.

Figure 6.2914



Dialog Box Options

Option	Description
Load Last Session	Opens all drawings that where open when the last BricsCAD session was closed: 1. Choose **Load Last Session**. 2. Click **Finish**. BricsCAD opens all the drawings that were open the last time you closed the program.
Load Working Set	Opens an previously saved working set: 1. Choose **Load Working Set**. 2. Click **Next**. 3. Choose the name of a workset from the **Select a Workset** list:(6.2915 on page 6018) 4. Click **Finish** button. The program opens all the drawings that are part of the workset.

Save Working Set	Saves drawings currently open by name as a working set: ===ERROR WITH DOWNLOADED IMAGE=== **Save** - displays the Save Workset dialog box: (6.2916 on the next page) 1. Enter a name for the working set of drawings 2. Click **OK**. The program reports that has saved the workset. 3. Click **Finish** to close the dialog box. Working sets are saved in the registry and so they are defined differently for each user profile. See the ProfileManager (6.24.52) command to learn more about user profiles. **Delete** - removes an named working set: 1. Select a workset name 2. Click **Delete**. The program asks, "Are you sure you want to delete workset?" 3. Click **Yes**. The name of the workset is removed from the list. 4. Click **Finish** to close the dialog box. Redefine (overwrites) an existing named working set: 1. Click the name of a workset in the list. 2. The program asks, "The workset already exists. Do you want to replace it?" Click **Yes**. The program saves the current set of open drawings to the named workset. 3. Click **Finish** to close the dialog box.

Related Commands

Open (6.23.8) - opens drawing (DWG), template (DWT), and interchange (DXF) files.

Figure 6.2915

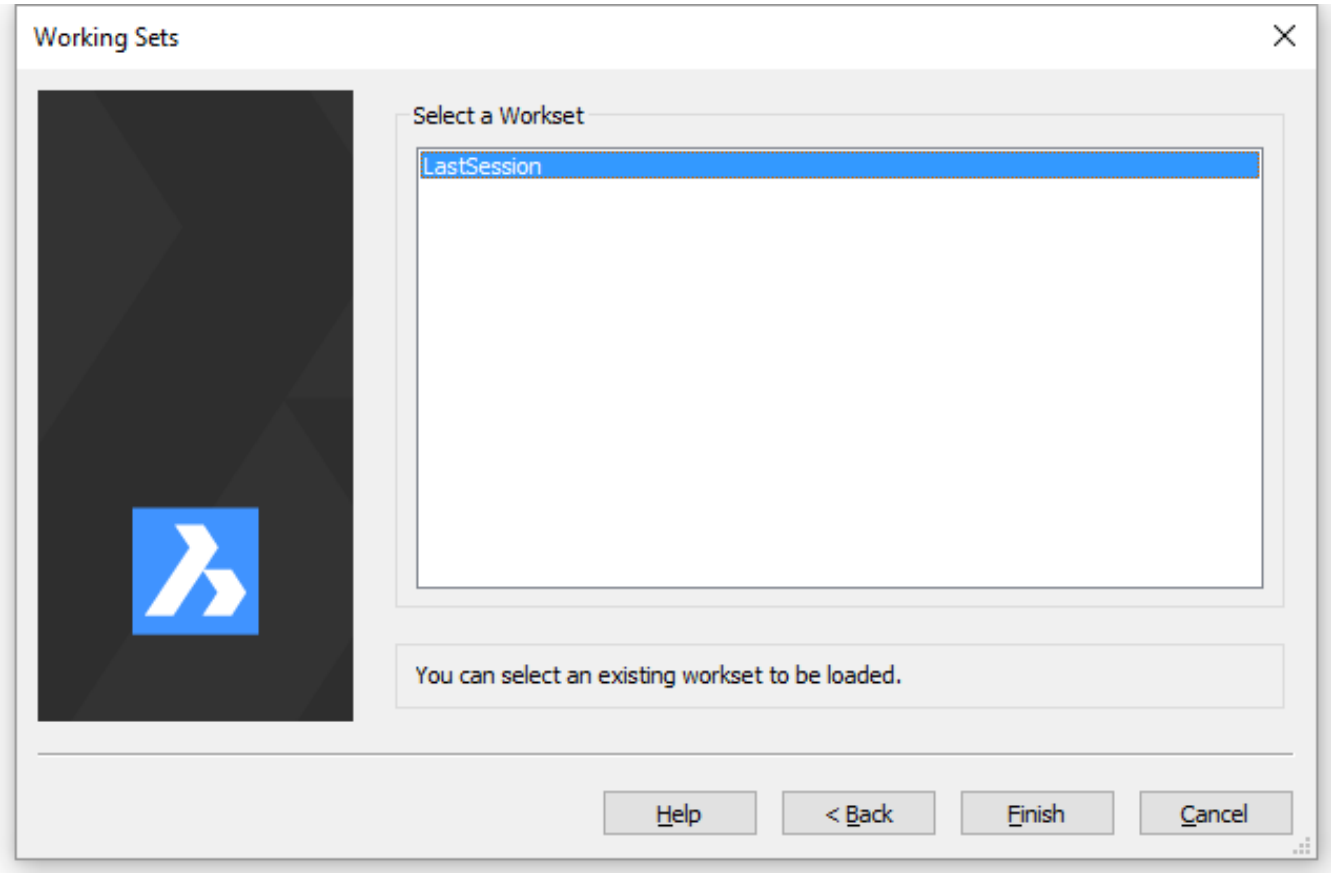


Figure 6.2916

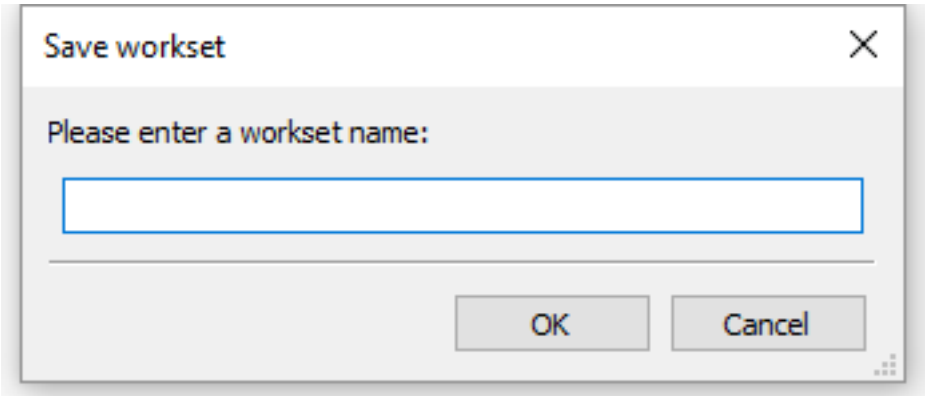

Figure 6.2917

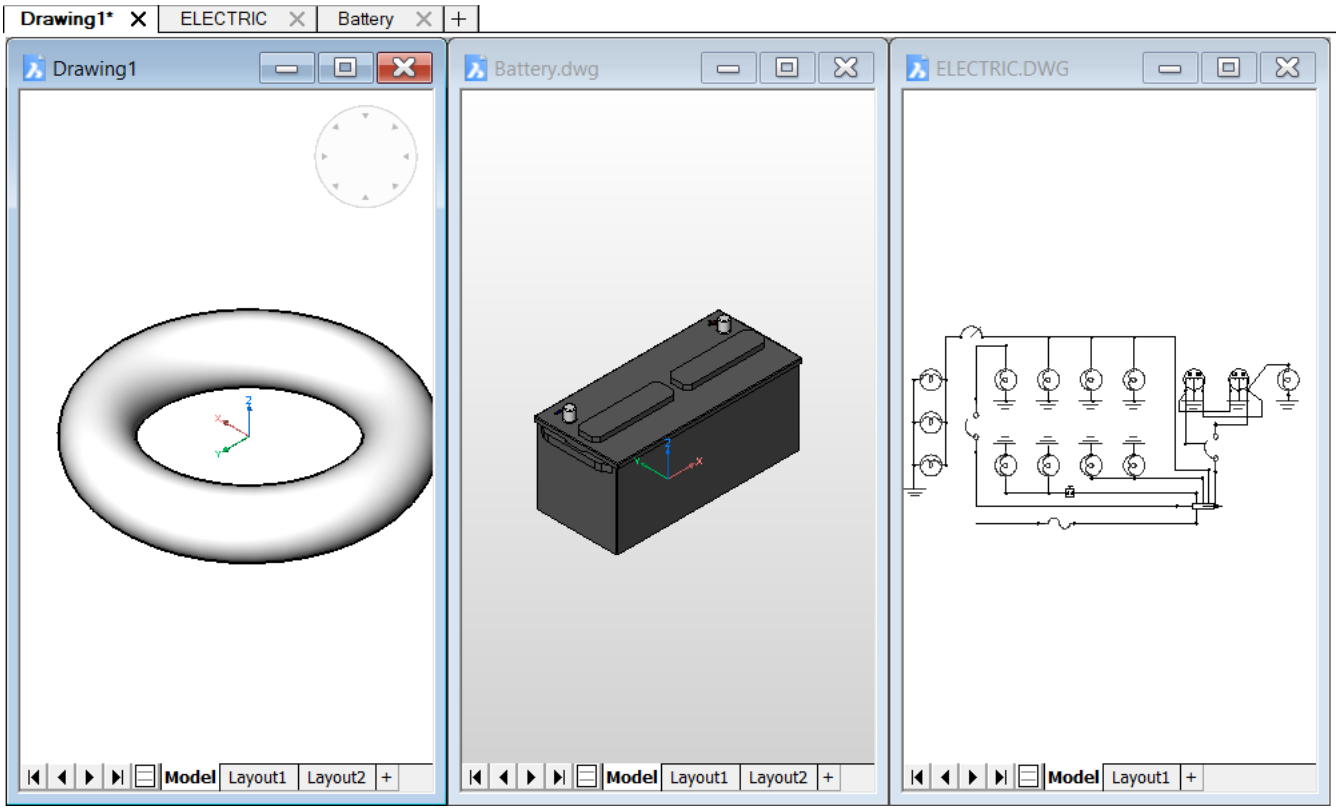
6.33.16 WvTile

(6.2981 on page 6079) Tiles drawing windows vertically (short for "window vertical tile").

Accessing the Command

 command bar: **wvtile** menu bar: **Window | Tile Vertically** ribbon: **View | Windows | Tile Vertically** : **WvTile**
Displays no prompt in the command bar. Windows are tiled vertically, with the most recent drawing window highlighted (6.2918 on the next page)

Figure 6.2918



Command Options

No options.

Related Commands

WCascade (6.33.2) - cascades the windows. WClose (6.33.7) - closes the current window. WCloseAll (6.33.5) - closes all windows. WhTile (6.33.13) - tiles windows horizontally. WiArrange (6.33.9) - arranges iconized windows. SysWindows (6.27.65) - arranges windows.

Figure 6.2919

6.33.17 Wprev

(6.2981 on page 6079) Displays the previous drawing window, when multiple drawings are open (short for "window previous").

Accessing the Command

command bar: **wprev** keyboard: **Ctrl + Shift + Tab** menu bar: **Windows | Previous** : **Wprev** Bring the previous drawing window to the foreground.

Command Options

No command options.

Related Commands

Wnext (6.33.11) - displays the next drawing window if multiple drawings are open simultaneously.

Figure 6.2920

6.33.18 WsSettings

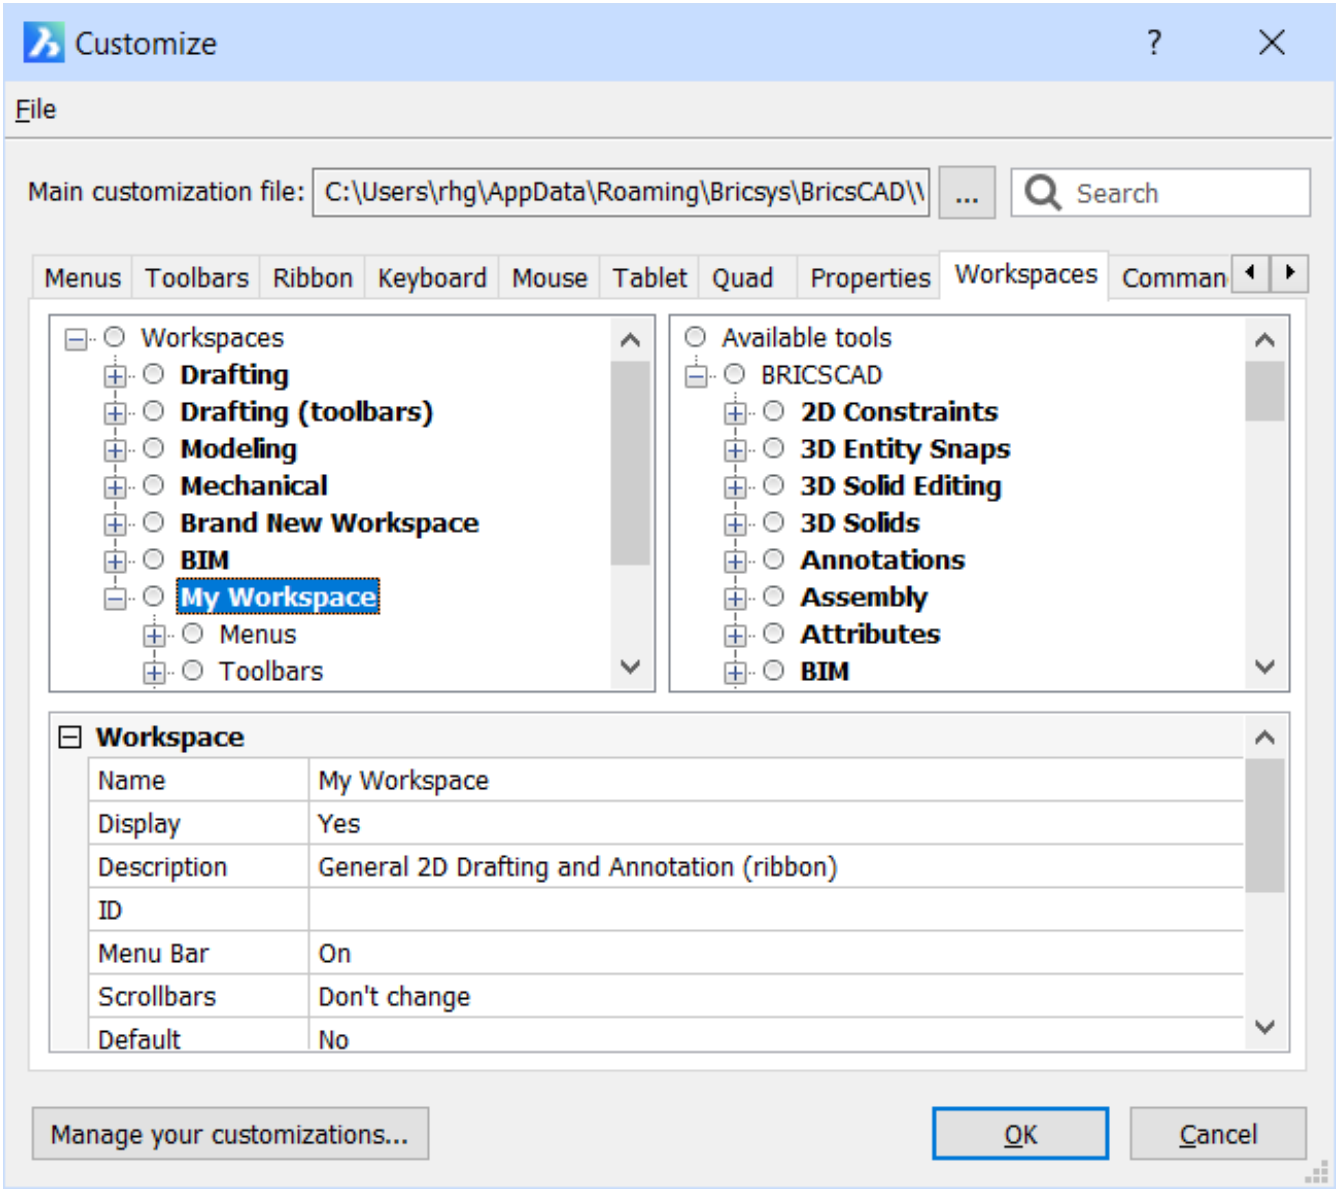
(6.2981 on page 6079) Opens the Customize dialog box at the Workspaces tab.

Accessing the Command

command bar: **wssettings** : **WsSettings** Displays a dialog box: (6.2921 on the facing page)

- Make adjustments to the workspace of your choice. See the Customize (6.9.47) command.

Figure 6.2921



Command Options

See Customize Workspaces (1.17.11).

Related Commands

Customize (6.9.47) - customizes the user interface of BricsCAD: Menus, Toolbars, Keyboard shortcuts, Mouse actions, tablet, Quad settings, Properties, Workspace settings, Aliases, and Shell Commands.

Figure 6.2922

6.33.19 WsSave

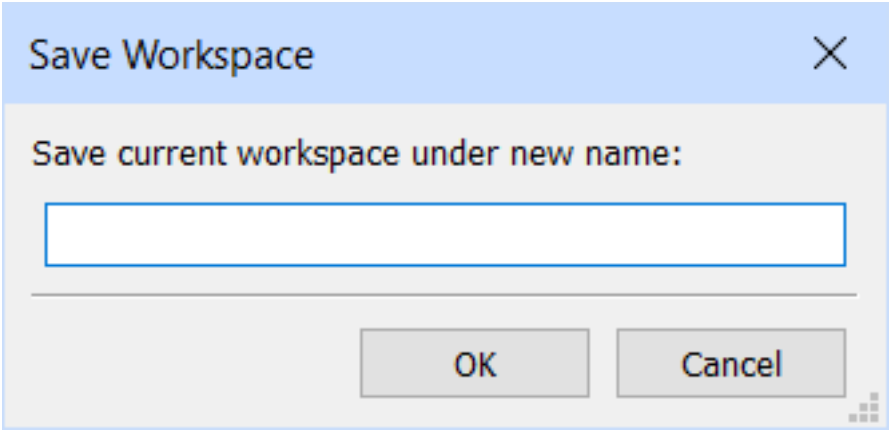
(6.2981 on page 6079) Saves the current workspace (arrangement of user interface elements) under a different name, creating a new workspace.

Accessing the Command

command bar: **wssave** menu: **Tools | Save Workspace** : **WsSave** Displays a dialog box: (6.2923)

1. Type a name.
2. Click **OK**.

Figure 6.2923



Dialog Box Options

Options	Description
Save current workspace under new name	Specifies the name for the new workspace. You can access it later through the Workspaces toolbar or from the status bar.

Related Commands

Customize (6.9.47) - customizes the user interface of BricsCAD: menus, toolbars, keyboard shortcuts, mouse actions, tablet, Quad settings, workspaces, aliases, and shell commands. Workspace (6.33.14) - sets the current workspace and lets you create, modify and save workspaces.

6.34 X

6.34.1 XAttach

(6.2981 on page 6079) Attaches externally-referenced drawings to the current drawing, through a dialog box (short for "external attach"). **Note:** This command is a shortcut to using the -XRef (6.34.8) command's Attach option.

Figure 6.2924

Accessing the Command

 command bar: **xattach** transparent: **'xattach** alias: **xa** menu bar: **Insert | Attach XRef** ribbon: **Insert | External References | Attach XRef** toolbar: **Insert |**  : **XAttach** Displays a dialog box: (6.2925 on the facing page)

1. Choose a DWG file.
2. Click **Open**. The program displays a dialog box: (6.2926 on the next page)
3. Choose options.
4. Click **OK**.
5. If you choose **Specify On-screen**, then you are prompted in the command line for the insertion point, scale, and/or rotation angle.

The XDWGFADECTL (1.17.10) system variable controls the fading level for Xref inserts. Non positive values disable fading. Values between -90 and 90 are accepted.

Figure 6.2925

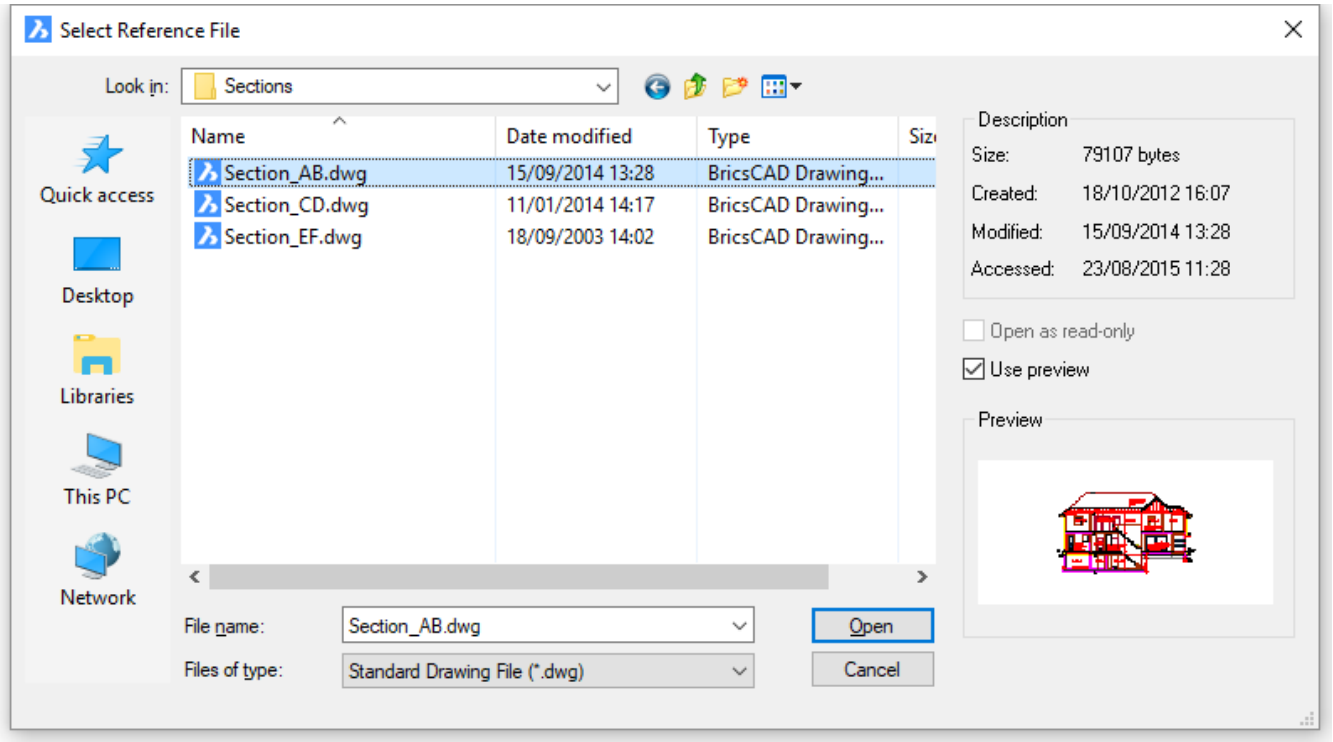


Figure 6.2926

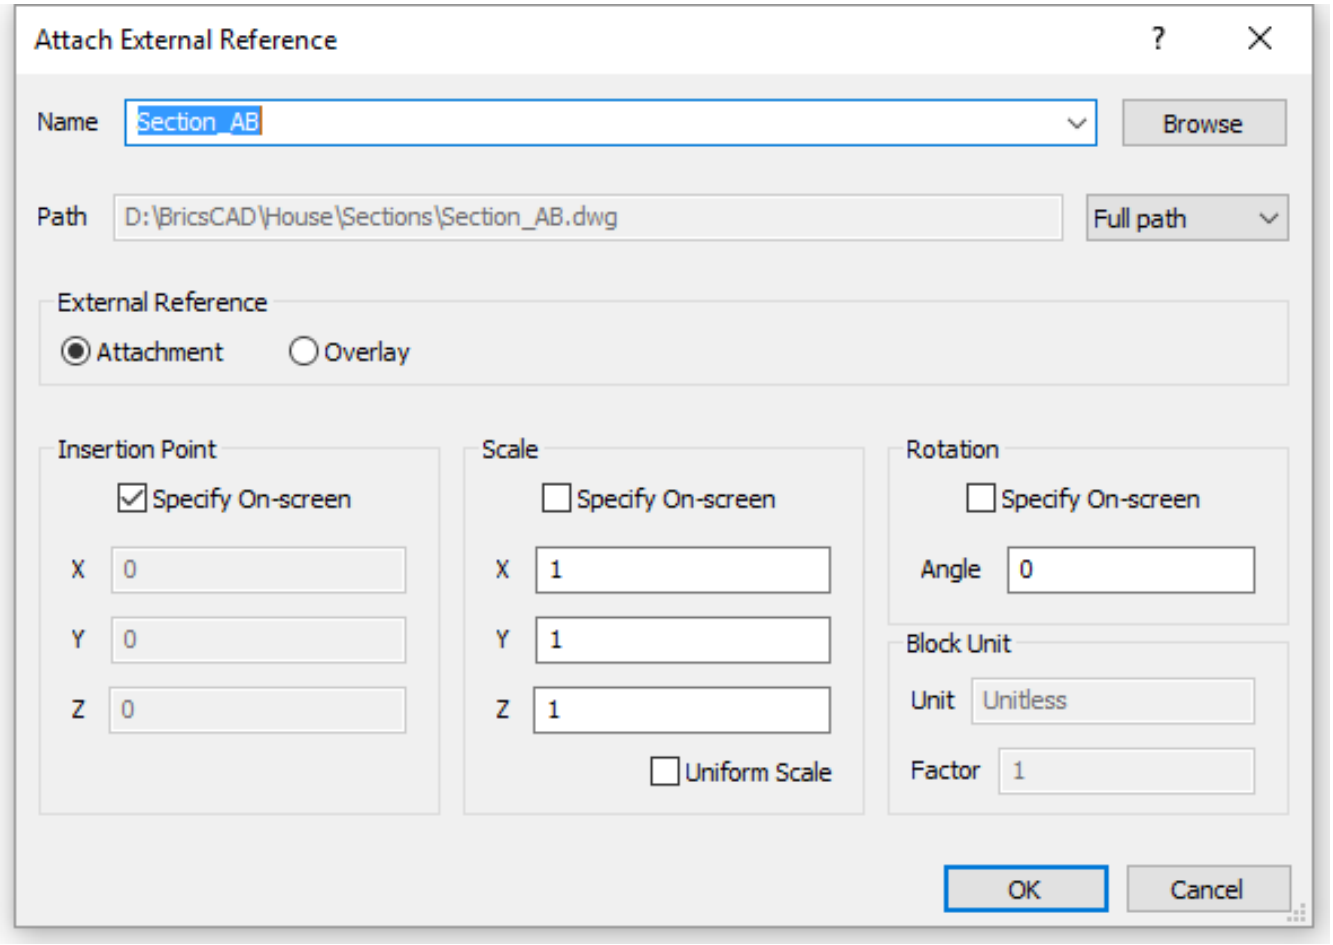

Dialog Box Options

Option	Description
Name	Lists the names of DWG files attached to the current drawing, including the one you just selected: (6.2927 on page 6032) Choosing another name lets you modify that xref's properties.
Browse	Attaches additional DWG files without leaving this dialog box. Displays the Select Reference File dialog box: 1. Choose a DWG file 2. Click **Open**.
Path	Reports the path that will be remembered by BricsCAD. You cannot edit this field; instead, use the **Browse** button to modify the path to the file.
Full Path	Changes the way in which the program remembers the path to the attached DWG file: 1. Click the droplist 2. Choose a different path type (6.2928 on page 6032) • **Full path** - stores the drive and folder names of the DWG file as an absolute reference, such as **c:\cad\dwg\filename.dwg** • **Relative path** - stores the relative route to the xref'ed DWF file's folder, such as **..\filename.dwg** (..\ means one folder higher). This option does not work until the drawing has been saved at least once. • **No path** - strips the drive and folder names, leaving just the DWG file name, such as **filename.dwg**
External Reference	Specifies how the external reference is to be attached: • **Attachment** - attaches the xref and nested xrefs • **Overlay** - attaches only the first level of xref
Insertion Point	Specifies the location of the xref's lower-left corner: **Specify On-screen** - determines when the insertion point is specified: 1. **On** - specify the insertion point in the drawing after the dialog box is closed; you will be prompted: **Insertion point for block - (pick a point or enter x,y,z coordinates.)** 2. **Off** - specify the insertion point in the dialog box using the X, Y, and Z fields **X**, **Y**, **or Z** - specifies the x, y, and/or z coordinates for the xref's insertion point. Use 0,0,0 to insert the xref at the drawing's origin.

Scale	Specifies the size of the xref: **Specify On-screen** - determines when the scale factors are specified: • **On** - specify the scale factor in the drawing after the dialog box is closed; you will be prompted: 1. **Corner/XYZ/X scale factor** - **(enter an option, pick two points a number, or press Enter for the default value.)** 2. **Y scale factor: < Equal to X scale>** - **(enter an option, a number, or press Enter for the default value.)** • **Off** - specify the scale factor in the dialog box using the X, Y, and Z fields **X**, **Y**, **or Z** - specifies the x, y, and/or z scale factors of the xref in the x, y, and z directions. Use 1,1,1 to keep the xref at its original size. **Uniform Scale** - makes the y and z scale factors equal to that of x
Rotation	Specifies the rotation angle of the xref: **Specify On-screen** - determines when the rotation angle is specified: • **On** - specify the angle in the drawing after the dialog box is closed; you will be prompted: **Rotation angle for block** - **(enter a number, pick two points, or press Enter for the default value.)** • **Off** - specify the angle in the dialog box using the Angle field. Angle - specifies the rotation angle about the insertion point: • Positive angles rotate the xref counterclockwise • Use 0 to keep the xref at it original orientation
Block Unit	Specifies the units with which the drawing will be inserted, usually a form of Imperial or metric units, such as inches or mm: **Unit** - reports the INSUNITS setting of the drawing being attached. **Factor** - reports the calculated scaling factor with respect to the INSUNITS setting of the drawing being attached and the current drawing.
OK	Attaches the DWG file to the current drawing. If you choose **Specify On-screen**, then you are prompted in the command line for the insertion point, scale, and/or rotation angle.

Procedures

- To attach an external reference (1.30.19)

Related Commands

Insert (6.17.13) - inserts drawings as blocks. PlaceView (6.24.34) - places a model view selected from a source drawing into a paper space layout of the current drawing. XRef (6.13.23) - attaches and controls externally referenced drawings through the Drawing Explorer. -XRef (6.34.8) - attaches and controls xrefs through the command bar. XClip (6.34.2) - clips externally-referenced drawings.

Figure 6.2927

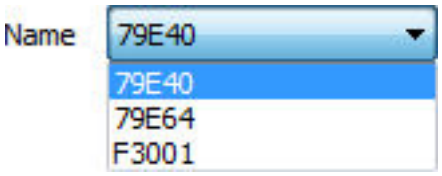

Figure 6.2928

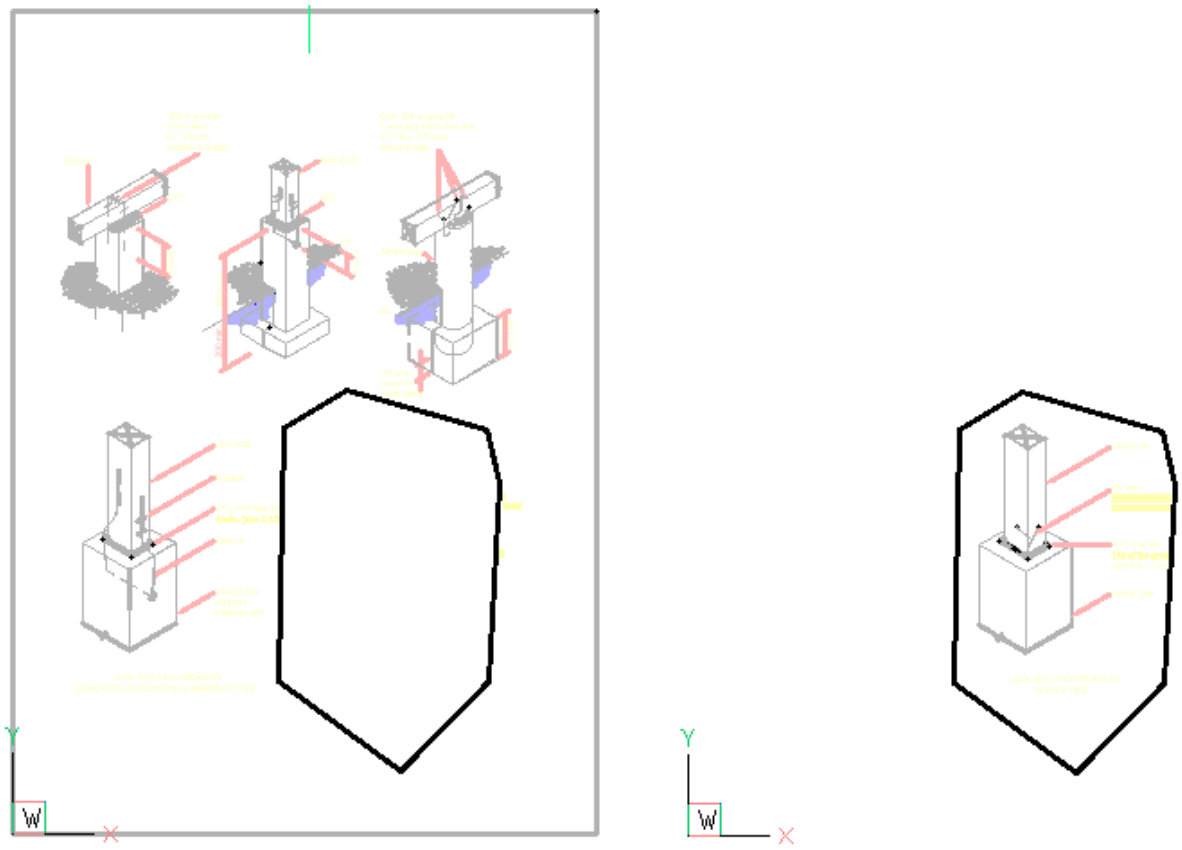
Figure 6.2929

Figure 6.2930



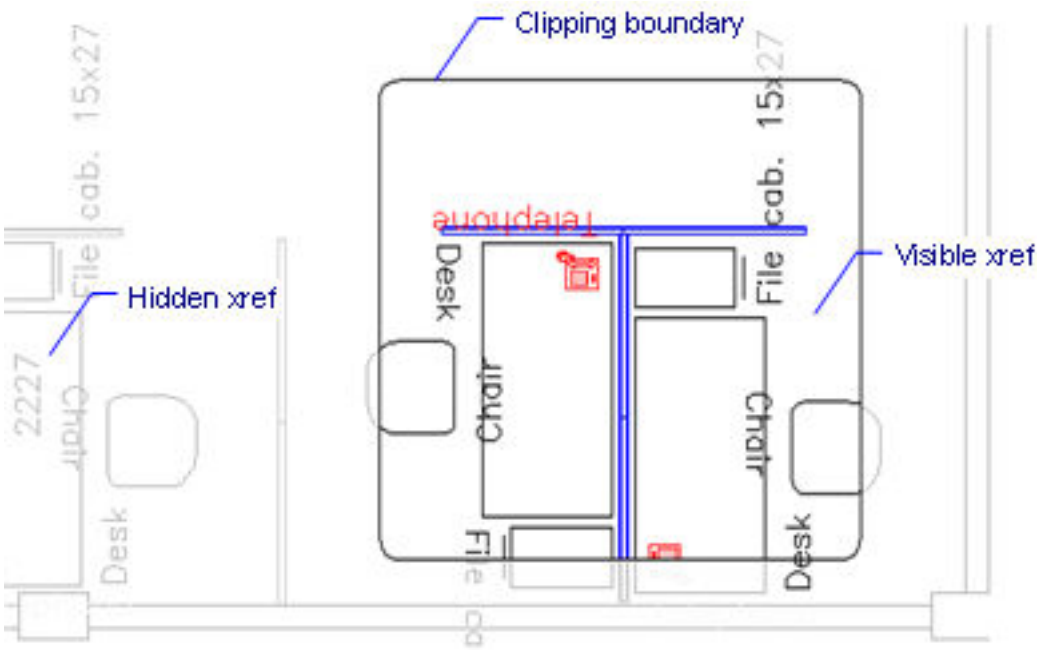
6.34.2 XClip

(6.2981 on page 6079) Clips externally-referenced drawings with polygons to hide parts of them, and adjusts the front and rear clipping planes (short for "xref clip"). Shown below is a clipped xref (left) and an inverted clipping (right): (6.2930)

Accessing the Command

command bar: **xclip** alias: **clip** menu bar: **Modify | XRef Clip** : **XClip Prompts you in the command bar:** Select entities: **(Choose one or more xrefs)** Entities in set: 1 Select entities: **(Choose more xrefs, or press Enter to continue)** [ON/OFF/Clipdepth/Invert/Delete/generate Polyline/New boundary] <New boundary>: **(Enter an option, or else press Enter to create a new clipping boundary)** [Select polyline/Polygonal/Rectangular] <Rectangular>: **(Enter an option, or press Enter to create a rectangular clipping boundary)** In the figure below, the hidden portion of the xref is shown in light gray for illustrative purposes only; it is normally not seen when clipping is turned on. (6.2931 on the following page)

Figure 6.2931



Command Options

Option	Description
Select entities	Chooses the xrefs to be clipped: • Choose one or more xrefs • Enter **all** to choose all xrefs in the current drawing • Press **Enter** to continue
ON	Turns on clipping boundaries that were turned off by the OFF option.
OFF	Turns off clipping so that all of the xref is again visible. The clipping is saved, and is turned on again with the ON option.

Clipdepth	Sets 3D clipping to the front and rear, to hide parts of 3D models that might obscure the front and confuse the back; prompts you: 1. **Specify front clip point or [Distance/Remove]** - **(enter an option.)** 2. **Specify back clip point or [Distance/Remove]** - **(enter an option.)** This option does not operate until you create at least one clipping boundary. It is no useful for 2D xrefs. • **Specify front or back clip point** - specifies the position of the front or back clipping plane: pick a point, or enter coordinates. The cutting plane is parallel to the current viewpoint. • **Distance** - specifies the distance of the clipping point; prompts you: **Specify distance from boundary** - **(enter the distance from the clipping boundary to the front or rear planes.)** • **Remove** - **(remove the front or rear clipping point.)**
Invert	Inverts the clipping mode so that the interior of the clipping boundary is hidden from view (the the outer area is visible); repeat this option to invert again, making the inner portion visible. It is much easier to toggle the Invert status through the Properties panel.
Delete	Erases all clipping boundaries; does not prompt or warn you.
generate Polyline	Draws a polyline over a selected clipping boundary: this allows you to edit the clipping boundary, but in an indirect fashion. Follow these steps: 1. Generate the polyline with this option, and then exit the XClip command. 2. Use the PEdit (6.24.24) command to edit the polyline. 3. Restart the XClip command, and then use the **New | Select polyline** option to turn the polyline back into a clipping boundary.

New boundary	Draws a new clipping boundary: • If a boundary exists, then you are prompted: **Delete old boundary(s)? [Yes/No]** - **(type Y or N.)** **Caution**! This option replaces all existing clipping boundaries with the new one. The command continues only when all previous boundaries are deleted: typing No at this prompt cancels the XClip command. • If no boundary exists, then you are prompted instead: **[Select polyline/Polygonal/Rectangular]** - **(type S, P, or R)** • **Select polyline** - choose any open or closed entity made from polylines, such as splined polylines, rectangles, donuts, and polygons. While the polyline does not need to be closed, it cannot cross over itself. • **Polygonal** - creates non-rectangular clipping boundaries, with a minimum of three sizes; prompts you: 1. **Specify first point** - **(pick a point in the drawing, or specify x,y coordinates.)** 2. **Specify next point or [Undo]** - **(pick another point in the drawing, or specify x,y coordinates.)** 3. **Specify next point or [Undo]** - **(pick more points, or press Enter to complete the polygon)** • **Rectangular** - creates rectangular clipping boundaries; prompts you: 1. **Specify first corner** - **(pick a point in the drawing, or specify x,y coordinates.)** 2. **Specify opposite corner** - **(pick another point in the drawing, or specify x,y coordinates.)**

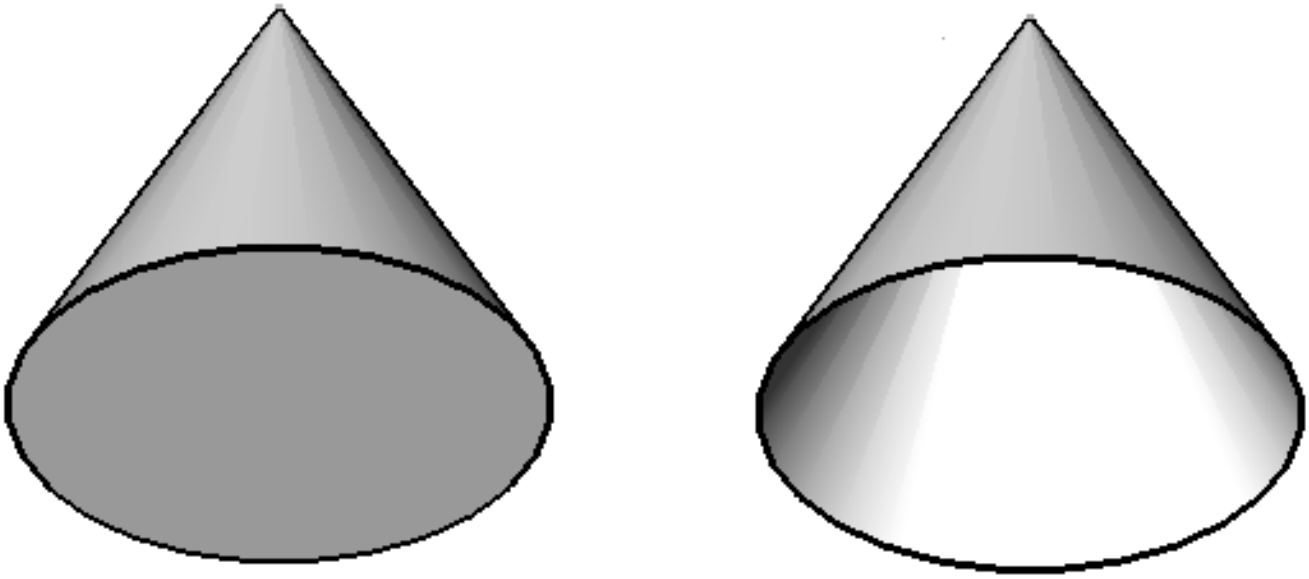
Related Commands

pdfclip (6.24.19) - clips a PDF underlay. XRef (6.13.23) - attaches and controls externally referenced drawings through the Drawing Explorer. -XRef (6.34.8)- attaches and controls externally referenced drawings through the command bar. VpClip (6.31.18) - clips viewports. ImageClip (6.17.7) - clips images.

Figure 6.2932

Figure 6.2933



6.34.3 XFaces

(6.2932) Generates 3D surface faces from the faces of 3D solids and 3D surface faces. **Note:** This command works with any kind of solid and surface face. Below, the original 3D solid (at left) and the 3D surface face extracted from it (right). (6.2933)

Accessing the Command

command bar: **xfaces** transparent: **'xfaces** menu: **Model | Direct Modeling | Extract Faces** toolbar: **Direct Modeling |** Quad: **Draw |** : **XFaces Prompts you in the command bar:** Select faces to extract [Move]: **(Select faces*.)** Select faces to extract [Move]: **(Select more faces or press Enter to extract the current selection set.)** The newly created 3D surfaces are placed on the current layer.

Command Options

Option	Description
Select faces to extract	Select one or more faces of 3D solids and 3D surfaces: • Pick one of more faces • Type **all** to select all entities in the drawing; the program filters out those that are not eligible for edge extraction • Press **Enter** to end the command

Move	Moves the newly created 3D surface entities; prompts you: 1. **Enter base point [Displacement] <Displacement> - (specify a point from which to move the entities.)** 2. **Enter second point <Use base point as displacement> - (specify another point at which to place the entities.)**

Related Commands

XEdges (6.34.4) - creates 2D linear entities (lines, arcs, circles, ellipses, elliptical arcs and splines) from the edges of 3D solids, 3D solid faces, and regions.

Figure 6.2934

6.34.4 XEdges

(7.3 on page 6132) Generates 2D entities from the edges of 3D solids, 3D flat faces, and regions. **Note:** This command does not extract entities from curved faces, such as a sphere or torus.

Accessing the Command

 command bar: **xedges** menu bar: **Draw | Boundaries | Extract Edges** ribbon: **Solid | Draw | Boundary | Extract Edges** toolbar: **Draw | Boundaries |**  Quad: **Draw |**  : **XEdges Prompts you in the command bar:** Select entities: **(Select one or more 3D solids, 3D solid faces, or a regions)** Entities in set: 1 Select entities: **(Select more entities, or else press Enter to end the command)** The result are 2D entities drawn in 3D space, such as lines, arcs, circles, ellipses, elliptical arcs, and splines. The entities are placed on the current layer.

Command Options

Option	Description
Select entities	Select one or more of the following entities: 3D solid, 3D solid face, and region: • Pick one of more 3D entities • Type **all** to select all entities in the drawing; the program filters out those that are not eligible for edge extraction • Press **Enter** to end the command

Related Commands

Boundary (6.6.15) - creates a polyline that forms a boundary inside a closed area through a dialog box. -Boundary (6.6.16) - creates a polyline boundary inside closed areas through the command bar. Imprint (6.17.12): imprints 2D entities onto planar faces of 3D solids and surfaces; allows to create additional edges on planar faces. ProjectGeometry (6.24.53) - projects 2D geometry onto a region, a surface or a 3D solid; allows to create additional linework on the faces of solids and surfaces. XFaces (6.34.3) - extracts a set of 3D solid or surface faces as a new 3D surface object.

Figure 6.2935

6.34.5 XOpen

(6.2981 on page 6079) Opens an externally-referenced drawing (xXref) attached to the current drawing, for editing in a separate window.

Accessing the Command

 command bar: **xopen** menu: **Xref context menu | Open Xref** ribbon: **Insert | External References | Open XRef** toolbar: **Drawing Explorer - External References |**  : **XOpen Prompts you in command bar:** Select reference: **(Click an externally-referenced drawing in the current drawing)**

1. The drawing opens in a new drawing tab.
2. When done editing, save the drawing.
3. Close the tab.

Command Options

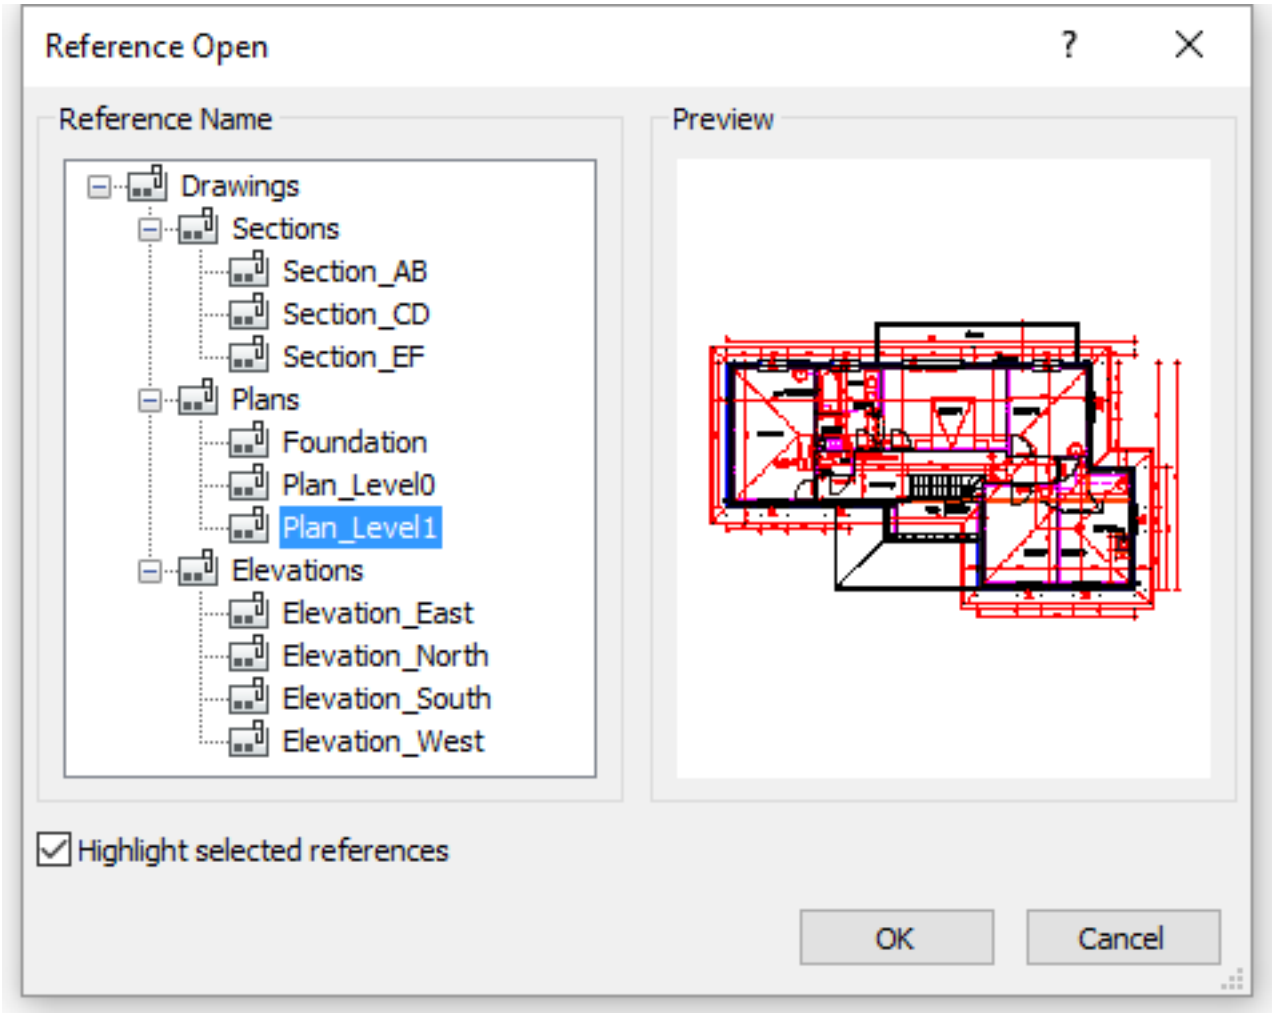
Option	Description
Select reference	Click an externally-referenced drawing in the current drawing

Dialog Box Options

When the selected externally-referenced drawing contains nested references a dialog box displays to let you choose the drawing to be opened: (6.2936 on the next page)

Dialog Box Option	Description
Reference Name	Select an xref to open for editing
Highlight Selected References	Toggles the highlighting of xrefs in the drawing: • **On** - the xref you select in this dialog box is highlighted in the drawing • **Off** - the xref is not highlighted
OK	Closes the dialog box and opens the selected xref in a new drawing tab

Figure 6.2936



Related Commands

Refedit (6.26.13) - edits block references and externally-referenced drawings through a dialog box. BmOpen (6.8.21) - opens the source drawing of an external mechanical component.

Figure 6.2937

Figure 6.2938

6.34.6 XLine

(7.3 on page 6132) Draws infinitely long lines. **Note:** Xlines have no starting point and no ending point as both ends stretch to infinity, and are useful as construction lines; they are ignored when the program determines the extents of the drawing. (6.2938)

Accessing the Command

command bar: **xline** aliases: **xl infline** menu bar: **Draw | Infinite Line** ribbon: **Draw | Draw | Line | Construction Line** toolbar: **Draw | Lines |**  : **XLine Prompts you in the command bar:** Infinite line: Set point along line or [Horizontal/Vertical/Angle/Bisect/Parallel]: **(Pick a point, or else enter an option)** Direction: **(Pick a point, or enter x,y coordinates)** Direction: **(Pick another point, or else press Enter to exit command)**

Command Options

Option	Description
Point along line	Specifies a point on the xline: pick a point in the drawing, or enter x,y coordinates; prompts you: **Direction - (specify the direction of the xline.)** The Direction prompt repeats so that you can draw multiple xline from the same starting point. Press Enter to exit the command.

Bisect	Draws an xline that bisects entities perpendicularly; prompts you: **Entity/<Vertex point>** - **(enter an option:)** • **Entity** - draws xlines perpendicular to the midpoint of the selected line or polyline segment, and the center point of arcs and polyarcs; prompts you: **Select line,arc, or polyline segment to bisect** - **(select a line, an arc, a polyline segment, or a polyarc:)** – When you select a line or polyline segment, the command draws the xline perpendicular to the segment's midpoint: (6.2940 on page 6046) – When you select an arc or polyarc, the command draws the xline perpendicular to the arc's center point and through its midpoint: (6.2941 on page 6047) This option works with splined polylines, but not with spline entities. • **Vertex point** - draws xlines that start at the vertex point and bisect two pick points; prompts you: 1. **Bisection angle start point** - **(specify one part of the bisection angle.)** 2. **Bisection angle start point** - **(specify the other part of the bisection angle.)** (6.2942 on page 6047)
Horizontal	Draws xlines horizontal to the current UCS; prompts you: **Location** - **(specify the horizontal location of the xline; pick a point in the drawing, or enter x,y coordinates. The 'Location' prompt repeats for drawing multiple horizontal xlines at different starting points. Press Enter to exit the command.)**
Vertical	Draws xlines vertical to the current UCS; prompts you: **Location** - **(specify the vertical location of the xline; pick a point in the drawing, or enter x,y coordinates. The 'Location' prompt repeats for drawing multiple vertical xlines at different starting points. Press Enter to exit the command.)**

Angle	Draws xlines at angles; prompts you: **Reference/<Enter angle (0)> - (enter an option:)** • **Reference** - Draws xlines at an angle relative to another entity; prompts you: 1. **Select reference entity** - **(choose a line that provides the reference (base) angle.)** 2. **Enter angle** - **(specify the angle, measured relative to the entity.)** 3. **Location** - **(specify the angle's start point; need not coincide with the entity's end points.)** (6.2943 on page 6047) The 'Location' prompt repeats for drawing multiple infinite lines at the same angle. • **Enter angle -** specifies the angle; enter an angle or pick two points to indicate the angle; prompts you: **Location** - **(specify the starting point of the xline.)** (6.2944 on page 6048) The 'Location' prompt repeats for drawing multiple infinite lines at the same angle.
Parallel	Draws xlines parallel to lines and polyline segments; prompts you: **Through point/<Offset distance for parallel infinite line> (Through)** - **(enter an option:)** • **Through point** - specifies the point through which to draw the xline; prompts you: 1. **Select entity for parallel infinite line** - **(choose the entity to offset with a xline.)** 2. **Through the point** - **(specify the point through which to draw the xline; this point also specifies the xline's start point.)** (6.2945 on page 6048) This option works only with line segments. • **Offset distance for parallel infinite line** - specifies the offset distance: enter a value or pick two points; prompts you: 1. **Select entity for parallel infinite line** - **(choose the entity to offset with an xline.)** 2. **Side for parallel infinite line** - **(specify the side on which to place the xline.)** (6.2946 on page 6048) The xline's start point is parallel to the line's start point. The 'Select entity for parallel infinite line' prompt repeats for drawing multiple xlines at different offset distances.

Grips Editing

XLines can be edited directly through grips:

1. Select the xline. Notice that it has three grips.
2. Drag the grips to perform the following actions:
   - Drag the midpoint grip to move the xline.
   - Drag the other grips to rotate the xline.

(6.2939 on the next page)

6.34.7 XRef

(6.2947) Opens the Attachments panel. See the ATTACHMENTSPANELOPEN (6.4.30) command.

Figure 6.2948

6.34.8 -XRef

(6.2981 on page 6079) Attaches DWG files to the current drawing through the command bar (short for "external reference").

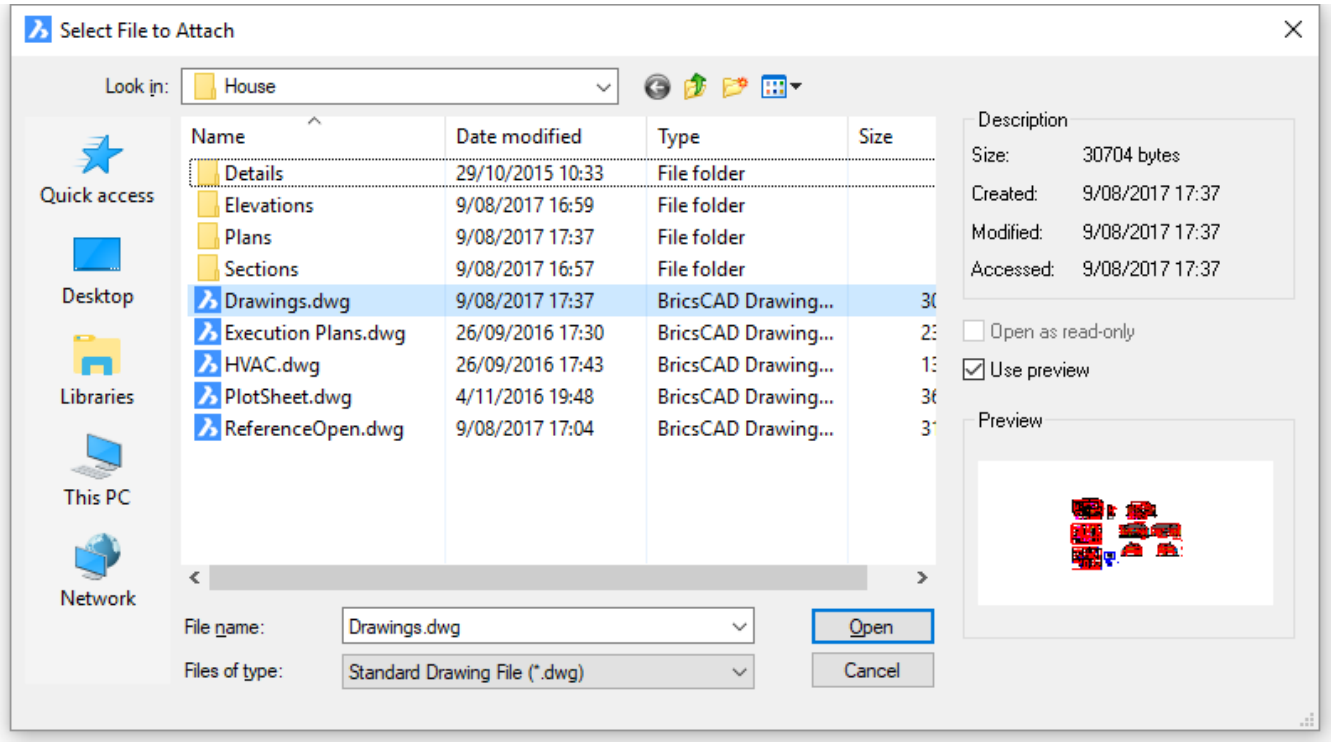
Accessing the Command

command bar: **-xref** alias: **-xr** : **-XRef Prompts you in the command bar:** External References [? to list external references/ Attach/ Overlay/ Bind/ Detach/ Path /Reload/ Unload] <Attach>: **(Enter an option)** Displays a dialog box: (6.2949 on the facing page)

1. Choose a DWG file
2. Click Open. The program prompts you in the command bar (see -Insert (6.17.14) command):
3. Insertion point for block: **(Pick a point, or enter x,y coordinates)**
4. Corner/XYZ/X scale factor <1.000000>: **(Enter an option, a number, or press Enter for the default value)**
5. Y scale factor: < Equal to X scale (1.000000)>: **(Enter an option, a number, or press Enter for the default value)**
6. Rotation angle for block <0>: **(Enter a number, or press Enter for the default value)**

The XDWGFADECTL (1.17.10) system variable sets the fading of external references. Values between 0 (no fading) and 90 are accepted.

Figure 6.2949



Command Options

Option	Description
? to list	Lists the names of all blocks in the current drawing. Prompts you: **Xref(s) to list <* for all>** - **(press Enter to list xrefs already attached, or enter part of a name to view some xrefs.)** Sample report: `Xref name Xref Type Path ---------- -------` If necessary, press **F2** to view the full list. See TextScr (6.29.16) command.
Bind	You are prompted differently, depending on the setting of the BINDTYPE variable: • If BINDTYPE = on(Insert-like behavior): Converts xrefs into blocks; prompts you: **Externally referenced drawing(s) to insert** - **(enter the names of one or more xrefs; separate multiple names with commas.)** • If BINDTYPE = off(traditional binding behavior): Binds the xref; makes the xref part of the drawing; prompts you: **Externally referenced drawing(s) to bind** - **(enter the names of one or more xrefs; separate multiple names with commas.)**
Insert	Converts xrefs into blocks; prompts you: **Externally referenced drawing(s) to insert** - **(enter the names of one or more xrefs; separate multiple names with commas.)** This option is hidden, but you can type **i** or **insert** at the command prompt.

Detach
Detaches xrefs from the drawing; prompts you: **Externally referenced drawing(s) to detach** - **(enter the names of one or more xrefs; sSeparate multiple names with commas.)** Detached xrefs are removed from the drawing, and are no longer displayed. Use the Attach option to reattach them.

Path
Changes the path to the xref's source DWG file; prompts you:

1. **Externally referenced drawing(s) to edit path** - **(enter the names of one or more xrefs; separate multiple names with commas;)**
2. Displays the New Location for XREF dialog box: choose a new path
3. Click **Open**. The New Location for XREF dialog box repeats for each xref named.

When the path is incorrect, the program cannot display the xref, so use this option when the source DWG file is located in a different folder or on another computer.

Reload
Reloads the xrefs from their source DWG files; prompts you: **Externally referenced drawing(s) to reload** - **(enter the names of one or more xrefs; separate multiple names with commas.)** The program reports whether the DWG file has changed since the xref was last loaded:

```
-- Reload Xref XREF1: d:\CAD \XREF 1.DWG -- XREF1 has n
```

Use this option when the source DWG file has changed, and you want to see the updated drawing.

Unload
Unloads the xrefs from the drawing; prompts you: **Externally referenced drawing(s) to unload** - **(enter the names of one or more xrefs; separate multiple names with commas.)** BricsCAD reports the xrefs that were unloaded:

```
-- Xref XREF2: d:\CAD \XREF 2.DWG -- XREF2 is unloaded
```

This option keeps the links to the source DWG files, and hides the display of xrefs in the drawing.

Overlay
Overlays xrefs in the current drawing; displays the Select File to Overlay dialog box.

1. Choose a DWG file
2. Click **Open**. BricsCAD prompts you in the command bar:
3. **Insertion point for block** - **(pick a point, or enter x,y coordinates.)**
4. **Corner/XYZ/X scale factor** - **(enter an option, a number, or press Enter for the default value.)**
5. **Y scale factor: <Equal to X scale>** - **(enter an option, a number, or press Enter for the default value.)**
6. **Rotation angle for block** - **(enter a number, or press Enter for the default value.)**

See the Insert (6.17.13) command.

Attach	Attaches xrefs to the current drawing; displays the Select File to Attach dialog box. 1. Choose a DWG file 2. Click **Open**. BricsCAD prompts you in the command bar: 3. **Insertion point for block - (pick a point, or enter x,y coordinates.)** 4. **Corner/XYZ/X scale factor - (enter an option, a number, or press Enter for the default value.)** 5. **Y scale factor: <Equal to X scale> - (enter an option, a number, or press Enter for the default value.)** 6. **Rotation angle for block - (enter a number, or press Enter for the default value.)** See the Insert (6.17.13) command.

Overlay and Attach operate the same way. The difference is in how they treat xrefs that have xrefs themselves (nested xrefs).

- **Overlay** - attaches only the first level of xref, nested xrefs are not attached.
- **Attach** - attaches all xrefs, including nested xrefs.

Grips Editing

External references can be edited directly through grips:

1. Select the xref. Notice that it has one grip at its insertion point.
2. Drag the grip to move the xref.

Related Commands

Pdfattach (6.24.16) - inserts a PDF file as an underlay into the current drawing. -PdfAttach (6.24.18) - inserts a PDF file as an underlay into the current drawing; displays prompts in the command bar. XRef (6.13.23) - attaches and controls externally referenced drawings through the Drawing Explorer. XAttach (6.34.1) - attaches xrefs through a dialog box. XClip (6.34.2) - clips externally-referenced drawings. Insert (6.17.13) - inserts drawings as blocks.

Figure 6.2951

6.34.9 Xplode

(7.3 on page 6132) Explodes entities, providing control over the resulting entities (short for "explode"). **Note:** This command does not explode attached references, entities on frozen layers, or basic entities, such as lines, circles, and arcs.

Accessing the Command

command bar: **xplode** transparent: **'xplode** : **Xplode Prompts you in the command bar:** Select entities to explode: **(Choose one or more entities, but usually you wan to explode one at a time)** Entities in set: 1 Select entities to explode: **(Choose more entities, or else press Enter to continue)** Xplode entities [Separately/All] <All>: **(Enter an option)** [All listed/Multiple/LAyer/Color/LType/ltScale/Inherit all from parent] <Xplode>: **(Enter an option)**

Command Options

Option	Description
Select entities to explode	Selects the entities to explode. Choose one or more entities; use any selection method. Entities on frozen layers are not selected and not frozen.
Separately	Explodes one entity at a time; the prompts repeat themselves for each entity.
All	Explodes all selected entities together.
All listed	Allows to specify all properties for the selected entities.
Multiple	Specifies more than one property for the exploded entities; prompts you: **[LAyer/Color/LType/ltScale/Exit] <Xplode>** - **(choose properties one by one. For instance, when you want to specify the color and the linetype scale:)** 1. **[LAyer/Color/LType/ltScale/Exit] <Xplode>** - **(press C and the program responds:) Altering: Color** 2. **[LAyer/Color/LType/ltScale/Exit] <Xplode>** - **(type LT,and the program responds:) Altering: Color LTScale** 3. **[LAyer/Color/LType/ltScale/Exit] <Xplode>** - **(press Enter to proceed; and the program responds:)** 4. **Color for drawing new entities <BYLAYER>** - **(specify a color name or number.)** 5. **Linetype scale for new entities <1>** - **(specify the linetype scale factor.)**
Color	Specifies the color for the exploded entities; prompts you: **Color for new entities** - **(specify a color name or number.)**
LAyer	Specifies the layer for the exploded entities; prompts you: **Layer for new entities** - **(specify the name.)** The layer name must exist in the drawing.
LType	Specifies the linetype for the exploded entities; prompts you: **Linetype for new entities** - **(specify the name.)** The linetype name must exist in the drawing.

ltScale	Specifies the linetype scale for the exploded entities; prompts you: **Linetype scale for new entities - (specify the scale factor.)**
Inherit all from parent	Inherits the color, layer, and linetype scale from the source entities.
Xplode	Explodes the selected entities.

Related Commands

Explode (6.13.16) - explodes complex entities into simpler ones. TxtExp (6.29.36) - explodes text into polylines. U (6.30.3) - undoes the effect of the explosion.

6.35 Z

6.35.1 ZCenter

(6.2981 on page 6079) Toggles the 3D center entity snap, which snaps to the centers of 3D faces. **Note:** The GCenter (6.15.5) entity snap also snaps to the centers of faces. (6.2953 on the following page)

Figure 6.2952

OSnap (6.23.16) - sets entity snaps through the Settings dialog box. -OSnap (6.23.13) - toggles entity snap modes at the command line . Aperture (6.4.14) - sizes the aperture cursor for entity snaps. Zcenter (6.35.1) - toggles the 3D center entity snap. Snaps to the center of planar or curved 3d faces. Zintersection (6.35.2) - Toggles the 3D intersectionpoint snap. Snaps to the intersection of linear entities, edges and polar or entity snap tracking lines with faces. Zknot (6.35.3) - toggles the 3D knot entity snap. Snaps to a knot on a spline (6.27.63). Zmidpoint (6.35.4) - toggles the 3D midpoint snap. Snaps to the midpoint of a face edge. Znearest (6.35.5) - toggles the 3D nearest entity snap. Snaps to a point on the face of a 3D entity that is nearest to the cursor. Zperpendicular (6.35.8) - toggles the 3D perpendicular entity snap. Snaps to a point perpendicular to a face. Zvertex (6.35.9) - toggles the 3D vertex entity snap. Snaps to the closest vertex of a 3d entity.

Figure 6.2967

6.35.7 Zoom

(7.3 on page 6132) Changes the size of the drawing larger and smaller visually within the current viewport. **Note:** To zoom in and out at any time, roll the mouse's wheel back and forth; the zoom is centered at the cursor location, which is handy for zooming into a specific entity.

Accessing the Command

command bar: **zoom** transparent: **'zoom** alias: **z** menu bar: **View | Zoom** ribbon: **View | Zoom | Zoom** tool-bar: **Zoom |** (6.2968) : **Zoom Prompts you in the command bar:** Zoom [zoom In/zoom Out/All/Center/Dynamic/Extents/Left/Pr (nx/nxp)/Window/OBject] <Scale (nX/nXP)>: **(Enter an option, or pick two points for a windowed zoom, or enter a zoom factor)**

Figure 6.2968

Command Options

Option	Description
Scale	Specifies the absolute zoom scale factor: • Less than 1 - makes the drawing appear smaller. • **1** - keeps the drawing the same size. • More than 1 - makes the drawing appear larger.
nX	Specifies the zoom factor relative to the current zoom For example, 2x makes the current view twice as large.
nXP	Specifies the zoom factor in paper space relative to model space. For example, 2xp makes the model space view twice as large as the surrounding paper space.
In	Zooms in by 50%, equivalent to Zoom 0.5
Out	Zooms out by 50%, equivalent to Zoom 2
All	Displays the entire drawing; zooms to the larger of: • Drawing limits - see the Limits (6.20.38) command • Extents of drawing - excludes entities on frozen layers
Center	Zooms in or out about a specified center point; prompts you: 1. **Center of view** - **(pick a point or enter x,y coordinates.)** 2. **Enter zoom factor (nX/nXP), or view height** - **(enter a zoom factor or view height.)** The view height defines the zoom; it is the height of the current viewport: (6.2969 on the following page)
Dynamic	Pans and zooms using a rectangular box which represents the viewport; this command is largely replaced by real-time zooming. (6.2970 on page 6073) This option first executes a zoom extents or zoom limits to show the original size of the viewport as a dashed rectangle. Adjust the size of the view box dynamically, then pan it to the part of the drawing you want to view. Click to switch between the two modes. • **X** - zoom mode • **->** (arrow) - pan mode
Extents	Displays the drawing to the extents of entities; limits and frozen entities are ignored. (6.2971 on page 6073)
Left	Zooms in or out with the lower left corner specified by a point; prompts you: 1. **Lower left corner** - **(pick a point or enter x,y coordinates.)** 2. **Enter zoom factor (nX/nXP), or view height** - **(enter a zoom factor or view height.)** The view height defines the zoom; it is the height of the current viewport. (6.2972 on page 6073)

Previous	Displays the previous view, whether set by the Zoom, Pan, or View commands.
Right	Zooms in or out with the upper right corner specified by a point; prompts you: 1. **Upper right corner - (pick a point or enter x,y coordinates.)** 2. **Enter zoom factor (nX/nXP), or view height - (enter a zoom factor or view height.)** The view height defines the zoom; it is the height of the current viewport. (6.2973 on page 6074)
Window	Zooms in to a rectangular area; prompts you: 1. **First corner - (pick a point or enter x,y coordinates.)** 2. **Opposite corner - (pick another point or enter x,y coordinates.)** (6.2974 on page 6074)
OBject	Zooms in on a single entity or a selection set; prompts you: 1. **Select an entity - (select one or more entities.) Entities in set: 1** 2. **Select an entity - (select more entities or eles press Enter to zoom in on the selection set.)**

Related Commands

RtZoom (6.26.42) - performs real-time zooming of the drawing. Pan (6.24.3) and -Pan (6.24.4) - move the drawing within the current viewport. RtPan (6.26.36) - performs real-time panning of the drawing. View (6.31.2) and -View (6.31.3) - set up named views of drawings. DdVPoint (6.10.23) - changes the 3D viewpoint of the drawing through a dialog box. VPoint (6.31.21) - changes the 3D viewpoint of the drawing through the command bar. RtRot (6.26.37) - rotates the 3D viewpoint in realtime. RtRotX (6.26.50) - rotates the 3D viewpoint about the x axis in realtime. RtRotY (6.26.41) - rotates the 3D viewpoint about the y axis in realtime. RtRotZ (6.26.44) - rotates the 3D viewpoint about the z axis in realtime.

6.35.8 ZPerpendicular

(6.2981 on page 6079) Toggles the 3D perpendicular entity snap, which snaps to a point perpendicular to a face on a 3D entity. (6.2976)

Accessing the Command

 command bar: **zperpendicular** transparent: **zpe** toolbar: **3D Entity Snaps |** 

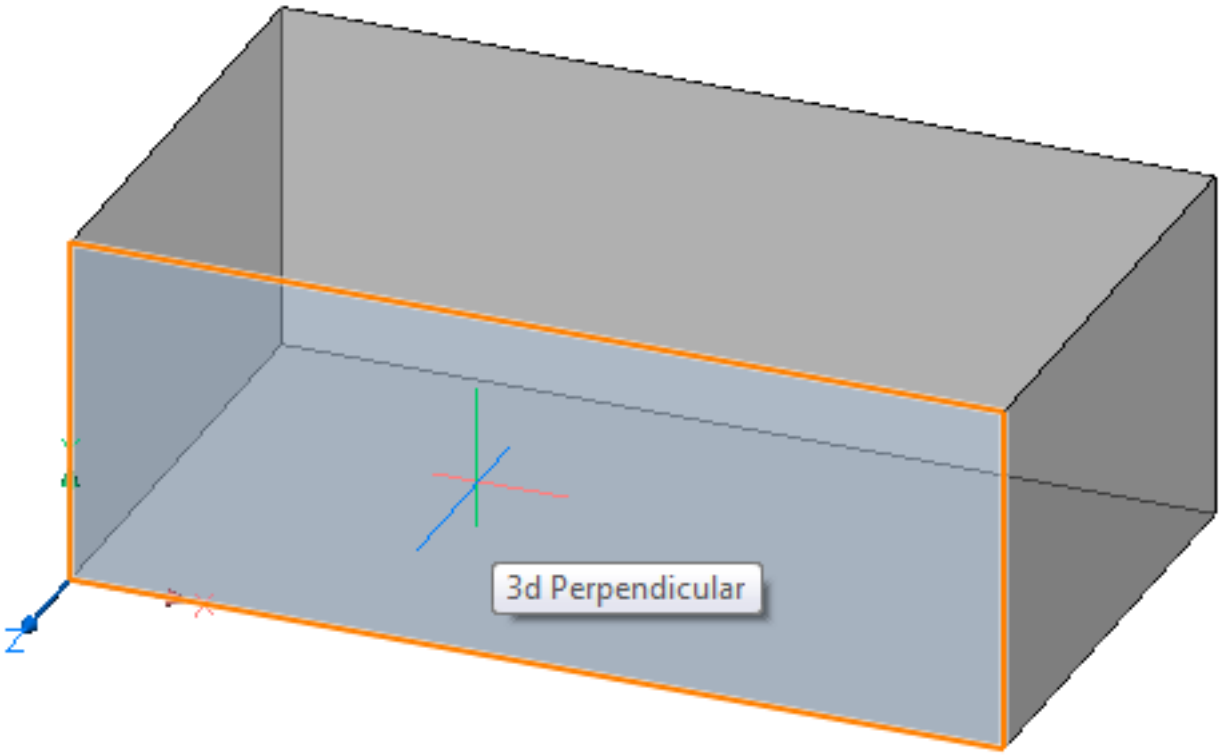
- When used at the command prompt:

: **ZPerpendicular** Displays no prompts in the command bar

- When used as a transparent toggle during another command:

: **Line** Start of line: zpe Snap to face perpendicular of: **(Pick a point)** (6.2977 on the following page)

Figure 6.2977



Command Options

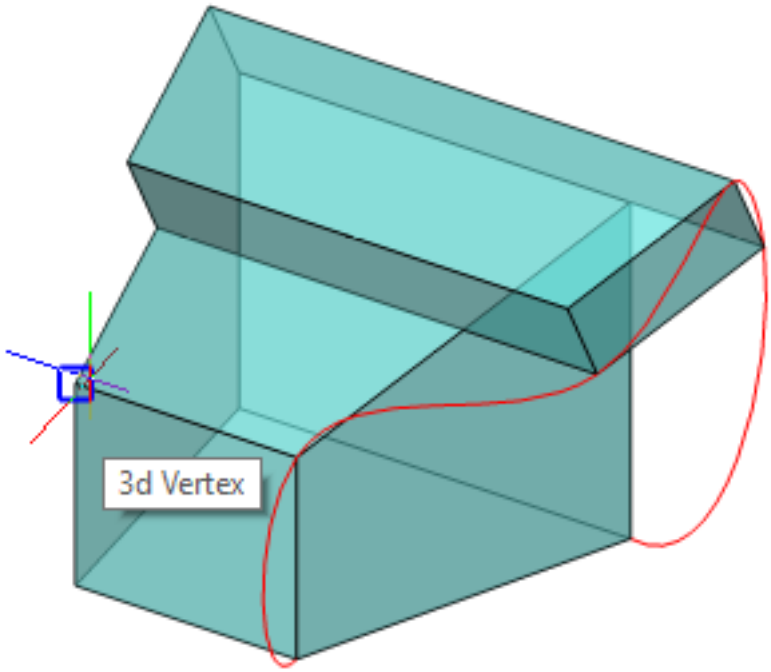
Option	Description
zperpendicular	This command can be entered transparently during commands, but must be entered without the apostrophe prefix (').
Snap to face perpendicular of	Move cursor onto the body whose face you want to snap to perpendicularly. The program displays a tooltip reading "3d Perpendicular".

Related Commands

3dOsnap (6.3.8) - sets the entity snap modes for 3D entities through the Settings dialog box. -3dOsnap (6.3.11) - toggles the entity snap modes for 3D entities at the command line. OSnap (6.23.16) - sets entity snaps through the Settings dialog box. -OSnap (6.23.13) - toggles entity snap modes at the command line . Aperture (6.4.14) - sizes the aperture cursor for entity snaps. Perpendicular (6.24.25) - toggles perpendicular entity snap mode. Zcenter (6.35.1) - toggles the 3D center entity snap. Snaps to the center of planar or curved 3d faces. Zintersection (6.35.2) - Toggles the 3D intersectionpoint snap. Snaps to the intersection of linear entities, edges and polar or entity snap tracking lines with faces. Zknot (6.35.3) - toggles the 3D knot entity snap. Snaps to a knot on a **spline**. Zmidpoint (6.35.4) - toggles the 3D midpoint snap. Snaps to the midpoint of a face edge. Znearest (6.35.5) - toggles the 3D nearest entity snap. Snaps to a point on the face of a 3D entity that is nearest to the cursor. Znone (6.35.6) - disables all 3d snap modes. Zvertex (6.35.9) - toggles the 3D vertex entity snap. Snaps to the closest vertex of a 3d entity.

Figure 6.2978

Figure 6.2979



6.35.9 ZVertex

(6.2981 on page 6079) Toggles the 3D vertex entity snap, so that the cursor snaps to the closest vertex of a 3D entity. (6.2979)

Accessing the Command

 command bar: **zvertex** transparent: **zve** toolbar: **3D Entity Snaps |** 

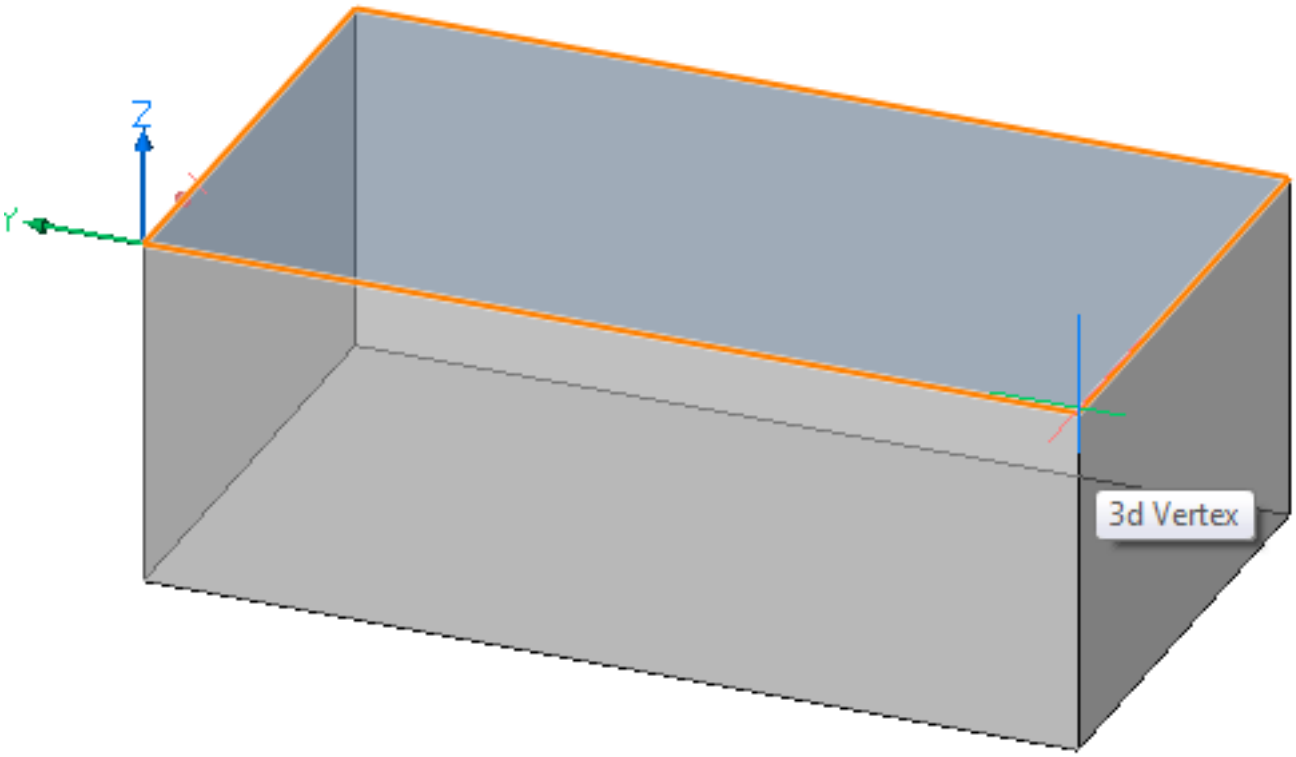
- When used at the command prompt:

: **ZVertex** Displays no prompts in the command bar

- When used as a transparent toggle during another command:

: **Line** Start of line: zve Snap to vertex of: **(Pick a point)** (6.2980 on the next page)

Figure 6.2980



Command Options

Option	Description
zvertex	This command can be entered transparently during commands, but must be entered without the apostrophe prefix ('). • When 3D snapping (Zvertex) is off, the 2D snap ENDpoint still works on 3D entities • When 2D snapping is off, 3D snap does not work on 2D objects
Snap to vertex of	Move cursor near the vertex of the 3D solid which you want to snap. The program and displays a tooltip reading "3d Vertex". A vertex is where two or more edges come together.

Related Commands

3dOsnap (6.3.8) - sets the entity snap modes for 3D entities through the Settings dialog box. -3dOsnap (6.3.11) - toggles the entity snap modes for 3D entities at the command line. OSnap (6.23.16) - sets entity snaps through the Settings dialog box. -OSnap (6.23.13) - toggles entity snap modes at the command line . Aperture (6.4.14) - sizes the aperture cursor for entity snaps. Endpoint (6.13.7) - toggles endpoint entity snap; snaps to the ends of open entities, such as line, arcs, and open polylines and vertices of 3D solids. Zcenter (6.35.1) - toggles the 3D center entity snap. Snaps to the center of planar or curved 3d faces. Zintersection (6.35.2) - Toggles the 3D intersectionpoint snap. Snaps to the intersection of linear entities, edges and polar or entity snap tracking lines with faces. Zknot (6.35.3) - toggles the 3D knot entity snap. Snaps to a knot on a **spline**. Zmidpoint (6.35.4) - toggles the 3D midpoint snap. Snaps to the midpoint of a face edge. Znearest (6.35.5) - toggles the 3D nearest entity snap. Snaps to a point on the face of a 3D entity that is nearest to the cursor. Znone (6.35.6) - disables all 3d snap modes. Zperpendicular (6.35.8) - toggles the 3D perpendicular entity snap. Snaps to a point perpendicular to a face.

FAQ & Troubleshooting

7.1 Error Codes

7.1.1 Reprise error codes

Symptoms

RLM_EH_NOHANDLE	-101	No handle supplied to call
RLM_EH_READ_NOLICENSE	-102	Can't read license data
RLM_EH_NET_INIT	-103	Network (msg_init()) error
RLM_EH_NET_WERR	-104	Error writing to network
RLM_EH_NET_RERR	-105	Error reading from network
RLM_EH_NET_BADRESP	-106	Unexpected response
RLM_EH_BADHELLO	-107	HELLO message for wrong server
RLM_EH_BADPRIVKEY	-108	Error in private key
RLM_EH_SIGERROR	-109	Error signing authorization
RLM_EH_INTERNAL	-110	Internal error
RLM_EH_CONN_REFUSED	-111	Connection refused at server (this can also happen if you have a bad TCP/IP address in your local database)
RLM_EH_NOSERVER	-112	No server to connect to
RLM_EH_BADHANDSHAKE	-113	Bad communications handshake
RLM_EH_CANTGETETHER	-114	Can't get ethernet address
RLM_EH_MALLOC	-115	malloc() error
RLM_EH_BIND	-116	bind() error
RLM_EH_SOCKET	-117	socket() error
RLM_EH_BADPUBKEY	-118	Error in public key
RLM_EH_AUTHFAIL	-119	Authentication failed
RLM_EH_WRITE_LF	-120	Can't write new license file
RLM_EH_DUP_ISV_HID	-122	ISV-defined hostid already registered
RLM_EH_BADPARAM	-123	Bad parameter passed to RLM function
RLM_EH_ROAMWRITEERR	-124	Roam File write error
RLM_EH_ROAMREADERR	-125	Roam File read error
RLM_EH_HANDLER_INSTALLED	-126	Heartbeat handler already installed
RLM_EH_CANTCREATELOCK	-127	Can't create 'single' lockfile
RLM_EH_CANTOPENLOCK	-128	Can't open 'single' lockfile
RLM_EH_CANTSETLOCK	-129	Can't set lock for 'single'
RLM_EH_BADRLMLIC	-130	Bad/missing/expired RLM license
RLM_EH_BADHOST	-131	bad hostname in license file or port@host
RLM_EH_CANTCONNECTURL	-132	Can't connect to specified URL (activation)
RLM_EH_OP_NOT_ALLOWED	-133	Operation not allowed on server. The status reread shutdown or remove command has been disabled for this user.

RLM_EH_ACT_BADSTAT	-134	Bad status return from Activation server
RLM_EH_ACT_BADLICKEY	-135	Activation server built with incorrect license key
RLM_EH_ACT_BAD_HTTP	-136	Error in HTTP transaction with Activation server
RLM_EH_DEMO_EXISTS	-137	Demo already created on this system
RLM_EH_DEMO_WRITEERR	-138	Demo install file write error
RLM_EH_NO_DEMO_LIC	-139	No rlm_demo license available
RLM_EH_NO_RLM_PLATFORM	-140	RLM is unlicensed on this platform
RLM_EH_EVAL_EXPIRED	-141	The RLM evaluation license compiled into this binary has expired
RLM_EH_SERVER_REJECT	-142	Server rejected (too old)
RLM_EH_UNLICENSED	-143	Unlicensed RLM option
RLM_EH_SEMAPHORE_FAILURE	-144	Seamphore initialization failure
RLM_EH_ACT_OLDSERVER	-145	Activation server too old (doesn't support encryption)
RLM_EH_BAD_LIC_LINE	-146	Invalid license line in LF
RLM_EH_BAD_SERVER_HOSTID	-147	Invalid hostid on SERVER line
RLM_EH_NO_REHOST_TOP_DIR	-148	No rehostable hostid top-level dir
RLM_EH_CANT_GET_REHOST	-149	Cannot get rehostable hostid
RLM_EH_CANT_DEL_REHOST	-150	Cannot delete rehostable hostid
RLM_EH_CANT_CREATE_REHOST	-151	Cannot create rehostable hostid
RLM_EH_REHOST_TOP_DIR_EXISTS	-152	Rehostable top directory exists
RLM_EH_REHOST_EXISTS	-153	Rehostable hostid exists
RLM_EH_NO_FULFILLMENTS	-154	No fulfillments to revoke
RLM_EH_METER_READERR	-155	Meter read error
RLM_EH_METER_WRITEERR	-156	Meter write error
RLM_EH_METER_BADINCREMENT	-157	Bad meter increment command
RLM_EH_METER_NO_COUNTER	-158	Can't find counter in meter
RLM_EH_ACT_UNLICENSED	-159	Activation Unlicensed
RLM_EH_ACTPRO_UNLICENSED	-160	Activation Pro Unlicensed
RLM_EH_SERVER_REQUIRED	-161	Counted license requires server
RLM_EH_DATE_REQUIRED	-162	REPLACE license requires date
RLM_EH_NO_METER_UPGRADE	-163	METERED licenses can't be UPGRADED
RLM_EH_NO_CLIENT	-164	Disconnected client data can't be found
RLM_EH_NO_DISCONN	-165	Operation not allowed on disconnected handle
RLM_EH_NO_FILES	-166	Too many open files
RLM_EH_NO_BROADCAST_RESP	-167	No response to broadcast message
RLM_EH_NO_BROADCAST_HOST	-168	Broadcast response didn't include hostname
RLM_EH_SERVER_TOO_OLD	-169	Server too old for disconnected operations In addition rlm_act_request() will return the following errors:I
RLM_ACT_BADPARAM	-1001	Unused â€“ RLM_EH_BADPARAM returned instead.
RLM_ACT_NO_KEY	-1002	No activation key supplied
RLM_ACT_NO_PROD	-1003	No product definition exists
RLM_ACT_CANT_WRITE_KEYS	-1004	Can't write keyf table
RLM_ACT_KEY_USED	-1005	Activation key already used
RLM_ACT_BAD_HOSTID	-1006	Missing hostid
RLM_ACT_BAD_HOSTID_TYPE	-1007	Invalid hostid type
RLM_ACT_BAD_HTTP	-1008	Bad HTTP transaction. Note: unused after v3.0BL4
RLM_ACT_CANTLOCK	-1009	Can't lock activation database
RLM_ACT_CANTREAD_DB	-1010	Can't read activation database
RLM_ACT_CANT_WRITE_FUFILL	-1011	Can't write licf table
RLM_ACT_CLIENT_TIME_BAD	-1012	Clock bad on client system (not within 7 days of server)
RLM_ACT_BAD_REDIRECT	-1013	Can't write licf table

RLM_ACT_TOOMANY_HOSTID_CHANGES	-1014	Too many hostid changes for refresh-type activation
RLM_ACT_BLACKLISTED	-1015	Domain on blacklist for activation
RLM_ACT_NOT_WHITELISTED	-1016	Domain not on activation key whitelist
RLM_ACT_KEY_EXPIRED	-1017	Activation key expired
RLM_ACT_NO_PERMISSION	-1018	HTTP request denied (this is a setup problem)
RLM_ACT_SERVER_ERROR	-1019	HTTP internal server error (usually a setup problem)
RLM_ACT_BAD_GENERATOR	-1020	Bad/missing generator file (Activation Pro)
RLM_ACT_NO_KEY_MATCH	-1021	No matching activation key in database
RLM_ACT_NO_AUTH_SUPPLIED	-1022	No proxy authorization supplied
RLM_ACT_PROXY_AUTH_FAILED	-1023	Proxy authentication failed
RLM_ACT_NO_BASIC_AUTH	-1024	No basic authentication supported by proxy
RLM_ACT_GEN_UNLICENSED	-1025	Activation generator unlicensed (ISV_mklic)
RL_ACT_DB_READERR	-1026	Activation database read error (Activation Pro)
RLM_ACT_GEN_PARAM_ERR	-1027	Generating license - bad parameter
RLM_ACT_UNSUPPORTED_CMD	-1028	Unsupported command to license generator
BOA_KEY_INACTIVE	-1030	Key is not Active in BOA (probably upgraded)
RLM_EL_NOPRODUCT	-1	No authorization for product rlm_checkout() did not find a product to satisfy your request.
RLM_EL_NOTME	-2	Authorization is for another ISV The license you are requesting is in the license file but it is for a different ISV.
RLM_EL_EXPIRED	-3	Authorization has expired.
RLM_EL_NOTTHISHOST	-4	Wrong host for authorization The hostid in the license doesn't match the hostid of the machine where the software is running.
RLM_EL_BADKEY	-5	Bad key in authorization The signature in the license line is not valid i.e. it does not match the remainder of the data in the license.
RLM_EL_BADVER	-6	Requested version not supported Your application tried to check out a license at a higher version than was available e.g. you specified v5 but the available license is for v4.
RLM_EL_BADDATE	-7	bad date format -not permanent or dd-mm-yy The expiration start or issued date wasn't understood eg 316-mar-2010 or 31-jun-2010. You'd probably never see this in the field unless somebody had tampered with the license file.
RLM_EL_TOOMANY	-8	checkout request for too many licenses Your checkout request will never work because you have asked for more licenses than are issued.
RLM_EL_NOAUTH	-9	No license auth supplied to call This is an internal error.
RLM_EL_ON_EXC_ALL	-10	On excludeall list The license administrator has specified an EXCLUDEALL list for this product and the user (host etc) is on it.

RLM_EL_ON_EXC	-11	On feature exclude list The license administrator has specified an EXCLUDE list for this product and the user (host etc) is on it.
RLM_EL_NOT_INC_ALL	-12	Not on the includeall list The license administrator has specified an INCLUDEALL list for this product and you are not on it.
RLM_EL_NOT_INC	-13	Not on the feature include list The license administrator has specified an INCLUDE list for this product and you are not on it.
RLM_EL_OVER_MAX	-14	Request would go over license MAX The license administrator set a license MAX usage option for a user or group. This checkout request would put this user/group/host over that limit.
RLM_EL_REMOVED	-15	License (rlm)removed by server A license administrator removed this license using the rlmremove command or the RLM web interface.
RLM_EL_SERVER_BADRESP	-16	Unexpected response from server The application received a response from the license server which it did not expect. This is an internal error.
RLM_EL_COMM_ERROR	-17	Error communicating with server This indicates a basic communication error with the license server either in a network initilization read or write call.
RLM_EL_NO_SERV_SUPP	-18	License server doesn't support this
RLM_EL_NOHANDLE	-19	No license handle No license handle supplied to an rlm_get_attr_xxx() call or rlm_license_xxx()
RLM_EL_SERVER_DOWN	-20	Server closed connection The license server closed the connection to the application.
RLM_EL_NO_HEARTBEAT	-21	No heartbeat response received Your application did not receive a response to a heartbeat message which it sent. This would happen when you call rlm_get_attr_health() or automatically if you called rlm_auto_hb().
RLM_EL_ALLINUSE	-22	All licenses in use All licenses are currently in use and the user did not request to be queued. This request will succeed at some other time when some licenses are checked in.
RLM_EL_NOHOSTID	-23	No hostid on uncounted license Uncounted licenses always require a hostid.
RLM_EL_TIMEDOUT	-24	License timed out by server Your application did not send any heartbeats to the license server and the license administrator specified a TIMEOUT option in the ISV server options file.
RLM_EL_INQUEUE	-25	In queue for license All licenses are in use and the user requested queueing by setting the RLM_QUEUE environment variable.

RLM_EL_SYNTAX	-26	License syntax error This is an internal error.
RLM_EL_ROAM_TOOLONG	-27	Roam time exceeds maximum The roam time specified in a checkout request is longer than either the license-specified maximum roaming time or the license administrator's ROAM_MAX_DAYS option specification.
RLM_EL_NO_SERV_HANDLE	-28	Server does not know this license handle This is an internal server error. It will be returned usually when you are attempting to return a roaming license early.
RLM_EL_ON_EXC_ROAM	-29	On roam exclude list The license administrator has specified an EXCLUDE_ROAM list for this product and the user (host etc) is on it.
RLM_EL_NOT_INC_ROAM	-30	Not on the roam include list The license administrator has specified an INCLUDE_ROAM list for this product and you are not on it.
RLM_EL_TOOMANY_ROAMING	-31	Too many licenses roaming already A request was made to roam a license but there are too many licenses roaming already (set by the license administrator ROAM_MAX_COUNT option).
RLM_EL_WILL_EXPIRE	-32	License expires before roam period ends A roaming license was requested but the only license which can fulfill the request will expire before the roam period ends.
RLM_EL_ROAMFILEERR	-33	Problem with roam file There was a problem writing the roam data file on the application's computer.
RLM_EL_RLM_ROAM_ERR	-34	Cannot check out rlm_roam license A license was requested to roam but the application cannot check out an rlm_roam license.
RLM_EL_WRONG_PLATFORM	-35	Wrong platform The license specifies platforms=xxx but the for client application is not running on one of these platforms.
RLM_EL_WRONG_TZ	-36	Wrong timezone for client The license specifies an allowed timezone but the application is running on a computer in a different timezone.
RLM_EL_NOT_STARTED	-37	License start date in the future The start date in the license hasn't occurred yet e.g. today you try to check out a license containing start=1-mar-2030.
RLM_EL_CANT_GET_DATE	-38	time() call failure The time() system call failed
RLM_EL_OVERSOFT	-39	Request goes over license soft_limit This license checkout causes the license usage to go over it's soft limit. The checkout is successful but usage is now in the overdraft mode.

RLM_EL_WINDBACK	-40	Clock setback detected RLM has detected that the clock has been set back. This error will only happen on expiring licenses.
RLM_EL_BADPARAM	-41	Bad parameter to rlm_checkout() call This currently happens if a checkout request is made for < 0 licenses.
RLM_EL_NOROAM_FAILOVER	-42	Roam operations not allowed on failover server A failover server has taken over for a primary server and a roaming license was requested. Roaming licenses can only be obtained from primary servers. Re-try the request later when the primary server is up.
RLM_EL_BADHOST	-43	bad hostname in license file or port@host The hostname in the license file is not valid on this network.
RLM_EL_APP_INACTIVE	-44	Application is inactive Your application is set to the inactive state (with rlm_set_active(rh 0) and you have called rlm_get_attr_health().
RLM_EL_NOT_NAMED_USER	-45	User is not on the named-user list You are not on the named user list for this product.
RLM_EL_TS_DISABLED	-46	Terminal server/remote desktop disabled The only available license has Terminal Server disabled and the application is running on a Windows Terminal Server machine.
RLM_EL_VM_DISABLED	-47	Running on Virtual Machines disabled The only available license has virtual machines disabled and the application is running on a virtual machine.
RLM_EL_PORTABLE_REMOVED	-48	Portable hostid removed The license is locked to a portable hostid (dongle) and the hostid was removed after the license was acquired by the application.
RLM_EL_DEMOEXP	-49	Demo license has expired Detached Demotm license has expired.
RLM_EL_FAILED_BACK_UP	-50	Failed host back up - failover server released license If you application is holding a license from a failover server when the main server comes back up the failover server will drop all the licenses it is serving and you will get this status.
RLM_EL_SERVER_LOST_XFER	-51	Server lost it's transferred license Your license was served by a server which had received transferred licenses from another ay have gone down in which case your server will lose the licenses which were transferred to it.
RLM_EL_BAD_PASSWORD	-52	Incorrect password for product RLM_EL_BAD_PASSWORD is an internal error and won't ever be returned to the client - if the license password is bad the client will receive RLM_EL_NO_SERV_SUPP

RLM_EL_METER_NO_SERVER	-53	Metered licenses require server Metered licenses only work with with a license server.
RLM_EL_METER_NOCOUNT	-54	Not enough count for meter There is insufficient count in the meter for the requested operation.
RLM_EL_NOROAM_TRANSIENT	-55	Roaming not allowed Roaming is not allowed on servers with transient hostids ie dongles.
RLM_EL_CANTRECONNECT	-56	Can't reconnect to server On a disconnected handle the operation requested needed to reconnect to the server and this operation failed.
RLM_EL_NONE_CANROAM	-57	None of these licenses can roam The license max_roam_count is set to 0 This will always be the case for licenses that are transferred to another server.
RLM_EH_SERVER_TOO_OLD	-58	Server too old for this operation In v10 this error means that disconnected operation (rlm_init_disconn()) was attempted on a pre-v10.0 license server.

7.1.2 Error writing license file on Windows (error 2)

Quick solution Right click the BricsCAD icon and choose 'Run as administrator'.

Preferred solution:

1. Make sure the permissions on following folders are full access for everyone:
   - on Windows XP: %SystemDrive%\Documents and Settings\All Users\Application Data\Reprise %SystemDrive%\Documents and Settings\All Users\Application Data\Bricsys
   - on other Windows versions : %SystemDrive%\Users\All Users\Reprise %SystemDrive%\Users\All Users\Bricsys C:\ProgramData\Bricsys
2. If a license file exists in the 'Bricsys' folder mentioned above, make sure it is not read-only and not opened in some editor.

Symptoms

When activating a license, 'Error writing license file (2)' is shown.

Cause

The license file can not be (over)written.

7.1.3 Error writing license file on OSX (error 2)

Check the following:

- Make sure the permissions on /var/tmp/bricsys give full access for everyone.
- If a license file exists in /var/tmp/bricsys , make sure it is not read-only and not opened in some editor.

Symptoms

When activating a license, 'Error writing license file (2)' is shown.

Cause

The license file can not be (over)written.

More information

On OSX /var is a symbolic link to /private/var. So /var/tmp/bricsys, or /private/var/tmp/bricsys points to the same directory.

7.1.4 Error writing license file on Linux (error 2)

Make sure the directory /var/bricsys exists with full write/read access for every BricsCAD user. Normally the BricsCAD installer creates this directory with proper permissions. With Custom installations (for instance using a downloaded archive without installer) it has to be created manually. Also, /var/tmp should exist with read/write access when running BricsCAD.

Symptoms

When activating a license, 'Error writing license file (2)' is shown.

Cause

The license file can not be (over)written.

7.1.5 License activated as administrator cannot be used by other users (error -4) (error -1)

Make sure the permissions of the following folder is set to allow full access for everyone: On Windows: %SystemDrive%\Users\All Users\Reprise %SystemDrive%\Users\All Users\Bricsys On Linux and Mac: /var/tmp/Reprise /var/tmp/Bricsys

Symptoms

I activated a license as administrator but when I run BricsCAD as another user it doesn't recognize the license. Diagnostics shows error -4: invalid hostid. or error -1 : no license found.

Cause

Error -4: The user can not read the rehostable hostid folder. Error -1 : The user can not read the Bricsys license folder.

More information

See also about error -4: The license for this product is locked to another computer or is using an invalid hostid (error -4) (7.1.6).

7.1.6 The license for this product is locked to another computer or is using an invalid hostid (error -4)

Do one of the following:

- If the folder (see 'Cause' below) was copied from another computer, or from another drive, delete the folder from your computer and activate again (see 'More Information' below).
- If the folder was not copied, it got corrupted or unreadable in another way. Make sure full read and write access rights are set on the folder and on all its subfolders. If that is the case, the resolution is also to delete the folder. Additionally, the previous activation should be revoked (1.13.1),

Symptoms

After entering my activation key, activation fails with the error message "The license for this product is locked to another computer or is using an invalid hostid. (Error -4)"

Cause

The rehostable hostid is invalid. This is a copy protected file in the folder:

- On Windows: %SystemDrive%\ProgramData\Reprise\bricsys\bricscad\ Note: This folder can be hidden, so you might have to turn on showing hidden files and folders on Windows.
- On Linux and Mac: /var/tmp/bricsys/bricscad/

More information

Warning: The rehostable hostid is locked to a computer. Do not copy the rehostable hostid folder (see Cause) from one computer to another computer.

7.1.7 Terminal server disabled (Error code -46)

You can try BricsCAD on another machine. If you want to purchase a license, you will have to purchase a network license. If you want to try the network license, contact support to request for a trial network license.

Symptoms

I try to activate a trial and the error "Terminal server disabled" is displayed, and BricsCAD does not start.

Cause

BricsCAD only runs on a terminal server with a network license, otherwise the number of users of the license is not controllable.

7.1.8 Error reading from network (error -105)

Do one of the following:

- Disable the firewall during activation. Enable the firewall again afterwards.
- Make an exception on the firewall for port 80 and url : license.bricsys.com/actpro
- If it is not possible to disable the firewall or make the exception, do a manual activation (1.7.3).

Symptoms

When trying to activate BricsCAD, I get the error message: "Error reading from network. (error -105")

Cause

A firewall is blocking internet traffic.

7.1.9 Cannot connect to the Bricsys License Activation Server (error -132) (error -136)

If all the solutions below fail, activate your license manually (1.7.3).

Symptoms

When trying to activate BricsCAD, I get one of the following error messages:

- Can't connect to the Bricsys License Activation Server. ... (error -132)
- Error in http transaction with Activation server. (Error code -136)

Cause

- error 132 only:
  - No internet connection.
  - If there is no problem with your internet connection, try again later, perhaps our activation server was down or unreachable.
- If you connect to internet through a proxy server: configure proxy settings before activating.
- if you connect to internet behind a firewall: try to disable the firewall, or add an exception to allow connection on port 80, url: license.bricsys.com/actpro
- error 136 only: Try turning off your antivirus software during activation.

7.1.10 Key already used (error -1005)

Deactivate the license (1.13.1) on one of the computers where the license was activated. If you cannot deactivate it, please contact Support. Indicate clearly which license key you want to deactivate, and why you couldn't deactivate it:

- Because the computer cannot be used anymore. If you still have the .lic file, please attach it to the support request. If you don't have the .lic file, and you have a single license, and it is also activated on another computer, then attach the .lic file from that computer, indicating that that is the activation which should not be deactivated. Location of the .lic file:
  - on Windows: %SystemDrive%\ProgramData\Bricsys\
  - on Linux and Mac: /var/tmp/bricsys/
- Because the license was activated on the website, and the 'Deactivate' button is disabled in BricsCAD. Attach either the .lic file, or the hostid of the computer which was used to activate the license on our website.

Symptoms

Failed to activate a license key, error message is "Key already used (error -1005)"

Cause

The license key has already been activated on the maximum allowed number of computers.

7.1.11 Manual license activation fails with (error -1007)

You have to paste the complete hostid, including the prefix disksn=: disksn=OCZ-U43M095U73BO3T5D

Symptoms

I pasted my hostid and tried to activate but the answer was: Oops. Something went wrong. Please try again or contact us. Error creating license. status=-1007 Invalid hostid type

Cause

If the hostid is a disk serial number, it is listed in BricsCAD like this: disksn=OCZ-U43M095U73BO3T5D If you use only the part OCZ-U43M095U73BO3T5D on the website, you will get this error.

7.1.12 Unknown error (error -1030)

Enter a valid license.

Symptoms

When I try to activate my license I get an error message "Unknown error (error -1030)".

Cause

One possible cause is that the license is an old license that has been upgraded. Upgraded licenses are not valid and cannot be activated anymore.

More information

See the Where can I find my licenses? (7.5.1) article.

7.1.13 BricsCAD cannot connect to a network license server (error -17)

Please check the following: 1. Is a virus scanner running on the server blocking the RLM service? If so, unblock it. 2. Is there a firewall between BricsCAD and the server ? If so, open port number 5053 and the port number assigned to the bricsys license server. This port number is assigned dynamically when the server starts. You can see this port number on the general 'Status' page on the web interface of the RLM license server. You can fix that port number by modifying the next line in the license file: ISV bricsys into ISV bricsys port=the_port_number. After changing this, the server program (rlm.exe on Windows, rlm on Linux/Mac) needs to be shut down and restarted. If this does not solve it, add the program RLM.exe as an exception onto the Firewall exceptions. Restart rlm.exe after doing that. 3. Is there a proxy server between BricsCAD and the server? On the computer where BricsCAD is running, create following system variable(s):

- HTTP_PROXY=server:port
- (optionally) HTTP_PROXY_CREDENTIALS=username:password if the proxy server supports basic authentication.

Symptoms

We are using a network license. When BricsCAD tries to connect to the server it reports error -17.

7.2 Network Licenses

7.2.1 What is a network License file?

A nework license file is a text file that contains the floating license keys and is placed on a read/write network location, e.g. in the Bricsys office in Gent there is such a file on: \\autoinstaller\public\NetworkLicense.lic Users who want to use the license pool, enter the path to this file in the "Enter License Key" dialog. A radio button was added to choose between a regular license key or a network license file. The file contains as many license keys as the requested number of floating licenses, e.g. for 5 licenses it could be this file : KZV6-Z6MB-MQ3N-XYUV-EFWA-DNHG $ 9YKR-YKA2-DBPR-GDVS-MWZG-66HE $ D6H3-K2KX-5XBV-MA7G-9YG8-ZTWV $ WV6W-DKB6-ZDX3-UZYA-9G3M-ZVWN $ 16YG-WVYJ-BZK7-WK6N-VZ3W-1DAV $ The dollar sign after a key means that the key is not in use. When a BricsCAD session is started, it looks for a license key in the file that follows these 3 conditions:

1. The user type is "Network License"
2. The license key matches the product, language, platform, version, etc., just like a regular license key.
3. One of the following is true:
    - After the key there is a space + a dollar sign
    - After the key there is a space + the mac address of the machine this BricsCAD session is running on.

If it finds such a key, BricsCAD starts. If the key was free (dollar sign), then it writes the mac address instead of the dollar sign to lock it. When BricsCAD shuts down, it replaces the mac address again by the dollar sign. Note: Do not use the keys from the example : these are not valid license keys.

Symptoms

BricscCAD installs LicenseManager.dll, which supports floating network licensing.

Cause

How does it work?

More information

If BricsCAD crashes or is closed without access to the network, then the license key remains locked, until BricsCAD is closed again that same machine, with access to the network. IMPORTANT :

- It is not possible to lock a key and migrate it to a machine to run BricsCAD when not connected to the network. (e.g. it is not possible to use it on a laptop when this laptop is not connected to the network)
- The user on the client machine where BricsCAD is running, has to have write access to the shared network drive where the network license file is placed.
- A license key with user type 'Network License', does only work when used in a network license file. It can not be entered as a regular license key. Vice versa, a regular license key (User type 'Single User' or 'Volume License') can not be used in a network license file.

7.2.2 Add BricsCAD to an existing RLM setup

Do the following:

- Download our Network License Installer (1.11.2)
- Install the package, making sure that the checkboxes prompted on installation are not checked.
- Obtain your license file in one of 2 ways:
  - Run actNetworkLicense.exe (installed in C:\Program Files (x86)\Bricsys\Bricsys Network License Manager), which generates a Bricsys.lic file in the folder specified in the activation dialog.
  - Do a manual activation, as described in the BricsCAD Help.
- Copy the following files into your RLM install directory:
  - bricsys.set (found in C:\Program Files (x86)\Bricsys\Bricsys Network License Manager)
  - The license file obtained by the previous step.
  - OPTIONAL: replace the rlm.exe you have installed with our version of rlm.exe (some features will not be available on an older version).
- Perform a Reread/Restart of your RLM instance.

Symptoms

I already have a Reprise License Manager installed on my system. How do I add BricsCAD to my setup?

7.2.3 Where is the license file on a network license server?

The license file is normally stored in the network license manager installation folder, on Windows this usually is: C:\Program Files (x86)\Bricsys\Bricsys Network License Manager. The license file is named 'Bricsys.lic' by default. If multiple license keys are activated on this server, these are stored in different license files by default. They are named 'Bricsys.lic', Bricsys2.lic', etc...

Symptoms

Where can I find the license file on a network license server?

7.2.4 How to move a network license to another server

Do the following:

1. Revoke the license (1.13.1).
2. Activate the license on your new server.
3. Shut down the license manager on the old server and delete the license file on the old server.

Symptoms

I want to move my network license to another server.

More information

The number of revocations is limited.

7.2.5 Network license server : Service install failed.

Do the following:

1. Close the DOS Window where rlm.exe is running.
2. Right click the shortcut 'License Server' and choose 'Run as Administrator'
3. Open the web interface and try again to install the service.

Symptoms

When trying to install the network license server as a service, it fails with this message: Service install failed. Error: Access to Service Control Manager denied.

Cause

The process of the network license server (rlm.exe) does not have administrator rights.

7.2.6 Network license on Linux

The shared folder needs to be mounted on the client's linux machine in order to select the file. Then the path to the file is in the same format as if the file would be located on the machine itself. How to mount a shared folder ? It is best to mount it permanently, so that every time the system reboots, BricsCAD can find the network license file. Otherwise BricsCAD will not start. To mount a folder permanently, a line should be added in the file /etc/fstab. The exact contents of the line depends on the type of folder and machine the folder is on. Below are two examples :

- //x.x.x.x/path/to/folder1 /media/mount-folder1 cifs ro,user=DOMAIN/user,uid=1000,gid=1000 0 0
- //y.y.y.y//path/to/folder2 /media/mount-folder2 cifs rw,user=DOMAIN/user,uid=1000,gid=1000,username=loginname, 0 0

x.x.x.x and y.y.y.y are the IP addresses of the machine with the shared folder. Please consult your Linux documentation for more detailed information about mounting drives and folders.

Symptoms

When selecting the location of a network license file, it is not possible to browse the network (like it is on Windows).

7.2.7 How to use two Network licenses with different levels

Do the following:

- Rename your license files so that when sorted alphabetically, your Pro license file is listed before the Classic license file.
- Open the web interface, go to Status, click on the 'bricsys' button in the 'Options' column and enter this in the text field (say you have 20 Pro licenses):
  - GROUP Pro user1 user2 user3 etc..
  - RESERVE 20 bricscad GROUP Pro
- Click on the 'Update Options' button.
- Reread the server.

Now the first 20 licenses = the Pro licenses, are reserved for the 'Pro' group.

Symptoms

I have two types of Network licenses, e.g. Classic and Pro, on the same license server. I want some users to allow to use Pro, others Classic.

More information

- Flexible licensing
- RLM License Administration

7.3 Installation

7.3.1 Download recent and previous BricsCAD release

1. It is necessary to **register** and **login** first.
2. Most recent release: Go to the **Download** page. For older releases: Click the **Show old releases** link on the **Download** page.
3. Select the platform, language and version you want to download.
4. Check the **I agree with the terms of use** box.
5. Click the **Download** button.

7.3.2 I cannot install / run VBA

- BricsCAD versions V17 or higher: After installing BricsCAD, the installation includes a separate installer (BricsCAD-VBA-Runtime.exe) located in the folder VBA of the BricsCAD installation. This installer still needs to be explicitly executed (=run) in order to make the local BricsCAD installation 'VBA-ready'.
- Install BricsCAD Pro or Platinum. VBA will be installed, also in trial mode.
- BricsCAD versions V14 to V16: Install the 32-bits version.
- BricsCAD versions before V14: If you like to evaluate BricsCAD's VBA environment, please contact us.

Symptoms

I cannot install / run VBA.

Cause

- BricsCAD versions V17 or higher: need to run the BricsCAD-VBA-Runtime.exe installer.
- BricsCAD versions V14 to V16: A 64-bit BricsCAD version has been installed. However VBA only works on 32-bits versions of BricsCAD.
- BricsCAD versions before V14: VBA is not installed in trial mode.
- BricsCAD Classic is installed, while VBA is installed only with the Pro or Platinum version.

7.3.3 When I upgrade to the latest build will I lose my registration info?

No. Your registration info is retained even if the update requires to uninstall the previous version.

7.3.4 ROAMABLEROOTFOLDER and LOCALROOTFOLDER

When BricsCAD starts up, the following three steps are performed (conditionally) : **Step 1** ROAMABLEROOTFOLDER and LOCALROOTFOLDER in 'HKCU\Software\Bricsys\BricsCAD\V20x64\en_US\Settings' are generated:

- ROAMABLEROOTFOLDER = value of 'AppData' in key 'HKCU\\Software\\Microsoft\\Windows\\CurrentVersion\\Explore Folders' + subfolders '\Bricsys\BricsCAD\V20x64\en_US\'
- LOCALROOTFOLDER = value of 'Local AppData' in key 'HKCU\\Software\\Microsoft\\Windows\\CurrentVersion\\Explor Folders' + subfolders '\Bricsys\BricsCAD\V20x64\en_US\'

Triggers step 1:

- LOCALROOTFOLDER : the setting is empty, the folder does not exist, the folder has no subfolders.
- ROAMABLEROOTFOLDER : the setting is empty, the folder does not exist, the folder has no subfolder named 'support' or this subfolder contains no files.

Step 2 Files are copied from INSTALLFOLDER\UserDataCache to user folders:

- ("*.dwt") from userdatacache\templates to LOCALROOTFOLDER\templates
- ("*.*") from userdatacache\templates\en_US to LOCALROOTFOLDER\templates
- ("*.*") from userdatacache\plotstyles to ROAMABLEROOTFOLDER\plotstyles
- ("*.*") from userdatacache\plotconfig to ROAMABLEROOTFOLDER\plotconfig
- ("*.*") from userdatacache\support to ROAMABLEROOTFOLDER\support
- ("*.*") from userdatacache\support\en_US to ROAMABLEROOTFOLDER\support

Triggers step 2:

- either LOCALROOTFOLDER or ROAMABLEROOTFOLDER setting was created in step 1.
- setting 'VersionCustomizableFiles' in 'HKCU\Software\Bricsys\BricsCAD\V20x64\en_US\Settings' does not exist or has a value smaller than the value hard coded into the current running version of Bricscad. (i.e. on a new installation or after an update)

Step 3 System paths, if empty, are initialized:

- PLOTSTYLEPATH = ROAMABLEROOTFOLDER\plotstyles
- PLOTCFGPATH = ROAMABLEROOTFOLDER\plotconfig
- SRCHPATH = ROAMABLEROOTFOLDER\support;INSTALLFOLDER\support;INSTALLFOLDER\Fonts;INSTALLFOLDER\H
- TEMPLATEPATH = LOCALROOTFOLDER\templates
- DRAWINGPATH = MYDOCUMENTSFOLDER
- BLOCKSPATH = MYDOCUMENTSFOLDER
- RECENTPATH = MYDOCUMENTSFOLDER
- XLOADPATH = MYDOCUMENTSFOLDER

Triggers step 3.: This step is always performed. Empty paths are created .

Symptoms

When and how does BricsCAD initialize and use ROAMABLEROOTFOLDER and LOCALROOTFOLDER.

More information

TIPS to use ROAMABLEROOTFOLDER and LOCALROOTFOLDER. On standard installations, BricsCAD initializes these registry keys, and performs steps 1 - 3. To change this behavior, you can specify your own preferred folders by creating these keys in the registry : ROAMABLEROOTFOLDER and LOCALROOTFOLDER in 'HKCU\Software\Bricsys\BricsC
If you make sure that the folders exist and that they have this folder structure:

- LOCALROOTFOLDER\templates
- ROAMABLEROOTFOLDER\plotstyles
- ROAMABLEROOTFOLDER\plotconfig
- ROAMABLEROOTFOLDER\support (not empty folder)

then BricsCAD initializes all paths automatically into these folders. (see Step 3) Notes:

- For version V1x,... please replace V20 by V1x. For other languages, e.g. de_DE, please replace en_US by de_DE.
- It is possible to override ROAMABLEROOTPREFIX with a new path. The new path will be accepted if the matching folder contains a subfolder "support" with at least one file in it, just as is the case with ROAMABLEROOTFOLDER. Otherwise the path will be reset to the default.
- LOCALROOTPREFIX can also be overridden. The new path should contain at least one subfolder, otherwise the path is reset to default.

7.3.5 I believe I got a bad install, do I have to uninstall and do a full reinstall

No, you do not need to uninstall first. Just run the installer again and choose Repair at the start of the installation process. Then click the Next button and follow the instructions.

More information

When you run the installer, the software checks which version is currently installed.

- If this version is more recent than the one you are trying to install, the installation procedure is aborted automatically.
- If the version of the installer is more recent, the installation procedure updates the software.
- If the versions are the same you are prompted to either Modify, Repair or Remove the current installation.

The above assumes that the installation is bad. Sometimes however there is a problem in the configuration (the cui file for instance, and the user profile stored in the registry) and this is not fixed by reinstallation. Often reinstallation is not even required or helpful and just a clean reinitialization is needed. This can be done by cleaning the userfiles and cleaning the BricsCAD userprofile . This is best done while BricsCAD is not running.

- The program stores userfiles in the path stored as ROAMABLEROOTFOLDER. An example of a typical path is C:\Users\username\AppData\Roaming\Bricsys\BricsCAD\V18x64. The program also stores templates in LOCALROOTFOLDER , and a typical path used for that is C:\Users\username\AppData\Local\Bricsys\BricsCAD\V18x64 In order to reset the program in a more thorough manner these folders have to be emptied. Windows explorer may have set these folders as invisible. See also: ROAMABLEROOTFOLDER and LOCALROOTFOLDER (7.3.4)
- The userprofiles are stored in the registry can be managed with the standalone UserProfileManager (6.24.52) utility. This allows to delete and add BricsCAD profiles.

7.3.6 Silent install with MSI installer

See Silent Installation.

Symptoms

This topic explains how to perform so-called silent installation with a MSI installer*.

Cause

The user interface of an MSI installer* typically queries the target system and displays an installation wizard (Setup Wizard) which enables the user to change various options that will affect the installation. The same MSI can also perform a so-called 'quiet mode' or 'silent mode' installation whereby the User Interface of the Setup Wizard gets suppressed. This is done by running the msiexec.exe command-line utility with the /qn (or /qb or /qr) option and specifying on the command line all the information that the wizard would normally gather. Therefore, any actions that occur within the user interface sequence will not be performed during a 'silent' installation.

More information

See Command line options for msiexec.exe on the Microsoft site. * Windows Installer (aka Microsoft Installer .msi).

7.3.7 Install more than one BricsCAD version on the same computer

Windows To install different versions of the same major release version next to each other:

1. In Windows Explorer, make a copy of the BricsCAD installation folder. (by default: C:\Program Files\Bricsys\Bricscad Vxx) The copy is best placed in the same parent folder as the original. (by default: C:\Program Files\Bricsys)
2. Rename the copied folder according to the BricsCAD version (e.g. BricsCAD 20.2.05).
3. Run the installer of the higher version, which will replace the current version in the BricsCAD installation folder.
4. Optionally, place a shortcut to Bricscad.exe in the copied folder on your desktop. Rename the shortcut according to the BricsCAD version (e.g. BricsCAD 20.2.05).

Linux and Mac Multiple BricsCAD versions can be installed in a similar way.

Symptoms

When I install a newer version of BricsCAD, the previous version is replaced and upgraded. Instead I would like to keep my previous version and install the newer one next to it.

More information

Note that BricsCAD installs and runs MAJOR versions (V19, V20, ...)independently. Also x86 or x64 versions are installed at different locations and are effectively different applications. Please notice rhe current article is a about side-by-side installation of multiple BricsCAD versions with different MINOR number of the same MAJOR version. The BricsCAD installation procedure refuses to install a lower version than the one that is currently installed in the default BricsCAD installation folder. If you want to install such version, you must first uninstall the higher version. After you have installed the lower version you can use the above procedure to install the higher version next to the lower version.

7.3.8 BricsCAD registry structure

The language version of BricsCAD is defined by the presence of a subfolder next to bricscad.exe, with a name that represents a valid locale, i.e. of the format 'la_CO', 'la' being two lowercase letters specifying the language, 'CO' two uppercase letters specifying the country. Anything that BricsCAD writes/reads in the registry is first subdivided per major version (V12,V15,..) and platform: e.g. V15 for a 32 bit version and V15x64 for a 64 bit version, written as VX below, then per language (en_US, fr_FR, .. written as 'la_CO' below). - This value in the registry contains the most recently used major version of BricsCAD: CURVER in HKEY_CURRENT_USER\Software\Bricsys\Bricscad
- This value in the registry contains the most recently used language for Bricscad VX: CURVER in HKEY_CURRENT_USER\Softv
- This value in the registry contains the most recently installed language for BricsCAD VX: CURVER in HKEY_LOCAL_MACHINE
- all BricsCAD VX la_CO user settings and profiles can be found in : HKEY_CURRENT_USER\Software\Bricsys\Bricscad\VX\la_
- all BricsCAD VX la_CO installation information can be found in : HKEY_LOCAL_MACHINE\Software\Bricsys\Bricscad\VX\la_
- Below is a list of available languages for BricsCAD. cs_CZ de_DE en_US es_ES fr_FR it_IT ja_JP ko_KR lt_LT pl_PL pt_BR ro_RO ru_RU zh_CN zh_TW

Symptoms

Overview of BricsCAD registry structures, for all major versions and languages.

More information

Registry settings and files installed by BricsCAD (7.3.9)

7.3.9 Registry settings and files installed by BricsCAD

After a new installation

Note 1: in VX.Y.Z, X.Y.Z are major, minor and revision version number, e.g. V20.2.05 Note 2: [x] is x64 for a 64 bit version and an empty string for a 32 bit version Note 3: en_US is to be replaced by the corresponding notation for another language, e.g. de_DE, ja_JP, ...
REGISTRY Nothing is written in HKEY_CURRENT_USER. Following info is written in HKEY_LOCAL_MACHINE: HKEY_LOCAL_MA
: CURVER="en_US" HKEY_LOCAL_MACHINE\Software\Bricsys\Bricscad\VX[x]\en_US : FullVersion="X.Y.Z" InstallDir="%Insta
%Installdir% is the folder chosen by the user during installation. FILES Files are installed in %Installdir% only.

The first time BricsCAD runs

REGISTRY All BricsCAD's configuration settings are initialized with default values, and when BricsCAD closes, they are written to the registry in HKEY_CURRENT_USER. Here are the most important values, related to files and paths:

LocalRootFolder and RoamableRootFolder HKEY_CURRENT_USER\Software\Bricsys\Bricscad\VX[x]\en_US\Settings
On Windows XP: LocalRootFolder=C:\Documents and Settings\%username%\Local Settings\Application Data\Bricsys\Bricsc
RoamableRootFolder=C:\Documents and Settings\%username%\Application Data\Bricsys\Bricscad\VX\en_US On
other Windows versions: HKEY_CURRENT_USER\Software\Bricsys\Bricscad\VX[x]\en_US\Settings LocalRoot-
Folder=C:\Users\%username%\AppData\Local\Bricsys\Bricscad\VX[x]\en_US\ RoamableRootFolder=C:\Users\%username
The prefixes for these folders (i.e. the path before \Bricsys), are looked up in the registry, in the key : HKEY_CURRENT_USER\Sc
Folders values: "Local AppData" for LocalRootFolder, "AppData" for RoamableRootFolder. e.g. On Windows XP :
Local AppData=C:\Documents and Settings\%username%\Local Settings\Application Data AppData=C:\Documents
and Settings\%username%\Application Data e.g. On other Windows versions : Local AppData=C:\Users\%username%\AppDa
AppData=C:\Users\%username%\AppData\Roaming

Search paths The above folders are now used as default values for following search paths: (note that in the following text %RoamableRootFolder%, %LocalRootFolder% and %Installdir% are used, but BricsCAD does not store these indirections: the expansion to the full path is stored. HKEY_CURRENT_USER\Software\Bricsys\Bricscad\VX[x]\en_US\
PlotCfgPath=%RoamableRootFolder%\plotconfig\ PlotStylePath=%RoamableRootFolder%\plotStyles\ SRCHPATH=%Roama
TemplatePath=%LocalRootFolder%\templates\ Note: BricsCAD searches for default.cui and default.pgp using SRCHPATH. FILES When BricsCAD starts up for the first time, files are copied: (Plotter Configuration shortcut) from: %InstallDir%\UserDataCache\PlotConfig to : %RoamableRootFolder%\plotconfig\ (ctb and stb files) from: %InstallDir%\UserDataCache\PlotStyles to : %RoamableRootFolder%\plotStyles\ (cui, pgp, fmp, lin, pat, unt files) from: %InstallDir%\UserDataCache\Support\en_US to : %RoamableRootFolder%\support\ (dwt files) from: %InstallDir%\UserDataCache\Templates\en_US to: %LocalRootFolder%\templates\

When BricsCAD is updated to a new version

REGISTRY The following information in the registry is used by BricsCAD to determine if your version can be updated, and where it was installed. The update will be installed in the same folder. At the end of the installation, the "FullVersion" field is updated. HKEY_LOCAL_MACHINE\Software\Bricsys\Bricscad\VX[x]\en_US: FullVersion="X.Y.Z" InstallDir="%Installdir%" FILES More information in Local support files (7.3.10).

Symptoms

Where does BricsCAD install files? What and where does BricsCAD write in the registry upon installation? This article is probably interesting for Citrix administrators.

More information

BricsCAD registry structure (7.3.8) Install and use BricsCAD on a Citrix server (7.3.11)

7.3.10 Local support files (default.pgp, default.cui) are missing or out of date

Where does BricsCAD copy these files? The files are copied to the folders whose path is stored in system settings LOCALROOTPREFIX and ROAMABLEROOTPREFIX. The values can be found in the settings dialog or by typing the names on the commandline. The paths typically point to subfolders of C:\Documents and Settings\%USERNAME%\Application data\Bricsys\Bricscad and C:\Documents and Settings\%USERNAME%\Local Settings\Bricsys\Bricscad The program search path (variable SRCHPATH) is also constructed from these settings so that the menufile, alias file and so on are automatically found. When the menufile cannot be found three things need to be compared:

- What is the value of LOCALROOTPREFIX and ROAMABLEROOTPREFIX.
- What is the value of SRCHPATH.
- Maybe the default.cui etc. files have been copied to a different path.

Do they exist in another subfolder in 'C:\documents and settings'? Do they exist for the other users of the machine?

When does BricsCAD copy these files? 1. When one of these values in the registry is missing or empty: HKEY_CURRENT_USE HKEY_CURRENT_USER\Software\Bricsys\Bricscad\V8\languageCode\Settings\RoamableRootFolder In this case all support files are copied, overwriting any file that already exists. 2. When (after installing an update) BricsCAD's internal value of VersionCustomizableFiles is higher than this value in the registry: HKEY_CURRENT_USER\Software\Bricsys\ In this case, if a certain file already exists, the central data-cache file will only be copied if it is newer, and in case the existing file was modified, the user will be asked if it is ok to overwrite it.

Symptoms

On startup the program shows a dialog "Unable to open program parameter file default.pgp." The menu file (default.cui) and the aliases file (default.pgp) are not available.

Cause

All support files are installed in the BricsCAD program folders. Some of these will be used directly by BricsCAD (e.g. Fonts), but the menu file default.cui, the default.pgp alias file, the ctb files, the templates and others are all copied from a subfolder of the program folder, called 'userDataCache' folder to the current user folder. If the program searches for these files in the wrong location, the above error dialog is raised.

More information

Both of the update actions mentioned above will be triggered by editing/deleting the corresponding registry keys while BricsCAD is closed. The next time BricsCAD starts up it will copy the files again. Using support files from the user's local support files folder, is the default behaviour of BricsCAD. This can be changed by pointing the SRCHPATH system variable to some other folder, but note that the copy actions described in 1. and 2. above, will not be influenced by such a change to SRCHPATH.

7.3.11 Install and use BricsCAD on a Citrix server

Do not run BricsCAD when the citrix server is in 'install' mode. If you did, erase the Bricsys registry subtree under HKEY_LOCAL_MACHINE\Software\Microsoft\Windows NT\Terminal Server\ before other users log on.

Symptoms

I installed BricsCAD on a citrix server, logged in as administrator. When I start BricsCAD logged in as a normal user, the following problems arise:

- Access violations when copying files to C:\Documents and Settings\ADMINISTRATOR\...
- Unable to load program parameters file (default.pgp), and default.cui. BricsCAD starts up with an empty user interface.

Cause

When installing BricsCAD on the server, probably the server is running in "Install mode". This is OK, but you should NOT RUN BricsCAD while in install mode. When BricsCAD runs on a terminal server in install mode, this registry key is initialized : HKEY_CURRENT_USER\Software\Bricsys\Bricscad\V8\en_US\Settings with: RoamableRootfolder and LocalRootFolder, pointing to C:\Documents and Settings\ADMINISTRATOR\... Now because we're running in "Install mode", all Bricsys' registry keys are copied to: HKEY_LOCAL_MACHINE\Software\Microsoft\Windows NT\Terminal Server\.... When a user logs on, these registry entries are copied to the user's HKCU registry. So, when BricsCAD starts up, the RoamableRootfolder and LocalRootFolder are not initialized to the user's Documents and Settings, but re-use the administrator's values, i.e. c:\Documents and Settings\ADMINISTRATOR\.. , where this user most probably has no access.

More information

Registry settings and files installed by BricsCAD (7.3.9)

7.3.12 Remove Windows Registry entries

Normally the Uninstall procedure will clear all Windows Registry Entries made by the BricsCAD installation. That is: in the HKEY_LOCAL_MACHINE part of the registry. HKEY_CURRENT_USER is only accessed by the application, not by the installer. Uninstalling will not remove keys from HKEY_CURRENT_USER. One of the reasons for that is that the user that performs (un)installation, is often another user than the one that uses the application. CAUTION: Unless you are familiar with using the registry editor, and have a pressing reason to change these registry keys, you are advised not to modify or delete these keys. To proceed: start the registry editor, e.g. by entering 'regedit' at the dos prompt, then search and modify/delete following keys: HKEY_CURRENT_USER\Software\Bricsys\Bricscad\Vx HKEY_LOCAL_MACHINE\Software\Bricsys\Bricscad\Vx Replace Vx with the BricsCAD version no. you want to remove, e.g. V19.

Symptoms

How to manually delete Windows Registry Entries made by Bricscad

7.3.13 Bricscad on 64bit Linux systems

(1) On 64 bit Ubuntu systems, use the "--force-architecture" flag at commandline to install Bricscad (Linux), for instance, like this: dpkg --force-architecture -i Bricscad-V12.1.14-1-en_US.deb Alternatively, our tar.gz version can be downloaded and unpacked to /opt/bricsys/bricscad/v12/. Missing dependencies need to be installed manually. Missing dependencies can be listed using ldd (see More Information). (2) On Fedora use the following command to install some additional packages: yum install qt-x11.i686 gtk2.i686 freetype.i686 On OpenSuse use the following command to install some additional packages: zypper install libexpat1-32bit libgcc44-32bit libjpeg-32bit libpng12-0-32bit libstdc++44-32bit libqt4-x11-32bit cups-libs-32bit gtk2-32bit freetype2-32bit The listed packages are sufficient to install the missing libraries.

Symptoms

(1) Installation of Bricscad (Linux) using the DEB installer on a 64 bit Ubuntu version 11.10 or newer fails. (2) After installing Bricscad (Linux) using the RPM installer on a 64 bit Fedora or OpenSUSE Bricscad (Linux) fails to start.

Cause

(1) The Bricscad (Linux) DEB installer does not work as-is on the newest 64 bit Ubuntu versions. (2) The Bricscad (Linux) rpm installer is not completely self-serving for 64 bit systems. It relies on some 32 bit libraries that are not automatically installed by our RPM installer on 64 bit systems. This issue is caused by providing the same RPM for both 32 and 64 bit. While it is possible to make an RPM that behaves differently on 32 / 64 bit, we lack experience in doing so. It is something we wish to study and implement in the future.

More information

Running Bricscad from commandline yields more feedback about startup failures. If the problem persists even though all required libraries are found, please run Bricscad from the commandline to review the commandline output. To do so, open a terminal and enter: cd /opt/bricsys/bricscad/v11 LD_LIBRARY_PATH=. ./bricscad The missing libraries can be listed by using ldd in the Bricscad installation folder. To do so, open a terminal and enter: cd /opt/bricsys/bricscad/v11/ LD_LIBRARY_PATH=. ldd -r ./bricscad | grep "not found" The libraries that are not found, need to be installed in addition to the Bricscad RPM.

7.4 Printing problems

7.4.1 Text not showing correctly in PDF documents

A straightforward solution for both issues is to embed the fonts in use. This will increase the size of the pdf somewhat but it will provide reliable output.

Symptoms

This is about TEXT as TEXT, there is another kb about TEXT as GRAPHICS Incorrect display can take three forms when fonts have not been embedded.

- text is not readable and has random characters. This depends on the viewer. Some viewers will have this problem, others not.
- text is readable but a different font is being used.
- individual characters are rotated. This is treated in a separate kb (see kb 452)

Cause

Text is not readable: with the current way BricsCAD encodes text in pdf not all viewers will look up characters as intended. While one viewer will show perfectly readable text, the text will show up but will contain seemingly random characters in another viewer. We are looking for ways to fix this. The font has been substituted: This behaviour is as designed. If a viewer does not find the font in use it will use another one. This substitution can happen in a viewer but it can also happen when printing, so the fact that a pdf looks correct in a viewer does not mean it will print correctly. If this is considered a problem it can be avoided by embedding the font. In viewers it can be avoided by restricting the fonts to a basic set consisting of : Courier, Courier Bold, Courier Oblique, Courier Bold-Oblique, Helvetica, Helvetica Bold, Helvetica Oblique, Helvetica Bold-Oblique, Times Roman, Times Bold, Times Italic, Times Bold-Italic and Symbo l and ZapfDingbats. For printers it is more difficult to predict.

More information

Viewers that will display non-embedded fonts with random characters: PDF Architect and Microsoft Edge Viewer. Viewers that are more tolerant towards non-embedded fonts and will still display them correctly: Adobe Acrobat and Foxit.

7.4.2 Gradient Hatches print as black fills

There is no fix for this in BricsCAD. There are two approaches to resolve the problem:

- Upgrade the printer driver to the latest version. This can resolve the problem for a number of printers.
- Use the 'Print As Pdf' built-in device to create a pdf, then print this pdf.

Symptoms

Gradient hatches show up as black or invisible solids in print and sometimes they print partially.

Cause

Some printer drivers have problems with the way gradient hatches are drawn in print (GDI ::GradientFill). Then they print the gradient hatch as a black solid.

More information

PDF printers that have been shown to work with the latest drivers: doPDF, PDFCreator, PDF995, Bull zip PDF, CutePDF . List to be completed.

7.4.3 Images, pdf underlays or OLE objects print partially or as black filled rectangles

First try to update the printer driver. Otherwise, a switching mechanism has been introduced to allow printing images using a different mechanism.

- The program is able to choose between several methods for printing transparent images and a new default method has been chosen that works in most cases.
- It is possible to set an override when a specific printer still cannot handle the images.

The ImagePrinting.xml configuration file is installed in the plotter configuration path. It allows to explicitly set the methods for printing images. Clarifications are given in the file. Note that settings in ImagePrinting.xml do not affect how OLE objects with transparencies are printed. In order to get an OLE object to print transparently you should either to set the variable PLOTTRANSPARENCYOVERRIDE to 1 and set the "Plot transparencies" option in the Print dialog or to set the PLOTTRANSPARENCYOVERRIDE to 2. There are cases where gradient hatches print in black or where they blank out other entities where they should be transparent. This cannot be mended by configuring ImagePrinting.xml either. 'Publish to pdf' and 'Print as pdf' are non-system printers based on export to pdf. They use a different approach to printing than system printers. They do not make use of ImagePrinting.xml.

Symptoms

Depending on the chosen printer, some images, pdf underlays or OLE objects print partially or as black filled rectangles while the rest of the drawing prints correctly. Even some other images will print correctly. Other printers or even other versionscreate correct output for the same drawing.

Cause

If the problem depends on printer choice and not on the paper size then it's likely the images, pdfs or OLE objects have transparent areas and with transparent areas a method that works well with one printer does not work with another printer. In V12 always the same method was used.

More information

A second, less common cause is that sometimes images print as invisible on large prints because not enough memory is available for them. Depending on the operating system the memory limit on 32bit machines is sometimes only 1.5 Gb. It is possible to increase the available memory to 3 Gb.

7.4.4 Printing ignores plotstyles

The possible causes are all behavior that is as designed, so in general the only solution is take in account this behavior. Application of plotstyles can be verified in the print, in preview, and directly in the layout if you switch ON 'Display Plot Styles' in the PAGESETUP dialog or for the current layout, the CPAGESETUP dialog (which is not identical to the print dialog.)

Symptoms

A ctb is associated with a layout in pagestup but the plotstyles are ignored in print

Cause

Possible known causes:

- The checkbox "plot with plotstyles" (found on the Print and Pagesetup dialogs) is OFF in the layout
- The print is made with a visual style that does not support plotstyles. There are only a few visual styles that support plotstyles:
  - Visual styles: 2dwireframe, wireframe,
  - Shade plot properties: legacy hidden, legacy wireframe, and wireframe.
- The plotstyle table is actually not found.
- Entities are using truecolor. These are not mapped by the ctb and such entities will be printed as they are.

More information

"plot with plotstyles" is ON in all default templates.

7.4.5 PRINT dialog takes a long time to open

Place CTB and PC3 files in their own subfolder rather than in the root of a larger folder. Then set the PlotCfgPath and PlotStylePath user preferences accordingly.

Symptoms

The print dialog takes a long time to open. Printing itself does not have to be slow once the dialog is open.

Cause

There can be multiple causes including network issues, but a known issue is that a weak lookup mechanism is used for finding the plot config (*.pc3) and plotstyle config (*.ctb) files. If the user has modified the PlotStylePath and/or PlotCfgPath user preferences, so they are set to a large folder with many files and subfolders, then the entire folder and subfolders are searched for appropriate files. This happens in an inefficient manner and it can take a long time, especially if this folder is on the network.

More information

The problem will not occur when PlotCfgPath and PlotStylePath point to the dedicated default subfolders.

7.4.6 Print has become lighter and thinner

The change may require small modifications in the CTB's on the client side. Our apologies for the inconvenience. From V10.3.12 on we deliver two new CTB's that can serve as a reference for conversion. The two new CTBs allow to print the colors as they show onscreen on a white background, and on a black background, so they are close to the 'default.ctb' file but slightly darker.

Symptoms

After upgrading to V10.3 printed text has become less fat and printed colors have become lighter.

Cause

We've recalibrated our colormapping for print. Historically it was set too dark. Print results are now more compatible with 'other programs'. Actual print with default.ctb (all colors 'by entity')is now a bit lighter than the view on display. It used to be a bit darker than displayed. Every CTB, including default.ctb, now yields lighter prints than before. Two new print color table files, displaycolors.ctb and displaycolors-darkbg.ctb, were added to allow printing of colors as they display onscreen, both for a white background and for a dark background. In addition, and independent from the above changes, printing of TTF text has been changed and the print result will now look slightly thinner, though better readable. The excessive boldness tended to turn small characters into blobs.

More information

Other causes of thinner/fatter results

- Verify LWDEFAULT. This is stored at application level.

7.5 Licensing

7.5.1 Where can I find my licenses?

On the Bricsys website, log on to your account click on your name in the upper right corner. (7.1 on the next page) Then click on Licenses and support contracts to get an overview of your licenses. Only valid licenses are displayed. Upgraded or expired licenses are not displayed. (7.2 on the facing page)

Figure 7.1

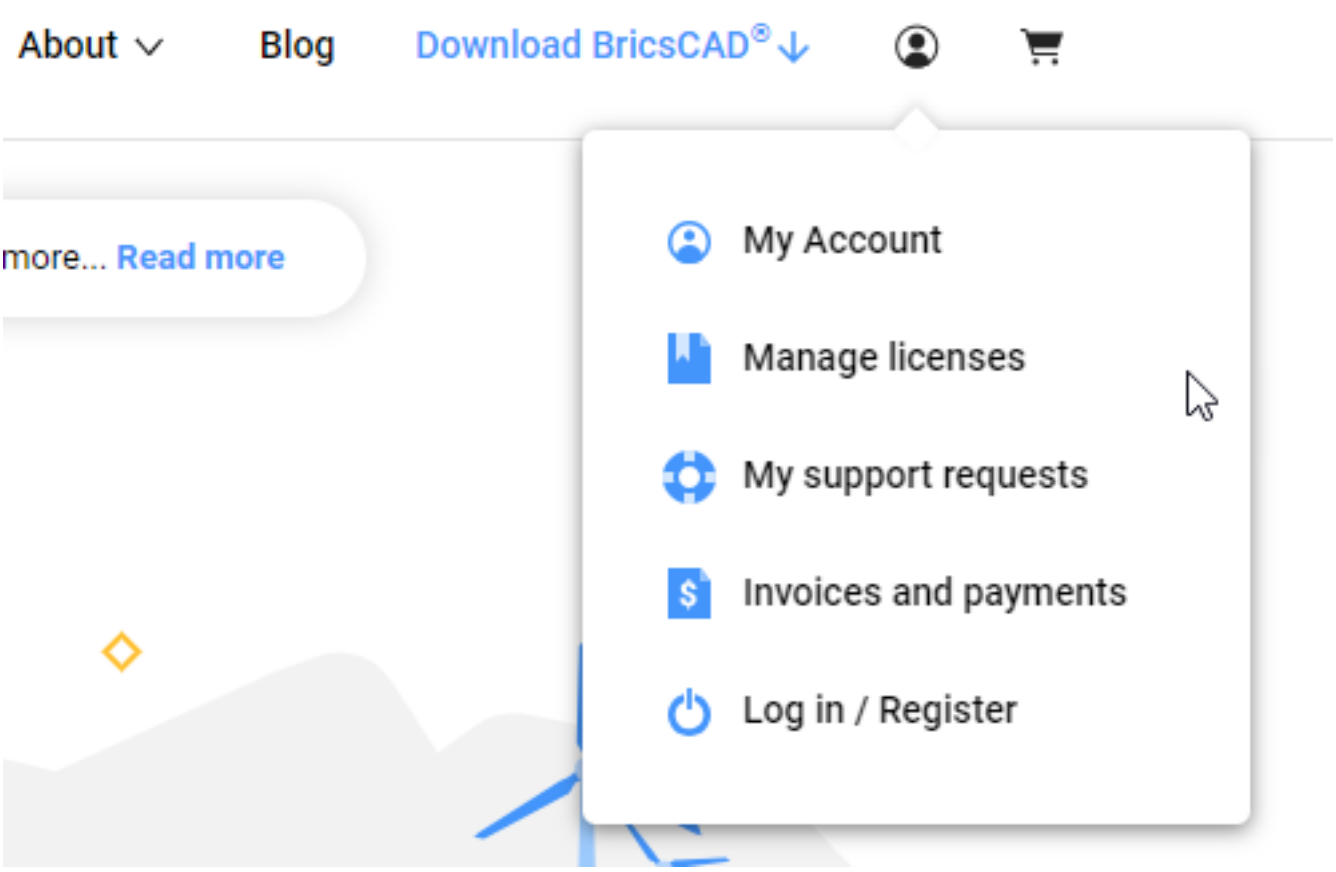

Figure 7.2

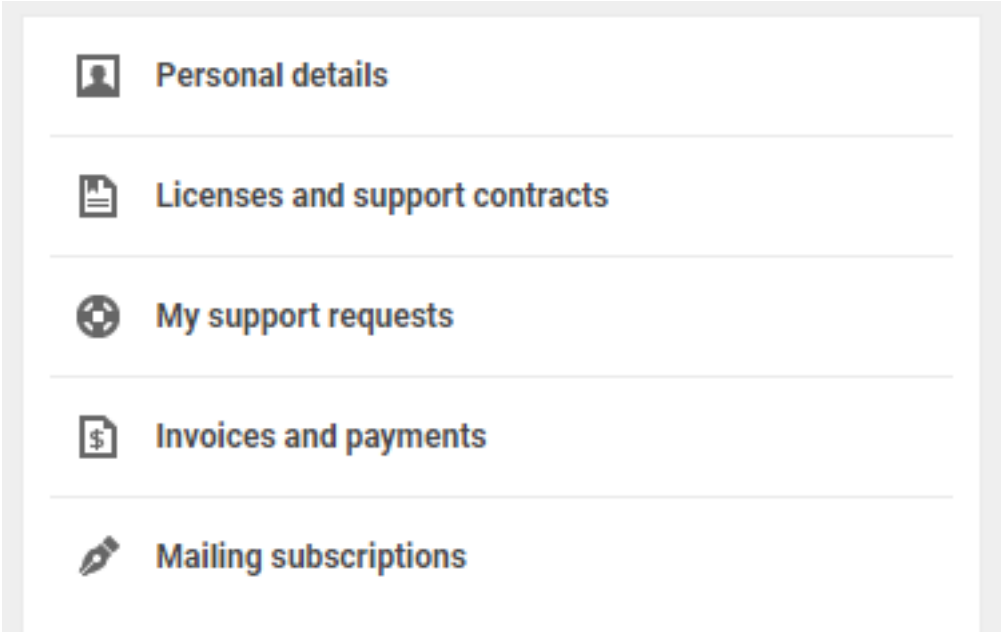

7.5.2 How can I see which license key is in use on a computer.

Do the following:

1. Open the License Manager (6.20.27) dialog box.
2. Click **Manage License** in the top right corner of the **License Manager** dialog box. The **LIcensing Information** dialog box displays.
3. The **License ID** is the license key in use.

More Information

You can find all you licenses in My Account > Licenses and Support Contracts on the Bricsys website.

7.5.3 How can I see which computers are using my (volume) license?

Do the following:

1. Go to My account > Licenses and Support Contracts on the Bricsys website.
2. Place the cursor over the license key that you want to check and click the pencil icon next to the license key. The details of the selected license display.
3. Under **Activations** you can find the requested info.

Symptoms

How can I see which computers are using my (volume) license?

7.5.4 Migrate my license to another computer

All your valid licenses can be found on the Bricsys website (login required): https://www.bricsys.com/protected/account/licenses. **Step 1**: Deactivate the license on the old computer. See: Deactivating a license (1.13.1) **Step 2**: Launch BricsCAD on the new computer. **Step 3**: Activate the license on the new computer. See: Activating and Licensing (1.7.2)

7.5.5 How to revoke an activation after system crash?

See: To revoke a license (1.13.1).

Symptoms

My hard drive crashed, therefore I cannot deactivate my license in order to reactivate it on the new hard drive. How can I revoke the activation which has been done on the crashed hard drive?

More information

The number of revocations is limited.

7.5.6 How to try a higher license level

Send in a Support Request. Bricsys will send you a trial license key, which enables you to try the advanced features for a 30 days limited time period. See To activate a license replacing or upgrading an existing license (1.7.2). When the trial license key expires, you have to re-enter your 'old' license key using the same procedure. You can see all your license keys in your account on the Bricsys website.

Symptoms

I cannot try advanced features.

Cause

(7.3) Some commands are available in a higher license level only. The necessary license level for each command is indicated in the Command Reference.

Figure 7.3

More information

You can always install the latest BricsCAD version in trial mode, which uses in the highest license level.

7.5.7 How to run BricsCAD in a lower license level?

The RunAsLevel preference setting allows to run BricsCAD in a lower license level, e.g. a Pro version can be run as a Lite, an Ultimate license can be run as a Lite or Pro. This facilitates the evaluation of the features available for each license level. To set the RunAsLevel user preference, execute the SETLICENSELEVEL (6.27.37) command.

Symptoms

I went to check the availability of a feature in a lower license level.

Cause

The availability of a feature depends on the license level.

More information

All features are available in a trial license. See also How to try a higher license level (7.5.6).

7.5.8 Windows 10 Upgrade

Not yet upgraded

We recommend deactivating the license before upgrading to Windows 10. You can do this by starting BricsCAD, and clicking [Help > BricsCAD License...] in the menu bar. Here you will find the deactivate button. Once upgraded, you can activate with your activation key as before. **Note:** this only applies to online activations. Manual activations will not be affected.

Already upgraded

V14 or older If you have upgraded with V14 still activated, you might get an error: The license for this product is locked to another computer or is using an invalid hostid (error -4) (7.1.6).

V15 or newer Upgrading with V15 or higher should not cause any problems. If an activation dialog appears when starting BricsCAD, enter your activation key in the dialog and BricsCAD should start.

7.5.9 Failure to add license key on Windows Vista or higher

Log in with administrator rights and try again to enter the license key. Note that on Windows Vista, Windows 7 and Windows 8 it is not sufficient to log in as administrator or main user. You also have to start BricsCAD by right-clicking the shortcut and choosing "Run as administrator". This will launch BricsCAD with full elevated rights and privileges. During such an elevated session, you will be able to enter the license key.

Symptoms

Though the user is logged in as administrator, the license manager still doesn't accept a valid license key, with one of the messages below:

- "Failed to add license key (error 25)" (or error 27).
- "Error creating registry key (need administrator rights for this operation)."
- "Error opening registry key."
- "Error setting registry key value (need administrator rights for this operation)."

Cause

On Windows Vista or higher, access rights are more restricted. Even if you are logged in as administrator, it appears that the application has not enough rights to write in the registry under HKEY_CLASSES_ROOT.

7.6 Troubleshooting

7.6.1 Reset the user interface to defaults

Symptoms

Menus, toolbars and/or ribbon have disappeared.

Cause

- You accidently closed menus, toolbars or the ribbon.
- Something went wrong when customizing BricsCAD.

Solution

Do the following:

1. Launch the CUSTOMIZE (6.9.47) command. The **Customize** dialog displays.
2. Click the **Manage your customizations...** button. The **Manage your customizations** dialog displays.
3. Click the **Revert to defaults** button, then click the **OK** button. The **Manage your customizations** dialog closes.
4. Click the **OK** button to close the **Customize** dialog box. The default settings for the current workspace are restored.

Related Topics

Understanding the Customize dialog (1.17.4) Workspaces (1.17.11) The BricsCAD Launcher (**??**)

7.6.2 Files to include when reporting crashes

crash_report.txt A crash report is written to the crash_report.txt file each time BricsCAD crashes. The crash report is saved in the BricsCAD startup folder. The location of this folder depends on how you start BricsCAD, so be aware that multiple files can exist on your system in different folders. If the program does not have permission to create the file in the startup folder, the file is created in your %HOMEPATH% folder (typically c:\users\username\). Sometimes the crash report is generated without the program actually closing. Sometimes there is a crash without a crash report.

Crash dump (.dmp) file In most cases, a program crash results in a crash dump (.dmp) file, which is generated in the same folder as the crash_report.txt. The creation of a crash dump file can be enabled or disabled depending on QAFLAGS bit 2048. Before V18.2, the crash dump was only created if QAFLAGS bit 2048 had been set. In more recent versions, the meaning of the flag has been inverted, and the crash dump file is now created by default.

User profile Your current user profile settings can be exported to a file using the Profile Manager (1.17.8).

Drawing file If a crash is specific to a drawing, then such drawing will be helpful.

Safe mode Starting with V20, the program can be started in safe mode (7.6.3). If the problem goes away when running in safe mode, then it can be helpful to switch back to normal mode and disable or uninstall plugins and customization to narrow down the culprit.

Symptoms

You experienced a program crash, or the program crashes frequently.

Cause

The most reliable way to report a crash is to provide a repeatable scenario. That means a step-by-step procedure is provided together with a well defined starting context. This can take some effort to get right, but it has by far the largest chances for success. In general, to make a scenario repeatable the environment is best reduced to be as standard as possible. This is a process of simplification and elimination. If possible, a scenario should be provided that starts with a default BricsCAD user profile, a new drawing, no thirdparty plugins or user customization, and a default .cui file. If it is not possible to provide a repeatable scenario then in some cases we can deduce enough information from additional diagnostic files.

More information

What exactly is a crash? The word crash is often misused for other problems, so the analyst may ask questions to define exactly what happens. A hangup or freeze is not a crash, and an extremely slow operation is not a hangup. An operation which fails with an error but does not close down BricsCAD is also not a crash.

BricsCAD log: command logging This is now rarely requested, but BricsCAD can log each executed command to a text log file. The generation of this log is controlled by the LOGFILEMODE system variable. If LOGFILEMODE = 1 a logfile is created each time a drawing is opened. The filename format is DrawingName_yyyy-mm-dd_hh-mm-ss.log BricsCAD log files are saved in the folder specified by the LOGFILEPATH system variable. By default, this is the folder pointed to by the LOCALROOTPREFIX system variable.

7.6.3 Starting BricsCAD in Safe Mode, without any applications

The full checklist:

- Set DEMANDLOAD to 0. This disables the automatic loading of modules when a certain entity type is present in a drawing or whenever a certain command is executed.
- Start VBAMAN (6.32.4) : no applications should be loaded
- Start VBARUN (6.32.6) : only default.dvb should be present and no macros should be listed.

In a clean installation the following files are empty (at the time of writing) but thirdparties may extend them. If they have been extended they should be renamed or edited in order to disable the related applications.

- bricscad.rx
- on_start_default.lsp
- on_doc_load_default.lsp
- on_start.lsp
- on_doc_load.lsp
- default.dvb
- additional MNL files

The Lisp function (ARX) allows to verify which binary modules have been loaded. Only applications included in BricsCAD should be present. See also: What files are automatically loaded by BricsCAD? (7.6.4)

Symptoms

Sometimes you want to run BricsCAD in an equivalent of Safe Mode, without any thirdparty applications loaded. Thirdparty applications can be loaded through a variety of mechanisms. Here we give the complete list of mechanisms that can load thirdparty applications and that need to be checked in case of doubt.

More information

Starting with V20, the program can be launched in safe mode, using the SAFEMODE system variable. This temporarily suppresses all third party plugin code, enablers, and user lisp files from loading in the current session. Starting in a clean environment can help to eliminate potential causes of a crash. To enable safe mode:

1. Make a copy of the BricsCAD shortcut.
2. Right click on the copied shortcut and select 'Properties'.
3. Add /SAFEMODE at the end of the 'Target' field.
4. Click 'Ok'.
5. Launch BricsCAD using this shortcut.

7.6.4 What files are automatically loaded by BricsCAD?

- bricscad.rx : file that comes with the program. The filenames in it are loaded on startup.
- on_start_default.lsp : lispfile that comes with the program and is loaded on startup.
- on_start.lsp : userdefined lisp file that is loaded on startup.
- on_doc_load.lsp : userdefined lisp file that is loaded when a drawing is loaded.
- on_doc_load_default.lsp : lispfile that comes with the program and is loaded on when a drawing is loaded.
- default.mnl : lisp file that is loaded when the default menu is loaded.
- default.dvb is loaded on startup. This file is created automatically but by default it does nothing.
- additional MNL files that are loaded when a thirdparty menu of the same name is loaded.

Binary modules. At the time of writing these are:

- plotstyleservices_3.09_10.tx
- td_dynblocks_3.09_10.tx
- td_sm_3.09_10.tx
- dbconstraints_3.09_10.dll
- lgsconstraints_3.09_10.dll
- acmodeldocobj_3.09_10.tx
- exfieldevaluator_3.09_10.tx
- bdm_db.tx
- bdm_module.tx
- bmdb.tx
- bmxhdw.tx
- bmui.tx
- bmext.brx
- devcmds.tx
- recomputedimblock_3.09_10.tx
- td_ave_3.09_10.tx

More information

See also Starting BricsCAD in Safe Mode (7.6.3), without any applications loaded.

7.6.5 Crash during startup

Symptoms

The program crashes on startup. The crashes may have started suddenly for no apparent reason, or after some system or program upgrades.

Cause

There can be many causes. The purpose of this item is to provide a quick checklist to allow you to fix the crash yourself or to enable you to report the crash so that we can follow it up.

- The program installation is corrupted. By itself a corrupt install is very rare and blindly trying to reinstall will not work. What does happen is that a zealous antivirus (usually Norton Autoprotect) has quarantined one or more dlls that it considers suspicious, causing BricsCAD to no longer start up, or sometimes to lose functionality. The approach then is to resolve this conflict with the antivirus: Establish whether the antivirus did indeed cause a false positive and add an exception to the antivirus. Then fix the installation, e.g. by reinstalling.
- The program configuration is bad. A program configuration undergoes a history of changes across versions and it is possible that after an upgrade a new version of BricsCAD encounters something it cannot handle.
- It is possible that BricsCAD's COM registration is broken, this can happen for various reasons, and can result in very "strange" defects and behaviour, up to program crashes and third-party application failures. In order to re-register the COM interface properly, activate the "run as admin" checkbox in the desktop shortcut icon - normally it is sufficient to start BricsCAD once with this option enabled. If multiple BricsCAD versions and/or x86 and x64 versions are installed on the same machine, then it is mandatory to have the "run as admin" option enabled, because each BricsCAD version and platform has its own COM interface.
- Maybe the BricsCAD profile which stores settings across BricsCAD sessions (the user profile is stored in the windows registry) has ended up with values the program cannot handle. This can be verified by starting BricsCAD with a clean profile "bricscad.exe /p newprofilename".This can be done on the windows commandline, by editing the BricsCAD shortcut, or by using the standalone BricsCAD UserProfileManager (6.24.52) tool (profilemanager_app.exe). This approach does not delete the original profile, so it can be recovered if needed, or atteched to a support request for diagnostics even if the user managed to avoid the immediate crash. When starting with a new drawing, select a 2d drafting template to exclude the possible impact of RedSdk problems. The BIM and Mechanical templates use Redsdk.
- Maybe one of the resource files (default.cui, lisp files, pgp file..) cannot be loaded correctly. To verify this quickly try renaming the folder %APPDATA%\Bricsys\BricsCAD\V15x64\en_US\Support If BricsCAD starts (stunted, but running) then you have narrowed down the problem to this folder and one can try renaming it back and piecemeal moving/renaming its content, starting with the cui file.
- Maybe a third party application causes the crash. The above approaches will already disable most third-party applications but extra actions may be needed to fully disable them.
- Or it is more complicated. Then please file a support request. Please add log files and crash reports (7.6.2) when reporting crashes.

More information

Start BricsCAD in Safe Mode (7.6.3). If the problem goes away, then it can be helpful to switch back to normal mode and disable or uninstall plugins and customizations to narrow down the culprit.

7.6.6 Failed to update the system registry

Log in as main user (or administrator) or chose "Run as administrator".

Symptoms

When starting up BricsCAD, a message box appears: "Failed to update the system registry. Please try using REGEDIT".

Cause

Running BricsCAD requires access rights of at least the 'Main user' group because of registration of an OLE Server class in HKEY_CLASSES_ROOT.

More information

Important note about Windows Vista and higher: It is not sufficient to log in as administrator or main user, you also have to start BricsCAD by right-clicking the shortcut and choosing "Run as administrator".

7.6.7 Third party application does not work

If you are using third party applications on BricsCAD, make sure they are compatible with your BricsCAD version. See the application details in our application catalog. See also I cannot install / run VBA in the BricsCAD Knowledgae Base.

Symptoms

The third party application does not work on BricsCAD.

Cause

Possible causes are:

- The application does not support your BricsCAD version.
- VBA is not running.

7.6.8 Cannot create file in Desktop.ini (error 5: access is denied)

Change the **DrawingPath** user preference:

1. Open the Settings (6.27.25) dialog box.
2. Type drawingpath in the Search field and press Enter.
3. Click the Browse button () at the right hand side of the settings field. The Choose a Directory dialog dispays.
4. Choose a folder then click the Select Folder button.

Symptoms

When opening a drawing, BricsCAD displays the error: Can't create file [SomePath]\Desktop.ini (error 5: access is denied)

Cause

The path [SomePath] is set as DrawingPath, and the user does not have write access in this path. BricsCAD tries to write configuration settings in the .ShellClassInfo section of Desktop.ini for customization of the Open File Dialog.

7.6.9 Trailing afterimages or ghosts when dragging toolbars and dockable panels.

The problem does not block or delay the user. If the user considers the problem unacceptable the only known way to handle this is to avoid/delay installing Windows 10 Creator Fall update or to uninstall it.

Symptoms

When dragging toolbars or dockable panels there are gray afterimages left behind.As soon as you press the mouse button on a toolbar a gray boundary is drawn around the toolbar. That is normal. The problem now is that this gray rectangle is not or partially undrawn/refreshed as you drag the toolbar. It does not block the user from working and it is a transient problem. but it is inconvenient.

Cause

This started with Windows 10 Creator update 1709, fall 2017. The problem is not limited to BricsCAD. We've found the same problem in AutoCAD toolbars and in Acrobat Reader (element properties). The common attribute appears to be that these are all dialogs that are floating / dockable. At this time it has not been established what the cause is or how it will be fixed.

More information

It may be that a later update of Windows or a display driver may fix the issue. It is possible that a setting in windows can fix it but this has not yet been found. It is possible that we eventually have to adapt the program to work around the problem. It is also possible that this is a preexisting problem which now got much worse. Smaller redrawing problems with the boundary rectangles have been encountered in earlier versions of Windows.

7.6.10 VBA6.dll not found

Possible solution is suggested in this link. If registering VBE6.dll a does not help, have a look at the value of the following registry key: "HKEY_CLASSES_ROOT\TypeLib\{000204EF-0000-0000-C000-000000000046}\6.0\9\win32" Perhaps it points to an unexisting file, e.g. on a 64 bit system : "C:\\Windows\\SysWOW64\\msvbvm60.dll". Then try changing it to "C:\Program Files (x86)\Common Files\Microsoft Shared\VBA\VBA6\VBE6.DLL".

Symptoms

When running a VBA macro the following error pops up: error: "file not found: vba.6dll"

Cause

This is probably caused by the installation of another application that installs VBA 7. This installation can cause corruption of a VBA 6 registry key, that causes an incorrect reference to the VBA 6 dll's.

7.6.11 "There was a problem sending the command to the program" error

Do the following:

1. In the registry keys below, replace the path "C:\Program Files\Vxx\bricscad.exe" with valid path to bricscad.exe on your system. [HKEY_CURRENT_USER\SOFTWARE\Classes\.dwg] @="Bricscad.load.dwg" [HKEY_CURRENT @="BricsCAD Drawing file" [HKEY_CURRENT_USER\SOFTWARE\Classes\Bricscad.load.dwg\DefaultIcon] @="C:\\Prog Files\\Bricsys\\Vxx\\bricscad.exe,1" [HKEY_CURRENT_USER\SOFTWARE\Classes\Bricscad.load.dwg\shell] [HKEY_CURRENT_USER\SOFTWARE\Classes\Bricscad.load.dwg\shell\open] [HKEY_CURRENT_USER\SOFTWARE\Cla @="\"C:\\Program Files\\Bricsys\Vxx\bricscad.exe\" \"%1\"" [HKEY_CURRENT_USER\Software\Microsoft\Windows\C "Bricscad.load.dwg"=hex(0): [HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Explorer\FileExts "Progid"="Bricscad.load.dwg"
2. Paste the registry keys into a new textfile and save the file.
3. Change the file extenstion to .REG .
4. Execute the reg file as administrator to merge it into your registry

Symptoms

1. When you double-click a .dwg drawing file or a shortcut to a drawing, BricsCAD starts. However, the drawing does not open, and you receive an error message; e.g. 'There was a problem sending the command to the program". The error message may be different, depending on Windwos version.
2. Windows Explorer displays type of ".DWG" files as "AcadDocument Class | Bricscad14" in the status bar or in the "Type" column.

Cause

Support of DDE has been stopped in BricsCAD. Nevertheless, the subkeys which enable to run bricscad.exe with DDE are created in the registry at each startup: [HKEY_CLASSES_ROOT\BricscadApp.AcadDocument\shell\open\command] @="C:\\PROGRA~1\\Bricsys\\BRICSC~1\\bricscad.exe /dde" [HKEY_CLASSES_ROOT\BricscadApp.AcadDocument\shell\o @="[open(\"%1\")]" [HKEY_CLASSES_ROOT\BricscadApp.AcadDocument\shell\print\command] @="C:\\PROGRA~1\\Bricsy /ddenoshow" [HKEY_CLASSES_ROOT\BricscadApp.AcadDocument\shell\print\ddeexec] @="[print(\"%1\")]" [HKEY_CLASSE @="C:\\PROGRA~1\\Bricsys\\BRICSC~1\\bricscad.exe /ddenoshow" [HKEY_CLASSES_ROOT\BricscadApp.AcadDocument @="[printto(\"%1\",\"%2\",\"%3\",\"%4\")]" Usage of the ProgID "BricscadApp.AcadDocument" for ".DWG" association causes the problem.

7.6.12 Crash in file Open or Save As dialog - ACCESS_VIOLATION (C0000005) in AcSignCore16.dll

Try one of the following: Autodesk provides the hotfix http://usa.autodesk.com/adsk/servlet/ps/dl/item?siteID=123112&id=
Update AcSignCore16.dll to the most recent version available. Prevent Windows from loading AcSignCore16.dll, but do not rename, because next time Acad runs, it will restore renamed files. The best approach is to use the AutoRuns.exe utility which is part of the tools provided by former www.sysinternals.com, which is now owned by Microsoft. Microsoft provides the free SysInternalsSuite as a ZIP package which can simply be unzipped to a folder, no installation required.

- Run AutoRuns.exe.
- On the Explorer tab page, lookup entries here published by Autodesk.
- Uncheck the AcSignCore16.dll.
- Restart Windows. The problems should be gone, including performance issues.

Symptoms

When using the File Open or Save As dialog, Bricscad crashes. This may be accompanied by an error message: ACCESS_VIOLATION (C0000005) in module AcSignCore16.dll If crash logging is activated, then the crash log will point to AcSignCore16.dll as the faulty module. The problem occurs on machines which have one or more Autodesk products installed.

Cause

AcSignCore16.dll is an AutoCad dll. During AutoCad installation it is registered with the Windows operating system to be loaded along with *any* process, so it can check the signature of files with Autodesk file extensions such as dwg, dwf, dxf, ... As such it effectively intercepts and interferes with the file Open and SaveAs dialogs of other applications. In related posts on Acad forums several versions of this dll are reported to cause crashes as well as dramatic slowdowns for network drives, see:

- http://forums.autodesk.com/t5/AutoCAD-2004-2005-Archive/AcSignCore16-dll/td-p/16871
- http://forums.autodesk.com/t5/AutoCAD-2009/AutoCAD-Application-has-stopped-working/m-p/2412969

More information

AutoDesk registers more AcSign*.dll's for which you may want to disable their automatically being loaded along with any process that is started on your computer.

7.6.13 Corrupted "default.cui" file at BricsCAD startup

There are few ways to revert to a default working version of this file: Method 1:

1. Start BricsCAD.
2. Type 'CUI' or 'Customize' on the command line. This should open the Customize dialog
3. On the Customize (6.9.47) dialog press the 'Manage your customizations..." button. The Manage Customizations dialog box displays.
4. Click the 'Revert to defaults' button. This will replace the CUI file with the clean file from the UserDataCache.
5. Click the OK button on the Manage Customizations dialog box.
6. Click the OK button on the Customize dialog box.

Method 2: Use this method only if no customizations whatsoever have been made.

1. Erase the Support folder: C:\Users\<UserName>\AppData\Roaming\Bricsys\BricsCAD\Vxx\en_US\
2. Restart BricsCAD.

Symptoms

When I try to start BricsCAD, an error message displays: "Xerces Error - Fatal Error at the file...". Clicking OK opens the program but there are no menus available except for "File" that has Menu under it.

Cause

Something went wrong with the customization file. The "default.cui" menu file in the user folder is corrupted.

7.6.14 Default.cui is reverted at startup

Local and roamable root folders (with their subfolders) are created by BricsCAD at startup. Also, all necessary files are copied from the user data cache. If the message "A backup of default.cui was created..." keeps being displayed at startup, then missing local and roamable root folders is the most probable reason.

Symptoms

- The message "A backup of default.cui was created..." is displayed at the command prompt;
- All GUI settings (toolbars, menu etc.) are reverted to defaults.

Cause

The default.cui is reverted (= replaced with default.cui from the user data cache) and the message displays in the following cases:

- local root folder is missing;
- either roamable root folder itself or "Support" subfolder in the roamable root folder is missing or there are no files in the "Support" subfolder;
- HKEY_CURRENT_USER\Software\Bricsys\BricsCAD\Vxx\en_US\Settings\VersionCustomizableFiles is is lower than the version number hardcoded inside BricsCAD
- "Created time" of default.cui from the installation is newer than the "created time" of default.cui in the roaming root folder.

7.6.15 Text displays with wrong characters for certain fonts

The solution is to trim down the font family used for a single font, so that ambiguous choice of the file to use is avoided. In the case of "Gill Sans" this can be achieved by removing the files for:

- Gill Sans Light
- Gill Sans Light Italic
- Gill Sans SemiBold
- Gill Sans SemiBold Italic
- Gill Sans UltraBold

The visual effects of using less fonts files are minimal.

Symptoms

For some fonts like "Gill Sans" or "Linux Libertine G", the displayed text can be completely wrong. The characters are displayed with the correct style but they are the wrong characters. This happens since V18.

Cause

This problem is not limited to BricsCAD, but also happens with other programs. These are fonts which use many font files (such a bundle of files is called a font family) and programs implicitly look up the best matching font file in a font family for drawing a character. The display of the font would be fine even if a single font file would be used, but there are slight improvements when using more files for that font. Using a regular font file and saying 'draw this bold' is fine, but using the dedicated bold font file is better. Larger font families can have small flaws in them which will cause ambiguities in which file of the family to use. The effect is that when drawing of a character one font file is used in an early stage of the calculations and in a later stage another font file of the same family is used. It does not cause any problems in V17 but in V18 it can lead to a character being drawn which is completely wrong. Our new approach for calculation is actually correct and we cannot fix this.

More information

A font that is distributed with many files does not automatically show this issue. For example, the font "Noto Sans" has two font files with these styles: "Italic", "Light Italic". But when the two fonts are opened with Windows Font Viewer, one can see that the two fonts technically belong to two different font families: * Family "Noto Sans" (using style "Italic") * Family "Noto Sans Light" (using style "Italic") Since the font families differ, the font is not affected by this issue. Similarly, most fonts avoid this issue by using a different font family for 'extended' font styles. There are only a few fonts known by us that actually have this issue. With 'extended' styles, we mean font styles outside of these 4 styles: * Regular * Bold * Italic * Bold Italic For more information, see https://docs.microsoft.com/en-us/typography/opentype/spec/name#name-ids, sections "Font Family name" and "Font Subfamily name".

7.6.16 REDSDK error

Generally it's a good approach to start with an update of the graphics driver. This resolves a lot of cases. If that doesn't work please file a supportrequest and list the actual error as well as the output of the BricsCAD command REDSDKINFO. The REDSDKINFO command often displays a download link for a recommended version of the displaydriver for your graphics card. Usually this means the installed version should be the recommended version or a more recent version,

Symptoms

During operations suddenly an error dialog appears mentioning a REDSDK eror.

Cause

The REDSDK display device is used for rendering as well as drawing with a range of visual styles. For instance it's used for visual style Realistic but not for 2dwireframe. Roughly we can distinguish between cases where the error can occur over a wide range of graphics drivers, and cases where the error is specific to a specific driver of a specific card. The first case indicates a probable bug for which we recommend entering a supportrequest. The second case, not so much. It may be that the graphics card is not supported very well, or just that the driver of the card is outdated.

More information

Hidden line, Gouraud and Flat visual styles may be drawn using REDSDK or OpenGL depending on preference GsDeviceType3d. How to avoid using RedSDK when there is a problem(as a temporary workaround):

- system variable GsDeviceType2D can be set to anything but 2 (RedOpenGL). By default the variable is set to 0. It is then safe to use visual style 2dwireframe.
- set system variable GsDeviceType3D to 0. This allows using visual styles HIDDEN , FLAT, GOURAUD because these styles then do not use RedSDK.
- Don't use RENDER

7.6.17 BricsCAD freezes when visual style is changed

We are in contact with Nvidia in order to solve this but until that, user can set variable _CROSSHAIRDRAWMODE == 0 in order to remove the issue. Another way to solve the issue would be to downgrade Nvidia driver to 382.05.

Symptoms

BricsCAD freezes or work area becomes corrupted when visual style is changed from 2DWireframe to a rendered visual style or the other way around.

Cause

This affects hybrid systems with Intel + Nvidia video cards, which are using Nvidia drivers newer than 382.05.

7.6.18 UNDO reverts too many operations

Enable diagnostics to find out more.

- Set QAFLAGS=256 (cmd message enable). This enables undo diagnostic. A prompt tells the user when the command history has been corrupted.
- When the program raises an alert about the command history then issue DUMPSTATE on the commandline. This will write a report to the startup folder. Send us the report.

Note that diagnostics has been improved upon over time. It's best to test with V15.2 or more recent. For one thing, DUMPSTATE is then called automatically

Symptoms

An undo step reverts many more operations than was expected. It may or may not be possible to redo and recover the lost steps.

Cause

Cause is unknown but in general terms there is a mismatch between 'start of something' and 'end of something' markers and this mismatch will be triggered by a very specific operation. UNDO relies on these starts and ends and it's crucial these do not get corrupted. UNDO cannot undo creation of entities from a previous session. If entities from a previous session are erased then the problem is not one of 'excessive undo'.

More information

A distinction should be made between very different things:

- corrupt command history causing undo rewinding too much;
- undo deleting a large part of the drawing including entities from a previous session;
- undo stops working.
- things that are, intentionally or not, ignored by undo; This is not a fault with the undo mechanism, just an operation that is not registered with undo
- crashes on undo.
- things that are undone correctly but a screen update is missing.

This article is only about the first three items.

7.6.19 Lost customizations after update

If you store your customizations in a partial CUI file, you can choose to overwrite default.cui with the newer version after an update, and all you have to do then is reload the partial cui file once (the reference to your partial cui file is stored in the main cui file, default.cui). In any case if you made customizations to menus, toolbars, accelerators, aliases, etc., it is recommended to keep a copy of the files default.cui and default.pgp before doing an update.

Symptoms

After updating to a newer version of BricsCAD, my toolbars and menu customization is lost.

Cause

In a new version of BricsCAD there is often a newer version of the file default.cui, or default.pgp, because of new features added or enhancements made in the user interface. When you have made changes to your copy of default.cui (customizations to toolbars, menus, keyboard accelerators), you have to choose to either keep your version and miss the changes in the new version, or overwrite your changes with the newer version.

More information

The approach of making your custom CUI file the "main" CUI file, and attach "default.cui" to it as a "partial" CUI file no longer works. The partial menu is intended to contain customization. In the current implementation the partial menu takes precedence over the main menu. The obvious choice now is to use default.cui as the main menu file, with one's customized file a partial CUI attached to it; and then to re-attach the partial menu after each update.

7.6.20 Some toolbar icons display as question marks

To fix this situation: Open the Customize dialog and press the 'Revert to defaults' button. This will copy the most recent default.cui from the central datacache folder replacing the one in the user's local datacache folder. Note: Modifications made by the user to default.cui will be lost. Therefore, if you want to customize menus and toolbars, save them a separate .cui file, which can then be loaded as a 'Partial CUI' file on top of the default.cui. See To load a partial CUI file (1.17.3).

Symptoms

After upgrading some toolbar icons display as question marks.

Cause

The new default.cui file that came with the new version is not used.

More information

There can be several reasons why the default.cui was not replaced:

- The user responded 'no' when asked if it was OK to replace the existing default.cui with the new one (users who made modifications to default.cui may indeed decide not to replace it...).
- The path of the default.cui file cannot be found in the variable SRCHPATH.
- The resource file is missing.
- For some reason, the BricsCAD 'User data file update manager' failed to work.

7.6.21 Icons on flyout toolbars are invisible

Solution

Set color depth to 32 bit. For Windows 8: - right click on desktop > screen resolution > advanced settings > Adapter tab > list all modes > change to true color (32bit). If you are from windows terminal server, the color depth is handled in more than one place. please note that the server can limit color depth, even if the user has set it to 32 bits. To enforce a larger color depth, additional changes have to be done. Please see: http://technet.microsoft.com/en-us/library/cc772048.aspx

Symptoms

Flyout icons from toolbars are invisible but their functionality is OK. (Flyout icons are icons which have an additional little arrow triangle bottom right of the icon)

Cause

1. The Windows OS is running in 16bit color depth.
2. User is working on windows terminal server. This system is standard set to use 16bit color depth and even if the user has set color depth to 32 bits, it often overrules the user and limits the color depth to 16 bits anyway.

7.6.22 Distorted display for some hatch patterns

Use another hatch pattern or use a UCS of which the origin is close to the location where you want to create the hatch. When you restore the WCS, the display of pattern is still correct.

Symptoms

Distorted display for hatches. This does not happen if the hatches are created near the origin.

Cause

Pattern definitions have inherent inaccuracies that cause them to distort for large coordinates. If you create the same hatch near the origin the problem does not occur. If you create the hatch near the origin and then move the hatch, the display remains correct. This is not due to inaccuracies in how the program calculates. The problem is with the pattern definition itself.

More information

In time hatch patterns will be adapted so they become more robust.

7.6.23 Toolbar position and visibility in the Customize dialog

Symptoms

Changing one of the following properties of a toolbar in the Customize Dialog does not seem to have any effect: - Position (top,bottom,left,right,floating) - Visible (show,hide) - Xval,Yval

Cause

These properties of a toolbar, as shown in the Customize dialog, are stored in the CUI file. They are used when a user starts BricsCAD for the first time, or with a new profile. Once BricsCAD was shut down once, the positions, docking state and visibility are stored in the registry (config file on Linux), and the values from the CUI file are no longer used. So, the changes made to one of these properties in the customize dialog, will only be visible when starting BricsCAD with a new profile, or by new users that use this CUI file.

7.6.24 Menus from main CUI file do not display

Solution

The problem can be solved by adding a POP alias in the CUI file: <Alias>POP10</Alias> Such a POP alias will automatically be added by the Customize dialog when a new main menu is created in the main menugroup.

Symptoms

Some pulldown menus from the main CUI file are not displayed anymore.

Cause

To be compatible with AutoCAD, only menus with a POP alias are shown in the menubar (POP1 through POP32). Menus from the main CUI file without a POP alias are not shown (by default) in the menubar. They can be shown by the user at runtime with the MENUCMD LISP function: (menucmd "P5=+MENUGROUP.ALIAS")

More information

A POP alias is only necessary for the main CUI file. From the partial CUI files, all menus display by default (except the context-menus aka shortcut-menus). Context menus are distinguished by alias: CMCOMMAND, CMDEFAULT, CMEDIT, SNAP, GRIPS, an alias starting with 'OBJECT_' or 'OBJECTS_', or alias 'POPxx' where xx is either 0 (zero) or a number between 500 and 999.

7.6.25 Toolbar icons from MNU/MNS are missing in CUI

This can be fixed easily in the MNU/MNS file by making sure that all IDs are case sensitive. In the above example, if you replace "ID_Mkbom" with "ID_MkBom", the file will be converted correctly.

Symptoms

When a MNU or MNS file is loaded as main or partial customization file, some of the tools in toolbars or menus are missing. When the tools are selected in the Customize dialog, an error message is shown in the properties panel (e.g. "Tool not found in MacroGroup: SomeMenugroup.SomeToolID").

Cause

Tool IDs are case sensitive. When the MNU/MNS file contains IDs that are equal but in another case, the toolbar/menu will not find the correct item.

Example:

***MENUGROUP=MyMenuGroup ***POP1 ID_MnTools [Tools] ID_MkBom [Make &B.O.M.]^C^C^Pmakebom ***TOOLBARS **TB_TOOLS ID_TbTools [_Toolbar("Tools", _Top, _Show, 5, 1, 1)] ID_Mkbom [_Button("Make B.O.M.", "dt1_bom", "dt3_bom")]^C^C^Pmakebom When BricsCAD converts this MNU file to CUI, it will interpret "ID_MkBom" and "ID_Mkbom" as two different items but only add one MenuMacro. Therefore the item in the menu will work but the toolbar button will not.

7.6.26 "RLM1222.DLL" quarantined (or removed) by McAfee anti-virus

Ultimate resolution is the white-listing of the file by McAfee. We proactively work to do this as quickly as possible. In the meantime, there is a work-around. Go to the quarantined items folder, find the file and restore it. Then, go to the McAfee Real-Time Scanning configuration page and add the filename “RLM1222.DLL” to the excluded file list (a.k.a. the “white-list”). If the file has been deleted by McAfee AV, the user will need to disable McAfee first, then re-install BricsCAD, BricsCAD BIM or BricsCAD Shape.

Symptoms

A BricsCAD / BricsCAD BIM / BricsCAD Shape DLL (dynamic link library), is being flagged and quarantined by McAfee AntiVirus (AV) software. This situation can occur during a new installation on a computer where McAfee Antivirus is running, or when McAfee Antivirus scans a machine with an active installation of BricsCAD.

Use

The DLL in question is a part of the Reprise License Manager installation. The DLL holds our public crypto key and is responsible for initiating communications with the Reprise license server during the product authorization process. Occurrences of this behaviour appear to coincide with McAfee antivirus definition updates. As best as we can determine, a string or series of strings in the DLL may align with a recent addition to these antivirus definitions.

7.6.27 Norton Antivirus gives false positive alerts about BricsCAD

This is a recurrent problem with the Norton heuristics module. When the problem turns up we report it to Symantec and they provide an updated database with a fix. Because there is no definitive solution we recommend using another AV. But it is always possible to fix things locally and keep using Norton with BricsCAD. For this one has to add an exception to Norton locally for BricsCAD, so that Norton ignores it.

Symptoms

Norton Antivirus considers BricsCAD installsets a threat of WS.Reputation.1 and will delete the installer. If Norton is disabled during download of the package and during installation, then Norton will again complain about the installed program. Problem files are dcl.dll , acmodeldocobj_3.06_10.tx , pstyle_lib.dll and licensemanager.dll .

Cause

In the cases we are aware of this is an erroneous detection (false positive) from Norton Antivirus.

More information

There is a simple check to see if a virus has tampered with the installer: All BricsCAD installsets (MSI, EXE files) are signed with the "Bricsys NV" certificate. If someone alters the file (viruses, ...) after publication, windows will no longer consider the certificate to be valid. So this acts as a check.Symantec's WS.Reputation.1 System is contested, so you can bypass Symantec's WS.Reputation.1 System:

- http://www.symantec.com/business/support/index?page=content&id=TECH105602&actp=search&viewlocale=en_US&searchid=1309521900035

- http://www.symantec.com/security_response/writeup.jsp?docid=2010-051308-1854-99&tabid=3

7.7 Customizing

7.7.1 Customize right-click behavior

Solution

With the system variable SHORTCUTMENU, you can control whether the Default, Edit and Command menus are used or not. The value is stored as a bitcode using the sum of the values of the selected options.

- **0**: Disable all 3 shortcut menus. Right-click is always Enter.
- **1**: Enable the Default menu. This is displayed on right-click when nothing is selected and no command is active.
- **2**: Enable the Edit menu. This is displayed on right-click when an entity is selected.
- **4**: Enable the Command menu. This is displayed on right-click when a command is active.
- **8**: Enable command mode shortcut menus only when command options are currently available form the command line.
- **16**: Enable the display of a shortcut menu when the right mouse button is held down longer than the value of the SHORTCUTMENUDURATION system variable.

Shift + right-click always displays the Entity Snap menu.

Symptoms

How can I customize BricsCAD's right-click behaviour?

More information

The contents of these menus can be customized (Tools > Customize... , Menus tab) in the tree on the left in the branch BRICSCAD > Context menus. Note that for the Edit context menu, depending on which entity is selected, the items of the according OBJECT_ or OBJECTS_ shortcut menu are inserted. See Customizing Shortcut Menus (1.12.10).

7.7.2 Loading program parameters files (ICA or PGP files)

The command aliases can be edited in the Customize Dialog, in the "Command Aliases" and "Shell Commands" tabs. Another way to customize command aliases, is to edit or overwrite the default.pgp file. The REINIT command reloads the aliases from this file.

Symptoms

MENULOAD (6.21.14) command does not support ICA files nor PGP files.

Cause

Just like in AutoCAD, the MENULOAD and MENU commands only accept CUI and MNU files, no ICA or PGP files.

7.7.3 Mouse button customization

The mouse button actions can be edited in the CUI file. Under the section MouseButtonRoot , four sections are found, with alias 'AUX1' to 'AUX4'. The meaning of these groups is:

- AUX1: clicks without modifier
- AUX2: Shift-clicks
- AUX3: Ctrl-clicks
- AUX4: Ctrl-Shift-clicks

Within the group, there's a number of elements. BricsCAD will only use the first two of them. The first item defines the action for the right mouse button, the second one is for the middle button. The left mouse button behavior is fixed, it cannot be customized. When the has its attribute BlankLine set to true, the corresponding button will execute the default action (like in previous versions). Otherwise, its MenuMacro action will be executed. The SHORTCUTMENU, MBUTTONPAN and CTRLMOUSE system variables affect the behavior of the CUI ButtonItems!

- SHORTCUTMENU is a combination of bit-flags for different context menus (Default, Edit, Command). When the corresponding bit is on, right-clicks without Shift modifier will display the built-in context menu and ignore the cui ButtonItems.
- MBUTTONPAN: if this is on, middle-click without modifier will execute the built-in realtime pan function.
- CTRLMOUSE: if this is on, Ctrl-right-click will execute realtime Z-axis-rotation; Shift-Ctrl-right-click will execute realtime pan.

Symptoms

BricsCAD uses the MouseButtonRoot and DoubleClickRoot sections in the CUI file. In the MouseButtonRoot section, you can define the actions to call when the middle or right mouse button is pressed. The DoubleClickRoot section defines the actions to call when entities of a certain type are double-clicked upon.

Cause

How to customize the right and middle mouse buttons?

7.7.4 Import custom aliases, toolbars and shortcuts from older BricsCAD versions

Toolbars (*.mnu) can be imported in BricsCAD using MENULOAD or CUSTOMIZE dialogbox - "Browse" and "Load" from the Menuload dialog, or "Load partial CUI file" from the Customize dialog's File menu - just select filetype "MNU" in the Open File dialog. The MNU file will be silently converted to the new CUI format.

Symptoms

How can I import my custom aliases (*.ica), toolbars (*.mnu) and keyboard shortcuts (*.ick) into BricsCAD?

7.7.5 How to create a keyboard shortcut

To create a keyboard shortcut (e.g. Ctrl+Alt+E) which will launch the Drawing Explorer (1.19.2), do the following:

1. Open the Customize (6.9.47) dialog.
2. Select the Keyboard tab.
3. In the left panel select the customization group file to which you will add this shortcut. You can add it to the main 'BRICSCAD' customization group, or preferably to one of your own partial menus.
4. Right-click and select 'Insert shortcut'.
5. The 'Add keyboard shortcut' dialog opens.
6. Check the 'Select available tool' option.
7. In the tree list below select the Drawing Explorer tool (it is located under: Available tools > BRICSCAD > Drawing Explorer).
8. After pressing the OK button the 'Add keyboard shortcut' dialog closes and the focus returns to the Customize dialog. All the values for the new shortcut have been filled out expect for the keyboard key itself.
9. In the Properties grid of the new shortcut select Key field, then Press the key combination you want to assign to the shortcut. Ctrl+Alt+E in our example.

7.7.6 Edit Shortcut Menu

When the user right clicks a selection set, the menu that (optionally) pops up is the Edit Shortcut Menu. Here is how BricsCAD builds this menu:

1. If SHORTCUTMENU = 0, no menu appears (see Settings > Program Options > User Preferences > Shortcut menus).
2. Otherwise, the shortcut menu, which has alias "CM_EDIT", is shown. (e.g. if default.cui is the main CUI, see Customize > Menus tab > BricsCAD > Context menus > Edit. The 'Alias' field reads "CMEDIT")
3. If there is only one object in the selection set, a menu with alias "OBJECT_objecttype" is looked up, and its items are inserted after the first separator. 'objecttype' is the DXF object type of the entity, e.g. OBJECT_LINE for lines. You can fetch an entity's objecttype by pasting '(cdr (assoc 0(entget(car (entsel))))))' on the command line, and then picking the entity.
4. If there are more than one objects in the selection set, all of the same object type, a menu with alias "OBJECTS_objecttype" is looked up, and its items are inserted after the first separator.

BricsCAD searches for a context menu with a certain alias in the following order:

- first the main CUI file (main menu group, with default.cui this is BRICSCAD) is searched; if a menu is found there, the search stops and no menu in partial CUI files will be used.
- If there is no such menu in the main group, the partial CUI files are searched. If more than one partial CUI file contains such a menu, the menu from the CUI file that was first loaded is used, the other is ignored. The order in which CUI files are loaded, is the order in which they were loaded the first time, this is reflected by the order in which they appear in the main CUI file, and this can be changed by unloading and reloading a partial CUI file, or by changing the order in the CUI file with an external editor while BricsCAD is closed.

More information

See also Customize right-click behaviour (7.7.1) and Mouse button customization (7.7.1).

7.8 How to

7.8.1 How to PURGE the DGN linetypes from Microstation import

As a workaround, there is a compiled DLL file which purges DGN linetypes. Do the following:

1. Download the DLL and unzip the file.
2. Right click on DgnLsPurge.DLL and ensure that it is not blocked.
3. Launch the Netload (6.22.3) command and load DgnLsPurge.dll.
4. Run the DGNPURGE command.

Symptoms

BricsCAD takes a longer time than AutoCAD to handle/save drawings which contain DGN linetypes which also unnecessary increase drawing size.

Cause

The cause cannot easily be removed. There can be a lot of these linetypes due to previous bugs in AutoCAD which caused cumulation of these linetypes. The recommended approach would be to purge the linetypes, only PURGE does not apply to custom entities such as DGN linetypes.

More information

The sources for the DLL are listed here.

7.8.2 Create a plot file (*.plt)

To create a plot file you need to set the 'Ports' setting of the printer to 'Plot to File'. In the Printer/Plotter Configuration list on the Page Setup and Print dialogs you can choose between the various printer drivers that are installed on your computer. In addition to these Windows printer definitions, you can setup different configurations for each of these printers. Such configurations are saved in a PC3 file. PC3 files are saved in the folder specified by the PlotCfgPath user preference. To create a PC3 plotter configuration file:

1. On the BricsCAD Print or Page Setup dialog, select the printer/plotter in the Printer/Plotter Configuration list.
2. Click the Edit Plotter Configuration button (next to the list button).
3. On the Properties dialog of the selected printer, adjust the settings needed (if any), then click the OK button. The Properties dialog closes; the Plotter Configuration dialog opens.
4. On the Plotter Configuration Editor dialog, select the Ports tab.
5. Choose the Plot to File option and click the OK button. You are prompted to save the changes to a PC3 file.

When you select such a PC3 in the BricsCAD Print procedure, a plotfile will be created. You will be prompted to enter a name for the output file. The plotfile is saved in the folder specified by the PlotOutputPath user preference. NOTE: A Windows printer definition of which the Port is set 'Print to File' creates a plotfile in the BricsCAD Program folder.

More information

In Windows the file extension indicates the filetype. Different file extensions indicate different filetypes, and are processed differently. Unfortunately, there are many exceptions and print/plot files are one of them. Traditionally, if you create a plotfile with AutoCAD, it was created with the AutoCAD printer driver and output was called a PLT file. But if you created the same output with another application, then the windows printer driver was used, and Windows called it a PRN file. If you make a plotfile for a specific printer, the output is the same whether you are using a driver that proposes PLT extension or PRN extension, and you are free to change the extension afterwards. At the same time, the extension PLT can be used for very different file types that share but one feature: they were created by a plot output process. The same applies for PRN files. What counts is to select the right printer driver. To make the confusion even worse most PLT files used to be HP/GL or HP/GL-2 format. As a result most people identify the HP/GL-2 filetype with the PLT extension.

7.8.3 How to read CSV files in other programs

Most of modern text editors are able to detect encoding of a document automatically. Also, they have an option in the FileOpen dialog that allows to choose encoding: ANSI, Unicode or other. You should know for a fact the encoding of a document to use this option.

Symptoms

The DATAEXTRACTION (6.10.4), ATTEXT (6.4.38) and TABLEEXPORT (6.29.4) commands can generate CSV files that can be read in in other software such as Excel. The result will be correct if one pays attention to the delimiter and the encoding.

Cause

Encoding: characters can be encoded in more than one way, and if a document is interpreted in the wrong encoding in excel, Libreoffice or another editor, the characters display as completely different characters. These are the encodings for the different extraction commands:

- DATAEXTRACTION: UTF-8 with BOM
- ATTEXT UTF-8 without BOM.
- TABLEEXPORT: UTF-8 without BOM

Delimiter/separator : although CSV stands for comma separated file, the separator is not always a comma. If the import operation quietly assumes a different delimiter from the one in the csv file, the import fails.

- DATAEXTRACTION: the delimitor can be set in the extraction dialog
- ATTEXT: delimiter can be set in the extraction dialog
- TABLEEXPORT: the delimiter is set on OS level in regional settins.

Excel has several ways to read a csv file. Sometimes just opening with the default settings will work, but if that fails, one can switch to another method that offers a dialog where the user can select the encoding and the delimiter explicitly:

- Read Data/: this is an import, and the resulting document will be save as excel
- Open: this will save to the original format
- doubleclick open

7.8.4 Copy blocks and layers from one drawing to another drawing

The Drawing Explorer (6.13.15) allows to copy definitions between open drawings. See To copy definitions between drawings (1.19.2).

7.8.5 Publish to DWF

There are possible ways to produce DWF from DWG file in BricsCAD:

- EXPORT (6.13.18) command supports 2D and 3D DWF formats
- PUBLISH to PDF using either the native printaspdf printer or a pdf printer installed in windows, and then use a standalone converter to convert PDF to DWF.
- PUBLISH to free Autodesk DWF Writer printer driver (32 BIT ONLY, obsolete but can still be found).

Setup this driver, then set it as a printer on a Page setup and publish to it.

Symptoms

BricsCAD doesn't have a 'Publish to DWF' option.

Cause

At present we do not have plans to implement publish to DWF and related features: DWF is bound to become obsolete, Autodesk is no longer actively pushing it.

More information

Autodesk DWF Writer There have been issues with this DWF writer: on 64 bits it sometimes requires administration rights to run correctly. Also it may be possible to print to the DWFx file type only. Even if you logged on with administrative rights, it could be necessary to run the BricsCAD as administrator to print to DWF files. Autodesk Design Review can open DWFx files and save them in the DWF format, if necessary.

7.8.6 Change the order of drawing of elements

See the DRAWORDER (6.10.40) command.

Symptoms

By default entities are (re)drawn in the order in which were added to the DWG: new entities are added at the back of the file, hence they are drawn last. This means they are drawn on top of previously added entities.

More information

A simple trick to bring entities on top without having to rely on DRAWORDER is to perform a cut/paste operation:

1. Select the entity or entities.
2. Press Ctrl X to cut the selection and copy it to the clipboard.
3. Press Ctrl V; the selection is attached to the crosshairs.
4. Press the Enter key to paste the entities at their original location.

The pasted entities become the latest or 'youngest' entities, and therefore sit on top off 'older' entities.

7.8.7 Tablet support

Command: TABLET (6.29.8) Prior to installing the tablet within BricsCAD make sure it is properly installed at Windows level. After installing the tablet the pointing device has to work: the cursor on screen should react to puck movements on the tablet. If the pointing device does not work yet, this is an install problem at the Windows level and it has nothing to do with BricsCAD. Installation of the tablet in Windows can be problematic. Very few tablets have plug&play installers. Once the tablet works in Windows, we can configure it in BricsCAD. The tablet menus are customizable via the cui file(s). The tablet menus are not included in the standard 'default.cui' configuration. You have to add the tablet-menu-cui file that corresponds with your tablet overlay layout. Tablet cui-files and printable overlay files can be downloaded from the BricsCAD website here. The tablet-menu cui file of your choice can be activated by loading it as partial cui file, either with the 'cuiload' command (first browse for the cui file, then click 'Load') or with the 'customize' command (select 'Load partial' from File menu in the Customize dialog). The tablet has two modes: **Mode 1**: Menu mode (tablet OFF), with a little workspace for coordinate input. This requires running the Configure option, possibly retaining default values if your tablet is 12" by 12. Configure is necessary to access the tablet menus from the cui file. After you configure (_tablet;_cfg) you can see the menu commands in the task bar as you move the mouse over the tablet. Moving the mouse over the white coordinate input workspace makes the tablet cursor work like a mouse, so you can access all menus and tools on screen. I would start by using configure and checking if the tablet menu works. **Mode 2**: Coordinate input mode (tablet ON): uses the complete tablet for coordinates. Tablet ON starts calibration. You can also start calibrate command instead. The calibration asks for a tablet coordinate (no cursor on screen) and a screen coordinate (cursor shows on screen) alternately. If the calibration command runs successfully the tablet mode will be on afterwards. If it does not run well, the tablet has to be configured again to see the menus again. There could be initialization problems if the switching between modes does not go well. If you set the tablet to on for the first time, calibration starts and asks for tablet coordinates. If the switch on failed, it's not possible to enter the tablet coordinates, except if the mouse is in the little workspace. Please check this workspace. In that case I would try different sequences: Start by running Tablet ConFiGure. Try Tablet CALibrate instead of Tablet ON.

Symptoms

What do I need to do to connect a digitizer with Bricscad?

7.8.8 Copy with basepoint between drawings

See the COPYBASE (6.9.58) command.

More information

See Copying entities between drawings (1.32.18).

7.8.9 Change the background color

The default background color in BricsCAD is white. How can I change it to another color? Do one of the following:

- On the command line, enter BKGCOLOR (Model space) and BKGCOLORPS (Paper space). Enter the value of the color you want to display (256 for black, 255 for white, ...).
- Open the Settings dialog and search for BKGCOLOR and BKGCOLORPS. In the drop-down list, select the new background color.

Note: BKGCOLOR applies to rendered visual styles only if PERSPECTIVE = OFF. The 2D Wireframe visual style always uses BKGCOLOR. See also VisualStyles (6.31.15) and Background (6.6.3).

7.8.10 Use an external multiline text editor

(1) This can be solved by either extending the SRCHPATH variable with the path to wordpad.exe or by filling in the full path to the application in the MTEXTED system variable. (e.g. C:\Program Files\Windows NT\Accessories\wordpad.exe) (2) As an alternative to the in-place mtext editor, you can change the value of the _MTEXTED variable. You can either enter an external executable for text editing, or you can enter the value "oldeditor" to show a builtin mtext edit dialog instead of the mtext in-place editor. The edit dialog contains a standard text edit field, which typically does not suffer from international character input issues. This is a workaround to be able to continue working without delay. Be sure to report your character input issue anyway, so we can fix the in-place mtext editor as well.

Symptoms

(1) MTEXTED does not accept the Wordpad text editor and returns: "The specified value is not within the system variable range". Why? In Windows, typing "WordPad" at Run... from Start menu runs WordPad. (2) It is not possible to enter international characters by pressing a combination of two or more keys - for instance, japanese characters using IME, or latin characters such as É, ã...

Cause

(1) WordPad is often not in the environment variable %PATH% so BricsCAD does not find it while Windows can still find it. (2) The mtext in-place editor needs to properly process all possible character input events. This is a difficult task, especially on linux because of the wide choice of distributions and desktop managers.

More information

It is recommended to use the standard in-place editor.

7.8.11 Convert lwpolylines to polylines

See the CONVERTPOLY (6.9.31) command.

More information

The PLINETYPE system variable controls the use of optimized 2-D polylines in BricsCAD. You can save disk space and memory by using the optimized format (lwpolyline). PLINETYPE controls the use of optimized polylines for creating new polylines using the PLINE command, while it also controls conversion of previously created polylines.

- 0 = BricsCAD does not convert previously created polylines when opening the drawing file. Any new polylines created using the PLINE command are not optimized.
- 1 = BricsCAD does not convert previously created polylines when opening the drawing file. Any new polylines created using the PLINE command are optimized.
- 2 = BricsCAD converts previously created polylines when opening the drawing file. Any new polylines created using the PLINE command are optimized.

7.8.12 Use resource DLLs for toolbar icons

BricsCAD searches for the icons for its toolbars using the following sequence: 1. Look in the resources of bricscad.exe for built in icons. 2. Then look in a DLL that has the same name as the loaded menu. If the external menu has a name myToolbars.cui, then the resource DLL should have the name myToolbars.dll. 3. Then look in a RESZ file that has the same name as the loaded menu. If the external menu has a name myToolbars.cui, then the resource DLL should have the name myToolbars.resz. A RESZ file is a ZIP file containing the icons. 4. Then look for a separate bitmap file in the same folder as the CUI file 5. Then look for a separate bitmap file in any folder that is in SRCHPATH variable. So the practical approach is to create a resource DLL or RESZ archive with the same name as the menu it accompanies.

Symptoms

When there are many toolbar icons, they can be better managed if they are bundled in a resource DLL or RESZ archive. How does BricsCAD find these icons? And how can such DLL/RESZ be created?

More information

How to create a resource DLL? In Visual Studio, see Creating a Resource-Only DLL.
Howto create a RESZ archive? 1. Create a ZIP file with the bitmap files (do not put the bitmaps in folders) 2. Rename the zip file: same name as CUI file, RESZ extension 3. Put the RESZ file in the same folder as the CUI file

7.8.13 Insert a spreadsheet into a drawing

To insert a spreadsheet into a drawing:

Method 1: The TABLE (6.29.2) command allows to insert spreadsheet data as native table entities. This can be done either by copying from Excel to the clipboard and then using paste special, or by exporting the data from the spreadsheet (Excel, LibreOffice or OpenOffice) to xml 2003 format, xmlss and using the TABLE command to create a new table entity in BricsCAD using the xmlss data. In BricsCAD spreadsheet data are pasted as an OLE object in a drawing. When you select the object, then right click and choose Edit OLE object in the context menu, Excel (if not already open) will be launched to edit the spreadsheet. When you save the spreadsheet, the OLE object in the drawing is updated.

Method 2:

1. In the Insert menu choose Object...
2. On the Insert object dialog box choose between a new or an existing spreadsheet.
   - To insert a new spreadsheet: Choose Create New, then select Microsoft Office Excel in the Object Type list.
   - To insert an existing spreadsheet: Choose Create from File, then click the Browse... button and select the spreadsheet.
3. Optionally check the Link option. If selected the drawing will update the spreadsheet every time you open the drawing.
4. Click the OK button to insert the spreadsheet.

Method 3:

1. Open the spreadsheet in Microsoft Excel.
2. Select the part of the spreadsheet you want to import in a BricsCAD drawing.
3. Press Ctrl-C to copy the selection to the clipboard.
4. Switch to BricsCAD, then press Ctrl-V to paste the selection.

Symptoms

Can a table of data be pasted from a spreadsheet into a drawing to look like a "drafted" table of text?

7.8.14 How to open Bricsys ebooks on Mac OSX

Install the free Stuffit Expander tool and use it to unpack the zip file.

Symptoms

When opening a paid ebook, the following error is displayed on Mac OSX: Error Unable to expand "Name Of The Book" into "Name Of The Folder" (Error 2 - No such file or directory)

Cause

The default Archive Tool used to unpack zip files on Mac OSX cannot handle password protected ZIP files.

More information

You can find Stuffit Expander in the Apple Store or at SmithMicro's website. StuffIt Expander Mac opens compressed RAR and ZIP files, and more.

7.9 BricsCAD general

7.9.1 Apple Big Sur compatibility for BricsCAD

Apple's recent release of Big Sur (macOS 11) introduces major changes to the OS. These have resulted in a number of applications to break, including BricsCAD.

Support for Big Sur

- BricsCAD V21
  - Install BricsCAD 21.1.05 for support on macOS 11 / Big Sur
- BricsCAD V20
  - Install BricsCAD 20.2.11
- BricsCAD V19 or earlier
  - There are no plans to support Big Sur for older versions of BricsCAD

Support for MAC hardware running M1 chips

- BricsCAD (Mac) V21.2.06 works on Rosetta (Intel emulation on M1 chips). A native M1 build is planned in a future version.

7.9.2 Where can I find offline Help for current and previous BricsCAD versions?

Click to open and download the offline PDF Help files for current and previous BricsCAD versions:

V21

- V21 English (US)

V20

- V20 English (US)
- V20 German
- V20 Spanish
- V20 Italian
- V20 Japanese
- V20 Polish
- V20 Portuguese (Brazil)
- V20 Russian

V19

- V19 English (US)
- V19 German
- V19 Italian
- V19 Japanese
- V19 Polish
- V19 Portuguese (Brazil)
- V19 Russian

V18

Note: if you click on a link, the zip file downloads directly.

- V18 EN (US)
- V18 DE

7.9.3 User profiles

Command: PROFILEMANAGER (6.24.52) BricsCAD allows you to customize the settings that control your drawing environment, and then save and restore those settings in a user profile. You can maintain several user profiles in parallel. So you can choose to run BricsCAD with a white background, minimal set of toolbars, and no command bar. Another user profile will have black background, different toolbars, and no flyover snapping. Both user profiles share the list of recently opened drawings but no other settings. User profiles can be helpful if you have multiple users with different preferences, or if you are a single user who works on various projects that require unique settings. You can even export your user profile and bring it with you when you work on a different computer. The User Profile Manager is a standalone tool that lists the existing profiles and provides all the needed operations on user profiles, such as Load, Create, Set Current, Copy, Rename, Delete, Export and Import. To export a user profile to a file In the User Profile Manager, click the Export... button. The Save As dialog box opens. A file name with the same name as the user profile is proposed. The file will receive the ARG extension. Click the Save button. To import a user profile from a file In the User Profile Manager, click the Import... button. The Open dialog box opens. Select the ARG file you want to import. Click the Open button.

Symptoms

What is the User Profile Manager and where is it located? Can profiles be exported or imported?

More information

See also Portable User Profile (7.9.4).

7.9.4 Portable User Profile

1. Export the profile using BricsCAD Profile Manager
2. Edit the resulting .ARG file with a text editor. There will be settings which the editor may want to remove in order to rely on whatever the program uses as default values. Paths usually need separat attention because they contain machine-specific data . These paths should not be hardcoded but refer to environment variables instead. These are in a format like this: %ENVIRONMENTVARIABLE% or %ENVIRONMENTVARIABLE%/subfolder. When the program closes and writes the settings to registry it will automatically substitute hardcoded paths partially or completely to environment variables where it can, saving the user work but the editor still needs to verify the result.

Some examples: %HOMEDRIVE% = C: %HOMEPATH% = \Users\[myName] %ProgramFiles% = C:\Program Files %USERPROFILE% = C:\Users\[myName] %APPDATA% = C:\Users\[myName]\AppData\Roaming etc. - replace "C:\\Program Files" by "%ProgramFiles%\\..." - replace "C:\\Users\[myName]" by "%USERPROFILE%\\..." - replace "C:\\Users\[myName]\\AppData\\Roaming" by "%APPDATA%\\..." etc.
On Linux or Mac: $HOME = /home/[myName] $PWD = /home/[myName]/Desktop $USER of $LOGNAME = [myName] etc.
When starting BricsCAD with this profile on a target computer, the environment variables will be interpreted as the absolute paths on that computer.

Symptoms

How to make a user profile that is portable to other computers and other users.

More information

1. On Windows, the %ProgramFiles% replacement above will only work if all people have installed BricsCAD in the same location.
2. If you know that all machines have the same mapped drive letter for a shared network folder, you can of course leave this in the profile.
3. If you can create environment variables on all machines, you can also use your own variables.
4. Names of defined environment variables, user profile and application data paths can vary between platforms and versions. On Windows, to find out which variables are available, type 'set' in a command line window.

See also: User profile manager (1.17.8).

7.9.5 Which file formats are supported by BricsCAD?

Natively BricsCAD only supports DWG/DXF. Settings allows to save a DWG to a specific DWG (DXF) revision. See 'Save as' in the help project. Alternatively the Export command allows to export drawings to a variety of vector and raster formats. See 'Export' in the help project. Apart from DWG format, BricsCAD is also able to handle Acis (.SAT) files. BricsCAD can import (/export) .SAT (=Acis) files via the ACISIN, ACISOUT commands respectively. There is no direct support to import STEP/IGES or SolidWorks formats in BricsCAD. However there are many additional applications which will perform data exchange/transformation.

VECTOR FILES

1. DWG format import/export
   - open DWG/DXF/DWT
   - saveas DWG/DXF/DWT
   - export DWF
2. Non-DWG formats:
   - IFC: IFC files can be imported/exported via Import/Export command
   - SKP: Sketchup files can be imported
   - DGN: DGN files can be imported
   - SAT: ACIS sat files can be imported/exported via acis-in acis-out
   - IGS, STP, SLDPRT are not supported in plain BricsCAD, but are imported/exported with use of an optional module: BricsCAD Communicator, along with several other 3D MCAD modeling formats. Please read below for complete information.

RASTER files (also known as BITMAP or IMAGE files):

Import/Attach Strictly speaking, you cannot import a RASTER image into a DWG. The DWG format is, in essence, a Vector and not a Raster format. BricsCAD does, however, enable you to attach a raster file as a background image. This is achieved via the Image Enabler. Supported formats include: .BMP, .TIFF, .JPEG, .GIF, .PNG, .WMF, .EMF, .PCX, .RAS, .TGA V9.1.1 and higher: Support for ECW images. V10.1.4 and higher: support of MrSID images. LizardTech's MrSID is one of the leading geospatial imagery formats. Raster image files can have 'world files' or 'position files' associated to them. A world file is a text file which describes the size (scale), the orientation and the coordinates of the raster map images. Position file are typically used in GIS. Supported position file formats are: .TFW , .RAT, .JPW, .PNGW

EXPORT You can save screen view to raster format via file>export. The SLIDE command also produces raster files (.SLD). If you use a virtual printer like PDFCreator or PDF995, CutePDF, you can produce (large scale) PDF output. Finally, many 'external' programs allow you to save a screen copy.

Symptoms

What formats are supported by BricsCAD? What are the import and export formats?

Cause

Natively BricsCAD only supports DWG/DXF. Settings allows to save a DWG to a specific DWG (DXF) revision. See 'Save as' in the help project. Alternatively the Export command allows to export drawings to a variety of vector and raster formats. See 'Export' in the help project. Apart from DWG format, BricsCAD also able to handle Acis (.SAT) files. BricsCAD can import (/export) .SAT (=Acis) files via the ACISIN, ACISOUT commands respectively. There is no direct support to import STEP/IGES or SolidWorks formats in BricsCAD. However there are many additional applications which will perform data exchange/transformation.

More information

See the IMPORT (6.17.10) and EXPORT (6.13.18) commands to check which file formats can be imported using the BricsCAD Communicator (4.1.2) module.

7.9.6 What is BricsCAD communicator and which CAD formats are supported?

BricsCAD Communicator (4.1.2) is an optional module that provides support for high quality 3D data exchange between major CAD formats. It facilitates the import and export of 3D CAD data including neutral (e.g. STEP and IGES), native MCAD (e.g. CATIA, Inventor, SolidWorks) and kernel specific formats. See the IMPORT (6.17.10) and EXPORT (6.13.18) commands to see the supported file formats.

7.9.7 Backup files of type BAK and SV$

BricsCAD uses 2 file extensions to make backup copies: BAK and SV$. Both files are in essence DWG files, so you can rename them (using the Windows Explorer) if you want to recover a drawing.

BAK file Each time a drawing is saved, the previous version of the DWG file is saved to a BAK file. This BAK file is created in the folder of the DWG file which is being edited. The creation of BAK files is controlled by the ISAVEBAK system variable. If ISAVEBAK = 0 (zero) no BAK files are created.

SV$ file When automatic save is turned on, BricsCAD will automatically create a backup copy of your work at preset time intervals. When the automatic save kicks in, BricsCAD saves the currently open drawing(s) as SV$. The time interval (in minutes) at which the automatic save kicks in, is controlled through the SAVETIME system variable. BricsCAD restarts this interval timer whenever you save the drawing. If SAVETIME = 0 (zero), the automatic save is turned off. The path to the folder where BricsCAD saves the temporary files is specified by the SAVEFILEPATH system variable. By default this is: C:\Users\[Username]\AppData\Local\Temp.

Symptoms

What is the purpose of BAK and SV$ files and how are they used and controlled?

7.9.8 Transition From Offline to Online Help

If for any reason you do no not have a permanent internet connection, we do offer a downloadable pdf version of the Help, a download link sits at the bottom of our help center page. This will be further improved and updated in the future.

Symptoms

Stating with BricsCAD V19, I do not have help files locally, on my computer. The _HELP command (F1) will re-direct me to the Bricsys website, which requires an internet connection.

Cause

Until BricsCAD V19, Help consists of 4 .chm files sitting in the C:\Program Files\Bricsys\BricsCADversion\Help\en_US folder. These files are interlinked: double click (or create a shortcut) to) BricsCAD.chm to launch the Help. Starting with BricsCAD V19, we have migrated to an online Bricsys Help Center. We are using the latest cloud technology to host a help system that is up to today's standards, including rich content, lessons, tutorials and more. We've merged all support sources into this new system:

- Old CHM help
- Knowledge base
- Tutorials from the blog
- added brand new step by step lessons.

System variables are not included in offline help. The Settings dialog box (1.17.10) has help for all system variables and user preferences.

More information

We are in the process of translating all the Help Center content into multiple languages.

7.9.9 Display control of entities contained in block inserts

Thawed/Frozen Visibility control by freezing or thawing layers behaves straightforward: no entities that are located on frozen layers will display. If the layer on which a block was inserted becomes frozen, then ALL content of that block will no longer ze visible, regardless of the layer on which entities were located at creation time of the block. If a block is inserted on a thawed layer, but contains content placed on a layer that becomes frozen, then only such content will no longer be visible.

On/Off The On/Off setting behaves different from the Thawed/Frozen setting, specifically concerning the behavior for block content placed on layer 0. Entities that were on layer 0 at creation time of a block, will obey the On/Off setting of the layer on which the block is inserted, so these elements will behave as is they were placed on the layer on which the block is inserted. Entities that were not on layer 0 at creation time of a block, will obey the layer on/off setting in a normal way.

Example: A block is made with entities from layers 0, 1 and 2. The block is inserted on layer 1. Now, this is what happens:

- when we switch off layer 0: the block content that at block creation time was on layer 0, will remain visible because it now acts as if it were on layer 1!
- when we switch off layer 1: the block content that at block creation was on layer 0, becomes invisible, as well as the block content that initially was on layer 1.
- when we switch off layer 2: only the block content that at creation time was on layer 2 becomes invisible.

COLOR The way the color of entities is controlled is related to this behavior: Entities that at block creation time were on layer 0 and had color property 'BYLAYER' will obey the color property of the layer on which the block is inserted.

More information

The appearance of an entity is controlled by its COLOR, LINETYPE, LINEWEIGHT and TRANSPARENCY setting. In addition to a specific value, the BYLAYER and BYBLOCK options are available. These options cause an entity to adopt the property either fromthe layer or the block into which it is inserted. BYLAYER To draw all entities in the default property set for the current layer. BYBLOCK When you insert the block in a drawing, all entities inherit the currently selected defaults for new entities. If you insert a block that contains entities originally drawn on layer 0 and assigned color and linetype BYLAYER, it is placed on the current layer and assumes the color and linetype of that layer. If you insert a block that contains entities originally drawn on other layers or with explicitly specified colors or linetypes, the block retains the original settings. If you insert a block that contains entities originally assigned color and linetype BYBLOCK, and the block itself has the color and linetype BYLAYER, those entities adopt the color and linetype of the layer onto which they are inserted. If the block is assigned an explicit color or linetype, such as red or dashed, those entities adopt those qualities. If a block contains a mixture of colors, inserting blocks when the color is set to BYBLOCK can produce unpredictable results.

7.9.10 Is BricsCAD v20 supported on macOS 10.15 Catalina?

Yes, BricsCAD v20 or later supports macOS 10.15 Catalina. However we have discovered some potential issues with installing and running BricsCAD on Catalina.

Installing and running BricsCAD v20 on Catalina

To install and run BricsCAD version 20 on macOS 10.15, you need to explicitly select "Open Anyway". This option is available via System Preferences > Security & Privacy > General, or when using a right-click to open the application.

Activating a trial on Catalina

If you experience an issue activating your trial on Catalina, make sure you have installed version 20.2.05 or later. You can download the latest version here.

7.10 Shape

7.10.1 Where can I download the BricsCAD® Shape installer?

Symptoms

I am looking for the BricsCAD Shape installer and I can only find the BricsCAD installer. When I go to the BricsCAD Shape product page on Bricsys.com, and I select “Get Shape for free”, I end up with the BricsCAD installer. When I download BricsCAD Shape, the downloaded installer installs BricsCAD.

Solution

Shape is now part of the BricsCAD installer, i.e. you need to install BricsCAD to run Shape. After installation, when you launch BricsCAD, the BricsCAD Launcher (**??**) dialog box displays. Here you can choose to run Shape. It is possible to run Shape without activating the BricsCAD trial and to start your BricsCAD trial at a later date. Shape can also be used when you don't have a BricsCAD license or after your license expired.

Related Topics

Launch Shape (7.10.2) The BricsCAD Launcher dialog box (**??**)

7.10.2 I've installed BricsCAD® Shape, but I can't find the application.

Symptoms

I've downloaded the installer for BricsCAD Shape and installed it, but I only see BricsCAD installed. I want to use Shape and not BricsCAD.

Solution

Shape is now part of the BricsCAD installer, i.e. you need to install BricsCAD to run Shape. After installation, when you launch BricsCAD, the BricsCAD Launcher (**??**) dialog box displays. Here you can choose to run Shape. It is also possible to run Shape when you don't have a BricsCAD license or when your license is expired. (7.4 on the following page)

Figure 7.4

7.11 Switching from AutoCAD

7.11.1 NEW command in AutoCAD vs. BricsCAD

BricsCAD uses a system variable BASEFILE to store the template name. It does not ask for a template name when you create a new drawing. If the system variable BASEFILE is an empty string, BricsCAD does not use a template to create the new drawing. BricsCAD does not distinguish between template drawings and other drawings. BricsCAD ignores the file extension '.dwt'. In order to use DWT files in BricsCAD, they have to be renamed to DWG files. Beside the command NEW (6.22.5), BricsCAD has a command NEWWIZ (6.22.6) which uses a dialog. This dialog allowsto choose a template, or manually initialize a drawing from scratch. BricsCAD does not have SDI single document interface as such, it is only partially implemented. When the value of the SDI system variable is 1, it is still possible to open multiple drawings in each BricsCAD instance. Double clicking a drawing in Windows Explorer opens the drawing in a new BricsCAD instance though. So, the NEW command will not close any open drawings. Lisp initialisation routines work differently in BricsCAD:

- on_start_default.lsp is used instead of acad.lsp
- on_doc_load.lsp is used instead of acaddoc.lsp
- there is no separate workspace per drawing for lisp. Lisp symbols cannot be reinitialized for a single drawing. The other open drawings will also be affected. In BricsCAD the system variable LISPINIT gives the possibility to reinitialize all lisp code when opening a drawing, or not to reinitialize any lisp code on open (or new).

Symptoms

What are the differences between AutoCAD and Bricscad when creating a new drawing?

7.11.2 NCOPY command

The NCOPY command in AutoCAD copies entities that are contained in an xref or a block. The NCOPY command is available in the free Express Tools for BricsCAD. Alternatively use the REFEDIT (6.26.13) command as a workaround:

1. Start the REFEDIT command for the block or XRef which you want to copy.
2. Copy the required entities.
3. Select the copied entities and choose "Remove from Refedit' in Refedit toolbar.
4. Choose 'Refclose and discard' in the Refedit toolbar to exit command.

To copy entities contained in a block:

1. Select the block.
2. Start the BEDIT (6.6.7) command.
3. Select the required entities, then use COPYCLIP (6.9.36) (Ctrl C) to copy the entities to the clipboard.
4. Choose 'Discard Changes' in the Edit Block toolbar or ribbon panel.
5. Use PASTECLIP (6.24.13) (Ctrl V) to paste the entities in the drawing.

7.12 Programming

7.12.1 Add an Environment Variable in Windows

Do the following:

1. From the Control Panel click the System Button or type Environment variables in the search field. (XP Users) Click on the Advanced Tab (Vista, 7 and 8) Click on Advanced System Settings
2. Click Environment Variables...
3. Click New...
4. Variable Name: enter_variable_name_here
5. Variable Value: enter_variable_value_here
6. Press OK to set the Environment variable
7. Press OK to close the Environment Variables dialog.

Symptoms

I want to define an environment variable in Windows.

7.12.2 How to get the instance handle of custom DwgDirect applications (DRX modules)

You can get the instance handle of custom DwgDirect applications (DRX modules) as follows:

1. Using virtual void* OdRxModule::sysData() function HMODULE hModule = reinterpret_cast(pOdRxModule->sysData());
2. Using AfxGetInstanceHandle() if your DLL linked with the USRDLL version of MFC.

Symptoms

How to get the instance handle of custom DwgDirect applications (DRX modules)

7.12.3 Registration of COM libraries

The BricsCAD COM x86/x64 libraries should be re-registered when starting to use a different version/architecture/localization by running BricsCAD one time as an administrator. This can be achieved in more than one way:

- Right-click on the bricscad.exe shortcut or the corresponding BricsCAD User Profile Manager desktop application (by using e.g. Windows Start button and typing “User”) > choose “Run as administrator" option from the contextual menu
- Start Windows Command Prompt desktop application as an administrator > run a command like: "bricscad.exe /P MyProfile" (for more details on this, please see the BricsCAD Startup Options in the BricsCAD Help files).
- Create and use a customized bricscad.exe shortcut: right click on a new bricscad.exe shortcut > in the Shortcut Properties window, tick the “Run this program as an administrator” check-box > Apply button > OK button.

After the COM registration, BricsCAD can be further launched with regular (not admin) rights until the next BricsCAD version/architecture/localization switch. Then a new COM registration update is required.

Symptoms

The program crashes when running a .NET, BRX, TX, COM, or a VBA + Microsoft Office Excel/Word application.

Cause

When multiple BricsCAD versions (V19, V20, ...), architectures (x86/x64) or locales (en_US, de_DE, …) are installed on the same operating system, COM-based tools or applications may crash when failing to re-register the BricsCAD COM libraries upon switching to a different BricsCAD version.

7.12.4 BRX - The commands of my application are not recognized on BricsCAD

In your command registration code, never add an underscore prefix to any command name. Then BricsCAD and AutoCAD always recognize the commands in the correct and expected way.

Symptoms

Your module is compiled with the BRX SDK, but when loaded into BricsCAD your module commands are not recognized. On AutoCAD, the commands are recognized correctly.

Cause

Most likely, this is because you have registered your global command name with an underscore prefix. Strictly spoken, this is not correct, any global (and local) command name should always be registered without an underscore prefix. As a proof, try the following experiment on AutoCAD and Bricscad. To fully understand, it is important to use different names for global and local commands:

- ACED_ARXCOMMAND_ENTRY_AUTO(CYourApp, yourGroup, _global0, local0, ACRX_CMD_MODAL, NULL) //wrong
- ACED_ARXCOMMAND_ENTRY_AUTO(CYourApp, yourGroup, global1, local1, ACRX_CMD_MODAL, NULL) //correct

BricsCAD recognizes: local0, global1, _global1, local1 AutoCAD recognizes: local0, _local0, global1, _global1, local1, _local1 Note that BricsCAD, nor AutoCAD, recognizes global0 or _global0 The actual behavior in AutoCAD is not consistent with their documentation: AutoCAD recognizes the local command name with an extra underscore prefix. BricsCAD does not do this, as there is no logical need for it. However, the behaviour may change over time. The above test gives different results for BricsCAD V20 and AutoCAD 2020. If the commands are specified as follows:

- ACED_ARXCOMMAND_ENTRY_AUTO(CYourApp, yourGroup, _global0, local0, ACRX_CMD_MODAL, NULL)
- ACED_ARXCOMMAND_ENTRY_AUTO(CYourApp, yourGroup, global1, _local1, ACRX_CMD_MODAL, NULL)
- ACED_ARXCOMMAND_ENTRY_AUTO(CYourApp, yourGroup, global2, local2, ACRX_CMD_MODAL, NULL)

BricsCAD V20 recognizes: _global0, local0, global1, _global1, _local1, local2 BricsCAD V20 does not recognize: global0, _local0, local1, _local2 AutoCAD 2020 recognizes all the above commands.

7.12.5 How to port and add my application?

With the BricsCAD development platform you can port your AutoCAD ® based applications using unmodified source code. And the BricsCAD team will always be there for you, not only to support the porting but also to assist with the marketing of the solution to the worldwide community of BricsCAD users.

- Reach new cost conscious customers worldwide.
- Straightforward port with unmodified source code.
- Active sales & marketing campaigns, free of charge.
- Application Catalog and Online Store.
- Customer Support Infrastructure.

On the Bricsys website, register as developer and contact us to get started!

Chapter 8

Guided Lessons

8.1 2D Drafting in BricsCAD

8.1.1 Lesson 1: Getting Started with BricsCAD

Welcome to Learning BricsCAD. A fundamentals level course for the practical use and application of BricsCAD in a design environment. This course is intended for the learner who is new to computer-aided design (CAD). No experience with BricsCAD or any other CAD product is necessary.

8.1.2 Course chapters

After completing this course you will be able to:

1/ Identify key elements of the User Interface .

2/ Work with drawing files .

- Describe the methods available to open drawing files in BricsCAD.
- Explain how to create a new drawing file using a template file.
- Save a drawing file with a new name.
- Add shortcuts to the Places list.
- Explain how to use tabs to work with multiple files.
- Describe the importance of and how to set up autosave and backup settings.

3/ Use different tools to view your drawings .

- Identify what zooming tools are used for.
- Illustrate the various ways for accessing the Zoom tools including the Navigation bar, the right-click menu, and the command line.
- Describe how to use Real-Time Zoom and other Zoom options such as Window, Extents, and Previous.
- Change the view without changing the magnification of the view using the Pan command.
- View the contents of the drawing window from any direction using the LookFrom control.

This is only a preview Get access to the full course materials and step by step exercises at lessons.bricsys.com **The course lesson consists of a video that walks you through the exercise and shows how every step is done in BricsCAD. Underneath you can read the step-by-step instructions for the exercise with matching screenshots. Download the .dwg file and open it in BricsCAD to perform the exercise. After completing the exercise, an overview on the subject will be given with more guiding information.** (8.1 on the next page)

8.1.3 Lesson 2: Primary Drawing Techniques

Welcome to Learning BricsCAD. A fundamentals level course for the practical use and application of BricsCAD in a design environment. This course is intended for the learner who is new to computer-aided design (CAD). No experience with BricsCAD or any other CAD product is necessary.

8.1.4 Course chapters

After completing this course you will be able to:

1/ Draw basic objects .

- Draw a line by defining the start and endpoint.
- Add a rectangle.
- Create a circle.
- Draw an arc by selecting three consecutive points.
- Create a polygon.

2/ Work with Entity Snaps and Tracking .

- Improve the accuracy of your drawings by using entity snaps to create and edit geometry.
- Incorporate theoretical construction geometry when you create and edit geometry.

3/ Draw using precise values.

- Understand the Cartesian Coordinate System upon which the BricsCAD drawing window is based.
- Recognize the advantage of using Direct Distance Entry while creating and modifying objects.
- Understand how drawing units determine the way measurement values are returned.
- Assign specific drawing unit values to a drawing.

8.1.5 Lesson 3: Essential Drawing Techniques

Welcome to Learning BricsCAD. A fundamentals level course for the practical use and application of BricsCAD in a design environment. This course is intended for the learner who is new to computer-aided design (CAD). No experience with BricsCAD or any other CAD product is necessary.

8.1.6 Course chapters

After completing this course you will be able to:

1/ Use different selection modes and erase objects.

- Manually select objects in a drawing.
- Select objects using an Implied Window or an Implied Crossing.
- Use the Polygon selection mode to select objects.
- Use the Circle selection mode to select objects.
- Use the Point selection mode to select objects.
- Use the Fence selection mode to select objects.
- Use other selection modes to select objects.
- Use the Erase command to remove objects from a drawing.

2/ Move and Copy objects.

- Use the Move command to reposition objects in your drawings.
- Duplicate objects in your drawings using the Copy command.

3/ Offset objects.

- Create geometry at a specific distance from the selected geometry using the Offset command.

4/ Trim and Extend geometry.

- Understand how to change the length of geometry based on other geometry in the drawing with the Trim command.
- Utilize the Extend command to change the length of geometry in relation to other geometry.

5/ Apply fillets and chamfers to geometry.

- Use the Fillet command to create round and sharp corners where geometry intersects.
- Create angled corners with the Chamfer command.

8.1.7 Lesson 4: Additional Drawing Techniques

Welcome to Learning BricsCAD. A fundamentals level course for the practical use and application of BricsCAD in a design environment. This course is intended for the learner who is new to computer-aided design (CAD). No experience with BricsCAD or any other CAD product is necessary.

8.1.8 Course chapters

After completing this course you will be able to:

1/ Use Grips

- Utilize Grips on geometry to initiate editing commands.
- Change the behavior and appearance of grips using the Options dialogue box.

2/ Stretch Objects

- Use the Stretch command to change the shape of entities in the drawing.

3/ Break and Join Objects

- Use the Break command to separate one piece of geometry into two.
- Create a gapless break in geometry using the Same as First Point option.
- Take two pieces of geometry and combine them into one.

4/ Mirror Objects

- Create duplicate geometry based on a defined centerline.

5/ Rotate Objects

- Rotate geometry in relation to a specified base point.

6/ Scale Objects

- Change the size of an object in the drawing.

7/ Pattern Geometry

- Make copies of selected geometry in a specific pattern using one of three layouts.
- Create an array pattern based on rows, columns, and spacing.
- Use the Polar Array to arrange geometry in a circular pattern around a center point.
- Update the layout of a specified pattern using grips, the Array tab, and the Properties window.

8.1.9 Lesson 5: Organizing Objects in a Drawing

Welcome to Learning BricsCAD. A fundamentals level course for the practical use and application of BricsCAD in a design environment. This course is intended for the learner who is new to computer-aided design (CAD). No experience with BricsCAD or any other CAD product is necessary.

8.1.10 Course chapters

After completing this course you will be able to:

1/ Create and use Layers.

- Utilize separate virtual sheets to organize a drawing.
- Use the Drawing Explorer to create, delete, or change layers in a drawing.
- Change the appearance of objects in a drawing.
- Add layers into a drawing using the Drawing Explorer.
- Utilize the Layer List to change the current layer and alter certain layer properties.
- Understand how a layer can be changed.
- Delete a specific layer.

2/ Modify object properties.

- Understand how general properties affect an object.
- Make changes to an object using the Properties palette.
- Select an object and dynamically change it using Quad.
- Use a source object to apply congruent properties to another object.

3/ Obtain information about objects.

- Show specific information in a drawing using an Inquiry Command.
- Identify specifics about an objectusing a List command.
- Measure objects in a drawing for distance, angle, radius, and area.
- Use a Boundary Area to accurately measure an area of a curved or irregular object.
- Determine the location of an object on the coordinate plane.

This is only a preview Get access to the full course materials and step by step exercises at lessons.bricsys.com **The course lesson consists of a video that walks you through the exercise and shows how every step is done in BricsCAD. Working with Layers
This lesson teaches you the benefits of working with layers troughout the whole process.
The course lesson consist of a video that walks you through the exercise and shows how every step is done in BricsCAD. Underneath you can read the step-by-step instructions for the exercise with matching screenshots. Download the .dwg file and open it in BricsCAD to perform the exercise.
After completing the exercise, an overview on the subject will be given with more guiding information.
Lesson Objectives
After completing this lesson, you will be able to:
Utilize separate virtual sheets to organize a drawing.
Use the Drawing Explorer to create, delete, or change layers in a drawing.
Change the appearance of objects in a drawing.
Add layers into a drawing using the Drawing Explorer.
Utilize the Layer List to change the current layer and alter certain layer properties.
Understand how a layer can be changed.
Delete a specific layer.

8.1.11 Lesson 6: Drawing Annotations

Welcome to Learning BricsCAD. A fundamentals level course for the practical use and application of BricsCAD in a design environment. This course is intended for the learner who is new to computer-aided design (CAD). No experience with BricsCAD or any other CAD product is necessary.

8.1.12 Course chapters

After completing this course you will be able to:

1/ Create and Edit Text

- Create a single line of text to add annotation to a drawing.
- Create a paragraph of information to use as annotation in a drawing.
- Change Mtext settings and options using the Text Editor tab.
- Assign word processor type settings to a Mtext.
- Utilize grips and the Properties palette to edit Mtext.

2/ Use Spell Check

- Correct any spelling errors in the drawing using Check Spelling.
- Change and edit dictionaries used by the Check Spelling Command.

3/ Add Dimensions

- Determine the size and location of objects with dimensions.
- Use a dimension style to control the appearance of dimensions in a drawing.
- Use dimensions to quantify objects in a drawing.
- Find the horizontal or vertical distance from one point to another.
- Show the linear distance between two points regardless of relative angle.
- Find the relative angle between two lines.
- Determine the exact length of an arc.
- Apply a radius to an arc or a circle.
- Apply a diameter to an arc or circle.
- Identify the center of an arc or circle using a Center Mark.
- Create a series of dimensions based on an existing dimension.
- Determine the distance between a start point and multiple items following a baseline.
- Create dimensioning in a drawing for multiple objects simultaneously.

4/ Modify Dimensions

- Use the Properties palette to change the appearance of dimensions.
- Add text information to a text value.
- Add or remove a break in extension or dimension lines.
- Change the spacing between dimension lines.

5/ Add and Modify Multileaders

- Add information to a drawing in the form of multileaders.
- Add and position a mutileader in a drawing.
- Change the appearance of a multileader line.

8.1.13 Lesson 8: Supplemental Drawing Techniques

Welcome to Learning BricsCAD. A fundamentals level course for the practical use and application of BricsCAD in a design environment. This course is intended for the learner who is new to computer-aided design (CAD). No experience with BricsCAD or any other CAD product is necessary.

8.1.14 Course chapters

After completing this course you will be able to:

1/ Create and edit hatch patterns.

- Add a pattern to a specific area of a drawing.
- Add color fill to closed shapes in a drawing.
- Edit hatch and gradient patterns.

2/ Create and edit polylines.

- Create a single object using multiple line segments.
- Use grips and PEDIT command to edit a polyline.

3/ Create splines and ellipses.

- Create the smoothest possible curve between two or more points
- Make an ellipse using a major and minor axis.

4/ Work with tables.

- Insert a table filled with information into a drawing.

This is only a preview Get access to the full course materials and step by step exercises at lessons.bricsys.com **The course lesson consists of a video that walks you through the exercise and shows how every step is done in BricsCAD. 8.1.17 Lesson 9: Layouts and Printing

Welcome to Learning BricsCAD. A fundamentals level course for the practical use and application of BricsCAD in a design environment. This course is intended for the learner who is new to computer-aided design (CAD). No experience with BricsCAD or any other CAD product is necessary.

8.1.18 Course chapters

After completing this course you will be able to:

1/ Work with Layouts and Viewports.

- Organize a drawing for printing and electronic output.
- Navigate between different layouts in a drawing.
- Make a frame around specific areas of a drawing for viewing purposes.
- Add more than one viewport to a drawing.
- Define what in the drawing is shown in a viewport.
- Set up a scale for the size indicated in a viewport.
- Resize a viewport to fit information in a drawing.

2/ Create and manage Page Setups.

- Utilize a page setup to determine the appearance and format of a final output.
- Use the Page Setup Manager to create, modify, and import page setups for a drawing.

3/ Share your designs.

- Share a design with others physically or electronically.
- Print a design using a plotter or printer.
- Specify in the Plot dialogue box where and how the design should be printed.

4/ Use Annotation Scaling.

- Define what drawing annotation is.
- Use and determine an annotative scale on an object.
- Understand when to use different annotative styles.
- Set an annotative scale in a drawing or a viewport.
- Edit a preexisting annotative scale on an object.
- Create individual scale representations for an object.
- Determine how a line will be affected by an annotative scale.

8.2 Getting started with BricsCAD BIM

8.2.1 Lesson 3: Working with components

Welcome to Learning BricsCAD BIM. A fundamentals level course for the practical use and application of BricsCAD BIM in a design environment. This course is intended for the learner who is new to building information modeling (BIM). No experience with BricsCAD BIM or any other BIM product is necessary. ****Lesson available in English only****

Course chapters

After completing this course, you will be able to:

1/ Create Components

- Subtract a solid from another.
- Use modeling tools to create a window frame and glazing.
- Classify your manually created window as a window.
- Insert your window in other drawings.

2/ Insert Components

- Insert windows in your model.
- Copy windows.
- Create a window using a grid.
- Create a custom window, using a base profile.
- Create a curtain wall.

3/ Edit Components

- Flip a door to the other side of a wall.
- Flip a door swing from one side to the other.
- Change the parameters of a component.

4/ Review the lesson

This is only a preview. Get access to the full course materials and step by step exercises at lessons.bricsys.com. **The course lesson consists of a video that walks you through the exercise and shows how every step is done in BricsCAD BIM. Welcome to Learning BricsCAD BIM. A fundamentals level course for the practical use and application of BricsCAD BIM in a design environment. This course is intended for the learner who is new to building information modeling (BIM). No experience with BricsCAD BIM or any other BIM product is necessary. ****Lesson available in English only****

Course chapters

After completing this course, you will be able to:

1/ Identify key elements of the user interface.

- Open an existing file in BricsCAD BIM.
- Make a new file in BricsCAD BIM using the start-up wizard.
- Make a new file in BricsCAD BIM using a default template drawing.
- Make a new file in BricsCAD BIM using a template drawing of your choice.
- Identify the important elements of the BricsCAD BIM user interface.
- Use the different methods in the BricsCAD BIM user interface to access different tools.
- Hide and isolate entities.
- Reveal all hidden entities.
- Cut through a BIM model horizontally to show the details on a floor plan.
- Toggle the Clip Display property of a BIM section entity.
- Control the visibility of your BIM section cuts.
- Navigate in 3D.
- Make use of a series of shortcuts to help you model faster in BricsCAD BIM.
- Use the Quad (to draw a simple box).
- Right-click to redo the last active command.

2/ Select entities.

- Select whole entities.
- Select the desired sub-entities.
- Select multiple entities at once.
- Select multiple sub-entities at once.

Chapter 9

Developer Tools

9.1 BricsCAD Solution Build (BSB)

9.1.1 What is BSB (BricsCAD Solution Build)?

OEM software is often associated with a stripped- down or “lite” version of the original product. Bricsys follows a different path. We provide our OEMs with full CAD functionality, fully supported by our trusted partner eco-system. **We call our offering BSB (BricsCAD Solution Build) because the word “solution” defines our vision for the way that applications should be delivered.** The strategy is to bring together all of the ecosystem participants - Bricsys distribution partners, Bricsys application partners and Bricsys itself - and go to market as one organization with a unified approach: “The Collective”.

9.2 Developer Reference

9.2.1 Developer Reference

You can customize BricsCAD by adding custom programs written in any of several programming languages that run within BricsCAD, including LISP, C/C++, VB/VBA/VB.NET. BricsCAD offers several API's : COM, BRX, TX, .NET. With BricsCAD, you can run many programs originally created for use with AutoCAD. Specifically, you can use programs written entirely in AutoLISP with no modification. Also .dvb project files (VBA macro files) originally created on AutoCAD should run without modification on BricsCAD. BricsCAD supports the AutoCAD dialog control language (DCL), which is used by other applications such as Lisp/TX/BRX to customize dialog boxes. You can use all DCL files unmodified within BricsCAD. To write applications in C or C++, BricsCAD offers BRX, a C/C++ language interface, code-compatible with the AutoCAD Runtime eXtension (ARX) interface in AutoCAD. BricsCAD includes, a C/C++ language interface compatible with the AutoCAD Development System (ADS) interface in AutoCAD.

Compatible programming languages

For more information about adding custom programs to BricsCAD in one of the compatible programming languages, click the appropriate link below:

- LISP (LISt Processing)
- DCL (Dialog Control Language)
- DIESEL (Direct Interactively Evaluated String Expression Language)
- COM (Component Object Model)
- VBA (Visual Basic for Applications)
- BRX (BricsCAD Runtime eXtension)
- TX (Teigha eXtension)
- .NET

9.3 Application Porting Process

9.3.1 What are Bricsys LGS components?

Bricsys offers two families of components for constraint management: LGS 2D and LGS 3D. They can be embedded into any end-user software. The Bricsys LGS 2D and 3D components are available in binary form for several platforms: 32 and 64 bit Windows, Mac OS X, Linux and other OS. Please contact us to discuss licensing conditions specific to your business. Visit our website for more information...

Using the Bricsys LGS component technology

Using the Bricsys LGS component technology, any company or individual can add support for constraint management into their CAD, CAM or CAE software with minimal development cost and a short time to market. Bricsys offers two families of components for constraint management: LGS 2D and LGS 3D. Geometric, dimensional, and engineering constraints play a fundamental role in modern CAD, CAM and CAE software. They are used to specify and keep interrelations between geometric elements of any 2D/3D CAD model, and thus allow users not only to significantly reduce design time, but also to express their design intent, vastly simplifying future changes in geometry. Please contact us to discuss licensing conditions specific to your business.

9.3.2 How to port and add my application?

Tired of the exorbitant pricing and strict licensing policies of the major CAD vendors? Expand the market for your applications, become a BricsCAD developer. With the BricsCAD development platform you can port your AutoCAD ® based applications using unmodified source code. And the BricsCAD team will always be there for you, not only to support the porting but also to assist with the marketing of the solution to the worldwide community of BricsCAD users.

- Reach new cost conscious customers worldwide.
- Straightforward port with unmodified source code.
- Active sales & marketing campaigns, free of charge.
- Application Catalog and Online Store.
- Customer Support Infrastructure.

On the Bricsys website, register as developer and contact us to get started!

1. Register as developer
2. Explore the API
3. Port your application to BricsCAD
4. Add your app to the Application store
5. We promote your application

9.3.3 Supported API's

With BricsCAD, you can run many programs originally created for use with AutoCAD without modification on BricsCAD. BricsCAD supports the AutoCAD dialog control language (DCL). You can use all DCL files unmodified within BricsCAD. To write applications in C or C++, BricsCAD offers BRX, a C/C++ language interface, code-compatible with the AutoCAD Runtime eXtension (ARX) interface in AutoCAD. **BricsCAD offers several APIs**

- LISP (LISt Processing)
- DCL (Dialog Control Language)
- DIESEL (Direct Interpretively Evaluated String Expression Language)
- COM (Component Object Model)
- VBA Visual Basic for Applications)
- BRX (BricsCAD Runtime eXtension)
- TX (Teigha eXtension)
- .NET

9.4 Application Catalog

9.4.1 How to add your application to our catalog

BricsCAD offers a CAD development platform to which you can port your AutoCAD®-based applications. Porting is easy: you don't even have to modify any source code. And anyway: the BricsCAD team offers full technical support. https://https://www.youtube.com/embed/YCuRZeKvjDE

Chapter 10

Customer service and website

10.1 Customer service and website

10.1.1 My Bricsys Account

You can access your account by clicking the My Account icon in the upper right corner on the Bricsys web site. The page gives an overview of your:

- Personal details
- My organizations
- Licenses and support contracts
- Support requests
- Invoices and payments
- Mail subscriptions

Developers have also access to:

- My applications
- Press room
- Application Support

10.1.2 How to add Organization Info

1. Log in your account on www.bricsys.com.
2. Click your name in the upper right corner.
3. Select **My Account**.
4. Click **Add your organization**.
5. Select a country in the **Search in country**.
6. In the **Search by trading name** search for your organization, select it and click **Save**.
7. If your organization is not listed, you can add it by clicking **Add your organization** (make sure to fill in all required fields, marked with '*'). Once the details of the newly added organization are saved, the verification status will become **To be verified** – action which will be performed by the country manager. Even while the status is **To be verified**, the user can purchase from the E-Store. The first contact buying for a new organization will automatically become admin.
8. Once you set your organization, you can ask for a role (the assignment will be performed by the organization admin).

Possible roles within the organization

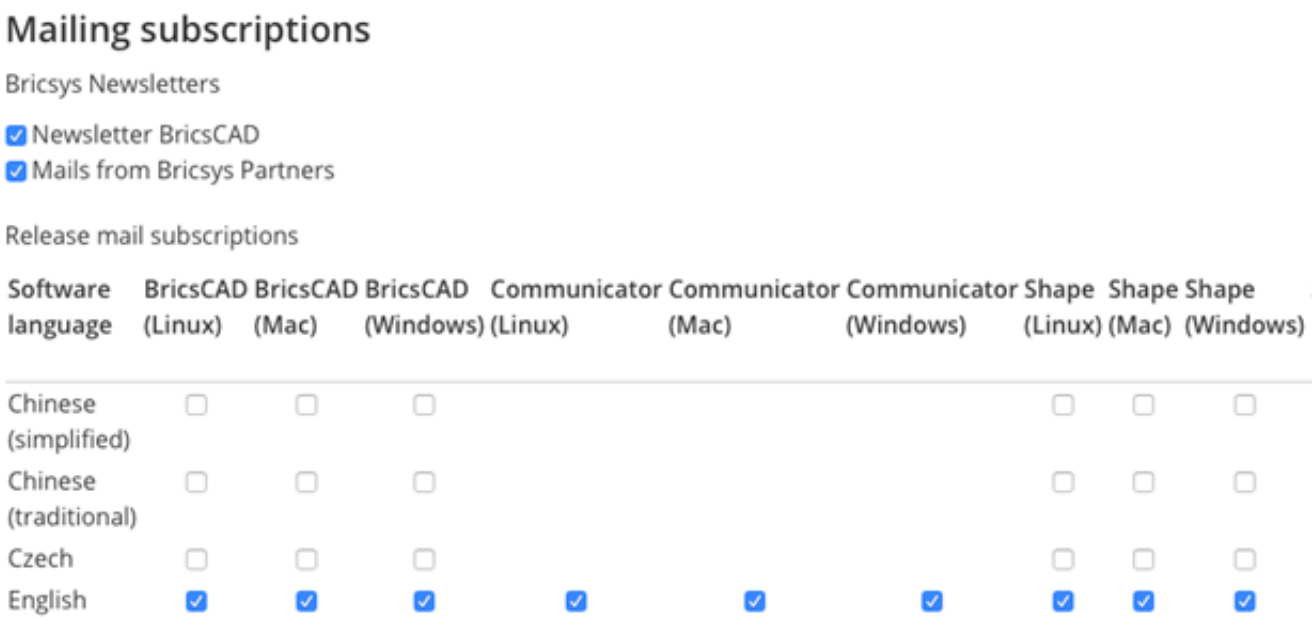
- Admin:
  - Can buy from E-Store on behalf of the organization.
  - Can invite/set roles members of organization.
- Financial Manager: can buy from E-Store on behalf of the organization.
- Employee: can see Support Request of all organization members.
- Rejected Employee: user who rejected the organization invite.
- Unauthenticated employee: can see his own Support Requests.
- License Manager: manages the licenses in his organization (not yet implemented).

Admin area

- In **My account**, a **My organizations** section will appear.
- Admins can invite/manage roles for other organization members.
- It is possible to add/correct organization data.
- The VAT number will automatically be checked against the expected number for the selected country.

It is not mandatory to be part of an organization, but it will restrict the possibility to buy from the E-Store. Users that are not part of an organization will have to contact BackOffice to buy in behalf of them. Being part of an organization but not having Admin/Financial Manager role will also restrict the possibility to but from the E-Store. A purchase request can be sent to your administrator to purchase for you.

Figure 10.1



10.1.3 Where can I change my mailing subscriptions

Your mailing subscriptions can be managed under **My Account** on the Bricsys website. You can access your account by clicking on your profile icon in the upper right corner of the Bricsys website. In the menu on the left, click on Manage your mail subscriptions. Here you can check/uncheck the newsletters or release mails you like to receive. (10.1)

10.1.4 How to solve 'this email address already exists'

Symptoms

You would like to register on the Bricsys website but you receive the message **This email address already exists**.

Cause

- One of our partners has registered you as a customer or prospect with this email address.
- You or somebody else have already registered this email address on the Bricsys website.
- You are using a CAD product that is built/based on our BricsCAD OEM solution (BSB) which is using our licensing system.

Solution

Reset your password using the Forgot username/password? link on the login page.
